epidemic [I' + *demōs*, people]. Appearance of an infectious disease not of local origin which attacks many people at the same time in the same area. SEE *Winckel's disease*.

e. jaundice. Infectious or spirochetal jaundice, Weil's disease. An infectious disease caused by a spirochete, *Leptospira icterohemorrhagica*. SYN: Onset of sudden fever, in a few days followed by jaundice, hemorrhage into skin, and anemia. SEE *caribi*, *endemic*, *pandemic*.

epidemiography [I' + I' + *graphein*, to write]. Study of epidemic diseases.

epidemiologic (ep'i-dem'i-o-loj'ik) [I' + I' + *logos*, study]. Pert. to the study of epidemics.

epidemiologist (ep'i-dem-i-o-lō-jist) [I' + I' + *logos*, study]. One who specializes in epidemic diseases.

epidemiology (ep-i-dem-i-o-lō-jī) [I' + I' + *logos*, study]. The science of epidemic diseases.

epidermal, epidermic [I' + *derma*, skin]. Pert. to the epidermis.

epidermatoplasty (ep-i-der-mat'o-plas-tī) [I' + I' + *plassein*, to mould]. Grafting with pieces of epidermis with the underlying layer of the corium.

epidermic (ep-i-der'mik) [I' + *derma*, skin]. Pert. to the external layer of the skin or epidermis.

epidermidolysis [I' + I' + *lysis*, loosening]. Loosening of the epidermis. SYN: *epidermolysis*.

epidermido'sis [I' + I' + *ōsis*]. Any disease of the skin. SYN: *epidermosis*.

epidermis [I' + *derma*, skin]. Cuticle, or outer layer of skin, scarf-skin.

It consists of four layers, (1) stratum germinativum (stratum mucosum, stratum Malpighi) which is the innermost, (2) stratum granulosum; (3) stratum lucidum, and (4) stratum corneum, the outermost.

epidermitis [I' + I' + *itis*, inflammation]. Inflammation of the superficial layers of the skin.

epidermization (ep-e-der-mī-zā'shun) [I' + *derma*, skin]. Skin grafting. Conversion of deeper germinative layer of cells into outer and horny layer of epidermis.

epidermoid (ep-i-der'moyd) [" + " + *eidōs*, form]. 1. Resembling or pert. to the epidermis. 2. A tumor arising from aberrant epidermal cells. SYN *cholesteatoma*.

epidermolysis (ep-i-der-mol'is-is) [" + " + *lysis*, loosening]. Loosening of the epidermis.

e. bullosa. A form characterized by formation of deep seated bullae appearing after irritation or rubbing of a part.

epidermo'ma [" + " + *ōma*, growth].

An excrescence on the skin.

epidermomycosis (ep-i-der'mo-mi'ko-sis) [" + " + *mykēs*, fungus, + *ōsis*]. Skin disease caused by a fungus.

Epidermophyton (ep-i-der-mof'i-ton) [" + " + *phyton*, plant]. A genus of fungi causing *tinea cruris* or *Dhobie itch*, *q.v.*

E. floccosum. The causative agent of certain types of *tinea*, esp. *tinea pedis* (athlete's foot), *tinea cruris*, and others.

epidermophytosis (ep-i-der-mo-fi-to'sis) [" + " + " + *ōsis*]. Infection by a species of *Epidermophyton*. SYN *Dhobie itch*, *washerwoman's itch*, *tinea cruris*, *tinea inguinalis*.

epidermo'sis [" + " + *ōsis*]. Any disease affecting the skin esp. the epidermis.

epidi'ascope [" + *dia*, through, + *skopein*, to examine]. Lantern used for projection of images on a screen. SYN: *episcope*.

epididymectomy (ep-i-did-i-mek'to-mi) [G. *epi*, upon, + *didymos*, testis, + *ektomē*, excision]. Removal of the epididymus.

epididymis (ep-i-did'i-mis) [Pl. *epididymides*] [" + *didymos*, testis]. A small, oblong body resting upon and beside the post surface of the testes, consisting of a convoluted tube 18-20 ft long, enveloped in the tunica vaginalis, ending in the vas deferens.

It consists of (1) the *head* caput or globus major which contains 12 to 14 efferent ducts of the testes, (2) the *body*, and (3) the *tail* (cauda or globus minor). It constitutes the first part of the excretory duct of each testis. The epididymis is supplied by the internal spermatic, deferential, and external spermatic arteries, it is drained by corresponding veins.

epididymitis (ep-i-did-im-i'tis) [" + " + *itis*, inflammation]. Inflammation of the epididymis.

EROT. Inflammation of internal genitals traveling up urethra. See *epididymus*.

e., gonorrhoeal. In third to eighth week of gonorrhea symptoms either acute (swelling increasing rapidly involving testes, scrotum, etc.) or subacute (moderate swelling developing slowly), with pain.

TREATMENT Rest in bed, immobilization of testes, local applications, ice pack.

e., nongonorrhoeal. Resembles gonorrhoeal but often terminates in gross supuration. **TREATMENT**. Prophylactic, by gentleness in treatment of urethritis. Suspensory bandage, hygienic regimen. Operation if palliative measures fail.

e. nonspecific. E. resulting from invasion of the epididymis by pyogenic organisms. May occur in connection with urethral stricture, cystitis, or prostatitis.

e. relapsing. Any acute form that becomes chronic.

e. specific. E. resulting from the organisms of gonorrhea, syphilis, pneumonia, meningitis, or other diseases.

e. traumatic. E. which occurs in the absence of a demonstrable causative factor.

epididymodeferentectomy (ep-i-did-i-mo-def'er-en-tek'to-mi) [" + " + *L. deferens*, carrying away, + *G. ektomē*, excision]. Excision of epididymis and vas deferens.

epididymodeferen'tial [" + " + *L. deferens*, carrying away]. Concerning both the epididymis and vas deferens.

epididymoorchitis (ep-i-did-im-o-or-ki'tis) [" + " + *orchis*, testis, + *itis*, inflammation]. Epididymitis with orchitis.

epididymot'omy [" + " + *tomē*, incision]. Incision into the epididymis.

epididymovasotomy (ep-i-did'im-o-vas-o'to-mi) [" + " + *L. vas*, vessel, + *tomē*, incision]. Making an anastomosis bet. the epididymis and the vas.

epidu'ral [" + *L. durus*, hard]. Located over or upon the dura.

e. space. Space outside of dura mater of brain and spinal cord.

epifascial. On or upon a fascia.

epifolliculitis (ep-i-fol-lik-u-li'tis) [" + *L. folliculus*, follicle, + *G. itis*, inflammation]. Inflammation of hair follicles of the scalp.

epigas'ter [" + *gastēr*, belly]. Embryonic structure which develops into the large intestine. SYN *hindgut*.

ep'igastral'gia [" + " + *algos*, pain].

Pain in the epigastrium.

epigas'tric [" + *gastēr*, belly]. Pert. to the epigastrium. SEE *precordia*.

e. reflex. Contraction of the upper portion of the rectus abdominis muscle when skin of the epigastric region is scratched.

epigastrium (ep-i-gas'tri-um) [" + *gastēr*, belly]. Region over the pit of the stomach. SEE *Auenbrugger's sign*.

epigastrocele (ep-i-gas'tro-sēl) [" + " + *kelē*, hernia]. Hernia in the epigastrium.

epigastrorrhaphy (ep-i-gas'tro-rā-fl) [" + " + *raphē*, suture]. Suture of an abdominal wound in the epigastric area.

epigenesis (ep-i-jen'es-is) [" + *genesis*, formation]. In embryology, the theory that parts of an organism arise by a process of progressive development from simple to complex structures through the utilization of cells as building units, in contrast to preformation which holds that parts exist in the ovum preformed.

epiglottid'ean [" + *glōttis*, glottis]. Pert. to the epiglottis.

epiglottidectomy (ep'i-glōt-id-ek'to-mi) [" + " + *ektomē*, excision]. Excision of the epiglottis.

epiglottiditis (ep'i-glōt-tid-i'tis) [" + " + *itis*, inflammation]. Inflammation of the epiglottis. SYN *epiglottitis*.

epiglō'tis (pl. *epiglōttides*) [" + *glōttis*, glottis]. A thin leaf-shaped structure located immediately posterior to the root of the tongue which covers the entrance of the larynx when swallowing. It consists of the epiglottic cartilage, an impaired laryngeal cartilage, and is covered with mucous membrane.

epiglottitis (ep'i-glōt-ti'tis) [" + " + *itis*, inflammation]. Inflammation of the epiglottis. SYN *epiglottiditis*.

epi'hy'al [" + *uoedēs*, U-shaped]. Pert. to the arch of the hyoid.

e. bone. Ossified stylohyoid ligament.

epilate (ep'i-lāt) [*L. ē*, out, + *pilus*, hair]. To extract the hair by the roots.

ep'ilating [" + *pilus*, hair]. Depilating; extracting a hair.

e. dose. The quantity of roentgen rays or radium necessary to cause temporary loss of hair.

e. forceps. Tweezers for pulling out hairs

epilation (ep-i-la'shun) [“ + *pilus*, hair]. Extraction of hair **SYN.** *depilation*.

epilatory (e-pil'a-tor-i) [“ + *pilus*, hair]. Pert. to removal of hairs, or that which removes them **SYN.** *depilatory*.

epilemma (ep-i-lem'ä) [G *epi*, upon, + *lemma*, husk] Neurilemma of small branches of nerve filaments

ep"illepsy [G. *epilēpsia*, seizure]. An episodic disturbance of consciousness during which generalized convulsions may occur.

Etiol. Unknown, however, electroencephalographic studies reveal a direct relationship between changes in electrical brain potentials and the occurrence of seizures Heredity plays an important role

SYM Often a peculiar sensation or feeling (the aura) precedes loss of consciousness. The patient falls during the attack, often injuring himself, he may bite his tongue, pass urine, and awake to realize something has happened because of muscular soreness

There is a tendency to sleep following the attack; indeed attacks may occur only during sleep. The convulsion may be replaced by a so-called equivalent—during the unconsciousness, violent, antisocial or unnatural conduct may occur (automatism), which may have vast medicolegal significance.

On recovery, amnesia is complete and so no precautions to hide the antisocial acts are taken, this in itself is significant, esp if associated with postautomatism, sleep, and a particularly vicious type of crime The epileptic may gradually deteriorate, and in some cases finally become completely demented

TREATMENT Do not attempt to stop attack. During attack arrange head so as to facilitate breathing Prevent tongue from being bitten, or from obstructing windpipe Place pad between teeth during attack Afterward allow patient to sleep. Dilantin is used as an anticonvulsant without depressive action, but toxicity must be guarded against.

DIET. Ketogenic diet, q.v. One rich in fat has been successful in some cases due to the fact that it produces acidosis. An acid condition of the system seems to improve such patients Fasting causes ketosis, or a mild acidosis, but a high-fat, low-carbohydrate diet produces the same condition. (a) Very little meat, no salt; milk, 2 pints, and 2 eggs daily; white fish sometimes; bread and butter; plenty of vegetables (b) Lactovegetarian diet. (c) Salt-free diet. (d) Bread made with sodium bromide. Avoid overeating; tea, coffee, alcohol, strong soups, etc.

GRAND MAL Often preceded by a peculiar sensation known as an aura, beginning in finger or toe and rising until head is involved, when patient gives shrill cry and falls unconscious; tonic spasm followed by clonic movements; face cyanosed; frothing at mouth; coma.

Prog. Unfavorable, although not fatal. **FERT. MAT.** Seizure consists of momentary unconsciousness.

e. abortive. Petit mal

e., cardiac. E. causing severe interference with heart action.

e., cortical. **SEX:** Jacksonian e.

e. focal. **SYN:** *cortical e.*, *Jacksonian e.* *symptomatic e.* E. due to a local injury or lesion of the motor areas of the cerebral cortex

e., hemiplegic. **SEX** *cortical e.*

e., idopathic. Presence of epilepsy without known cause.

e. Jacksonian. E in which convulsions tend to be restricted to certain groups of muscles, or limited to one side of the body, due to disease involving the cortex Also called cortical or symptomatic e

e., menstrual. Form in which attacks coincide with menstruation.

e. myoclonic. E in which clonic contractions of muscles, esp., those of the extremities, occur between seizures **SEE** myoclinia

e., nocturnal. Occurs only during sleep. Symptoms similar to grand mal. **Prog** Favorable.

e., partial. **SEE:** *cortical e.*

e. reflex. E in which attacks are induced by peripheral irritation

e., sleep. Spasmodic uncontrollable desire to sleep. **SYN** *narcolepsy*.

e., spinal. E due to lateral sclerosis of the spinal cord

e. symptomatic. Cortical, focal, or Jacksonian e Epilepsy due to an identifiable lesion of the brain

e., syphilitic. E present in syphilis

e., thalamic. Form with lesion of the thalamus, causing hallucinations

e. toxemic. E due to presence of toxic substances in the blood

e., traumatic. E caused by trauma, particularly of the cranial vertex.

e. uncinatē. E due to a lesion of the uncinate gyrus of the temporal lobe

epilepsy, words pert. to: *absentia epileptica*, *analepsis*, *aura*, *cataplexis*, *fit*, *furore epilepticus*, *haut mal*, *ictus*, *status epilepticus*.

epilep'tic [G. *epilēptikos*, pert. to a seizure]. 1 Concerning epilepsy. 2 Individual suffering from epileptic attacks

epilep'tiform [G. *epilēpsia*, seizure, + L. *forma*, form]. Having the form of epilepsy.

epileptogen'ic, epileptog'enous [“ + *genan*, to produce]. Giving rise to epileptoid convulsions

e. zone. Certain motor areas in cerebral cortex, irritation of which gives rise to an epileptic seizure.

epilep'toid [“ + *eidōs*, resemblance] Resembling epilepsy **SYN.** *epileptiform*.

epileptol'ogy [“ + *logos*, study]. Study of epilepsy

epileptosis (ep-i-lep-to'sis) [“ + *ōsis*]. Any mental disease due to epilepsy.

epiloia (ep-i-loi'ä) **SYN** *tuberosa sclerosis*, *tuberosa gliosis*, *hypertrophic nodular gliosis* A syndrome consisting of mental deficiency, adenoma sebaceum, epileptic fits, hypertrophic sclerosis of the brain, tumors in the kidneys, and nodules on floor of lateral ventricle

epimandibular (ep'i-man-dib'u-lar) [G. *ept*, upon, + L. *mandibulum*, jaw]. Above or upon the lower jaw.

epimenorrhagia (ep-i-men-o-ra'i-ä) [“ + *mēn*, month, + *rēgnunai*, to burst forth]. Profuse menstruation

epimenorrhea (ep-i-men-o-re'ä) [“ + “ + *roia*, flow]. Too frequent menstruation.

epimerite (ep-i-mer'it) [“ + *meros*, part]. An organ of certain protozoa by which they attach themselves to epithelial cells.

epimysium (ep-i-mis'i-um) [“ + *mys*, muscle]. Outermost sheath of connective tissue which surrounds a skeletal muscle. Consists of irregularly dis-

tributed collagenous, reticular, and elastic fibers, connective tissue cells, and fat cells.

epinasty (ep-i-nas'tē) [*epi*, upon, + *nastos*, pressed close]. More vigorous growth on the upper than on the under surface, leading to a downward curvature of an organ.

epinephrectomy (ep-i-ne-frek'tō-mī) [*epi* + *nephros*, kidney, + *ektomē*, excision]. Excision of the suprarenal gland. *SYN* *adrenalectomy*.

epinephrine (adrenalin) (ep-i-nef'rīn) [*G* *epi*, upon, + *nephros*, kidney] [*CoH₁₇NO₃*]. *SYN* *adrenalin*, *adrenine*, *suprarenalin*, *suprarenin*. *USP*. The active principle of the medulla of the adrenal gland, occurring as a white or light brown powder, darkening on exposure to the air. It has been prepared synthetically. It is employed therapeutically as a vasoconstrictor, cardiac stimulant, to induce uterine contractions, and to relax bronchioles. Its effects are similar to those brought about by stimulation of the sympathetic division of the autonomic nervous system.

Dosage (1 1000 solut.) *Subcut.*, 1/20 gr (0.0005 Gm.).

e. hydrochloride solution. *USP*. A 1 1000 solution of the drug.

USES. To check local hemorrhage, to relieve asthmatic paroxysms, shock, etc. Also to prolong action of local anesthetics by constricting blood vessels, which prevents rapid absorption.

AVERAGE DOSAGE Hypodermically, 8 m (0.5 cc).

INCOMPATIBILITIES Light, heat, and air, iron salts, and alkalies.

epinephrinemia (ep'i-nef'rī-ne'mī-ā) [*epi* + *aima*, blood]. Epinephrine in the blood.

epinephritis (ep'i-nef'rī'tis) [*G* *epi*, upon, + *nephros*, kidney, + *itis*, inflammation]. Inflammation of an adrenal gland.

epinephroma [*epi* + *ōma*, tumor]. A lipomatoid tumor of the kidney. *SYN*. *Gravitz's tumor*, *hypernephroma*.

epineural (ep-i-nū'rāl) [*epi* + *neuron*, nerve]. Located upon a neural arch.

epineurium (ep'i-nū'rī-um) [*epi* + *neuron*, nerve]. The general connective tissue sheath of a nerve. *SEE* *nerve*.

ep'iotic [*epi* + *ous*, of-, ear]. Located above the ear.

e. center. Ossification center of temporal bone forming upper and post part of the auditory capsule.

epipas'tic [*epi* + *passcin*, to sprinkle]. Resembling a dusting powder.

epipharynx (ep-i-far'inks) [*epi* + *pharynx*]. Nasal portion of pharynx. *SYN* *rhinopharynx*.

epiphenomenon [*epi* + *phainomenon*, phenomenon]. An exceptional and extraneous phenomenon in a disease.

epiphora (ep-i-fō'rā) [*G* downpour]. Abnormal overflow of tears down the cheek.

epiphylac'tic [*G* *epi*, upon, + *phylaxis*, protection]. Pert. to epiphylaxis.

epiphylar'is [*epi* + *phylaxis*, protection]. Increase of defensive powers of the body.

epiphys'al (ep-i-fiz'e-al) [*G* *epiphysis*, a growing upon]. Pert. to or of the nature of an epiphysis.

epiphys'eolysis (ep'i-fiz-e-o-lis-is) [*epi* + *lysis*, loosening]. Separation of an epiphysis.

epiphys'eopathy (ep'i-fiz-e-op'ā-thī) [*epi* + *pathos*, disease]. Any disease of an epiphysis or of the pineal gland.

epiphys'al (ep-i-fiz'a-al) [*G* *epiphysis*, a growing upon]. Of the nature of or concerning an epiphysis.

epiphysis (ep-if'is-is) (pl *epiphysēs*) [*G* a growing upon] 1 A juvenile piece of bone separated from a parent bone in early life by cartilage, but later becoming a part of the larger (or parent) bone; a center for ossification at each extremity of long bones. *SEE* *diaphysis*.

e. cerebri. The pineal body.

epiphys'itis (ep'i-fiz-itis) [*epi* + *itis*, inflammation]. Inflammation of an epiphysis, esp that at the hip, knee, and shoulder in infants.

epipial (ep-i-pī'al) [*G* *epi*, upon, + *L. pia*, tender]. Situated above or upon the pia mater.

epiplocele (ep-ip'lō-sēl) [*G* *epiploon*, omentum, + *kēlē*, hernia]. Hernia containing omentum.

epiploenterocele (ep-ip'lō-en'ter-o-sēl) [*epi* + *enteron*, intestine, + *kēlē*, hernia]. Hernia consisting of omentum and intestine.

epiploic (ep-i-plo'ik) [*G* *epiploon*, omentum]. Pert to the omentum.

e. foramen. The opening between the greater and lesser peritoneal cavities.

epiploitis (ep-i-plo-itis) [*epi* + *itis*, inflammation]. Inflammation of the omentum.

epiploerocoele (ep-ip'lō-mer'o-sēl) [*epi* + *meros*, thigh, + *kēlē*, hernia]. Femoral hernia containing omentum.

epiplophalocoele (ep-ip'lō-fal-o-sēl) [*epi* + *omphalos*, navel, + *kēlē*, hernia]. Umbilical hernia with omentum protruding.

epiploon (ep-i-plo-on) [*G* omentum]. The omentum, esp the great omentum.

epiplopezy (ep-ip'lō-peks-i) [*epi* + *pēsis*, fixation]. Suturing of omentum to the ant abdominal wall.

epiplosarcomphalocoele (ep-ip'lō-sar-kom-fal-o-sēl) [*epi* + *sarx*, flesh, + *omphalos*, navel, + *kēlē*, hernia]. An umbilical hernia with protruding omentum. *SYN* *epiplophalocoele*.

epiploschecele (ep-ip-lōs'ke-o-sēl) [*epi* + *oscheon*, scrotum, + *kēlē*, hernia]. Omental hernia into the scrotum.

episciera (ep-i-skī'rā) [*G* *epi*, upon, + *sklēros*, hard]. Loose connective tissue between sclera and conjunctiva.

episceral (ep-i-skī'rāl) [*epi* + *sklēros*, hard]. Overlying the sclera of the eye.

episceritis (ep-i-skī-rītis) [*epi* + *itis*, inflammation]. Inflammation of the subconjunctival layers of the sclera.

ep'iscope [*epi* + *skopein*, to examine]. Projection lantern for examination of an object on a screen. *SYN* *epidiascope*.

episioclisia (ep-i-z'io-klis'i-ā) [*G* *epi-seion*, pudenda, + *kleisis*, closure]. Surgical closure of the vulva.

episioclytorrhaphy (ē-pis'io-el-i-tror'rā-fi) [*epi* + *elytron*, vagina, + *raphē*, suture]. Narrowing of vagina and vulva.

episioperineorrhaphy (ē-pis'io-per-in-e-rā-fi) [*epi* + *perinaion*, perineum, + *raphē*, suture]. Suturing the vulva and perineum for the support of a prolapse of the uterus.

NP Prevent necessity for straining on defecation, routine perineal care.

episioplasty (ē-pis'io-plas'tī) [*epi* + *plassein*, to form]. Plastic surgery on the vulva.

episiorrhaphy (ē-pis'io-rā-fi) [*epi* + *raphē*, suture]. Sewing of a lacerated perineum.

episiostenosis (ē-pis'io-stē-no'sis) [*epi* + *stenosis*, narrowing]. Narrowing of the vulvar slit.

episiotomy (e-plis'i-ot'o-mī) [+ *tomē*, incision]. Incision of perineum at end of second stage of labor to avoid laceration of perineum.

episol (ep-is-ol). A preparation of sodium morrhuate

Uses For obliteration of varicose veins

Dosage From 1½ to 1 cc by injection.

epispadias (ep-i-spa'di-as) [G *epi*, upon, + *span*, to tear away] Congenital opening of urethra on dorsum of penis, and in the female, opening by separation of the labia minora and a fissure of the clitoris

epispas'fic [+ *span*, to draw]. An agent that, applied locally, will produce a serous or puriform discharge by exciting inflammation

epispilenitis (ep'i-sple-ni'tis) [+ *splēn*, spleen, + *-itis*, inflammation] Inflammation of the splenic capsule

epistasis (e-pis'ta-sis) [+ *stasis*, standing] 1 A substance rising to the surface instead of sinking, scum, as on the urine. In heredity a condition in which the presence of a gene or determiner prevents another gene not allelomorph to it from expressing itself 2 The checking of any discharge See *hypostasis*

epistaxis [G *epistazein*, to bleed from nose]. Hemorrhage from nose.

Etiol. Trauma, picking the nose with finger, direct blow, postoperative, foreign bodies, diseases (local and general, violent exertion, basilar skull fracture, menstrual suppression, vicarious menstruation, and high altitudes.

Treatment Lie quietly propped up in bed, cold compresses, adrenalin locally, followed by cautery of bleeding vessel, packing, radium. Simple nose bleed may be stopped ordinarily by elevating head of patient and pinching nostrils. Refrain from breathing through or blowing nose. Pressure across upper lip or cold cloths placed over nose and on back of neck are beneficial.

NP In severe nose bleeding, if necessary, pack entire nose or upper pharynx (retrograde packing). Occasionally epinephrine, styptics, or astringents may be used. However, for most First Aid purposes, these are unsatisfactory.

episternal (ep-i-ster'nal) [G *epi*, upon, + *sternon*, chest]. Situated above the sternum.

episternum [+ *sternon*, chest]. Upper portion of the sternum. Syn *manubrium*.

epistropheus (ep-i-stro'fe-us) [pl *epistrophei*] [+ *strephen*, to turn] BNA. Second cervical vertebra. Syn *axis*.

epitendineum (ep-i-ten-din'e-um) [+ *tenōn*, tendon]. The fibrous sheath enveloping a tendon.

epitenon (ēp-it'ē-nōn) [+ *tenōn*, tendon]. The connective tissue holding a tendon within its sheaths. Syn *epitendineum*.

epithalamus (ep-i-thal'ā-mus) [+ *thalamos*, chamber]. The uppermost portion of the diencephalon. It includes the pineal body, trigonum habenulae, striae medullares thalami, and the posterior commissure.

epithelaria (ep-i-thal'aks'i-ā) [+ *thēlē*, nipple, + *allaris*, falling]. Desquamation of epithelial cells, esp. of lining of the intestine.

epithē'lia [+ *thēlē*, nipple]. Epithelial layer or cells.

epithelial (ep-i-thē'lī-al) [+ *thēlē*, nipple]. Pert. to or composed of epithelium.

e. cancer. Carcinoma composed of epithelial cells. Syn *epithelioma*.

e. casts. Aggregations of renal epithelium, with cells filled with granules or fat droplets. They often preserve their original form in the epithelial tubes.

e. cells. Cells which are irregular in shape, having a single nucleus. Frequently 2 or 3 are joined together. May be hyaline or granular.

e. tissue. Those cells which form the outer surface of the body, and line the body cavities and the principal tubes and passageways leading to the exterior. They form the secreting portions of glands and their ducts, and important parts of certain sense organs. The cells of epithelial tissues lies closely approximated to each other and contain very little intercellular substance. They are arranged in one or a few layers and are devoid of blood vessels. Syn *tissue*, *epithelial*.

epithē'lioblastoma [+ *blastos*, germ, + *ōma*, tumor]. Epithelial cell tumor.

epitheliogenic, epitheliogenetic (ep-i-thē'lī-o-jen'ik, -jen-et'ik) [+ *gen-*, to produce]. Caused by epithelial proliferation.

epithelioid (ep-i-thē'lī-oid) [+ *eidos*, form]. Resembling epithelium.

epitheliolysis (ep-i-thē'lī-ol'i-sis) [+ *lysis*, dissolution]. Death of epithelial tissue. The destruction or dissolving of epithelial cells by an epitheliolysin.

epithelioma (ep-i-thē'lī-ō'mā) [+ *ōma*, tumor]. A malignant tumor consisting principally of epithelial cells; a carcinoma. A tumor originating in the epidermis of the skin or in a mucous membrane.

e. adamantine. An adamantinoma, q.v.

e. adenoides cysticum. A basal-cell carcinoma of low malignancy, occurring on the surface of the body, esp. the face. Characterized by formation of cysts.

e. basal cell. Syn *e. adenoides cysticum*, *rodent ulcer*. One derived from cells in the basal layer of the epidermis (stratum germinativum).

e., deep seated. Involving lymphatic glands, irregular rounded ulcers, occurring after several months.

e. molluscum. Molluscum epitheliale, q.v.

e., papillary. Malignant, more often occurring in men and after middle life. Attacks genitals, nose, eyelids, or lower lip, etc.

e., superficial. Papules, yellowish or brownish, degenerating and forming ulcers, secreting a yellowish fluid.

epitheliomatous (ep'i-thē'lī-ō'māt-ūs) [+ *ōma*, tumor]. Pert. to epithelioma.

epitheliosis (ep-i-thē'lī-ō'sis) [+ *ōsis*]. Trachomatlike proliferation of the conjunctival epithelium.

epithelium (ep-i-thē'lī-um) [pl *epithelia*] [+ *thēlē*, nipple]. The layer of cells forming the epidermis of the skin and the surface layer of mucous and serous membranes. The cells rest on a basement membrane and lie closely approximated to each other with little intercellular material between them. Epithelium may be *simple*, consisting of a single layer, or *stratified*, consisting of several layers. Cells comprising epithelium may be *flat* (squamous), *cube-shaped* (cuboidal) or *cylindrical* (columnar). Modified forms of epi-

thelium include ciliated, pseudostratified, glandular, and neuroepithelium. Epithelium may include *goblet cells*, which secrete mucous. Squamous epithelium is differentiated into *endothelium*, which lines the blood vessels and the heart, and *mesothelium*, which lines the serous cavities. Epithelium serves the general functions of protection, absorption, secretion, and specialized functions such as movement of substances through ducts, production of germ cells, and reception of stimuli. Its ability to regenerate is high.

e., ciliated. E with cilia at the free ends of the cells.

e., columnar. E composed of cells shaped like pillars.

e. cuboidal. E consisting of cube-shaped or prismatic cells with height approximately equal to width.

e., cylindrical. SEE *columnar e.*

e., germinal. The e which covers the surface of the genital ridge of the urogenital folds of an embryo. It gives rise to seminiferous tubules of the testes and the surface layer of the ovary. It is thought to give rise to the germ cells (spermatozoa and ova).

e. glandular. E consisting of cells which secrete.

e. laminated. Stratified epithelium.

e., maternal. Uterine e contrasted with that of the embryo.

e. mesenchymal. E of the squamous type which lines the subarachnoid and subdural cisterns, the chambers of the eye, and the perilymphatic spaces of the ear.

e., neuro. E terminating the nerves of special sense.

e., pavement. E of flat, platelike cells.

e. pigmented. E consisting of cells containing pigment granules.

e. pseudostratified. E in which the bases of cells rest on the basement membrane but the distal ends of some do not reach the surface. Nuclei of the cells lies at different levels giving the appearance of stratification.

e., squamous. SEE *pavement e.*

e., stratified. E with the cells in layers.

e. transitional. A form of stratified epithelium in which the cells have the ability of adjusting themselves to mechanical changes such as stretching and contracting. Found only in the urinary system (pelvis of kidney, ureter, bladder, and a part of the urethra).

epithem (ep'them) [G *epithēma*, a cover]. Any external application, as a poultice.

epitonic (ep-i-ton'ik) [G. *epitōnos* strained]. Increased tonus.

epitoxoid [G *epi*, upon, + *toxikon*, poison, + *eidos*, form]. Any toxoid which has less affinity for an antitoxin than is possessed by the toxin. SYN: *toxoid*.

epitrichium (ep-i-trik'ti-um) [" + *trichion*, hair]. Superficial layer of the epidermis of the fetus.

epitrochlea (ep-i-trok'lē-ā) [" + *trochalia*, pulley]. The inner condyle of the humerus.

epitrochlear (ep-i-trok'lē-ar) [" + *trochalia*, pulley]. Pert. to the inner condyle of the humerus.

epituberculo'sis [" + L. *tuberculum*, tubercle, + G *ōsis*]. Resembling tuberculo'sis but without tubercle bacilli. SYN: *paratuberculo'sis*.

epiturbinate [" + L. *turbo*, top]. The tissue upon or covering the turbinate bone.

epitympanum (ep-i-tim'pan-um) [" + *tympanon*, drum]. The attic of middle ear; area above the drum membrane.

epityphlitis (ep'ti-tif-li'tis) [" + *typhlon*, cecum, + *-itis*, inflammation]. Appendicitis.

epizoic (ep-i-zo'ik) [" + *zōon*, animal]. Parasitic on the epidermis.

epizoidic (ep-e-zo'is-id) [" + " + L. *caedere*, to kill]. That which destroys epizoa. SEE *epizoon*.

epizoon (ep-i-zo'on) (pl. *epizoa*) [" + *zōon*, animal]. An animal organism externally parasitic.

épluchage (ā-plū-shazh') [Fr cleaning]. Wound excision for removing contaminated tissues.

eponychium (ep-o-nik'i-um) [G *epi*, upon, + *onyx*, *onych-*, nail]. The horny embryonic structure from which the nail develops.

ep'onym [G *epōnymos*, named after]. A name for anything (diseases, organs, functions, places) adapted from the name of a particular person.

eponym'ic [G *epōnymos*, named after]. Pert. to eponym. SYN: *eponymous*.

epon'ymous [G *epōnymos*, named after]. Named after a person.

epoophorectomy (ep'o-o-to-rek'to-m) [G. *epi*, upon, + *oophoron*, ovary, + *ektomē*, excision]. Removal of the parovarium.

epoophoron (ēp'o-ōt'ōr-ōn) [G *epi*, upon, + *oophoron*, ovary] SYN: *parovarium*, *organ of Rosenmüller*. A rudimentary structure located in the mesosalpinx consisting of a longitudinal duct (duct of Gartner) and ten to fifteen transverse ducts. It is the remains of the upper portion of the mesonephros and is the homolog of the head of the epididymis in the male.

epsom salt (ep'sum) USP. SEE: *magnesium sulfate*.

epulis (ep-u'lis) [G *epoulis*, a gumboll]. A fibrous, sarcomatous tumor having its origin in the periosteum of the lower jaw.

e., malignant. Jaw sarcoma made up of giant cells.

epuloid (ep'u-loid) [" + *eidos*, form]. 1. Like an epulis. 2. Tumor of the jaw or gum appearing like an epulis.

epulosis (e-pu-lo'sis) [" + *-ōsis*]. Cicatrization, a cicatrix.

epulot'ic [G *epoulis*, gumboll] Promoting cicatrization.

equa'tion [L *aequāre*, to make equal] 1. State of being equal. 2. In chem a symbolic representation of a chemical reaction.

equa'tor. Line encircling a round body and equidistant from both poles.

e. of a cell. The boundary of a plane through which the division of a cell occurs.

e. of crystalline lens. Line which marks the junction of the anterior and posterior surfaces; the aequator lentis. To it are attached the fibers of the suspensory ligament.

e. oculi. An imaginary line encircling the bulb of the eye midway between ant. and post. poles.

equato'rial [L. *aequāre*, to make equal]. Pert. to an equator.

e. plate. Mass of chromosomes at equator of the nuclear spindle during karyokinesis.

equi- [L]. Prefix meaning equal.

equilibrating (e-kwī'l-brāt-ing). Maintaining equilibrium.

e. operation. Section of the antagonist of a paralyzed ocular muscle. **See** *tenotomy*.

equilibrium [L. *aequus*, equal, + *libra*, balance]. Equipoise Condition in which contending forces are equal

e., nitrogenous. Having amt of nitrogen in egesta equal to that of ingesta

e., physiological. Having egesta equal to the ingesta

equilin(e) (ek'wīl-in) [L. *equus*, horse] Crystalline estrogenic hormone derived from pregnant mares' urine, which affects growth of female sex organs. **SYN** *theelin*.

equination [L. *equinus*, equine]. Inoculation with virus of horsepox

equinia (e-kwīn'ā) [L. *equus*, horse]. Infectious disease of horses which can also affect man **SYN** *glanders*.

equinovarus (e-kwī'no-vā-rus) [L. *equinus*, equine, + *varus*, bent inward] A form of clubfoot with a combination pes equinus and pes varus

equivalence (e-kwīv'al-ens) [L. *aequis*, equal, + *valere*, to be worth] 1 Quality of being equivalent 2 Condition in which 2 radicals reacting are of the same valence and 1 displaces the other in a compound

equivalent (e-kwīv'a-lent) [' + *valere*, to be worth] 1 Equal in power, force, or value. 2. Amount of weight of any element needed to replace a fixed weight of another body

Er. or E. Symbol for erbium

E.R. Symbol for external resistance

eration (e-ra'zhun) [L. *ē*, out, + *radere*, to scrape] 1 Laying open a diseased part and scraping away diseased tissue. 2 Scraping away morbid products

Erben's reflex (er'bēns) Retardation of pulse when head and trunk are forcibly bent forward

erbium. A rare metallic element. **SYMS:** Er Atomic weight, 166

Erbs' paralysis or palsy. Paralysis of group of muscles of shoulder and upper arm involving cervical roots of 5th and 6th spinal nerves

The arm hangs limp, the hand rotates inwards and normal movements are lost **See** *paralysis*.

erectile [L. *erigere*, to erect] Able to become erect.

e. center. A reflex center located in the lumbosacral region of the spinal cord Cutaneous stimuli applied to the genitalia or neighboring parts are the most frequent cause of erection When the penis is stimulated, afferent impulses pass over the dorsal nerve of the penis, a branch of the internal pudendal nerve to the center, efferent impulses pass over the nervi erigentes to the blood vessels of the penis bringing about vasodilatation Other stimuli such as visual, olfactory, auditory, and psychic conditions may induce erection

e. tissue. Vascular tissue which, when filled with blood, becomes erect or rigid, as the clitoris or penis

erection [L. *erigere*, to erect]. The state of swelling, hardness, and stiffness observed in the penis and to a lesser extent in the clitoris of the female, generally during sexual excitement

Due to engorgement with blood of the *corpora cavernosa* and the *corpus spongiosum* of the penis and the *c. cavernosa* *clitoridis* of the female

It is necessary in the male for the intromission of the penis into the vagina of the female and for the emission

of semen. After ejaculation the blood withdraws from the penis and the erection is reduced Erection of the penis also occurs normally under other special conditions Abnormal, persistent erection of the penis is called priapism *

RS. *clitoris, coition, coitus, copulation, ejaculation, emission, excitation, penis, sexual intercourse.*

e. center. This is in lumbar and sacral region, responds to organic and psychic stimuli and with the genitalia responding to peripheral irritation of the sensory nerves This center is not directly under control of the will The *nervi erigentes* in the first 3 sacral nerves under excitation convey their impulse to the *corpora cavernosa*. Reflex stimuli also affect it.

erector [L. *erigere*, to erect]. A muscle that raises a part

e. spinae reflex. Irritation of the skin over the erector spinae muscles causing contraction of muscles of the back

erect position. One having the occiput and heels in line with nose, groin, and great toes in same relative plane

Employed in the practice of ballottment, in differentiation of tumors, cystic and solid hernias, and examination of pelvic joints

eremacausis (er'em-ak-aw'sis) [G. *ērema*, slowly, + *kausis*, burning] Slow oxidation of organic matter exposed to heat

eremophobia (er-em-o-fo'bi-ā) [G. *ērēmos*, solitude, + *phobos*, fear] Dread of being alone

erepsin. Term applied to a peptid-splitting enzyme found in the succus entericus (intestinal juice) The peptid-splitting action is now known to be due to the action of several peptidases which act on peptides which have escaped pancreatic digestion transforming them to amino acids

erethin (er'e-thin) [G. *erethizein*, to irritate] The principle of tuberculin which causes fevers

erethism (er'e-thizm) [G. *erethisma*, stimulation]. Abnormal excitement or irritation which may be combined with collapse

erethismic [G. *erethisma*, stimulation]. Pert to or causing erethism. **SYN.** *erethitic*.

erethisophrenia (er-e-thī-so-fre'nī-ā) [G. *erethizein*, to irritate, + *phrēn*, mind]. Unusual mental excitability

erethistic (er-e-this'tik) [G. *erethisma*, stimulation] Erethismic, exciting

erethitic (er-ē-thit'ik) [G. *erethisma*, stimulation] Causing erethism, irritable, excited.

erythrophobia (er'u-thro-fo'bi-ā) [G. *erythros*, red, + *phobos*, fear] Pathological fear of blushing. **SYN** *erythrophobia*.

erg [G. *ergon*, work]. In physics, the amount of work done when a force of 1 dyne acts through a distance of 1 centimeter.

One erg is roughly 1/980 gram-centimeter; that is, to raise a load of 1 gram against gravity the distance of 1 centimeter requires that a force of 980 dynes operate through a distance of 1 centimeter and hence that 980 ergs of work be done **See** *unit, work*.

ergasia (er-ga'sī-ā) [G. *ergasia*, work]. Functions of the mind and behavior resulting therefrom in contrast to those depending upon physiological functions.

ergasi dermatosis (er-gas'ti-o-der-mā-to'sis) [*"* + *derma*, skin, + *-sis*]. Dermatitis due to occupational cause.

ergasiomania (er-gas'i-o-mā'nī-ā) [*"* + *mania*, madness]. Active interest in a task without completing it, seen in certain phases of manic excitement.

ergasiophobia (er-gas'i-o-fō'bi-ā) [*"* + *phobos*, fear]. Abnormal dislike for assuming responsibility or for work of any kind.

ergasthenia (er-gas-the'nī-ā) [G. *ergon*, work, + *astheneia*, weakness]. Overwork and debility caused therefrom.

ergastic [G. *ergon*, work]. Possessing potential energy.

ergastoplasm (er-gas'to-plazm) [*"* + *plasma*, a thing formed]. Cytoplasm with higher power than ordinary plasma. *SYN* *kinoplasm*.

ergin [G. *ergon*, work]. Substance presumed to be present in blood or tissue fluids which, when united with an allergen produces the symptoms of allergy.

ergograph (er-go-graf) [*"* + *graphein*, to write]. An apparatus for recording the contractions of muscles and measuring the amount of work done.

ergometer [*"* + *metron*, measure]. An apparatus for measuring the amount of work done by a human or animal subject.

ergophobia [*"* + *phobos*, fear]. Morbid dread of working.

ergophore (er-go-fōr) [*"* + *pherein*, to bear]. That part of an antigen on which the specific properties of the substance depend. *SYN* *toxophore*.

ergoplasm [G. *ergon*, work, + *plasma*, a thing formed]. *SYN* *kinoplasm*, *archoplasm*. Protoplasm peculiar to the centrosome, and composing the attraction sphere.

ergostat [*"* + *statos*, standing]. A machine for measuring work done by a contracting muscle.

ergosterin, **ergosterol**. A substance derived from yeast, ergot, and other fungi, and resembling cholesterol in composition.

e. irradiated. E subjected to ultraviolet radiation which develops vitamin D; potency. A remedy for rickets. It is believed that it activates some gland, perhaps the parathyroid, making possible better use of calcium and phosphorus. It is said to be present in skin and tissue. *SYN* *viosterol*.

ergot (er'got) [L. *ergota*]. A drug obtained from *claviceps purpurea*, a fungus which grows parasitically on rye. It is a mixture of several alkaloids.

USP ACTION AND USES As a uterine stimulant, and hemostatic.

Dosage 30 gr. (2 Gm.). Fluid extract 30 m. (2 cc.).

e. poisoning. May come from eating bread made with diseased grain or by taking overdoses of the drug.

SYM Appear several hours after administration. Vomiting, burning, and cramping in abdomen, great thirst, profound weakness, diarrhea, slow, weak pulse; anesthesia, tingling and twitching in extremities, occasionally convulsions, anuria; if patient survives may develop gangrene of fingers, toes or limited areas of skin.

P. A. TREATMENT Gastric lavage, cathartics, warm baths, increase fluid intake, stimulants as coffee, caffeine, and tea in large doses.

ergotamine (ēr-gōt'ām-ēn). A crystalline alkaloid (C₂₈ H₃₅ O₅ N₂) derived from ergot.

e. tartrate. *SYN* *gynergen*. A white crystalline substance which stimulates smooth muscle of blood vessels and the uterus, inducing vasoconstriction and uterine contractions used in the treatment of migraine.

ergotherapy (er-go-thēr'ā-pī) [G. *ergon*, work, + *therapeia*, treatment]. Work used as a treatment of disease.

e. passive. Generalized muscular exercise excited by faradic current.

ergotism (er-go-tizm) [L. *ergota*, ergot, + G. *ismos*, condition]. Poisoning resulting from excessive use of ergot or from eating food made from rye or wheat infected with the fungus *claviceps purpurea*. May be acute or chronic.

ergotrate (er-go-trāt). An active principle isolated from ergot.

USES Same as ergot.

Dosage 1/320 gr. (0.2 mg.) orally, intramuscularly, or intravenously.

ergotropic [G. *ergon*, work, + *tropos*, a turning]. Pert to ergotropy.*

ergotropy (er-got'ro-pī) [*"* + *tropos*, a turning]. Injection of nonspecific proteins to increase body resistance.

Erichsen's disease (ēr'ik-sēn). *SYN* *railway spine*. A group of symptoms following injury to the spine.

erioneter [G. *erion*, wool, + *metron*, measure]. Device for measuring minute particles.

Eristalis. A genus of flies belonging to the family Syrphidae. The larva, called rat-tailed maggot, may cause intestinal myiasis in man.

erode (e-rōd') [L. *erodere*, to gnaw away]. 1 To wear away. 2 To eat away by ulceration.

erogenous (e-roj'en-us) [G. *erōs*, love, + *gennan*, to produce]. Causing sexual excitement. *SYN* *erotogenic*.*

e. zone. Any part of the body which, by touching or stroking, causes sexual excitement. *Ex* The penis, the perineum, the nipples, labia, or clitoris.

erosion (e-ro'shun) [L. *erodere*, to gnaw away]. 1 An eating away of tissue, destruction of a surface layer, either external or internal, by physical or inflammatory processes.

e. of the cervix uteri. The alteration of the epithelium on a portion of the cervix as a result of irritation by infection.

SYM In the early stages, the epithelium shows necrosis which nature tries to heal by a down growth of epithelium from the endocervical canal. If this is accomplished by a single layer of tissue, having a grossly granular appearance, it is called a simple granular erosion. If the down growth is excessive, and shows papillary tufts, it is called a papillary erosion.

Histologically, the papillary erosion shows many glands of the branching racemose type whose epithelium is the mucus-bearing cell with the nucleus at the base. In the healing process, squamous epithelium grows over the eroded area with the following results: the squamous cells take the place of the tissue beneath it completely, giving a complete healing, or the glands fill with squamous plugs and remain in that state, or the mouths of the glands are occluded by the squamous cells and cysts are formed (nabothian cysts). In the congenital type of erosion the portio is covered by high columnar epithelium.

TREATMENT: Prophylaxis, proper care of the cervix following delivery, proper hygiene by means of douches, and cau-

terization of the early erosion with the electrocautery is usually curative. In cases of erosion in association with a badly lacerated cervix amputation of the cervix is indicated

e. dental. The wearing away of the surface layer (enamel) of a tooth

erosive (e-ro'siv) [G *erodere*, to gnaw away] 1 Able to produce erosion 2 An agent that erodes anything

erotic (e-ro'tik) [G *erōtikos*, pert to love] Pert. to sexual passion **SYN:** *lustful*.

eroticism [' + *ismos*, condition of] Excessive or morbid libido, also intense but normal sex desire

e., allo. Eroticism directed to an external object rather than to self. **SEE** *eroticism, erotomania*.

e., anal. Sensations of pleasure experienced by the child through defecation, which later are inhibited

e., oral. Sensation of pleasure experienced when nursing at the breast, modified and sublimated but continuing into adult life through normal contacts of the lips, mouth, and throat

e., auto-. 1 Self-gratification of the sexual instinct 2 Self-admiration combined with sexual emotion, such as that obtained from viewing one's naked body, or one's genitals **SEE** *erotomania, zones, erotogenic*.

erotism [' + *ismos*, condition of] **PSY:** eroticism

erotogenic (er'o-to-jen'ik) [G *erōs*, love, + *gennan*, to produce] Producing sexual excitement **SEE** *erotic zones*

erotology (er-o-to'l-o-jī) [' + *logos*, study] The study of love and its manifestations

erotomania (e-rot-o-ma'nī-ā) [' + *mania*, madness] Unrestrained libido in the insane **SEE** *eroticism, zones, erotogenic*.

erotopathia (er-o-to-path'i-ā) [' + *pathos*, disease] Any abnormal or perverted sex impulse

erotophobia (er-o-to-to'fō-bī-ā) [' + *phobos*, fear] Aversion to sexual love or its manifestations

erotopsychic (er-o-to-sī'kik) [' + *psychē*, mind] Mental perversion of the sexual impulse

erratic [L. *errāre*, to wander]. Wandering, as from one part of the body to another part, roving, odd **SYN** *eccentric*.

errhine (er'in) [G *en*, in, + *ris*, rinse, nose]. An agent that will increase the secretion of the mucous membrane lining the nose **SYN** *sternutatory*. **EX** *quillaja, salicylic acid*.

erubescence [L. *erubescere*, to grow red]. Reddening of the skin, a blush

eructation [L. *eructāre*, to belch] Raising of gas or acid fluid from the stomach, belching **SEE** *oxyrygmia*

eruption (e-rup'shun) [L. *eruptio*, a breaking out] 1 A breaking out, esp. applied to the appearance of a skin lesion or rash accompanying a disease such as measles or scarlet fever 2 The appearance of a lesion such as redness or spotting on the skin or mucous membrane 3 The breaking through of a tooth through the gum, the cutting of a tooth

e. creeping. A skin lesion characterized by a tortuous elevated red line which progresses at one end while fading out at the other It is caused by the migration of the larvae of certain nematodes, esp. *Ancylostoma braziliense* and other cat and dog nematodes which occur as accidental invaders of

man The larvae of certain species of flies (*Gasterophilus*, *Hypoderma*) may produce similar effects (*dermatomyiasis linearis migrans oestrosa*)

e. drug. Dermatitis medicamentosa, skin reaction resulting from the ingestion of certain drugs, such as iodides **e., primary.** Blebs, macules, papules, pustules, tubercules, tumors, vesicles, wheals or phomphi, *q.v.*

e., secondary. Crusts, excoriations, fissures, pigmentations, scales, scars, ulcers, *q.v.*

e. serum. E caused by the injection of a serum

eruptive [L. *eruptio*, a breaking out] Breaking out, as with a rash

erysipelas (er-is-īp'e-l-as) [G *erythros*, red, + *pella*, skin] Acute, febrile disease with localized inflammation and swelling of skin and subcutaneous tissue accompanied by systemic disturbance of variable degree **SYN** *St Anthony's fire*.

ETIOL *Streptococcus erysipellatus*

PATH The skin of the face is most commonly infected Lesion involves skin and subcutaneous tissues

SYM Eruption begins on first or second day as minute erythematous patch, spreading peripherally, affected skin becoming swollen, painful, burning, itching, red with glazed, shining surface. Eruption begins to fade about 4th day

PROC Favorable generally in idiopathic types but sometimes fatal in traumatic and phlegmonous (scalp, puerperal women) and in gangrenous always **SO**

TREATMENT Symptomatic (constitutional) with mercurial purge followed by salines at outset. Antistreptococcus serum, convalescent serum, whole blood transfusions, ultraviolet and x-ray therapy, sulfanilamide

DIET Milk and other fluids, no alcohol

e., ambulant. E which disappears from one part of the body and reappears in another

e., erythematous. E in a mild form. **e., facial.** Form found mainly on the face

e., idlopathic. E which does not develop subsequent to trauma or injury

e., migrans. Widely spread form of e

e., phlegmonous. Purulent form of e

e., surgical. E developing in a wound.

e., traumatic. **SEE** *surgical e.*

erysipellatus (er'i-sī-pel'a-tus) [' + *pella*, skin]. Of the nature of or pert to erysipelas

erysipeloid. Erythema migrans or serpens (er-is-īp'e-loid [' + *oides*, form]) An infective dermatitis resembling erysipelas usually limited to the hands and characterized by hyperemia, edema, and occasionally systemic complications

ETIOL It is caused by *Erysipelothrix rhusiopathiae*, usually acquired by contact with pork or fish products

Erysipelothrix (er-i-sī-pel'ō-thriks). A genus of bacteria belonging to the family Corynebacteriaceae They are branching filamentous, rod-shaped, non-motile organisms

E. rhusiopathiae. The causative agent of swine erysipelas and erysipeloid in man

E. erysipellatus suis. Causative agent of swine erysipelas

erysipelotoxin. The toxin produced by *Streptococcus erysipellatus*, the causative agent of erysipelas.

Eruptive, Infective, and Contagious Diseases

Name	Period of Incubation	Time of Eruption	Duration of Eruption	Period of Quarantine
1 Scarlet Fever	2- 5 days	12-24 hr. after onset	4-5 days	21 days
2 Smallpox	8-12 days	3rd day of fever	14 to 21 days	21 days
3 Measles	10 days	4th day of fever	5 to 10 days	14 days
4 Roetheln	5-21 days	2nd day of fever	3 days	5 days.
5 Mumps	14 to 21 days			Until all swellings have subsided
6 Whooping Cough	7-10 days			28 days
7 Chickenpox	4-27 days	2nd day of fever	7 days	7 days
8 Diphtheria	5 days			7 days, and until 2 successive nose and throat cultures, 24 hr apart, are negative.
9 Typhus Fever	12 days	5th or 6th day of fever	14 days	14 days
10 Typhoid Fever	14 days	4th day of fever	20 days	Release after 2 successive negative cultures of urine and feces not less than 24 hr apart
11 Erysipelas	3- 7 days	2nd day of fever	4 days	

See quarantine.

erythema (er-ith-e'mă) [G redness] A form of macula showing diffused redness over the skin

Etiol. Caused by capillary congestion, usually due to dilatation of the superficial capillaries as a result of (1) some nervous mechanism within the body, (2) inflammation, (3) as a result of some external influence, such as heat, sunburn, etc

e. annulare. E. with rounded, raised marginal lesions

e. circinatum. In red circles

e. congestivum. E with congestive state of skin.

e., diffuse. Widely spread over body.

e. dose. The amount of radiant energy sufficient to evoke perceptible redness of the skin.

e., hyperaemicum. Caused by heat or cold (erythema calorificum, chilblain), sun (erythema solare), artificial heat, as from hot water bottle or electric pad (erythema ab igne)

e. infectiosum. Contagious form with rose-colored eruption

e. intertrigo. Chafing of opposing surfaces, with erythema and often with maceration and abrasion.

e. multiforme. A macular eruption with dark red papules or tubercles. Usually on extremities appearing in successive eruptions of short duration. No itching, burning or rheumatic pains. May appear in separate rings, concentric rings, in disk-shaped patches, in distributed elevations, and figured arrangements

e. nodosum. Red and painful nodules on legs associated with rheumatism. Also caused by certain drugs and food poisoning.

e., punctate. In minute points, as scarlet fever rash.

e. symptomaticum. Hyperemia of the skin with level patches

e. venenatum. Form caused by an irritation from mineral poisons, etc

erythemat'ic, erythema'tous [G *erythēma*, redness]. Pert. to or marked by erythema.

erythemogen'ic [' + *gennan*, to produce]. Pert to erythema

erythemomegalal'gia [' + *megas*, great, + *algos*, pain] Painful redness of skin. **Syn:** erythromelalgia.

erythralgia (er-i-thral'i-ă) [G *erythros*, red, + *algos*, pain] A condition of painful redness of the skin **Syn:** erythromelalgia

erythrasma (er-i-thraz'mă) [G. *erythros*, red] Reddish-brown eruption in patches in the axillae and groins due to a fungus

erythredema (ë-rith'rë-de'mă) [' + *oidēma*, swelling] **Syn** *acrodynis*. *Swift's disease*, *dermatopolynneuritis*, *pink disease* A disease occurring in infants characterized by lesions of the skin on the hands and feet, swelling of the extremities, digestive disturbances. It is frequently followed by multiple arthritis Its cause is unknown

erythre'mia [' + *aima*, blood]. Excessive increase of red blood corpuscles with cyanosis **Syn** *polycythemia rubra*.

erythrism [' + *ismos*, condition of]. Redness of the hair and beard with ruddy complexion

erythristic (er-i-thrist'ik) [G *erythros*, red] Ruddy complexion. Having reddish hair

erythro. Prefix meaning "red"
erythroblast (er-ith-ro'blast) [' + *blastos* germ] The youngest erythroblasts are called basophilic erythroblasts or proerythroblasts Successive stages are polychromatophil erythroblasts or megablasts, and normoblasts. Erythro-

blasts possess hemoglobin. In the embryo they are found in blood islands of the yolk sac, body mesenchyma, liver, spleen, and lymph nodes, after the third month they are restricted to the bone marrow.

erythroblastemia [" + " + *ama*, blood]. An excessive number of erythroblasts in the blood.

erythroblast'ic [" + *blastos*, germ]. Pert. to erythroblasts.

erythroblastoma [" + " + *ōma*, tumor]. A tumor (myeloma) with cells resembling megaloblasts.

erythroblastosis [" + " + *ōsis*]. A condition marked by many erythroblasts in the blood.

e. fetalis. A hemolytic disease of the new born characterized by anemia, jaundice, and enlargement of the liver and spleen, generalized edema (hydrops fetalis). **Error**. It is due to the development in an Rh negative mother of antibodies against an Rh positive fetus. This occurs following a preceding pregnancy in which the fetus was Rh positive or following transfusion of Rh positive blood.

erythrochloropia (er-'I-thro-klo-ro-'pī-ā) [" + *chlōros*, green, + *ōps*, eye]. Partial color blindness with ability to see only red and green.

erythrochromia (er-'I-thro-kro-'ml-ā) [" + *chrōma*, color]. Hemorrhagic red pigmentation of the spinal fluid.

erythroclastic [" + *klast*, to break]. Destructive to red blood cells.

erythrocyte [G *erythros*, red]. An abnormal rod-shaped structure found in erythrocytes in cases of pernicious anemia.

erythrocyano'sis [" + *kyanos*, blue, + *ōsis*]. Red or bluish discoloration on the skin with swelling, itching, and burning.

erythrocyte (e-rith-'ro-sīt) [" + *kytos*, cell]. Red blood corpuscle.

Each is a non-nucleated, biconcave disc averaging 7.7 microns in diameter. The body of the cell consists of a spongelike stroma containing a respiratory pigment, *hemoglobin*, enclosed in a cell membrane of proteins in combination with lipid substances. Hemoglobin is a conjugated protein consisting of a colored iron-containing portion, *heme*, and a simple protein, *globin*. It combines readily with oxygen to form an unstable, compound, *oxyhemoglobin*.

NUMBER. In a normal person, the number of erythrocytes average about 5,000,000 per cu. millimeter. (5,500,000 for males, 4,500,000 for females.) The total number in an average sized person is about thirty five trillion. The number per cubic millimeter varies with (1) *age*, being higher in infants, (2) *time of day*, being lower during sleep, (3) *activity and environmental temperature*, increasing in both conditions, and (4) *altitude*. Persons living at altitudes of 10,000 ft. or more may have a red cell count of 8,000,000 or more.

FUNCTIONS. The primary function of the red blood cells is to carry oxygen and carbon dioxide. They also play a role in the regulation of the acid-base balance of the blood and in the formation of bile pigments which are derived from decomposition products of hemoglobin.

ORIGIN. Red cell formation (*erythropoiesis*) in the adult takes place in the red bone-marrow, principally in the vertebrae, ribs, sternum, diploe of cranial bones, and proximal ends of the

humerus and femur. They arise from large nucleated stem-cells (*proerythroblasts*) which give rise to *erythroblasts* in which hemoglobin appears. These give rise to *normoblasts* which extrude their nuclei. Red cells at this stage possess a fine reticular network and are known as *reticulocytes*. This reticular structure is lost before the cells enter circulation as *mature erythrocytes*.

The proper formation of erythrocytes depends upon several factors among them. (a) healthy condition of the bone marrow, (b) dietary substances such as iron, cobalt, and copper, all essential for the formation of hemoglobin, essential amino acids, and certain vitamins, esp. B₁₂ and folic acid (pteroylglutamic acid), (c) an *anti-anemic factor* stored in the liver.

LIFE HISTORY AND FATE. The average length of life of a red blood cell is estimated to be about 120 days. Cells are continuously dying and disintegrating. The cellular debris is picked up by the cells of the reticulo-endothelial system esp. those of the spleen, liver, and bone marrow. Hemoglobin is broken down, and proteins and iron are stored and utilized in the formation of new erythrocytes. The iron-containing portion, *heme*, gives rise to *bilirubin*, which is excreted in the bile as one of the bile pigments.

VARIATIONS. On microscopic examination, erythrocytes may reveal variations in the following respects: (1) *Size anisocytosis*, (2) *Shape* (poikilocytosis), (3) *Staining reaction* (achromia, hypochromia, hyperchromia, polychromatophilia), (4) *Structure* (possession of bodies such as Cabot's rings, Howell-Jolly bodies, a reticular network, or nuclei), (5) *Number* (anemia, polycythemia).

e. achromatic. A phantom corpuscle or one from which the hemoglobin has been dissolved, a colorless corpuscle.

e. basophilic. E in which cytoplasm stains blue indicating the presence of basophilic material. May be diffuse (basophilic material uniformly distributed) or punctate (material appearing as pin point dots).

e. crenated. E with a serrated or indented edge usually the result of withdrawal of water from the cell as occurs when cells are placed in hypertonic solutions.

e. immature. An erythroblast.

e. orthochromatic. E that stains with acid stains only, cytoplasm appearing pink.

e. polychromatic. E that does not stain uniformly.

erythrocythemia (er-'Ith-'ro-si-the-'ml-ā) [" + " + *ama*, blood]. Enormous increase in red blood cells. **SYN**: *erythremia*, *polycythemia*.

erythrocytolysis (er-'Ith-'ro-si-to-'lī-sis) [" + " + *lysis*, dissolution]. Dissolution of red blood corpuscles with the escape of hemoglobin; hemolysis.

erythrocytometer [" + " + *metron*, measure]. Instrument for counting red blood corpuscles.

erythrocytopenin [" + " + *ōpsōnein*, to prepare food for]. A substance opsonic for red corpuscles.

erythrocytorrhexis (er-'I-thro-si-tor-'reks'-is) [" + " + *rēxis*, rupture]. The breaking up of red blood cells with particles or fragments of the cell escaping into the plasma; plasmorrhesis.

erythrocytosis (er-'I-thro-si-to-'sīs-is) [" + " + *schisis*, division]. The break-

ing up of red blood cells into small disklike particles resembling blood platelets

erythrocytosis (ēr-īth-rō-sī-tōs'is) Abnormal increase in the number of red blood cells in circulation, polycythemia, erythemia erythrocytthemia

erythroderma (er'-īth-rō-derm'ā) Erythema, erythrodermia, *q v*

e. desquamativum. A disease in infants characterized by redness of skin and development of scales, Leimer's disease

e. ichtyosiforme congenitum. A congenital condition characterized by thickening and redness of the skin, may resemble ichthyosis or lichen

e. maculopapular. A condition of the skin characterized by redness and eruption of macules and papules

e. squamosum. An eruption of the skin consisting of groups of papules covered by scales, parapsoriasis

erythrodermia (er-ī-thro-derm'ī-ā) [" + *derma*, skin] Abnormal redness in the skin *SYN* erythema.

erythrodextrin (er-īth-rō-dex trīn) [" + *L dexter*, right] Form of dextrin from splitting of a polysaccharide molecule. *See* *achroodextrin*.

erythrogenesis [" + *genesis*, development] The development of red blood corpuscles

erythrokatalysis (er-ī-thro-ka-tal'ī-sis) [" + *katalysis*, dissolution] Ingestion and digestion of red blood corpuscles

erythrol tetranitrate (er'īth-rol tet-ra-nī-trāt) A white crystalline mass with explosive properties like nitroglycerine, but used in medicine as a dilute powder or in tablets

Uses As an antispasmodic and vasodilator, with action similar to nitroglycerine

DOSAGE ¼ to ½ gr. (0.015-0.03 Gm). INCOMPATIBILITIES Especially alcohol, and should not be rubbed with other substances.

erythroleukemia (er-ī-thro-lu-ke'mī-ā) [G. *erythros*, red, + *leukos*, white, + *aima*, blood] Many immature cells in the blood causing anemia

erythroleukosis (er-ī-thro-lu-ko'sis) [" + *ōsis*]. Abnormal increase of red cells and granulocytes

erythrol'ysin [" + *lysis*, dissolution] An agent causing erythrolysis *SYN* hemolysin, erythrocytolysin. *See* *lysin*.

erythrol'ysis [" + *lysis*, dissolution]. Dissolution of red blood corpuscles. *SYN* erythrocytolysis.

erythromelalgia (er-ī-thro-mel-al'jī-ā) [" + *melos*, limb, + *algos*, pain] A skin neurosis accompanied by burning and throbbing which come and go, affecting any one of the extremities, esp the feet.

erythromelia [" + *melos*, limb] Erythema of extensor surfaces of extremities but without pain

erythron (er'ī-thrōn). Capillaries in red marrow in which erythrocytes are formed

erythroneocytosis (er'ī-thro-ne'o-sī-to'sis) [" + *neos*, new, + *kytos*, cell, + *ōsis*]. Regenerative forms of red blood cells in the blood

erythronoclastic (er-ī-thron-o-klas'tīk) [" + *klastō*, to break]. Destructive to erythrons

erythroparasite [" + *parasitos*, parasite]. A red blood corpuscle parasite

erythrop'athy [" + *pathos*, disease]. Disease of the red blood corpuscles.

erythropenia (er'ī-thro-pe'nī-ā) [" + *penia*, poverty]. Deficiency of red blood corpuscles.

erythrophage (er-īth'ro-fāj) [" + *phagein*, to eat] A phagocyte which destroys red corpuscles.

erythrophag'ia [" + *phagein*, to eat]. Destruction of red blood cells by phagocytes

erythrophile, **erythroph'ilous** [" + *philein*, to love] Readily staining red

erythrophobia (e-rīth'ro-fō-bī-ā) [" + *phobos*, fear] 1 Abnormal dread of blushing or fear of being diffident or of being embarrassed 2 A morbid fear of, or aversion to, anything colored red

erythrophose (e-rīth'ro-fōs) [" + *phōs*, light] Any red subjective perception of a bright spot *See* *phase*.

erythrophth'is [" + *phthisis*, wasting] Serious damage to the restorative power of the red corpuscles

erythrophthor'ic [" + *phtheirein*, to destroy] 1 Rapid destruction of erythrocytes 2 By any means other than hemolysis

erythrop'ia, **erythrop'sia** [" + *opsis*, vision] Condition in which objects appear to be red

erythroplasia (er-īth-rō-plā'sī-ā) A condition considered to be precancerous characterized by the appearance of erythematous lesions involving the junctions of the epithelium of the skin and mucous membranes at the mouth, anus, penis, and vulva

erythropoiesis (e-rīth'ro-poy-e'sis) [" + *poiesis*, making] The formation of red blood corpuscles

erythropoietic (er'īth'ro-poy-et'īk) [" + *poiesis*, making] Pert to red blood cells

erythropsopalgia (er'īth'ro-pros-o-pal'-jī-ā) [" + *prosōpon*, face, + *algos*, pain] A neurosis marked by redness and pain in the face

erythropt'sia (er-ī-throp'sī-ā) [" + *opsis*, vision] Perversion of color vision in which all objects look red

erythropt'sia [" + *opsis*, vision]. Pigment in the external portion of the rods of the retina *SYN* *rhodopsin*, *visual purple*.

erythropt'kno'sis [" + *pyknos*, dense, + *ōsis*]. Alteration of red blood cells by malarial parasites, "brassy bodies" *SYN* *pyknosis*.

erythrorrhex'is [" + *rēxis*, rupture] Rupture of a cell and escape of its plasma. *SYN* *erythrocytorrhexis*, *plasmorrhexis*.

erythros'is [" + *ōsis*]. A reddish-purple discoloration of the skin and mucous membranes in polycythemia

er'ythrothrom'bomono'blasto'sis. A disorder characterized by appearance in the blood of excessive numbers of erythroblasts, thrombocytes, and immature monocytes. Other symptoms include enlargement of the spleen, increase in basal metabolism, and bone atrophy

erythroxin (er-īth'ro-toks'in) [" + *toxikon*, poison] An exotoxin that attacks red blood cells *See* *leukotoxin*.

erythru'ria (er-ī-thru'ri-ā) [" + *ouron*, urine]. Red color of the urine.

Esbach's method (es'baks). A method of estimating quantity of albumin in urine. The urine is collected for 24 hours, and after stirring well, a specimen is taken.

The specific gravity is read and, if necessary, urine is diluted until it shows a reading of 1.010 or below. It should be slightly acid. It is poured into a special Esbach's test tube, which is marked off in grams, until the letter U (urine) is reached. Then Esbach's reagent is poured in up to the mark R.

The tube is tightly corked and gently inverted once or twice, care being taken to prevent bubbles forming.

The tube is now set aside, upright, for 12 hours. It must not be disturbed, and the temperature of the room should be kept constant. The albumin is seen as a precipitate at the bottom of the tube, and is read off in grams per liter. If grains per ounce are required, multiply the result by 0.4. Esbach's reagent contains picric acid and citric acid RS *albumen*.

E.'s quantitative estimation of albumen. Apparatus required

(a) An Esbach's albuminometer. This is a large test tube marked with a scale for reading off the precipitate in grams per liter. Above this is the letter U, and about 2 in. higher is the letter R.

(b) Esbach's reagent. Consists of Picric acid, 10 Gm., citric acid, 20 Gm., water, 1 liter.

The following points should be noted before carrying out the test.

1. The urine must be acid.

2. Its specific gravity must be 1.010 or below. If above this the urine must be diluted with an equal quantity of water, the final result being multiplied by 2.

3. The urine should be cold.

4. Keep the specimen in a room with a constant temperature.

Technic. Pour some of the urine into the Esbach's tube up to the letter U. Then add reagent up to the letter R. Cork, and then gently invert the tube 2 or 3 times, taking care not to form bubbles. The tube is now set aside in an upright position and the precipitate allowed to settle for 12 hours. It is then read off on the scale as grams per liter. If it is desired in grains per ounce the number of grams is multiplied by 0.4, e. g., if the precipitate reaches the figure 4 it means that there is present 4 Gm. of dried albumen to 1 liter of water. To bring this to grains per ounce $4 \times .4 = 1.6$ gr. per ounce RS *albumen*.

escape mechanism. In psychiatry, the reaction of a person in adjusting temporarily to difficult, unpleasant, or intolerable situations by unconsciously employing another means which is less difficult or more pleasant.

escape, vagal. Occurrence of a ventricular contraction when the normal rhythmic beat of the heart has been stopped or inhibited by stimulation of the vagus nerve. Also called "escape from inhibition", "escape of the heart", or "vagus escape".

escape, ventricular. Occurrence of single or repeated ventricular contractions from impulses arising in the atrioventricular node. Also called nodal extrasystole.

eschar (es'kar) [G. *eschara*, scab]. A slough, esp. one following a cauterization or burn. SEE *escharotic*.

escharotic (es-ka-ot'ik) [G. *eschara*, scab]. Agent used to destroy tissue and to cause sloughing which produces what is known as an *eschar*. The third degree of counterirritation.

They are caustics, the mild ones being used in the treatment of skin diseases, the stronger being employed to destroy infected tissue, and to counteract the bites of animals and insects, caustic soda and antimonial ointment being applied for this purpose. Silver nitrate is used by some physicians as a solution

to be painted around the *meatus urinaris* for incontinence of the urine. They may be acids, alkalies, metallic salts, phenol or carbolic acid, carbon dioxide, or the cautery, epispastics, q.v.

eschatin (es'ka-tin) An extract of supraprenal cortex.

Uses Specific in Addison's disease.

Dosage. Average, 1-5 cc subcutaneously.

Escherichia (esh-er-ik'i-ä). A genus of bacteria belonging to the family Enterobacteriaceae, tribe Eschericheae. They are common inhabitants of the alimentary canal of man and other animals.

E. coli. SYN *Bacterium coli communis*. The colon bacillus. A short, plump, gram-negative, nonspore-forming motile bacillus almost constantly present in the alimentary canal of humans and some animals. They are normally non-pathogenic but may cause inflammatory condition of the gall bladder, urinary bladder and the peritoneal cavity. Their presence in milk or water is an indicator of fecal contamination.

Escherich's reflex (esk'ër'ik) Pursing or muscular contraction of lips resulting from irritation of mucosa of lips.

eschrolalia (es-kio-lal'i-ä) [G. *aischros*, indecent, + *lalia*, babble] Utterance without meaning of obscene words SYN *coprolalia*.

Escudero's test. A test for gout.

es'culent [L. *esculentus*, eatable] Suitable to be eaten.

escutcheon (es-kutch'un) [Fr. *escuchon*, shield, from L. *scutum*, shield]. The coarse pubic hair in the adult.

eserine (es'er-in). USP. SEE *physostigmine*.

Es'march's bandage. A rubber bandage for controlling bleeding. Before operation commences, bandage is applied tightly to limb, commencing at distal end and reaching above site of operation, where a rubber tourniquet is firmly applied. The bandage is then removed. This renders operative area absolutely bloodless. SEE *bandage*.

esodic (es-od'ik) [G. *esô*, within, + *odos*, way]. Centripetal or afferent; pert. to sensory nerves conducting impulses toward the brain and spinal cord.

esenteritis (es'o-en-ter'i-tis) [+ *enteron*, intestine, + *-itis*, inflammation]. Inflammation of the mucous membrane of the intestine.

esothmoiditis (es-o-eth-moy-di'tis) [+ *ethmos*, sieve, + *oidos*, form, + *-itis*, inflammation]. Inflammation of membrane of ethmoid cells.

esogastri'tis [+ *gastër*, belly, + *-itis*, inflammation]. Catarrhal inflammation of the gastric mucous membranes.

esophagalgia (ës-ô-fâj-äl'j'i-ä) Pain in the esophagus.

esophageal (e-sof-ä'je-al) [G. *oisophagos*, esophagus]. Pert. to the esophagus.

esophagectasia, esophagectasis (ë-sôf-ä-jék-tä'si-ä) Dilatation of the esophagus.

esophagec'tomy [+ *ektomë*, excision]. Excision of a part of the esophagus.

esophagismus (e-sof-aj-is'mus) [+ *ismos*, condition of]. Esophageal spasm.

esophagitis (e-sof-a-j'i'tis) [+ *-itis*, inflammation]. Inflammation of the esophagus.

esophagocoele (e-sof-a-go-sël) [+ *kêlë*, hernia]. Hernia of the esophagus.

esophagodyn'ia [+ *odynë*, pain]. Pain in the esophagus.

esophagoenterostomy (e-sof'a-go-en-ter-os'to-mī) [+ *enteron*, intestine, + *stoma*, mouth]. Formation of communication bet. the esophagus and intestine with excision of stomach

esophagogastrscopy [+ *gastēr*, belly, + *skopein*, to examine]. Inspection of esophagus and stomach through an illuminated instrument.

esophagogastrstomy (e-sof'ā-go-gas-tros'to-mī) [+ *stoma*, mouth]. Formation of a communication bet. the esophagus and stomach

esophagomalacia (e-sof'ā-go-māl-a'sī-ā) [+ *malakia*, softness]. Softening of the esophageal walls.

esophagomycosis (e-sof'ā-go-mī-ko'sis) [+ *mykēs*, fungus, + *ōsis*]. Bacterial or fungous disease of esophagus

esophagoplasty (e-sof'ā-go-plas'tī) [+ *plasma*, to form]. Repair of the esophagus by a plastic operation.

esophagoplication (e-sof'ā-go-plī-ka'shun) [+ *L plicāre*, to fold]. Reduction of dilation of the esophagus by taking tucks in its walls

esophagoptōsia, **esophagoptōsis** [+ *ptōsis*, a falling]. Relaxation and prolapse of the esophagus

esophagoscope (e-sof'ag-o-skōp) [+ *skopein*, to examine]. Device for examination of esophagus.

esoph'agospasm [+ *spasmos*, spasm]. Spasm of walls of the esophagus

esophagostenosis (e-sof'ā-go-stē-no'sis) [+ *stenosis*, contraction]. Stricture or narrowing of the esophagus

esophagostomy (e-sof-ag-os'to-mī) [+ *stoma*, opening]. Formation of esophageal fistula.

esophagotome (e-sof'a-go-tōm) [+ *tomē*, incision]. Instrument for forming an esophageal fistula

esophagotomy (e-sof-ag-o'to-mī) [+ *tome*, incision]. Making of an incision in esophagus, so as to remove foreign substance.

esophagus (e-sof'a-gus) (pl *esophagi*) [G. *oísophagos*]. A musculomembranous canal extending from the pharynx to the stomach. Length about 9 inches. RS. *epicardia*, *epicardium*, *quiet*

e., foreign bodies in the. F A TREATMENT The patient may complain of pain or an uncomfortable feeling deep in the chest. The article often can be dislodged by making the patient vomit by wiggling the finger in the back part of the throat, or it may be displaced downwards by giving thick materials to the patient to swallow

Such foods as mashed or boiled potatoes, oatmeal, gruel, soft bread, etc., usually adhere to the object, prevent its irritation on the wall of the esophagus and aid in carrying it to the stomach.

A physician should always be called. Foreign bodies in the stomach are ordinarily not dangerous and usually pass through the alimentary tract in a few days without danger. However, it may be dangerous to give cathartics or enemas. These patients should always be under the care of a physician

esophoria (es-o-fō'ri-ā) [G. *esō*, inward, + *pherein*, to bear]. OPTH. Tendency of visual lines to converge. SEE *exophoria*.

esophylac'tic [+ *phylaxis*, protection]. That which is phylactic or protective.

esophylaxis (es'o-fi-laks'is) [+ *phylaxis*, protection]. The protective biological action against disease exercised by the

fluids and cells of the body. SEE *exophylaxis*.

esophenoiditis (es'o-sfen-oy-di'tis) [+ *sphen*, wedge, + *oidos*, form, + *itis*, inflammation]. Osteomyelitis of the sphenoid bone

esoteric (es-o-ter'ik) [G. *esōteros*, within]. Coming from within the organism.

esotropia (es-o-trō'pī-ā) [G. *esō*, inward, + *trepein*, to turn]. Marked turning inward of eye, crossed eyes

-ess [Fr.] Suffix noting female sex.

es'sence [L. *essentia*, being or quality]. 1. The spirit or principle of anything. 2. An alcoholic solution of volatile oil

essen'tial [L. *essentia*, being or quality]. 1. Pert to an essence. 2. Indispensable. 3. Specific, independent of a local morbid condition. SYN *idiopathic*.

e. amino acid. One of the ten amino acids necessary for normal growth. SEE *amino acid*

e. oil. Any volatile oil of vegetable or animal origin

es'ter. In organic chemistry, a compound formed by the combination of an organic acid with an alcohol.

Ex Ethyl acetate is an ester formed by combining acetic acid with ethyl alcohol. Esters are commonly liquids with characteristic fruity or flowery odors

esterase (es'ter-as) Generic term for an enzyme that catalyzes the hydrolysis of esters

e. acetylcholine. Cholinesterase, an enzyme that quickly hydrolyzes acetylcholine to acetic acid and choline

es'terize. To convert into an ester

esterol (es'ter-ol). Known also as benzyl succinate, a white, odorless powder.

USES As an antispasmodic

DOSEAGE 5 gr (0.3 Gm)

es'thetatol'ogy [G. *aisthēma*, sensation, + *logos*, science]. Science of the sense organs and their function

esthesia (es-the'zi-ā) [G. *aisthēsis*, sensation]. 1. Perception, feeling, sensation. 2. Any disease that affects the senses or perceptions. It forms the termination of many medical words

es'thesioblast [+ *blastos*, germ]. An embryonic ganglion cell. SYN. *ganglioblast*

esthesiol'ogy [+ *logos*, science]. Science of sensory phenomena. SYN *esthesiology*

esthesiomania (es-thez'i-o-mā'nī-ā) [+ *mania*, madness]. Insanity with sensory hallucinations and perverted moral sensibilities

esthesiometer (es-the-zī-om'et-er) [+ *metron*, measure]. Device for measuring tactile sensibility.

esthesioneurosis (es-the'zi-o-nu-ro'sis) [+ *neuron*, nerve, + *ōsis*]. A loss of feeling without any apparent organic lesion

es'the'ophysiol'ogy [+ *physis*, nature, + *logos*, study]. Physiology of the sense organs

esthesioscopy (es-the'zi-os'ko-pī) [+ *skopein*, to examine]. Testing tactile and other forms of sensibility

esthet'icokinetic (es-the't'ko-kin-et'ik) [+ *kinesis*, motion]. Being both sensory and motor

esthiomene (es-thī-om'en-e) [G. *esthiomēnos*, eating]. A chronic hypertrophic ulcerative vulvovaginitis of unknown origin

esthiomenus (es-the-om'en-us) [G. *esthiomenos*, eating]. Swelling and ulceration of perianal region and vulva.

es'tival [L. *aestivus*, pert. to summer]. Relating to or occurring in summer.

estivo-autumnal [" + *autumnalis*, pert. to autumn] 1 Pert to summer and autumn 2 A term applied to form of malarial fever

Estlander's operation. Resection of a part of 1 or more ribs and excision of diseased pleura in chronic empyema

estradiol (ă-tă'ăi-ôl) *Syn.* *dihydrotheelin*. Dihydroxyestrin, $C_{18}H_{26}O_2$, a crystalline steroid possessing estrogenic properties found in the ovary, the follicular fluid, corpus luteum, placenta, and adrenal gland. Large quantities are found in the urine of pregnant women and mares and in the urine of stallions, the latter two serving as sources of the commercial product. In the body it is converted to estrone and estriol. It is believed to be the true estrogenic hormone.

e. dipropionate. An estrogen very effective in menopause

es'triol. Hormone found in urine of pregnancy. *Syn.* *theicol*.

es'trogen. Any substance, natural or artificial, which induces estrogenic activity, more specifically the estrogenic hormone produced by the ovarian follicle and other structures, the female sex hormone. Estrogens are responsible for the development of secondary sexual characteristics, cyclic changes in the vaginal epithelium (and the endothelium) of the uterus. They are used in the treatment of menopausal symptoms. Natural estrogens include estradiol, estrone, and estriol. Synthetic estrogens used clinically are dihydroethylstilbestrol (hexestrol) and dienestrol.

estrogenic (es-tro-jen'ik) [*G. oistros*, mad desire, + *gennan*, to produce] Causing estrus.

es'trone. Theelin, $C_{18}H_{26}O_2$, an estrogenic hormone found in the ovary, the urine of pregnant women and mares, the placenta, the urine and testes of stallions and in certain vegetable compounds (palm oil). Used in the treatment of estrogen deficiencies. It is less active than estradiol, but more active than estriol. Also called *folliculin*, follicular hormone.

es'trual [*G. oistros*, mad desire] Pert to the rutting of animals

estru'ation [*G. oistros*, mad desire] Rutting of animals during heat period

es'trum, es'trus [*G. oistros*, mad desire]. In mammals other than primates, the recurrent period of sexual activity called "heat" characterized by congestion of and secretion by the uterine mucosa, proliferation of vaginal epithelium, swelling of the vulva, ovulation, and acceptance of the male by the female.

e. cycle. The cycle from the beginning of one estrus period to the beginning of the next. Includes proestrus, estrus, and metestrus followed by a short period of quiescence called *dies-trus*.

estua'rium [*L. aëstus*, heat]. Vapor bath. **état mameionné** (ă-tă' mă-mē-ion-nă') [*Fr.* knobby state]. Condition of gastric mucosa in chronic inflammation with nodular projections.

e'ther [*G. aithēr*, air]. 1. Hypothetical substance once regarded as permeating all space and capable of transmitting electromagnetic vibrations 2. Any organic compound in which an oxygen atom links together 2 carbon chains.

DOSAGE 15 gr. (1.0 Gm.)

The general formula is $R'OR''$. The ether used for anesthesia is diethyl

ether, $C_2H_5OC_2H_5$, and was formerly called sulfuric ether because it can be prepared from ethyl alcohol and sulfuric acid. As an anesthetic it is nauseating and it affects the kidneys.

e. anesthetic. Ethyl oxide, or diethyl ether ($C_2H_5)_2O$, the common ether used in anesthesia. It is a thin, colorless, highly volatile, and highly inflammable liquid with a specific gravity at 25° of 0.713-0.716. It was formerly called sulfuric ether because it was prepared from ethyl alcohol and sulfuric acid. It is widely used for general anesthesia. The action of ether is slower than other general anesthetics and the margin of safety is greater.

Phys. ACTION. Ether stimulates the respiratory, mucous membranes and the respiratory center in the medulla oblongata. It stimulates and accelerates the action of the heart. It lowers body temperature and raises blood pressure unless given in large doses, or continued over a long period, when it lowers blood pressure. It produces fair muscular relaxation and increases mucus and other secretions. It produces slight changes in body chemistry. It is usually chosen for most brain surgery and is the best anesthetic if properly administered.

CONTRA. Its use is avoided in acute respiratory infections, in pulmonary tuberculosis, renal diseases, diabetes, brain tumors, and conditions in which congestion may be present or caused in the brain. It acts as an irritant upon the kidneys and inhibits urinary secretion and elimination. It is also irritating to the muscular glands.

AFTER EFFECTS. Excitement with desire to talk follows ether anesthesia, the patient perspires freely, and exhibits signs of nausea and begins to vomit, all before the return to consciousness, which may not be regained for several hours. Upon awakening he feels dizzy, complains of headache and thirst. These effects may last for hours. The flow of saliva and the secretion of mucus may be increased. It is usually excreted from the body within 24 hr. Pneumonia is the most common complication following ether anesthesia. Gas pains may give trouble. Sodium bicarbonate in water sipped slowly, or small pieces of ice held in the mouth may relieve nausea and vomiting. Warm or cold water; the quantity permitted to relieve thirst depends upon the surgeon. The head should be turned to one side when vomiting, to prevent vomitus from passing into the trachea. Cold compresses may be placed to head and a rectal irrigation may be given to relieve gas pressure, or a rectal tube may be inserted for the purpose. See *chloroform a.*, *ethylene a.*

e. asphyxia. Suffocation during ether anesthetization. See *e. anesthesia*, *gases, resuscitation*.

e. bed. One prepared to prevent patient from injuring self, to keep patient warm, and to protect bedding.

Articles Necessary. Bedding for making an ordinary closed bed. Two small rubber sheets. Two draw sheets (or special "ether sheets"). Two bath blankets. Two pieces of bandage about 3 in. wide. Two towels. Two emesis basins. Pad and pencil. Small pieces of gauze or paper wipes. Paper bags. Safety pins. Shock blocks. Rubber pillow case. Hot water bottles filled and covered (if they are to be used).

PROCEDURE 1. Make up bottom part of bed as usual. 2 Place 1 small rubber where region of operation will come. 3. Place another across head of mattress where patient's head will lie. 4 Cover each with a draw sheet, tucking it firmly under mattress. 5. Spread the 2 bath blankets 1 over the other, with tops 6 in. from top of mattress. Hot water bottles to be placed between these. Tuck lower blanket in at sides. 6 Place top bedding as usual but do not tuck in 7. Fold top sheet over bed blanket to protect it. Fold all top bedding together, including the top bath blanket, even with mattress edge all around, then fold toward side of bed away from the door, or where the stretcher will be placed, until it lies in a neat fold 8 Tie 1 pillow upright on its side against bars at top of bed with bandage. 9 Put rubber pillow case on other pillow and have it ready to put under patient's knees if needed 10. Place shock blocks at foot of bed on each side ready for instant pushing into position 11 Place pad, pencil, emesis basin, wipes and 1 towel on bedside table, other towels over head-bar of bed 12 Place chairs and table out of way of the stretcher

e. drunkenness. Intoxication produced by imbibing ether.

etheral (e-there-al) [G. *aithēr*, air]. Pert. to or made with ether.

e. oil. A volatile oil.

etherin (e'ther-in) [G. *aithēr*, air]. A tuberculous toxin extracted by ether. **SYN** *etherobacillin*.

etherion (e-the'ri-on) [G. *aithēr*, air]. A gas of extreme tenuity in the atmosphere

etherization (e'ther-i-za'shun) [G. *aithēr*, air] Administering ether to induce anesthesia

e'therize [G. *aithēr*, air]. To anesthetize by use of ether.

e'therobacil'in [" + L. *bacillus*, rod]. Poison extracted from tuberculosis bacilli

etheromania (e'ther-o-ma'ni-ä) [" + *mania*, madness] Addiction to use of ether

ethics. A system of moral principles or standards governing conduct

e. medical. A system of principles governing medical conduct. It deals with the relationship of a physician to the patient, the patient's family, his fellow physicians, and society at large

e. nursing. A system of principles governing conduct of a nurse. It deals with the relationship of a nurse to the patient, the patient's family, her associates and fellow nurses, and society at large

ethiopia'c'ion [G. *Aithiops*, an Ethiopian, + L. *facere*, to make]. Pathological blackening of skin or production of argyria *

ethmo- [G.]. Prefix denoting "connected with or pert. to the ethmoid bone."

ethmocardi'tis [G. *ethmos*, sieve, + *kardia*, heart]. Chronic inflammation and proliferation of cardiac connective tissue. **SYN** *cardiosclerosis*.

ethmoid [" + *eidos*, form]. Sievelike, cribriform

e. bone. Sievelike spongy bone which forms a roof for the nasal fossae and part of floor of ant. fossa of skull, and containing air sinuses.

e. sinus. Air cells or space inside ethmoid bone.

ethmoid'al [" + *eidos*, form]. Pert. to the ethmoid bone or sinuses.

ethmoidectomy (eth-moy-dek'to-mi) [" + *ektome*, excision]. Excision of ethmoid cells

NP Patient in sitting position, ice packs to nose often ordered

ethmoid'i'tis [" + " + *-itis*, inflammation]. Inflammation of ethmoidal cells. May be acute or chronic **SYM** Headache, acute pain bet. eyes, nasal discharge.

ETHMOID BONE

1. Cribriform plate 2. Crista galli.
3. Perpendicular plate.

ethmyphitis (eth-mit-'tis) [" + *phē*, tissue, + *-itis*, inflammation] Diffuse inflammation of cellular tissue **SYN** *cellulitis*.

ethnography [G. *ethnos*, race, + *graphein*, to write] The description of the human race

ethnology [" + *logos*, science]. The science of human races

ethyl (eth'il) [G. *aithēr*, air, + *ylē*, matter]. In organic chemistry, the radical C_2H_5 , which enters into the constitution of many compounds such as ethyl ether, ethyl alcohol, and ethyl acetate.

e. acetate. $CH_3COOCH_2CH_3$, acetic ether. A colorless liquid used as a solvent

e. alcohol. CH_3CH_2OH Grain alcohol **SEE** *alcohol*, *ethyl*. Transparent, colorless, volatile liquid of characteristic odor and a burning taste. The most important poison in medical and legal professions. It is the active principle of alcoholic beverages, and many proprietary preparations **SEE** *alcohol*

e. aminobenzoate. Same as benzo-caine.

e. bromide. CH_3CH_2Br , hydrobromic ether. Used for local anesthesia.

e. carbamate. $C_2H_5OCONH_2$ urethane. Used to induce sleep and in the treatment of myeloid and lymphatic leukemia

e. chaulmoograte. The ethyl esters of the fatty acids of chaulmoogra oil. Used in the treatment of leprosy.

e. chloride. CH_3CH_2OH , hydrochloric ether. **USP**. A very volatile liquid with a pleasant odor. **Uses:** Local anesthetic in minor surgery, or used in much the same way as chloroform. It produces muscular spasms and, if not given cautiously, may result in sudden respira-

tory paralysis. It is used only for a very short anesthesia.

e. formate. HCOOC_2H_5 , formic ether, a volatile antispasmodic and anesthetic.

e. iodide. CH_3CHI , hydriodic ether, used in treatment of asthma.

e. nitrite, spirit of. Commonly known as sweet spirit of niter USP. Only liquid ACTION AND USES Diuretic and for relief of arterial spasm. DOSAGE. 30 m (2 cc.).

e. salicylate. A volatile liquid, characteristic odor, same effects, but less irritant than methyl salicylate. DOSAGE. From 5-10 m (0.3-0.6 cc.).

e'thylamine. $\text{CH}_3\text{CH}_2\text{NH}_2$. An amine formed in the decomposition of certain proteins.

e'thylene. A colorless gas (CH_2CH_2) prepared from alcohol by dehydration and found in illuminating gas to the extent of 4%. It is colorless, and has a sweetish taste but a pungent, foul odor. It is lighter than air and diffusible when liberated. It is inflammable and explosive.

e. anesthesia. Since ethylene is a rather weak anesthetic, it usually is given in a combination of oxygen 20%, cyclopropane 10%, and ethylene 70%.

PHYS. EFFECTS. It causes less alteration in the blood gases than does nitrous oxide. The CO_2 content is not altered. Full muscular relaxation and slight irregularity in heart action, respiration, and blood pressure. Analgesia results before loss of hearing or before complete unconsciousness. Nausea and vomiting seldom persist as long as 24 hr., but it generally disappears before consciousness has returned.

ADVANTAGES. Slightly stimulating to cardiac and respiratory systems. It lowers body temperature, less toxic than any known anesthetics. It is not irritating to mucous glands and kidneys. It has a short period of induction and makes possible a very rapid recovery. There is an absence of cyanosis, and a minimum of emesis. The difference between ethylene and any other anesthetic known today is that there is a less marked effect on all the systems of the body. It is the choice anesthetic for old patients and for poor surgical risks, and when moderate anesthesia is desired or where complete relaxation is not required.

DISADVANTAGES. Has an objectionable smell, is highly inflammable and explosive; increases capillary bleeding, the relaxation is not so complete or as perfect as from the use of ether anesthetics.

PRECAUTIONS. Many lives have been lost because someone was careless and a spark was emitted from some immediate source. Ethylene should be stored where there is plenty of air. The administration must be done away from fire or electric appliances or x-ray apparatus. All lights should be turned on before bringing the tanks into the room to prevent sparking from the plug or lighting fixture. Furniture should never be dragged into the room or rolled into the room while the anesthetic is being given. The humidity of the room should be checked during the administration of this anesthetic. Not even the exit lights should be burning during the giving of this anesthetic.

Ethylene does not combine with air as

do other anesthetics but floats around as clouds, as the vapor rises in a cloud-like form any gust of air may carry it out of the room and should someone be on the outside smoking or the elevator cause a sparking, an explosion would result with the destruction of life in a most devastating manner. Ethylene always comes in red tanks. Oxygen is stored in green tanks. Nitrous oxide is stored in blue tanks. Carbon dioxide is stored in gray tanks. SEE *chloroform a., ether a.*

etiolate (e'ti-o-lat) [Fr *étiole*, to blanch] Pale or sickly from lack of light or long continued illness.

etiologic, etiological (e'ti-o-loj'ik, e-ti-o-loj'ik-ál) [G *aitia*, cause, + *logos*, study] Pert to causes.

etiology (e-ti-ol-o-jí) [+ *logos*, study]. The study of the causes of disease which result from an abnormal state producing pathological conditions.

CONGENITAL. Embryonic malformations and conditions occurring during fetal life, such as abnormalities, anomalies, and monstrosities.

e'tiotropic. Directed toward the cause of a disease, said of a drug or treatment which destroys or inactivates the causal agent of a disease, opposite of nosotropic, *q v*.

etrohysterectomy (e'trô-his-tér-ék'tô-mi) Excision of the uterus through the abdominal wall in the hypogastric region.

etymology (et-i-mol'o-jí) [G *etymon*, true meaning of a word, + *logos*, science]. The science of the derivation of words.

Most medical words are derived from the Latin and Greek, but many of those from the Greek have reached us through the Latin, being modified by that language. When 2 Greek words are used to form 1 word, they generally are connected by the letter "o".

Many medical words have been formed from 1 or more roots, forms used or adapted from the Latin or Greek, and many of them are modified either by a *prefix* or a *suffix*, or both. A knowledge of important Latin or Greek roots, and of prefixes will reveal the meaning of a great many other words.

Eubacteriales (û-bák-tê-ri-a'lês) [G *eu*, well, + *bakterion*, little rod]. The true bacteria. Includes the simplest and least differentiated forms. SEE *bacteria, classification of*.

eubiotics (û-bi-ot'iks) [G *eu*, well, + *bios*, life], Hygienic living.

eu'bolism [+ (meta)bolê, change, + ismos, condition] Normal metabolism.

eucaine hydrochloride (û-kân'hy-dro-chlô-rid) USP. White, crystalline powder. Uses Local anesthetic. [2 to 5%]

DOSAGE. Typically, in strengths from INCOMPATIBILITY Salicylates.

eucalyptol. USP. A substance obtained from oil of eucalyptus. DOSAGE 5 gr (0.3 Gm)

eucalyptus, oil of (û-kal-ip'tûs) [G *eu*, well, + *kalyptein*, to cover]. USP. Oil distilled from fresh leaves of the plant.

ACTION AND USES. As an expectorant and antiseptic.

DOSAGE. 8 m (0.5 cc.).

eucapnia (û-kâp'ni-â) Presence of normal amounts of carbon dioxide in the blood.

euchlorhydria (û-klôr'hî-drî'â) Presence of the normal amount of free hydrochloric acid in the gastric juice.

eucholia (û-kô'll-â). Normal condition of bile as regards its constituents and amount secreted.

euchylia (û-ki'll-â) [" + *chylia*, *chylis*]. Normal condition of the chyle.

eucrasia (û-krâ'si-â). Condition of normal health, state of the body in which all activities are in normal balance.

eudiaphoresis (û-di'll-â-fo-re'sis) [" + *dia*, through, + *pherein*, to carry]. Normal secretion of perspiration.

eudiomorrhysis (u'di-em-or'i-sis) [" + " + *aima*, blood, + *rysis*, flow]. The normal blood flow through the capillaries.

eudiometer [G *eudia*, good weather, + *metron*, measure]. An instrument for testing purity of air and analysis of gases.

euesthesia (u-es-the'si-â) [G. *eu*, well, + *aisthêsis*, sensation]. Having normal senses.

eugenics (u-jen'iks) [" + *gennan*, to produce]. The science which deals with the physical, moral, and intellectual improvement of the human race by careful and judicious mating. It is also concerned with (1) the sterilization of mental defectives, (2) intermarriages, (3) restriction of marriage between persons physically unfit, (4) birth control and allied problems. See *aristogenics*.

e. negative. Those measures which seek to restrict the numbers of offspring of undesirable types.

e. positive. Those measures which seek to bring about an increase in the numbers of offspring of families of the better types.

eugenism (u-jen-izm) [" + " + *ismos*, condition]. The circumstances of environment and heredity which tend to bring about happy and healthy existence.

euglobulin (eu-glob'ûl-in) A true globulin, or one soluble in distilled water and dilute salt solution. See *pseudoglobulin*.

eugonic [" + *gonê*, seed]. Pertaining to a luxuriant growth of bacteria.

eukinesia (u-kin-e'si-â) [" + *kinêsis*, motion]. Normal power of movement.

Eulenburg's disease. Paramyotonia congenita.

eumenorrhea (eu-mên-or-rê-â) Normal menstruation.

eunoia (u-noy-â) [" + *nous*, mind]. Soundness of mind.

eunuch (û'nuk) [G *eunê*, bed, + *echein*, to hold]. Castrated male, one who has had his testicles removed.

The absence of the testicular secretions produces certain symptoms, such as a female type of voice and loss of hair on the face.

eunuchism (û'nuk-izm) Condition resulting from complete androgen deficiency, as occurs following castration.

eunuchoid. Having the characteristics of a eunuch, such as retarded development of external and accessory sex organs, absence of beard and bodily hair, high-pitched voice, and striking lack of muscular development.

e. pituitary. E. Due to failure of the ant lobe of the pituitary to secrete gonadotrophic hormones, secondary hypogonadism.

eunuchoidism (û'nuk-oid-izm) Condition resulting from androgen deficiency of the testes regardless of etiology.

eupancræatism (u-pân-kre-â-tizm) [G. *eu*, well, + *pankreas*, pancreas, + *ismos*, condition]. Normal condition of the pancreas.

eupepsia [" + *pepsis*, digestion]. Normal digestion, as distinguished from dyspepsia.

eupeptic [" + *pepsis*, digestion]. Possessed of a good digestion.

euphonia (û-ion'i-â) Having a normal, clear voice.

euphoria (û-fo'ri-â) [" + *pherein*, to bear]. 1. A condition of good health. 2. Psy. A feeling of well being, mild elation.

["ing quickly and well.

euplastic [" + *plassein*, to form]. Heal.

eupnea (up-ne-â) [" + *pnein*, to breathe]. Normal breathing, as distinguished from dyspnea and apnea.

eupraxia (u-prak'si-â) [" + *prassein*, to do]. Normal capacity to execute a motor pattern. See *paralysis*.

eupraxis (û-prak'sik) [" + *prassein*, to do]. Contributing to proper functioning.

euquinine (û-kwî'nin) (quinine ethyl carbonate) USP. Nearly tasteless, light, fleecy crystals.

DOSAGE Same as for quinine, but may be given in larger doses.

USCS Same as for quinine.

euresol (u're-sol) A trade name for resorcinol monacetate.

ACTION AND USES. Antiseptic, largely used for scalp lotions, in alcoholic solutions 3 to 5%.

Eurethum. A genus of molds.

E. malignum. A species causing inflammation in ext auditory meatus.

euryon (u're-on) [G *eury*, broad]. Either end of bilateral diameter of head.

euryosomic, **euryosomatic** (û'ri-ô-sôm'ik, -ri-sôm-at'ik) [" + *sôma*, body]. Having a thick, squat body.

eu'rythrol. Extract of ox spleen; used in chlorosis and anemia.

DOSAGE 60-120 m (3 75-7 5 cc).

eustachian (u-sta-ki-an) After Eustachio, an Italian anatomist. Pert to the auditory tube.

RS *salpingemphrazis*, *syringitis*, *sye. cathefer*. Instrument for introducing medicated vapor into the eustachian tube.

e. tube. The auditory tube (from the middle ear to the pharynx, 3-4 cm long and lined with mucous membrane).

e. valve. At the entrance of the inferior vena cava. SYN *valvula venae cavae inferioris*.

eustachitis (u-sta-ki'tis). Inflammation of the eustachian tube.

eusystole (u-sis'to-li) [G *eu*, well, + *systellein*, to draw together]. A state of the systole of the heart that is normal in time and force.

eutectic (u-tek'tik) [" + *têktos*, melting]. Easily melted.

e. mixture. A mixture of two or more substances which has a melting point lower than that of any of its constituents.

euthanasia (u-than-a'zi-â) [" + *thanatos*, death]. 1. An easy death. 2. The proposed practice of ending a life in case of incurable disease.

euthenics (û-then'tiks) [G. *euthênia*, well-being]. The science of improvement of the race through modification of the environment, in contrast to eugenics, q.v.

eutocia (u-to'si-â) [G. *eu*, well, + *tokos*, birth]. Normal or natural labor and childbirth.

eutonon (u'tô-non) [" + *tonos*, tension]. Proprietary liver extract, possibly a hormone, suggested for use in treating vascular diseases.

evacuant (e-vâk'û-ant) [L. *evacuans*, making empty]. Drug which moves the bowels.

evacuate [L. *evacuare*, to empty]. To discharge, esp. from the bowels.

evacuation (e-vak-u-a'shun) [L. *evacuare*, to empty]. 1. Emptying, esp the bowels. 2. The material discharged from the bowels, stool. 3. Removal of air from a closed container, the production of a vacuum. *RS absorption, feces, stool*

evacuator (e-vak'u-a-tor) [L. *evacuare*, to empty]. Device for emptying, as of the bowels or for irrigating the bladder and removing calculi.

evaginate [L. *ē*, out, + *vagina*, sheath]. Pert to protrusion of some part or organ from its normal place.

evagination (e-vaj-in-a'shun) [“ + *vagina*, sheath]. 1. Emergence from a sheath. 2. Protrusion of an organ or part. *Sfx invagination.*

evanescent [L. *evanescere*, to vanish]. Not permanent, of brief duration, passing gradually.

Evans-Strang diet, modified. *Sfx. reduction diet.*

evaporation [L. *ē*, out, + *vaporare*, to steam]. 1. Change from liquid form to vapor. 2. Loss in volume due to conversion of a liquid into a vapor.

Eve's method (F C Eve, physician, Hull, England) (resuscitation in drowning). Place the victim downward on a stretcher with ankles and wrists tied to handles, arms extending away from the body beyond the head. Support stretcher on a trestle about 34 inches high. Hold head of stretcher down to a tilt of about 45 degrees, and keep it there until no more water drains from the mouth. Then start rocking for a few minutes, then reduce tilt about 30 degrees each way with ten double rockings a minute. Remove wet clothing as the rocking proceeds, rub the body, and place hot-water bottle at back of neck, adding warm blankets about the patient. Paralysis of the diaphragm is thus prevented. *Sfx resuscitation, artificial respiration.*

evectics [L. *evectere*, to carry up]. Acquiring of bodily energy.

eventrion [L. *ē*, out, + *venter*, belly]. 1. Partial protrusion of the abdominal contents through an opening in the abdominal wall. 2. Removal of contents of the abdominal cavity.

e. of the diaphragm. Elevation of the diaphragmatic dome into the thoracic cavity.

eversion (e-ver'shun) [“ + *vertere*, to turn]. Turning outward. *Sfx chilectropion.*

e. of the cervix. A turning out of the cervical edges subsequent to laceration. *Syn. ectropion of cervix.*

évidement (ā-vid-mōn') [Fr. a scooping out]. Scraping away morbid tissue.

evipal (e-vi-pal). A derivative of urea, occurring as a white powder.

Uses: As a hypnotic of short duration but of rapid action, nervous insomnia and in labor.

Dosage: 4 gr. (0.259 Gm.) to be used cautiously in liver damage.

e., soluble. *Uses:* In short surgical operations as an anesthetic, given intravenously.

eviration (e-vi-ra'shun) [L. *ē*, out, + *vir*, man]. 1. Castration. 2. Effemination or defeminization, or transformations of psychological personality due to the development of contrary sexual instincts.

evisceration (e-vis-er-a'shun) [“ + *viscera*, viscera]. 1. Removal of the viscera. 2. Removal of the contents of a cavity. 3. Protrusion of the viscera.

e. obstetrical. Removal of the thoracic and abdominal contents of a fetus to facilitate delivery.

éviscéronéuromy [“ + “ + *G. neuron*, nerve, + *tomē*, incision]. Scleral evisceration of the eye with division of optic nerve.

evolution [“ + *volvere*, to roll]. A process of orderly and gradual change or development.

More generally, any orderly and gradual process of modification whereby a system, whether physical, chemical, social, or even intellectual, becomes more highly organized.

e. doctrine of. The view that all present day species of plants and animals, including man, have come into existence by gradual, continuous change from earlier pre-existing forms. It considers that life first came into existence as a simple primordial mass of protoplasm from which, through a series of progressive changes, the highly complex, specialized forms of today arose.

e., spontaneous. Spontaneous birth of a child in transverse presentation.

evulsion [“ + *vellere*, to pluck]. 1. Tearing away of a part or new growth. 2. Forceful extraction, as of teeth.

Ewald's test dinner. Chopped meat, 165 Gm., stale bread, 35 Gm., with a small portion of butter. This content is withdrawn in 3 hours. In this test, further action is desired than just 1 hour's effect could produce.

E.'s t. meal. White bread or rolls (no crust), 40 Gm., and water or clear tea, 400 cc. No butter, sugar, milk, or cream taken with this portion. One hour after giving, the contents of the stomach are expressed. Time plays a very important part in the carrying out of the treatment.

ex- [L.] Prefix. Out, away from.

exacerbation (eks'as-er-ba'shun) [L. *ex*, over, + *acerbus*, harsh]. Aggravation of symptoms or increase in the severity of a disease.

exacrinous (eks-ak'rin-us) [G. *ex*, outside, + *kriuein*, to secrete]. Concerning a gland's external secretion.

exaltation. A mental state characterized by feelings of grandeur, excessive joy, elation, and optimism, an abnormal feeling of personal well-being or self-importance.

examination, physical [L. *examinare*, to examine]. The act or process of examining the body and its products as to fitness or for symptoms of a disease.

Local examination includes specific parts and organs. Laboratory examination includes urinalysis, tests, cultures, basal metabolism, etc.

Terms employed indicating type of examination are: physical, bimanual, digital, oral, rectal, O.B. (obstetrical), roentgen, cystoscopic.

e. physical. Examination of the body for detection of symptoms of disease. Four procedures utilized are inspection, palpation, percussion, and auscultation.

exangia (eks-an'ji-ā) [G. *ex*, out, + *ageion*, vessel]. Any dilatation of a blood vessel. *Ex aneurysm, varix.*

exanthem, exanthema (eks-an'them, -an-the'mā) (pl. *exanthema'ta*) [G. *exanthēma*, eruption]. Any eruption of the skin, accompanied by inflammation, e.g., measles, scarlatina, erysipelas, q.v.

exanthematous (eks-an-them'ā-tus) [G. *exanthēma*, eruption]. Pert. to an exanthem, eruption or rash.

exanthrope (eks'an-thrōp) [G. *ex*, out, + *anthrōpos*, man] A cause or source of a disease originating outside the body.

e. dental. The preparation of a cavity in a tooth prior to filling
e. of the optic nerve. A slight depression in the center of the optic papilla or disk from which retinal vessels emerge. It is more pronounced in glaucoma.

e. recto-uterine. The recto-uterine pouch or pouch of Douglas.

exarteritis (eks-ar-ter-'tis) [' + *artēria*, artery, + *itis*, inflammation] Inflammation of the outer coat of an artery.

excarticulation [L. *ex*, out, + *articulus*, joint] Amputation of a limb through a joint.

excavation [' + *cavus*, hollow]. 1. A hollow or depression. 2. Formation of a cavity.

e. of optic nerve. A cupping of the optic disk.

excentric [G. *ex*, out, + *kentron*, center] Away from, efferent.

excerebration (eks-ser-e-bra'shun) [L. *ex*, out, + *cerebrum*, brain] Removal of brain.

excernant (eks-ser'nant) [L. *excernere*, to excrete] Bringing about an evacuation or excretion. SYN. *excretory*.

excipient [L. *excipiens*, from *ex*, out, + *capere*, to take] Any substance added to a medicine to give it form and consistency. SYN. *vehicle*.

excision [L. *excisio*, from *ex*, out, + *caedere*, to cut] An act of cutting away or taking out.

excitability [L. *excitare*, to rouse]. Sensitiveness to being stimulated.

e., independent. Power of a muscle to respond to a stimulus without intervention of motor nerves.

e., reflex. Sensitiveness to reflex irritation.

excitant [L. *excitare*, to rouse] An agent that will excite a special function of the body, subdivided, according to action, as *motor*, *cerebral*, etc. Ex. *alcohol*, *cocaine*, *strychnine*.

excitation [L. *excitare*, to rouse]. 1. The act of exciting. 2. Condition of being stimulated or excited. The entire vasomotor system of nerves is involved.

SYM. (Of sex impulse) Eves prominent, pupils dilated, conjunctiva injected, cardiac palpitation, turgescence of genitalia with erection of penis or clitoris. Sensory stimulation of the genitals causes ejaculation of the semen through the *ductus ejaculatorius* in the male, and of the vaginal glands in the female.

The 3rd and 4th sacral nerves acting upon the *bulbocavernosus* muscles are responsible for ejaculation in the male. In the female, friction of the vaginal membranes incites a series of stimuli to the *thalamus* and from there to the cerebral cortex from which centrifugal impulses are sent to the erection and ejaculation centers of the spinal cord, flowing out to the periphery, causing erection of the clitoris and stimulating circulation to the genitals and the muscles to rhythmic action and causing glandular ejaculation, esp. of the glands of Bartholin.

RS *clitoris*, *copulation*, *cotton*, *cortex*, *ejaculation*, *emission*, *erection*, *penis*, *sexual intercourse*.

e. direct. Stimulation of a muscle with an electrode.

e. indirect. Stimulation of a muscle via its nerve.

e. wave. The wave of irritability originating in the atrioventricular node which sweeps over the conductile tissue of the heart and induces contraction of the atria and ventricles.

exciting [L. *excitare*, to rouse]. Causing excitement.

e. cause. Acting immediately as a cause of disease.

exciteglandular [' + *glands*, *gland-*, kernel] Increasing glandular function.

excitometabol'ic [' + G. *metabolē*, change] Increasing metabolic changes.

excitomo'tor [' + *motor*, moving] Increasing rapidity of muscular activity.

excitomus'cular [' + G. *mys*, muscle]. Causing muscular activity.

excitonu'trient [' + *nutrire*, to nourish]. Stimulating nutrition.

excit'or [L. *excitare*, to rouse] That which incites to greater activity. SYN. *stimulant*.

excitosecre'tory [' + *secretiō*, a hiding]. Tending to bring about secretion.

excitovas'cular [' + *vascularis*, pert. to a vessel] Increasing circulation.

exclave (eks'klāv) [L. *ex*, out, + *clavis*, key] Detached part of an organ.

excochleation (eks-kok-le-a'shun) [' + *cochlea*, spoon] Curettage of a cavity.

excoriation (eks-ko-ri-a'shun) [' + *corium*, skin] Abrasion of the epidermis or of the coating of any organ of the body by trauma, chemicals, burns, or other causes.

excrement (eks'krē-ment) [L. *excernere*, to take away] The feces, excreta, dejecta. SEE *excretion*.

e., menstruum. Menstrual discharge.

excrementitious (eks-kie-men-tish'us) [L. *excernere*, to take away]. Of the nature of excrement.

exrescence (eks-kres'ens) [L. *ex*, out, + *crescere*, to grow] An outgrowth from the surface of a part. RS *crupion*, *macula*, *nodule*.

excre'ta [L. from *excernere*, to take away]. Waste intestinal matter, dejecta, feces. Waste material cast off by the body.

e., disinfection of. CARBOLIC ACID. A 5% solution to be used in quantity at least equal to the amount of the material to be disinfected.

CAUSTIC LIME. In the form of freshly prepared milk lime—this should contain about 1 part by weight of hydrate of lime mixed with 8 parts of water, to be used in an amount equal to that of the excreta to be disinfected.

CHLORIDE OF LIME. Dissolve in the proportion of 4 ounces to 1 gallon of water. One quart of this solution for disinfection of each liquid discharge. For solid fecal matter a stronger solution or a larger quantity of above solution will be required.

It will be prudent to use a large quantity of the standard solution recommended for a copious liquid discharge. With a spatula the formed material should be broken up and covered with chlorinated lime. The container should be set aside and the feces or urine, with the coating of lime, covered with a lid or newspapers. Let the mixture stand for 1 hour, stirring the lime into the contents from time to time, then it may be emptied into the sewer.

CUPRIC SULFATE. Is used as chloride of lime but in a 4% solution.

INVOLUNTARY DISCHARGES. These should be cared for by placing oakum pads under the patient. The pads should be thoroughly wrapped in strong paper after being soiled to prevent scattering.

of the feces. In handling all infected discharges, the nurse should wear rubber gloves.

e., kinds of. (1) Carbon and oxygen. Both given off as carbon dioxide from the lungs. (2) Hydrogen and oxygen. Both forming water and given off as: (a) Vapor from the lungs, (b) perspiration from the skin, (c) in urine from the kidneys. (3) Nitrogen. Given off in urine from the kidneys. (4) Intestinal excreta. (a) Waste mineral matter, (b) foreign matter, (c) unassimilated food material, (d) water and liquids.

excrete (eks-kre't) [L. *excernere*, to separate] To separate and expel useless matter not utilized by the body.

excretin. A crystalline substance found in the feces. A fraction of the hormone, secretin, which stimulates pancreatic secretion.

excretion [L. *excernere*, to separate] 1 Waste matter, excreta. 2 The elimination of waste products from the body.

e., organs of. **INTESTINES.** Indigestible residue, water and bacteria.

KIDNEYS. Filter from the blood water, nitrogenous substances (urea, uric acid, creatin, creatinine) mineral salts.

RESPIRATORY SYSTEM. Carbon dioxide, water vapor, and probably gases.

SKIN. Small amt through perspiration of water, salts, minute quantities of urea. Its excretory function is stimulated by kidney inactively. Diaphoretics, hot packs, and warm blankets stimulate skin and aid kidneys, thus helping to avoid uremic coma.

excretion, words pert. to: acatastasia, acathetic, acathetic, acoprosis, acrimia, allochemia, apocrosis, apoplepsia, chologagia, cholestasia, defecation, dejecta, elimination, emunctory, excrement, excreta, excretion, feces, hydragogue, ichor, incontinence, lung, perspiration, pore, respiration, sanies, semen, skin, sputum, sweat, urination, urine, void.

excretory [L. *excernere*, to separate]. Pert. to or bringing about excretion.

excursion [L. *ex*, out, + *currere*, to run] 1 Wandering from the usual course. 2 Extent of movement of the eyes from a central position.

excursion [L. + *curvus*, bend] A curvature outward. **SYN.** *kyphosis*.

excystation (eks'sis-ta'shun) [G. *ex*, out, + *kystis*, cyst] Pertaining esp. to the escape of certain organisms (parasitic worms, protozoa) from an enclosing cyst wall or envelope. Process which occurs in the life cycle of an intestinal parasite after encysted form is ingested.

exemia (eks-e'mi-ä) [L. + *aima*, blood] Loss of blood from circulation, though accumulation in a part.

exencephalia (eks-en-sef-a'l'i-ä) A term for *encephalocele*, *hydrecephalocele*, *meningocele*, and *synencephalocele*.

exenteration (eks-en-ter-a'shun) [L. + *enteron*, intestine] 1. Evisceration. 2. Removal of viscera of fetus in embryotomy.

exercise [L. *exercitatio*, training the body]. Functional activity of the muscles, voluntary or otherwise.

e., active. A form of bodily movement which the patient performs with or without the personal supervision of the operator.

e., assistive. A form of bodily movement which the patient performs assisted by the operator or some mechanical means such as a pulley or weight.

e., blowing. One in which water is blown from 1 bottle to another, thus increasing intrabronchial pressure which tends to aid in expansion of the lung. It is by this means that an empyema cavity is obliterated.

e., Burger's postural (bur'gers). Used for circulatory disturbances of the extremities.

e., Brandt's. Exercises for pelvic lesions. Fallen into disuse due to the attendant dangers.

e., crawling. Devised for treatment of scoliosis,* essentially for children.

e., free. Form of bodily movement which is carried through by patient against least possible resistance.

e., Frenkel's. Used to teach tabetics to walk.

e., Krida knee. In intertrochanteric fractures of femur, remove post half of plaster cast from the knee to the toes, anterior portion of leg cast remains attached to spica, and maintains position of hip. When patient is face down, this permits knee to be flexed and extended and ankle exercised.

e., Lewin circulatory. Passive exercise for leg for circulatory disturbance of extremity. (1) Patient lying supine, limb is elevated 60° allowed to rest on support 30 seconds to 3 minutes. (2) Leg is then lowered to hang over side of bed 2-5 minutes. (3) Limb is then placed horizontal and heat applied 3-5 minutes.

e., Master's. Ascending and descending 2 steps a variable number of times. Used as a tolerance test for circulatory efficiency and as an exercise in heart disease.

e., Mosher's. For dysmenorrhea. Lie on back on floor with knees bent, feet on floor. Raise abdomen, relax it, contract it forcibly and relax. Repeat 10 times.

e., passive. Form of bodily movement which is carried through by the operator without the assistance or resistance of the patient. Same as relaxed movement.

e., resistive. Form of supervised bodily movement, with or without apparatus, which offers resistance to muscle action.

e., rhythm. Used in obstetrical paralysis. Exercise to song or music.

e., Schott's. Named after the Dr. Schott of Nauheim, who first scientifically administered Nauheim baths. It consists of slowly and evenly executed exercises with slight resistance, for cardiac diseases.

e., sling suspension. Method of supporting arm or leg to be exercised in a sling suspended from overhead, thus eliminating the weight of the extremity as a hindrance during movement.

e., static. Alternate contraction and relaxation of a muscle or group of muscles without movement of the joint. Also known as muscle setting.

e., Stokes-Derfel (er'tel). For arteriosclerosis. A system in which walking and hill climbing are combined with restrictions of fluids.

e., therapeutic. Scientific supervision of bodily movement, with or without apparatus, for purpose of restoring normal function to diseased or injured tissues.

e., water. Hydrogymnastics.

exercise bone. Bony growth developing in a muscle due to overexercise.

exeresis (eks-er'es-is) [G. *ex*, out, + *eiresis*, taking] Excision of any part.

exfetation (eks-fe-ta'shun) [L. *ex*, out, + *foetus*, fetus]. Ectopic gestation.

exflagella'tion [' + *flagellum*, a switch]. The formation of microgametes (flagellated bodies) from the microgametocytes. Occurs in the malarial organism (*Plasmodium*) in the stomach of a mosquito

exfolia'tion [' + *folium*, leaf]. The scaling off of dead tissue. RS *apostasis*.

exhala'tion [' + *halare*, to breathe]. The process of breathing outward, the opposite of inhalation, emanation of a gas or vapor

exhaus'ter [' + *haurire*, to drain]. A cathartic evacuator for removal of loosened or fluid matter by vacuum pressure through a hollow needle

exhaus'tion [' + *haurire* to drain] 1 State of being exhausted, extreme fatigue, or weariness, loss of vital powers, inability to respond to stimuli. 2 Process of removing the contents of or using up, exhaustion of anything. 3 To draw or let out

e. heat. Heat prostration, a condition resulting from exposure to high temperatures. Characterized by drowsy state of mind, rapid breathing, paleness, cold, sweaty skin, and normal or below normal temperature

exhib'it [L *exhibere*, to display] 1 To show 2 To administer a drug 3 Collection of objects for public inspection

exhib'itionism [L *exhibere*, to display, + G *istos*, condition] 1 An abnormal impulse that causes one to expose the genitals to one of the opposite sex, seen in paretic and senile dementia, epilepsy, and other mental defects 2 Tendency to attract attention in other ways

exhibitionist (eks-i-'bi-shun-ist) [L *exhibere*, to display] 1 One with an abnormal desire to attract attention 2 One who yields to an impulse to expose the genitals to the view of one of the opposite sex

exhilarant (eks-il-'ā-rānt) [L *exhilarē*, to gladden] That which is mentally stimulating

exhuma'tion [L *ex* out, + *humus*, earth] Disinterment of a corpse

Ex'ner's nerve. One from the pharyngeal plexus to the cricoid thyroid membranes

E. plexus. A plexus of nerve fibers forming a layer near the surface of the cerebral cortex

exo- [G]. Prefix Without, outside of

exocar'dia [G *exō*, out, + *kardia*, heart]. Congenitally abnormal position of the heart

exocar'dial [' + *kardia* heart] Occurring outside of the heart

exocataphoria (eks-o-kat-'ā-for-'ā) [' + *kata*, down, + *pherein*, to bear] A downward and outward turning of the visual axes

exocoli'tis [' + *kōlon*, colon, + *itis*, inflammation] Inflammation of the peritoneal coat of the colon

exocrine (eks'o-'krēn) [' + *krinein*, to separate] 1. The external secretion of a gland, opp of endocrine 2 Term applied to glands whose secretion reaches an epithelial surface either directly or through a duct

exocystis (eks-o-'sist-'is) [' + *kystis*, bladder]. Prolapse of the urinary bladder.

exodic (eks-od-'ik) [' + *odos*, way] Efferent, centrifugal Transmitting impressions outward from the central nervous system

exodontia (eks-o-'don-'sh-'ā) [' + *odous*, odont-, tooth] 1. Extraction of a tooth. 2. Protrusion of teeth forward

exodontol'ogy [' + " + *logos*, science]. Branch of dentistry concerned with extraction of teeth.

exoen'zyme [' + *en*, in, + *zymē*, leaven] One that does not function within the cells from which it is secreted

exogamy (eks-og-'am-i) [' + *gamos*, marriage] 1 Marriage outside of same family, outbreeding 2 Biol. Conjugation bet gametes of different ancestry, as in some protozoans SFE *heterosexuality*

exogastr'i'tis [' + *gastēr*, belly, + *itis*, inflammation] Inflammation of the peritoneal coat of stomach

exogenous (eks-og-'en-us) [' + *gennan*, to produce]. Originating outside of an organ or part

exohemophylaxis (eks'o-'hem-'o-'fi-laks-'is) [' + *ama*, blood, + *phylaxis*, protection] Injection of one's own blood mingled with arsphenamine

exohysteropexy (eks-o-'his-ter-'o-'peks-'sī) [' + *ysterā*, uterus, + *pēxis* fixation]. Fixation of the uterus by implanting the fundus into the abdominal wall

exometritis (eks-o-'me-'tri-'tis) [' + *mētra*, womb, + *itis* inflammation] Inflammation of the peritoneal coat of the uterus.

exomphalos (eks-om-'fā-'los) [G *ex* out, + *omphalos*, navel] 1 Umbilical protrusion 2 Umbilical hernia SYN *exumbilication*

exopathic [G *exō*, out, + *pathos*, disease] Pert to a disease originating outside of the body

exophoria (eks-o-'fo-'ri-'ā) [' + *pherein*, to bear] Τенденция of visual axes to diverge outward SEE *esophoria*.

exophthal'mia [G *ex* out, + *ophthalmos*, eye] Abnormal protrusion of the eyeball SYN *exophthalmos*

e. cachectica. Exophthalmic goiter
e. fungosa. Late stage of glioma retinae

exophthalmic (eks-of-'thal-'mik) [' + *ophthalmos*, eye]. Pert to protrusion of the eyeball

e. goiter. A goiter marked by protrusion of the eyeballs, increased heart action, and enlargement of the thyroid gland Grave's disease

exophthal'mos, **exophthal'mus** [' + *ophthalmos*, eye] Abnormal protrusion of eyeball May be due to thyrotoxicosis, tumor of the orbit, orbital cellulitis, leukemia, or aneurysm

e. pulsating. E accompanied by pulsation and bruit due to an aneurysm behind the eye

exophylac'tic [G *exō*, out, + *phylaxis*, guarding] Pert to exophylaxis

ex'ophylaxis [' + *phylaxis*, guarding]. Protection from disease originating outside the body, as by the skin

ex'oplasm [' + *plasma*, matter] Outer protoplasm of a cell SYN *ectoplasm*.

exorbitism (eks-or-'bi-'tizm) [L *ex*, out, + *orbita*, eye]. Protrusion of eyeball. SYN: *exophthalmos*.

exormia (eks-or-'mī-'ā) [G. *ex*, out, + *ormē*, rash]. Any papular skin disease.

exosep'sis [G *exō*, out, + *sepsis*, decay]. Septic poison of external origin.

exoserosis (eks-o-'ser-'o-'sis) [L *ex*, out, + *serum*, whey, + G *ōsis*]. An oozing of serum or discharging of an exudate

exoskel'eton [G. *exō*, out, + *skeleton*, skeleton] 1 The hard outer covering of certain invertebrates such as the molluscs and arthropods Composed of chitin or calcareous material or both 2 In vertebrates, the hard outer covering such as the shell of a turtle, or more specifically, the hard parts of the body surface derived principally from the ectoderm. These include such

- structures as hair, nails, feathers, scales, etc.
- exosmo'sis** [G *ex*, out, + *ōsmos*, a thrusting, + *ōsis*]. Diffusion of a fluid from within outward, as from a blood vessel.
- exosplenopexy** (eks-o-splē'no-peks-i) [G. *exō*, out, + *splēn*, spleen, + *pēxis*, fixation]. Suturing the spleen to opening in the abdominal wall
- exostosis** (eks-os-tō'sis) [G *ex*, out, + *osteon*, bone] A bony growth which arises from the surface of a bone, often times involving the ossification of muscular attachments
- e. bursalis**. An *e* arising from the epiphysis of a bone and covered with cartilage and a synovial sac
- e. cartilaginea**. *E* consisting of cartilage underlying the periosteum
- e. dental**. *E* on the root of a tooth
- e. multiple osteocartilaginous**. *SYN* hereditary deforming chondroplasia, dyschondroplasia, diaphyseal aclasis
- A disorder of growth characterized by the development of multiple exostoses, usually located on the diaphyses of long bones near the epiphyseal lines. Results in irregularities of growth of the epiphyses and often times secondary deformities
- ETIOLOGY* Unknown, tends to be hereditary occurring more frequently in males than females
- exother'ic** [G *exoterikos*, outer] Pert to causes developing outside the body. *SYN* *exopathic*.
- exother'mal, exother'mic** [G *exō*, out, + *thermē*, heat] Chemical reaction with production of heat
- exothy'mopexy** [' + *thymos*, thymus, + *pēxis*, fixation] Suturing of an enlarged thymus gland to the sternum
- exothy'reopexy** (eks-o-thī're-o-peks-i) [' + *thyreos*, shield + *pēxis*, fixation]. Suture of the thyroid and external fixation to induce atrophy
- exothy'ropexy** [' + " + *pēxis*, fixation]. Suture of the thyroid and external fixation to induce atrophy. *SYN* *exothy'reopexy*.
- exotoxin** (eks-o-toks'in) [' + *toxikon*, poison] A toxin produced by a micro-organism and excreted into its surrounding medium. It can usually be recovered from the liquid medium in which the toxin-producing organisms have developed. Exotoxins are usually unstable being sensitive to the effects of chemicals, light, and heat. Exotoxins are produced by the diphtheria and tetanus organisms
- The exotoxins differ with regard to the particular tissues of the host that may be affected.
- RS* cytotoxin, endotoxin, erythrotorin, leukocidin, leukotoxin, neurotoxin.
- exotrop'ia** [' + *tropē*, a turning]. Divergent strabismus, abnormal turning of one or both eyes outward
- expansion** (eks-pan'shun) [L *expandere*, to spread out]. Increase of volume, spreading out.
- e., coefficient of**. Increase in length or in volume when temperature is raised 1° C. from zero
- e. muscle**. Degree a muscle may be stretched by an attached weight.
- expansive delusion**. Belief in one's power and wealth, accompanied by a feeling of well-being.
- expectant** [L. *ex*, out, + *spectāre*, to watch]. Waiting.
- e. treatment**. Treatment of symptoms as they arise.
- expectation**. Hoping, anticipation.

- e. of life**. Probable duration of life after a given age
- expectorant** [L. *ex*, out, + *pectus*, pector-, breast] An agent that facilitates the removal of the secretions of the bronchopulmonary mucous membrane
- Expectorants are sometimes classed as *sedative* expectorants and *stimulating* expectorants.
- Ex* Ammonium carbonate, ammonium chloride, *ipecac*.
- expectoration** (eks-pek'to-ra'shun) [' + *pectus*, pector-, breast] Expulsion of mucus or phlegm from the throat or lungs
- May be mucous, mucopurulent, serous, or frothy
- It is viscid and tenacious in pneumonia, sticks to anything, and is rusty in appearance. It is frothy, often streaked with blood, and greenish-yellow in character from pus in bronchitis. In tuberculosis it varies from small amt of frothy fluid to abundant greenish-yellow, offensive sputum often streaked with blood
- See* *anabole*, *anacatharsis*, *apophlegmatic*, *sputum*, *tonica*
- expel** [L *expellere*, to drive out]. To drive out
- expira'tion** [L *ex*, out, + *spirāre*, to breathe] The expulsion of air from the lungs in breathing. Its sound is the shortest breath sound heard
- Any longer sound will be pathological. In emphysema it is longer than the inspiration
- Muscles used in expiration are the *int* intercostal muscles, *m* rectus abdominis, *m* transversus abdominis, the *triangularis sterni* and possibly the *diaphragm*, *serratus post inf.*, and *quadratus lumborum*. *See* *inspiration*, *respiration*.
- e. active**. Expiration accomplished as a result of muscular activity, as in forced respiration. The muscles used in respiration are the muscles of the abdominal wall (*ext* and *int* oblique, *rectus*, and *transverse abdominis*), the *internal intercostals*, *serratus posticus inferior*, and *quadratus lumborum*
- e. passive**. *E* during quiet respiration in which no muscular effort is required. It is brought about by the elasticity of the lung, recoil of the elastic tissues of the chest, such as the costal cartilages, and the weight of the thoracic wall
- expiratory** (eks-pī'rā-tor-i) [' + *spirāre*, to breathe] Pert to expiration.
- e. center**. The part of the respiratory center in the medulla controlling *e* movements
- expire**. 1. to breathe out or exhale. 2. To die
- explant'** [' + *planta*, sprout] To remove a piece of living tissue from the body and transfer to an artificial culture medium for growth as in tissue culture. *Opp* of *implantation*, *qv*
- explora'tion** [L. *explorāre*, to search out]. Examination by various means of an organ or part.
- explo'ratory** [L. *explorāre*, to search out]. Pert to an exploration.
- explosive speech**. Sudden and explosive utterance. *See* *speech*.
- express'** [L. *expressus*, from *exprimere*, to press out]. To squeeze out.
- expres'sion** [L. *expressus*, from *exprimere*, to press out] 1. Expelling anything by pressure. 2. Facial disclosure of feeling or emotion. *SYN* *facies*. *See*: *face*.

expulsive [L *ex*, out, + *pellere*, to drive]. Having a tendency to expel

e. pains. Labor pains which are effective, contracting the uterine muscle.

exsanguinate (eks-sang'win-ât) [" + *sanguis*, blood] 1. To deprive of blood. 2. Bloodless

exsanguination (eks-san-gwin-a'shun) [" + *sanguis*, blood]. The process of expressing blood from a part

exsanguine (ek-sang'win) [" + *sanguis*, blood] Anemic, bloodless

excision [" + *secare*, to cut] Excision.

exsiccant (ek-sik'ant) [" + *siccare*, to dry] 1 Absorbing or drying up a discharge. 2 An agent that absorbs moisture. 3 A dusting or drying powder

exsiccation [" + *siccare*, to dry] The act of drying by heat *SYN* desiccation.

exsiccative [" + *siccare*, to dry]. Causing to dry up or that which dries *SYN*: desiccative.

exsomatize [G *ex*, out, + *sôma*, body]. To remove from the body

extrophy (eks'strof-i) [" + *strephein*, to turn] Eversion, turning inside out of a part

e. of the bladder. A congenital malformation in which the lower portion of the abdominal wall and anterior wall of the bladder are lacking and the bladder is everted through the opening; *ectopia vesicae*

ext. Abbr. of *L. extractum*, extract

extemporaneous [L *extemporaneus*, without time] Not prepared according to formula but devised for the occasion

e. mixture. A preparation to be taken at once because of tendency to deteriorate

extension (eks-ten'shun) [L *extendere*, to stretch out] 1 The movement by which the 2 ends of any part are pulled asunder. A movement which brings the members of a limb into or toward a straight condition. 2 The opposite of flexion. 3 The application of a pull (traction) to a fractured or dislocated limb

e., Buck's. A method of producing traction by applying adhesive tape or moleskin to the skin and keeping it in smooth close contact by means of circular bandaging of the part to which it is applied. The adhesive strips are placed longitudinal to the member, the superior ends being about 1 in. from fracture site. Weights sufficient to produce the required extension are fastened to the inferior end of the adhesive strips, by means of a rope which is run over a pulley to permit of free motion.

extensor [L *extendere*, to stretch out]. A muscle that extends a part

exterior [L] Outside of; external.

exteriorize. 1 In surg to temporarily expose a part, marsupialization, *q.v.* 2 In Psych the process of turning one's interests outward

extern(e) (ek'sturn) [L *externus*, outside]. A recently advanced medical student living outside of a hospital who assists in the medical and surgical care of patients. *SEE intern*.

external [L *externus*, outside]. Exterior; lateral; opp of medial or internal.

externa'lia [L *externus*, outside]. External genitalia

exteroceptive (eks'ter-o-sept'iv) [" + *ceptus*, from *capere*, to take]. Pert. to end organs receiving impressions from without

exteroceptor (eks-ter-o-sep'tor) [" + *ceptus*, from *capere*, to take]. A sense

organ adapted for the reception of stimuli from outside the body. *Ex* The eye

exteroceptive [" + *facere*, to make]. Pertaining to responses to stimuli mediated by the central nervous system and somatic nerves in contrast to those mediated through the autonomic nervous system

extima [L outermost]. The outer layer of a blood vessel, the tunica adventitia

extinction. 1 The process of extinguishing or putting out. 2 The complete inhibition of a conditioned reflex as a result of failure to reinforce it

e. of mercury. Causing the disappearance of mercury by rubbing with lard or some other agent

extirpation (eks-tir-pa'shun) [L *extirpare*, to root out]. Excision of a part—taking out by the roots

extorsion [L *ex*, out, + *torquere*, to twist]. Rotation of an organ or limb, outward.

extra- [L] Prefix Outside of, in addition to

extraarticular [L *extra*, outside, + *articulus*, joint] Outside a joint

extract [L *extractum*, from *extrahere*, to draw out] 1 A solid or semisolid preparation made by extracting the solubles with water or alcohol and evaporating the solution. 2 Active principle of a drug obtained by distillation or chemical processes

e., alcoholic. One in which alcohol acts as the solvent

e., aqueous. One in which water is the solvent

e., aromatic fluid. E made from an aromatic powder

e., compound. E prepared from more than 1 drug

e., ethereal. E using ether as the menstruum

e., fluid. One made into a solution from a vegetable drug, which contains medicinal components

e., powdered. A crushed, dried extract.

e., soft. E of the consistency of honey.

e., solid. E made by evaporating the fluid part of a solution.

extraction [L *extractum*, a drawing out]. 1 Pulling out, as a tooth. 2 The removing of the active portion of a drug.

extractor [L *extractum*, a drawing out]. Instrument for removing foreign bodies.

VARIETIES Esophageal, throat, shot, tympanum, tissue, etc.

e., tissue. Needles, trocars or pointed instruments with a form of barb for extracting soft tissue for examination.

e., tube. Device for removing an intubation tube from trachea.

extractum (ext.) [L a drawing out]. Solid or semi-solid preparations produced by evaporating solutions of vegetable principles

The official extracts are either powders or soft solids. The majority can be obtained in powdered form and many prefer them that way. Extracts are usually about 5 times the strength of the crude drug. Fourteen are official.

extracystic [L *extra*, beyond, + *G. kystis*, bladder] Outside of or unrelated to a bladder or cystic tumor.

extradural [" + *durus*, hard]. 1. On outer side of the dura mater. 2. Unconnected with the dura mater.

extragenital (eks-trâ-jen'tal) [" + *genitalis*, genital]. Outside of or unrelated to the genital organs.

extrahepatic [' + G. *ēpar*, *ēpat*-liver]. Outside of or unrelated to the liver.

extraligamentous [' + *ligāre*, to bind]. Outside of or unrelated to a ligament.

extramalleolus [' + *malleolus*, little hammer]. The external or lateral malleolus.

extramarginal [' + *margō*, margin]. Pert. to subliminal consciousness.

extramastoiditis (eks-trā-mas-toy-dī'tis) [' + G. *mastos*, breast, + *eidos*, form, + *-itis*, inflammation]. Inflammation of outside tissues contiguous to the mastoid process.

extramedullary [' + *medulla*, marrow]. Outside or unrelated to any medulla, esp the m oblongata.

extraneous (eks-tra'ne-us) [L. *extraneus*, external]. Outside and unrelated to an organism.

extranuclear [L. *extra*, beyond, + *nucleus*, kernel]. Outside of a nucleus.

extrapolar [' + *polus*, pole]. Outside instead of bet poles, as the electrodes of a battery.

extrasensory. Pertaining to forms of perception not dependent upon the five primary senses, e g. thought transference. Abb Esp.

extrasystole [' + G. *systellēin*, to contract]. Premature contraction of one of the parts of the heart, which may be induced experimentally by stimulating the heart at any time except during the absolute refractory period. In humans it is the result of some factor that initiates an impulse in the impulse-conducting system. It may occur either in the presence or absence of organic heart disease. It may be of reflex origin being initiated by stimuli from almost any part of the body or it may be of central origin. It usually results in abnormal heart rhythm.

e. auricular. Premature contraction of the atrium at some point outside the S-A node.

e. nodal. E occurring as a result of the origin of an impulse in the A-V node.

e. ventricular. E, which occurs after the normal contraction of the ventricle has ceased. Usually followed by a long "compensatory pause."

extrauterine [' + *uterus*, womb]. Outside the uterus.

extravaginal [' + *vagina*, vagina]. Outside the vagina.

extravasate (ek-strav'a-sāt) [' + *vas*, vessel]. 1 To escape from a vessel into the tissues, said of serum, blood, or lymph. 2 Exudate so escaping.

extravasation (eks-tra-va-sa'shun) [' + *vas*, vessel]. The escape of fluids into the surrounding tissue.

extravasacular [' + *vasculum*, vessel]. Outside a vessel.

extraventricular [' + *ventriculus*, little belly]. Outside of any ventricle, esp. one of the heart.

extremital [L. *extremus*, last]. Pert to an extremity. Syn *distal*.

extremity [L. *extremus*, last]. 1 The terminal part of anything. 2 An arm or leg. RS: *acanthokeratoderma*, "acro-" words, *dactyl*, *dactylus*.

e. lower. The lower limb, including the hip, thigh, leg, ankle, and foot.

e. upper. The upper limb, including the shoulder, arm, forearm, wrist and hand.

extrinsic [L. *extrinsecus*, from *extra*, outside, + *secus*, otherwise]. From or coming from without.

e. muscles. Those partly attached to the trunk and partly to a limb.

extroversion (ek-stro-ver'shun) [L. *extra*, out, + *vertere*, to turn]. 1 Eversion; turning inside out. 2 Psy. The direction of energy to objects in the environment.

extrovert [' + *vertere*, to turn]. A personality-reaction type, one who is interested mainly in ext. objects and actions.

The extreme pathologic extrovert reaction is seen in manic depressive insanity. Opp *introvert*, q v.

extrude (eks-tūd') [L. *extrudere*, to squeeze out]. To push out of a normal position or situation.

extrusion [L. *extrudere*, to squeeze out]. 1 Occupying an abnormal external position. 2 Position of a tooth pushed forward from line of occlusion.

extubation (eks-tu-ba'shun) [L. *ex*, out, + *tuba*, tube]. Removal of a tube, as the laryngeal tube.

exudate (eks-u-dāt) [' + *sudāre*, to sweat]. 1 Accumulation of a fluid in a cavity, or matter that penetrates through vessel walls into adjoining tissue, or the passing out of pus or serum, or the matter so passed.

They may be classified as *catarrhal*, *fibrinous*, *hemorrhagic*, *diphtheritic*, *purulent*, and *serous*, the fluids being different in various affections. A fibrinous exudate may wall off a cavity, resulting in adhesions following an operation, as in empyema* and appendicitis. Inflammatory processes tend to wall off the injured area to localize the inflammation and to prevent its spread. 2 An inflammatory product withdrawn through a membrane for exploratory purposes. See *exudation*, *infection*, *inflammation*, *pus*, *resorption*.

exudation [' + *sudāre*, to sweat]. Morbid oozing of fluids, usually the result of inflammatory conditions. See *ant. choroiditis*, *central choroiditis*, *exudate*, *exudative choroiditis*.

exudative [' + *sudāre*, to sweat]. Having the property of exudation.

exude [' + *sudāre*, to sweat]. To pass off slowly through the tissues, said of a semisolid or fluid.

exumbilical [' + *umbilicus*, navel]. Protrusion of navel. Syn *exomphalos*.

exuviae (eks-u-vī-e) [L. *exuere*, to strip]. Cast-off parts, as desquamated epidermis, a slough.

eye [AS *fēgel*]. Organ of vision; composed of 3 coats (a) *Retina*, sensory for light, (b) *uvea* (choroid, ciliary body, and iris), nutritional, (c) *sclera* and *cornea*, serve to protect delicate retina.

These layers enclose two cavities, the more anterior or *ocular chamber* being the space lying in front of the lens. It is divided by the *iris* into an *anterior chamber* and a *posterior chamber*, both of which are filled with a watery *aqueous humor*. The cavity behind the lens is much larger and filled with a jelly-like *vitreous body*. The lens is suspended behind the iris by the ciliary zonule. Anteriorly, the *cornea* is covered by the *conjunctiva* which continues and forms the inner layer of the eyelids.

e. aphacia (a-fas-i-a). An eye from which the crystalline lens has been removed.

e. black. Ecchymosis of the tissues surrounding the eye.

e. closure reflex. Contraction of orbicularis palpebrarum with closure of lids resulting from percussion above supraorbital nerve.

e., cold compresses: PURPOSE: (a) To relieve congestion of eyelids; (b) to

control intraocular hemorrhage; (c) occasionally for conjunctivitis and early lid injuries to prevent hemorrhage into tissues.

PROCEDURES. Scrub hands (a) Wring compresses out of boric acid solution with forceps and place on ice to chill; (b) place over lids and extend over cheek, (c) change every 30 seconds.

THE EYE

1 Optic nerve 2 Ciliary part of retina 3 Ciliary zonule. 4. Iris 5. Capsule of lens 6 Cornea 7 Anterior chamber 8 Posterior chamber. 9 Suspensory ligament of lens 10. Ciliary muscle 11 Anterior ciliary arteries 12 Vena vorticosae 13 Vitreous 14 Hyaloid canal. 15 Sclera. 16 Choroid. 17 Retina.

Each compress may be used over and over if there is no pus. When pus is present, may be used only once.

e. cross. Strabismus, q.v.

e. dark adapted. An eye which has become adjusted for viewing objects in dim light, one adapted for scotopic or rod vision. Depends upon the regeneration of a light sensitive substance, visual purple.

e. dominant. The eye which a person unconsciously gives preference to as a source of stimuli for visual sensations.

e., examinations and diagnosis. The diagnosis of disease which the physician makes from an examination depends largely upon symptoms manifested by the pupils of the eyes.

CONTRACTED PUPILS: They may denote irritative lesions of the 3rd nerve (in early stages of anesthesia from chloroform, or during alcoholic excitement) or they may result from opium poisoning. Contraction of one pupil indicates irritative lesion of the opposite side of the brain, situated at the 3rd nerve nuclei, or a paralysis of the sympathetic nerve fibers due to a lesion somewhere in their course.

DILATED PUPILS They may result from belladonna or atropine or from irri-

tating of the sympathetic, or they may occur during the attacks of dyspnea, in the last stages of anesthesia. Dilation of one pupil indicates a paralysis of the 3rd nerve from some brain lesion, or an irritation of the cervical sympathetic.

FLOATING SPECKS: They may indicate the want of transparency in the humors of the eye, or they may be due to some form of dyspepsia, migraine, excessive eye-strain, or severe falls.

SQUINTING: In the course of a brain disease, this is an unfavorable symptom.

e. exciting. In sympathetic ophthalmia, the damaged eye which is the source of sympathogenic influences.

e. fixing. In strabismus, the eye that is directed toward the object of vision.

e., foreign body in. Manifested by pain, lacrimation, spasm of the eye; later there is redness, swelling and occasionally headache.

F. A TREATMENT: Tearing itself often washes dust from the eye. Bringing the upper lid over the lower and directing patient to roll eye, often deposits dust on the margin of the lower lid.

Great care is necessary in removing larger particles, and should be done in a quiet place with excellent illumination. Follow by instillation of 1 or 2 drops of a bland oil into the eye. A mild antiseptic, as 5%-10% mild silver proteinate, is desirable. If inflamed, use repeated hot compresses.

If for any reason patient cannot be taken care of at once, the eye should be bandaged to keep it closed and thus avoid scratching the lid. There should be no delay in having the speck removed, as serious injury to the eyeball or to the vision may result. The longer the foreign body remains in the eye the deeper it becomes embedded.

Infection may be carried into the eye, resulting in an ulcer of the cornea. Metal produces a chemical effect, as it disintegrates, which affects the eyeball. The x-ray is sometimes used to detect any tiny particles of metal, and the electromagnet to remove them. Sympathetic ophthalmia,* the transference of inflammation from an injury to the normal eye, may be produced by wounds which pierce the eyeball. Loss of vision in both eyes may result.

e. hare's. Lagophthalmos; condition in which the eye cannot be completely closed.

e., hot compresses: PURPOSE: (a) To increase the blood supply to the eyelids and eyeballs, (b) to relieve pain.

PROCEDURES: Scrub hands (a) Apply vaseline to area to which compresses are to be applied, (b) wring compresses dry with forceps and test on wrist and apply as hot as patient can tolerate, (c) to increase blood supply to eyelids, place compresses over lids and extend over cheek, to increase blood supply to eyeballs, place compresses over lids and extend over brow; (d) use new compresses for each application if pus is present, (e) when last compress is removed, dry the eyelid.

e. light adapted. An eye that has become adjusted to viewing objects in bright light, one adapted for photopic or cone vision. One in which visual purple has been bleached.

e. muscles. Movements of the eye ball are brought about by six muscles the superior, inferior, medial and external rectus muscles and the superior and inferior oblique muscles.

e. nerve supply of. 2nd. or optic nerve; *eye muscles*, 3rd or oculomotor, 4th or trochlear, and 6th. or abducens, *lid muscles*, facial to orbicularis oculi and oculomotor to levator palpebrae. Sensory fibers to orbit furnished by ophthalmic and maxillary fibers of the 5th or trigeminal. Sympathetic post-ganglionic fibers are derived from the carotid plexus, their cell bodies lying in the superior cervical ganglion. They supply the dilator muscle of the iris, lacrimal gland, and smooth muscle fibers in the eyelid, parasympathetic fibers from the ciliary ganglion pass to the ciliary muscle and constrictor muscles of the iris.

e. pink. Acute epidemic conjunctivitis.

e. refracting media of. Aqueous humor, lens, and vitreous body.

e. refracting surfaces of. Cornea and anterior and post surfaces of the lens.

e. squint. Strabismus, *q.v.*

e. squinting. The eye affected in strabismus.

e. sympathizing. In sympathetic ophthalmia, the uninjured eye which responds to sympathogenic influences.

e. vision. Light entering the eye passes through the cornea, then through the *pupil*, an opening in the iris, and on through the crystalline lens and the vitreous body to the retina. The aqueous humor, lens and vitreous body constitute the refracting media of the eye. Through changes in the curvature of the lens brought about by its elasticity and contraction of the ciliary muscles, light rays are focused on the retina where they stimulate the rods and cones, the sensory receptors. The cones are concerned with color vision, rods with vision in dim light. Sensory impulses are conveyed over the optic nerve to the brain where, in the visual area of the cerebral cortex located in the occipital lobe, they register as visual sensations. The amount of light entering the eye is regulated by the pupil, its size being controlled by the dilator and constrictor muscles of the iris.

e. watery. Epiphora; abnormal secretion of tears.

eyeball [A.S. *ēage* + M. E. *bal*]. The body of the eye.

It has 3 humors: Aqueous, lens or crystalline, and vitreous. Tension and position in relation to orbit should be noted.

PATH. *Exophthalmos*, or protrusion. If bilateral may be due to goiter. Eyeball may appear to protrude in fright, asthma, and spasmodic croup. It is noted in thrombosis of sup. longitudinal sinus, cardiac atrophy, laryngeal stenosis and paralysis of ocular movements. One or both may be affected due to hemorrhage in orbit, to aneurysm, exostosis, or tumor of orbit, or enlarged lacrimal glands. *Enophthalmos*: Bilateral or unilateral recession of eyeball.

THE EYEBALL

1. Nerve sheath 2. Sclerotic coat. 3. Choroid coat 4. Retina 5. Ciliary body 6. Posterior chamber. 7. Cornea 8. Crystalline lens. 9. Anterior chamber 10. Iris 11. Sinus venosus sclerae 12. Ciliary processes. 13. Spatia zonularia. 14. M. rectus medialis 15. Canal for central artery. 16. Optic nerve.

eye/brow [A.S. *ēage*, eye, + *braew*, brow]. The arch over the eye, also its covering, esp. the hairs.

eye/cup. 1. The optic vesicle, evagination of the embryonic brain from which the retina develops. 2. A small cup which fits over the eye and used for bathing the surface of the eye.

eye/glass. A glass lens used to aid the defective eye in seeing.

eye/ground [A.S. *ēage* + *grund*, earth]. Fundus of eye, seen with ophthalmoscope.

eye/lash [" + *lasche*, a thin whip]. Cillum. A stiff hair on the margin of the eyelid. *Syn. capsulociliary, "cili-" words, phalangosia, trichiasis.*

eye/lid (palpebra) [" + *hlidan*, to cover]. One of two movable protective folds which when closed, cover the anterior surface of the eyeball. They are separated by the *palpebral fissure*. The upper (palpebrae superior) is the larger and more movable. It is raised by contraction of the levator palpebrae superioris muscle. Angles formed by the lids at inner and outer ends are known as the *canthi*. The *cilia*, or eyelashes, are attached. The post. surface is lined by the *conjunctiva*, a mucous membrane.

e. drooping. Ptosis.

e. fused. A congenital anomaly resulting from failure of the fetal eyelids to separate.

eyestrain. Tiredness of the eye due to overuse or uncorrected defect. *Syn: asthenopia.*

eyetooth. A cuspid or upper canine tooth.

eye worm, African. *Loa Loa*, a genus of nematode which frequently infests the eye.

F

F. 1. Abbr. of *Fahrenheit*, field of vision, formula, *Fusiformis*. 2 Symbol for fluorine.

F₁ In genetics the first filial generation, the offspring of a cross between two unlike individuals

F₂ The second filial generation or the offspring of a cross between two individuals of the F₁ generation

FA. Abbr for fatty acid.

F. A. Abbr for field ambulance

F. and R. Abbr for force and rhythm.

fabel'la [L little bean] Fibrocartilages or bones which sometimes develop in the head of the gastrocnemius muscle

fabrication (fab-ri-ka'shun) [L *fabricare*, to forge]. Recital of that which is not true, seen in Korsakow's syndrome

F. A. C. D. Abbr Fellow of the American College of Dentists.

face [L *facies*] Anterior part of the head from forehead to chin and ex-

tending laterally to but not including the ears, the visage or countenance

ANAT Arteries of Face and Head: Left common carotid with ext and int. branches Right common carotid with ext and int. branches and circle of Willis **Bones of The face** has 14 bones SEE *skeleton Veins of Face and Neck* Ext and int jugular

COLORING Brownish-yellow spots: Liver spots Seen in pregnancy, malignancies of liver or uterus, and in exophthalmic goiter Cosmetics and facial irritants, sunburn and exposure to weather also factors Occurs in many diseases including Addison's disease, diabetes, hemochromatosis, pellagra, acanthosis nigricans, and others Also occurs in arsenic poisoning

Yellowish discoloration Jaundice due to presence of excess of bile pigments in the blood

Cyanosis May be due to acquired or congenital malformations of the heart,

MUSCLES OF THE FACE

1. Depressor anguli oris. 2. Depressor labii inferioris. 3. Levator menti. 4. Buccinator. 5. Levator anguli oris. 6. Orbicularis oris. 7. Zygomaticus major. 8. Zygomaticus minor. 9. Depressor alae nasi. 10. Levator labii superioris. 11. Levator labii superioris alae quae nasi. 12. Compressor narium. 13. Orbicularis palpebrarum. 14. Auricularis anterior. 15. Temporalis. 16. Frontalis. 17. Galea aponeurotica. 18. Attollens aurem. 19. Auricularis posterior. 20. Occipitalis. 21. Masseter. 22. Latissimus colli. 23. Risorius.

MUSCLES OF THE FACE

1. Galea aponeurotica 2. Attollens aurem 3. Temporalis 4. Auricularis ant.
 5. Orbicularis palpebrarum 6. Compressor narium 7. Depressor alae nasi. 8.
 Levator labii superioris alae que nasi 9. Levator labii superioris 10. Zygomaticus
 minor 11. Zygomaticus major 12. Orbicularis oris 13. Levator anguli oris. 14.
 Masseter. 15. Buccinator 16. Orbicularis oris 17. Depressor anguli oris 18. De-
 pressor labii inferioris 19. Levator menti 20. Latissimus colli 21. Depressor alae
 nasi 22. Frontalis

to asthma, whooping cough, pulmonary tuberculosis, croup, obstruction of trachea, aneurysm, tumor, asphyxia, drug poisoning, emphysema, dilation of right side of the heart. See cyanosis

Expression Absence of expression. Myasthenia gravis, paralysis agitans.

Flushing (hyperemia) May be permanent or evanescent. Produced by the emotions if temporary. Permanent flushing may be due to febrile diseases, pulmonary tuberculosis, convulsions, alcoholism, ovarian tumors, goiter, plethorahypertrophy of the heart.

Pallor Absence of color. May be due to excessive confinement indoors, malnourishment, anemia, hemorrhage, shock, fright.

Redness, alternating with pallor. Emotion such as anger, cerebrospinal meningitis, typhoid, menopause, and general vasomotor disturbances.

Sallowness Cachexia, cancer, lead poisoning, chronic gallbladder disease, some anemias, Addison's disease, arthritis deformans, constipation, hepatic, pancreatic, and enteric diseases.

Diagnosis by The following conditions affect the features. Mouth breath-

ing, chronic alcoholism, drug habits, abdominal diseases, facial hemiplegia, insular sclerosis, cretinism, myxedema, congenital syphilis, exophthalmic goiter, myopathic and myasthenic conditions, paralysis agitans, encephalitis lethargica, locomotor ataxia, acromegaly, mongolian idiocy, acute diffuse peritonitis, dyspnea, hysteria, late stages of pulmonary tuberculosis, lobar pneumonia, renal diseases, typhoid fever, hippocritic facies.

EDEMA Swelling of the face from edema is noted in cardiac, renal, and blood diseases, pneumothorax, mediastinal tumors, and aneurysm. It may be localized and evanescent due to urticaria, angioneurotic edema, or anaphylaxis. Seen in thrombosis of sup longitudinal sinus, and in glanders.

EXPRESSION Absence of expression from half the face downward, drawn and distorted. Indicates facial paralysis of opposite side. *Anxious or pinched look* Forerunner of unfavorable conditions. *Hippocratic facies* A cadaverous appearance seen in cholera and acute general peritonitis. *Risus sardonius*: A sardonic smile caused by contraction of mouth muscles which indicates abdominal affections, such as spasms and peritonitis. *Sudden lack of expression* Apathy and immobility, generally bad symptoms, except in mental weakness and hysteria.

f. presentation. Fetal face presentation in childbirth.

f., spasms of. May be intermittent, continuous, bilateral or unilateral.

May be due to teeth, disorders of skin, nose, eyes, or constitutional nervous disorders. May be *mimic or habit spasms*; choreic, winking spasms, convulsive tic, blepharospasm. Closure of eyelids caused by spasm of orbicular muscles, due to affection of the nerve supply, the eye muscles, or to eye diseases. Clonic unilateral spasm due to epilepsy. Spasm of eyelids, chin, upper lips, or muscles of face seen in early stages of meningitis. Tonic spasms due to tetanus, spasms following paralysis, hysteria, and tic douloureux.

facet, facette (fas'et) [Fr *facette*, small face]. A small, smooth area on a bone or other hard surface.

fa'cial [L. *facies*, face] Pert. to the face.

f. center. Brain center causing facial movements.

f. nerve. Seventh cranial nerve, a mixed nerve consisting of efferent fibers supplying the facial muscles, the platysma muscle, the submaxillary and sublingual glands, afferent fibers from taste buds of the ant two thirds of the tongue and from the muscles. *Orig* afferent fibers from geniculate ganglion, motor and secretory fibers from nuclei in pons. *Dis* Ear, face, palate, tongue. *Br* Tympanic, chorda tympani, post auricular, digastric, stylohyoid, temporal, malar, infraorbital, buccal, supramaxillary, inframaxillary. *SEE* cranial nerves.

f. paralysis. Affecting the muscles of the face. The 7th cranial nerve is involved.

f. reflex. Contraction of facial muscles following pressure on eyeball.

f. spasm. Tic. *SEE* cranial nerves, face, facies, paralysis, tic.

facies (fash'i-ez) [L.]. 1. Face. 2. Countenance. 3. Surface.

f. abdominal'is. Pinched, anxious,

shrunken and drawn expression seen in abdominal troubles.

f. adenoid. Stupid appearance with open mouth.

f. aor'tica. Expression seen in aortic valve insufficiency, bluish sclera, cheeks sunken, face sallow.

f. hepatic'a. Seen in liver affections: Skin sallow, conjunctivae yellow, and eyeballs sunken.

f. hippocrati'ca. Seen in those dying from long continued illness or from cholera, cheeks and temples hollow, eyes sunken, complexion leaden, and lips relaxed.

f. mitra'lis. Seen in mitral insufficiency. Capillaries more or less visible, cheeks pink, more or less cyanosis.

f., myopath'ic. Due to muscular weakness, esp that of the face, lids drop and lips protrude.

f. ovar'ina. Seen in women with ovarian tumor, face drawn and pinched.

f. tetanica. Senile appearance due to wrinkling in tetanus.

f., typhoid. Dusky complexion, injected conjunctivae and dull expression.

facilitation (fas-il'i'ti-a'shun) [L. *facilis*, easy] Making an action or process easier, the energy of an impulse being added to that of other impulses activated at the same time.

fa'cing [L. *facies*, face] An inlay to form the outer surface of a tooth.

faciobrachi'al (fa-shi-o-bra'ki-al) [' + G. *brachion*, arm] Pert. to the face and arm, esp to juvenile muscular dystrophy.

faciocer'vical [' + *cervix*, neck] Pert. to the face and neck, esp to progressive dystrophy of facial muscles.

faciolin'gual [' + *lingua*, tongue] Pert. to the face and the tongue, esp a paralysis of them.

fa'cioplasty [' + G. *plassein*, to form]. Plastic surgery of the face.

facioplegia (fa'si-o-ple'ji-a) [' + G. *plégē*, stroke] Facial paralysis. *SYN*: prosopoplegia.

facioscapulohumeral (fa'shi-o-skap'u-lo-hu'mer-al) [' + *scapula*, shoulder blade, + *humerus*, shoulder] Pert. to the face, the scapula, and the upper arm.

F. A. C. P. Abbr. for *Fellow of the American College of Physicians*.

F. A. C. S. Abbr. for *Fellow of the American College of Surgeons*.

factitious (fak-tish'us) [L. *factitus*, made by art] Not natural, esp of certain skin lesions.

factor. A condition, element, influence, or circumstance that contributes to a result.

f. accessory food. A substance in food which does not serve as a source of energy but is essential for normal growth and development or normal metabolic activities, a vitamin, *qv*.

f. anti'anemic. A substance stored in the liver, essential for the normal development of red blood cells in the bone marrow. It is formed in the stomach and intestine by the interaction of an *extrinsic factor* present in certain foods, esp. those rich in the B-complex vitamins and an *intrinsic factor* present in gastric juice. Also called *anti'anemic principle*, *hematinic principle*, *erythrocyte maturation factor* (EMF). It is used in the treatment of pernicious anemia.

f. hereditary. A gene.

f. lethal. A gene which when homozygous, causes the death of an individual before development is complete.

f., milk. A substance present in certain strains of mice which is transferred to offspring through milk from the mammary glands, and is capable of inducing the development of mammary cancer

f., Rh. SEE *Rh blood factor*

facultative [L. *facere*, to do]. **Biol.** 1. Able to live under conditions of temperature or oxygen supply which vary. 2. Able to do something not compulsory; voluntary

faculty [L. *facultas*, function]. 1 A mental attribute or sense. 2 Ability to function

f., affective. Capacity for expressing emotions

f., germinative. Power of a germ to develop

facopyrism (fag-ō-pīr'izm) [L. *facopyrum*, buckwheat] Buckwheat poisoning

Fahr. Abbr for *Fahrenheit*.

Fahraeus' test. A measuring of the speed at which red blood corpuscles settle

Fahrenheit scale. The one used in the U. S. A., and England The freezing point of water is 32° and the boiling point 212° Indicated by capital letter F.

SEE *thermometer*.

faint [O.F. *faindre*, to feign] 1. To feel weak, as though about to lose consciousness. 2 Weak. 3. Syncope SEE *fainting*.

fainting (fānt'ing) [O.F. *faindre*, to feign]. Loss of consciousness due to cerebral anemia or insufficient blood to the brain **Sym** Prior to onset, patient may be pale, weak, dizzy, cold perspiration, uncomfortable abdominal sensation, and may fall on the ground unconscious. Pulse is usually weak, rapid, often irregular

F. A. TREATMENT: If patient is sitting, lower head between the knees, or preferably have patient lie down with the head lower than the body. Elevate lower extremities Apply heat Rub extremities toward the heart Stimulate by administering spirits of ammonia to the nostrils at intervals. When able to swallow, give hot black coffee, strong tea, or other hot drinks

Twenty drops of aromatic spirits of ammonia in hot water may likewise be used by mouth.

RS *apoplexy, asphyxia, coma, shock, swoon, syncope, unconsciousness.*

faintness [O.F. *faindre*, to feign]. 1. A sensation of impending loss of consciousness. 2. A sensation due to lack of food. **SEE:** *lipothymia.*

falcate (fal'kāt) [L. *falx*, sickle]. Sickle-shaped

falcial (fal'si-āl) [L. *falx*, sickle]. Pert. to the falx.

falciform [' + *forma*, form]. Sickle-shaped

f. ligament. The triangular ligament attached to sides of the sacrum and coccyx by its base. **SYN** *great sacro-sciatic l.*

f. process. Process of the dura that divides the hemispheres of the cerebrum **SYN** *falx cerebri*

fal'cula [L. little sickle]. The falx cerebelli.

fal'cular [L. *falcula*, little sickle]. 1. Sickle-shaped. 2. Pertaining to the *falx cerebelli*.

fallectomy [G. *ektomē*, excision]. Cutting away part of the fallopian tube.

falling drop. 1 A metallic tinkle heard over the normal stomach and bowel when inflated. 2 The same sound heard over large cavities containing fluid and air, as observed in hydropneumothorax.

f. sickness. Epileptic condition.

f. of the womb. Dropping of the uterus, so that it protrudes into vagina. **SYN.** *descensus uteri.*

fallo'pian. Pert to parts named for the Italian anatomist Fallopius.

f. canal. C. in petrous bone for *nervus facialis*.

f. ligament. Round ligament of the uterus.

f. tube. **SYN** *uterine tube, oviduct.* The tube or duct which extends laterally from the lateral angle of the uterus, terminating near the ovary It serves to convey the ovum from the ovary to the uterus and spermatozoa from the uterus toward the ovary. Medially each tube opens into the uterus, distally each opens into the peritoneal cavity Each lies in the superior border of the broad ligament.

BLOOD SUPPLY Derived from branches of the uterine and ovarian arteries.

NERVE SUPPLY Pelvic, ovarian, and uterine nerve plexuses send fibers to the tubes.

ANAT The narrow region near the uterus, the isthmus continues laterally as a wider *ampulla* The latter expands to form the terminal funnel-shaped *infundibulum*, at the bottom of which lies a small opening, the *ostium*, through which the ovum enters the oviduct Surrounding each ostium are a number of fingerlike processes called *fimbria*, one of which the *fimbria ovarica* is considerably longer than the others, extending towards the ovary Each tube averages about 4½ in. in length and ¼ in in diameter Its wall consists of three layers mucosa, muscular layer, and serosa The epithelium of the mucosa consists of ciliated and non-ciliated cells Ciliary action aids in the movement of the ovum towards the uterus The muscular layer consists of an inner circular and an outer longitudinal layer of smooth muscle The serosa consists of connective tissue underlying the outermost layer of peritoneum

fallostomy (fal-os'to-mī) [G. *stoma*, opening]. Surgical opening of the fallopian tube.

Fallot, tetralogy of. A congenital condition characterized by defect in the interventricular septum, stenosis of the pulmonary artery, dextroposition of the aorta, and hypertrophy of the

right ventricle. The defects are sometimes carried into adult life.

fallo'tomy. Division of the fallopian tubes. SYN: *salpingotomy*.

false ribs. The lower 5 pairs of ribs. Ssz: *ribs, vertebrae*.

falx [L.]. Any sickle-shaped structure.

f. cerebelli. A fold of the dura mater which forms a vertical partition between the hemispheres of the cerebellum.

f. cerebri. A fold of the dura mater which lies in the longitudinal fissure and separates the two cerebral hemispheres.

f. inguinallis. BNA. The conjoined or conjoint tendon which forms the origin of the transversus abdominis and internal oblique muscles.

f. ligamento'sa. The broad ligament of the liver. SYN: *falciform ligament*.

F. A. M. A. Abbr. for *Fellow of the American Medical Association*.

famil'ial [L. *familia*, family]. Pert. to or common to the same family, as *f. symptoms*.

family (fam'il-e) [L. *familia*, family]. 1. A group consisting of parents and their children. 2. In biological classification, the division bet. the *order* and *genus*.

f., degenerate. One that produces offspring of low or subnormal mentality.

f., Jukes. A family whose history covers 5 generations of degeneracy.

f., Kallikak. An American family with 1 branch mentally unfit and another of average intelligence.

fam'ine fever. Relapsing fever.

fang [AS *fōn*, to seize]. 1. A sharp-pointed tooth. 2. The root of a tooth.

f., poison. Two teeth in upper jaw of poisonous reptiles adjacent to their poison glands.

far'ad. A unit of electrical capacity. The capacity of a condenser which, charged with 1 coulomb, gives a difference of potential of 1 volt.

This unit is so large that one-millionth part of it has been adopted as a practical unit called a microfarad.

farad'ic. Pert. to induced electricity.

f. contraction, graduated. Produced by Smart or Bristow coils.

far'adism. The therapeutic use of an interrupted current to stimulate muscles and nerves. Such a current is derived from the secondary or induction coil.

faradiza'tion. The treatment of nerves or muscles with the faradic current, the condition of nerves or muscles so treated.

faradother'apy [G. *therapeia*, treatment]. Treatment of disease by the faradic current.

farastan (far'a-stan). A combination of iodine and cinchophen.

Uses. As an analgesic and antipyretic. Dosage: 3½ gr. (0.25 Gm.) with same caution as with cinchophen.

far'cy [L. *farcire*, to stuff]. A form of glanders.

f. bud. A glanderous tumor.

f., button. Farcy marked by dermal tubercular nodules.

farina (far-i'nā) [L.]. Wheat ground to pass a #20 sieve with only small siftings.

farina'ceous [L. *farina*, flour]. 1. Starchy. 2. Pert. to flour.

far-point. The farthest point of vision at which objects can be distinctly seen with eyes in complete relaxation.

Ferre's tubercles (fars). Carcinomatous masses on surface of the liver.

far-sight'ed. Pert. to far-sightedness. SYN: *hypermetropic, hyperopic*.

far-sight'edness. An error of refraction in which, with accommodation completely relaxed, parallel rays come to a focus behind the retina. SYN: *hypermetropia, hyperopia*.

fascia (fash'i-a) (pl. *fasciae*) [L. a band].

1. A fibrous membrane covering, supporting, and separating muscles. 2. A bandage. They also unite the skin to underlying tissue.

Fascia may be *superficial*, a nearly subcutaneous covering permitting free movement of the skin, and *deep*, enveloping and binding muscles.

f., anal. F. of connective tissue covering levator ani muscle from the perineal aspect.

f., Buck's. A fascial covering of the penis, derived from Colles' fascia.

f., cervical, deep. Fascia of the neck covering the muscles, vessels and nerves.

f., c., superficial. Fascia of the neck just inside the skin.

f., Cloquet's. Femoral fascia.

f., Colles'. Inner layer of the perineal fascia.

f., cremasteric. F. covering the cremaster muscle of the spermatic cord.

f., cribriform. The fascia of the thigh covering the saphenous opening.

f., dentata. Gray matter in the cerebral dentate convolution.

f., infundibuliform. Funnel-shaped f., derived from interior abdominal wall, encasing the spermatic cord and testis.

f., intercolumnar. F. derived from external abdominal ring sheathing the spermatic cord and testis.

f., ischio'rectal. Ssz *anal f.*

f. lata. Wide covering encasing thigh muscles.

f., lumbodorsal. Deep investing membrane covering deep muscles of the trunk and back.

f., pectineal. Pubic section of f. lata.

f., pelvic. Fascial tissues of extreme importance in the maintenance of normal strength in the pelvic floor. Ssz: *pelvic diaphragm under "diaphragm."*

f., thyro'lar'yngeal. F. covering thyroid gland.

f., transversalis. F. located between perineum and transversalis muscle.

fascial (fash'e-al) [L. *fascia*, band]. Pert. to or of the nature of fascia.

f. reflex. Muscular contraction resulting from percussing facial fascia.

fascioplasty (fash'i-ā-plas'tī) [f. + G. *plassein*, to form]. Plastic surgery of fascia.

fascicle (fās-sīk'le). A fasciculus.

fasciculus (fas-sīk'u-lar) [L. *fasciculus*, little bundle]. 1. Arranged like a bundle of rods. 2. Pert. to a fasciculus.

fasciculus (fa-sīk'u-lus) (pl. *fasciculi*) [L. a little bundle]. A bundle of nerve or muscle fibers. More specifically a division of a funiculus of the spinal cord consisting of fibers of one or more tracts. Sometimes the term is used as a synonym for "tract". SYN: *fasciola*.

f. cuneatus. A triangular shaped bundle of nerve fibers lying in the dorsal funiculus of the spinal cord. Its fibers enter the cord through the dorsal roots of spinal nerves and terminate in the medulla. Also called tract of Burdach.

f., fundamental. Portion of ant. column of spinal cord continuing into medulla oblongata.

f. gracilis. A bundle of nerve fibers lying in the dorsal funiculus of the

spinal cord medial to the f. cuneatus. Conducts sensory impulses from the periphery to the medulla.

f. longitudinal. *Inferior longitudinal fasciculus.* A bundle of association fibers connecting the occipital and temporal lobes of the brain, *medial longitudinal fasciculus.* a bundle of fibers running from the spinal cord to the upper portion of the midbrain, superior or dorsal longitudinal fasciculus, a bundle of association fibers connecting the frontal lobe with the occipital and temporal lobes.

f., posterior longitudinal. Nerve fiber bundle running bet. corpora quadrigemina and nuclei of 4th and 6th nerves.

f. teres. Column on both sides of median furrow on 4th ventricle's floor.

f. unciformis. Fibers within sylvian fissure connecting frontal and temporo-sphenoid lobes. SYN *Unciformis*.

fasciectomy (fā-shi-ek'to-mī) [L. *fascia*, band, + G. *ektomē*, excision]. Excision of strips of fascia.

fasciod/esis [+ G. *desis*, binding]. Operation of attaching a fascia to a tendon or another fascia.

fasciola (fā-se'ō-lā) [L. little band]. A bundle of nerve or muscle fibers. SYN *fasciculus*, *q. v.* [identata].

f. cinerea. Upper portion of fascia.

Fasciola [L. *fascia*, band]. A genus of flukes belonging to the class Trematoda.

F. hepatica. A species of flukes infesting the liver and bile ducts of cattle, sheep, and other herbivores, the common liver fluke. An occasional parasite of man. Intermediate hosts are snails belonging to the genus *Limneus*. Formerly called *Distomum hepaticum*.

fasciolar [L. *fasciola*, little band]. Pert. to the fasciola cinerea.

fascioliasis (fas-she-o-lī-as-is) [L. *fascia*, band]. Infection of the body with a genus of trematode worms. SYN: *distomiasis*.

fascioplasty [+ G. *plassein*, to form]. Plastic operation on a fascia.

fasciorrhaphy (fash-i-or'af-i) [+ *raphē*, suture]. Suturing a fascia.

fasciotomy (fash-i-o'to-mī) [+ G. *tomē*, incision]. Surgical incision and division of a fascia.

fascitis (fash-i'tis) [+ G. *itis*, inflammation]. Inflamed condition of a fascia.

fast [A.S. *faest*, fixed]. 1. Resistant to the effects or action of a chemical substance. 2. Fasting.

f. acid. Term applied to bacteria esp. the tuberculous group which after staining are not decolorized when treated with acid.

f. drug. Term applied to bacteria or other organisms which become resistant to drugs such as penicillin.

fastidium (fas-tid'i-um) [L. aversion]. Aversion to food or to eating.

Sometimes seen in hysteria but not as the result of delusions.

fastigatum (fas-tig-a'tum) [L. pointed]. The gray matter on both sides of the inf. vermiciform process of the cerebellum. SYN: *nucleus fastigii*.

fastigium (fas-tij'i-um) [L. ridge]. 1. The highest point. The full period of development of acute, infectious diseases when the temperature reaches the maximum or *stadium* and all symptoms have developed. 2. The most posterior portion of the 4th ventricle formed by the junction of the ant. and post. medullary vela projecting

into the medullary substance of the cerebellum.

fasting [A.S. *faest*, firm]. Going without food for a stated period.

It has been used successfully in treatment of various disorders, esp. epilepsy.

Energy requirements of body metabolism during fasting are supplied by the oxidation of fats which, if glucose is not supplied, results in the products of incomplete fat combustion, such as fatty acids, diacetic acid, and acetones, producing ketosis or a mild acidosis. This condition occurs quickly in children and they have little glycogen reserve. SEE *jejunitas*.

fastness [A.S. *faest*, firm]. Resistance to stains or destructive agents.

fat. 1. Adipose, obese, corpulent. 2. Greasy, oily. 3. CHEM. A triglyceride ester of fatty acids, one of a group of organic compounds closely associated in nature with the phosphatides, cerebrosides, sterols. The term *lipid* or *lipides*, *q. v.*, is applied in general to fats or fatlike substances. Fats are insoluble in water but soluble in ether, chloroform, benzene and other fat solvents. Upon hydrolysis, fats break down into fatty acids and glycerol (an alcohol). Fats are hydrolyzed by the action of acids, alkalies, lipases (fat-splitting enzymes) and superheated steam.

Chem. structure. In the fat molecule, one molecule of glycerol is combined with three of fatty acids. Three fatty acids, oleic acid ($C_{18}H_{34}O_2$), stearic acid ($C_{18}H_{36}O_2$), and palmitic acid ($C_{16}H_{32}O_2$) comprise the bulk of the fatty acids present in the neutral fats found in body tissues. According to the fatty acid with which the glycerol is combined, corresponding fats are *triolein*, *tristearin* and *tripalmitin*. These three fats are the principal fats present in foods.

Physiologic functions of. 1. Fats serve as a source of energy. 2. Subcutaneous fats form an insulating layer which prevents loss of heat. 3. Fat acts to support and protect certain organs such as the eye and kidney. 4. It provides a concentrated reserve of food. 5. It provides essential fatty acids necessary for normal growth and well-being. 6. It is a vehicle for natural fat-soluble vitamins. 7. In conjunction with carbohydrates, fats serve as protein spacers. 8. They are an important constituent of cell structure forming an integral part of the cell membrane. 9. When properly distributed, fat gives a pleasing contour to the body.

Digestion and absorption of fats. In the stomach, emulsified fats such as cream or egg yolk are acted on by gastric lipase, however, most fats undergo digestion in the intestine where they are acted on by a pancreatic lipase, *steapsin*, which hydrolyzes them to fatty acids and glycerol. Although containing no lipolytic enzymes bile is essential for the digestion of fats. Bile aids in the emulsification of fats and also has a hydrotropic action; i. e., renders substances such as fatty acids, which are normally insoluble in water, readily soluble in the fluids of the intestine. Bile salts also act as specific activators of the pancreatic lipase. Bile salts react with fatty acids forming water-soluble, diffusible, soaps which facilitate the emulsification of fats. Glycerol and fatty acids enter the epithelial cells where they recom-

bine to form neutral fats most of which enters the lacteals. The fats are carried by the lymph through lymph vessels to the thoracic duct from which they enter the blood stream. After a meal rich in fats the mesenteric lymph vessels are filled with a milklike fluid, the *chyle*, containing finely emulsified fat particles, called *chylomicrons*.

Metabolism of fats Absorbed fats are utilized in the following ways (a) oxidized with the release of energy, (b) deposited in adipose tissue as storage fat, (c) incorporated in the cells of tissues as an integral part of the protoplasm, (d) desaturated and stored in the liver, (e) excreted in the secretions of the mammary and sweat glands, and in the feces.

Sources of body fats In addition to fat being absorbed from the intestine, body fat may arise from the conversion of carbohydrates (glucose) or proteins into fat. Fat may possibly be converted into carbohydrates, but this occurs only to a limited extent.

Intermediate metabolism of fats In the oxidation of fat to carbon dioxide and water, several intermediary substances (ketones) are formed. The principal ones are acetoacetic acid, beta-hydroxybutyric acid, and acetone. Excessive production of ketone bodies which occurs when fats are incompletely oxidized is called ketosis. This especially occurs when there is an interference in carbohydrate metabolism, as in diabetes. Ketosis also occurs in certain fevers, in toxemias of pregnancy, and in hyperthyroidism. Ketosis results in acidosis.

Fat nutrition Fats have a high caloric value yielding 9.3 Cal per gram as compared with 4.0 and 4.1 Cal for carbohydrates and proteins respectively. The average diet of 3000 Cal should contain 30 to 40 per cent of its caloric value in fats. The average diet contains from 50 to 130 grams of fat. Quantities in excess of 150 grams are repulsive and difficult to digest. In addition to their nutritive values, fats improve the taste and odor of foods, provide a feeling of satiety, are absorbed slowly prolonging their nutritive effects, and because of their high caloric content, are of especial importance in high-caloric diets.

Contra Fat intake should be reduced in diseases of the gall bladder and liver.

RS bile, gall bladder, liver, fatty acids, lipases, ketones, glycerol.

f. deposit. Accumulations of fat in certain regions of the body such as the buttocks or abdominal wall.

f. low diet. Approximately 40 to 50 Gm fat daily. SEE *reduction diet*.

f. neutral. Compounds of the higher fatty acids (palmitic, stearic, and oleic) with glycerol. They are the common fats of animal and plant tissues.

f. and protein-free diet. 1. Carbohydrates. 2. Honey. 3. Fruit juices. 4. Juicy fruits. 5. Melons. 6. Cucumbers. 7. Marmalades and jellies. 8. Rhubarb. 9. Fresh tomatoes.

fat, words pert. to: absorption, acid, "adip-" words, calory, chondrolipoma, chromolipoid, digestion, fatty acids, fatty casts, fuel value, hydrogenation, ketogenic diet, "lip-" words, obesity, palmitic acid, palmitin, steariform, stearin, steatolysis, tissue.

fatigue (fā-tēg) [L. *fatigare*, to tire]. 1. A feeling of tiredness or weariness resulting from continued activity. 2.

The state or condition of an organ or tissue in which its response to stimulation is reduced or lost as a result of overactivity. 3. To bring about a condition of fatigue.

Fatigue may be the result of (a) excessive activity which results in the accumulation of metabolic waste products such as lactic acid, (b) malnutrition (deficiency of carbohydrates, proteins, minerals, or vitamins), (c) circulatory disturbances such as heart disease, or anemia which interfere with the supply of oxygen and energy materials to tissues, (d) respiratory disturbances which interfere with the supply of oxygen to tissues, (e) infectious diseases in which toxic products are produced or body metabolism altered, (f) endocrine disturbances such as occur in diabetes, hyperinulinism, and menopause, (g) psychogenic factors such as emotional conflicts, frustration, worry, boredom, (h) physical factors such as incorrect posture, flat feet, (i) miscellaneous factors, such as eye strain.

f. acute. Fatigue with sudden onset such as occurs following excessive exertion relieved by rest.

f. chronic. Long-continued fatigue not relieved by rest. Indicative of disease such as tuberculosis or diabetes or other conditions of altered body metabolism.

RS *bradyphrenia*, *glycogen*, *narcotic*, *stimulant*, *sleep*.

f. muscular. The reduced capacity of a muscle to perform work as a result of repeated contractions. Fatigue may be partial or complete.

f. reaction. In tuberculosis, an elevation of temperature following exertion.

f. stance. Fatigue resulting from standing for long periods of time.

f. syndrome. Neurasthenia, *q.v.*

fatty. Of or pertaining to fats or fatty substances, adipose.

f. casts. Mass of fat droplets arranged frequently in groups and probably remains of a true epithelial cast.

f. degeneration. A change involving the deposition of fat in the cytoplasm. SEE *fat, heart*.

fatty acid. A hydrocarbon in which one of the hydrogen atoms has been replaced by a carboxyl (COOH) group; a monobasic aliphatic acid made up of an alkyl radical attached to a carboxyl group.

The digestion and absorption of fats in foods.

The saturated fatty acids include: acetic, butyric, caproic, caprylic, capric, lauric, formic, myristic, palmitic, and stearic acids all of which contain an even number of carbon atoms. All are homologues of formic acid.

The unsaturated fatty acids include: Those of (a) the *oleic series*: oleic, tlgic, hypogaeic, palmitoleic, and phytoseleic acids and (b) the *linoleic* or *linoleic series*: linoleic, linolenic, clupanodonic, arachidonic, hydrocarpic, and chaulmoogric acids. The latter two are used in the treatment of leprosy.

f. a., essential. The unsaturated fatty acids, *q.v.* In certain animals, the absence of these fatty acids in their diet leads to loss of weight, eczematous condition of the skin, and kidney disorders.

By boiling with alkalis, esp. in alcoholic solutions, also by the action of many ferments, as the steapsin of the pancreatic juice, fats are split up into glycerine and free fatty acids.

The fatty acids unite with the alkalies present, forming salts of fatty acids, the soaps (sodium soap, or hard soap, and potassium soap, or soft soap). If fats contain free fatty acid (rancid fats) they can, on melting, form an emulsion with water and a little soda; in this process of emulsion the fats are finely divided, forming a milky fluid.

As emulsification is dependent upon the presence of soap, formed by the union of fatty acid and alkali, a purely neutral fat cannot be emulsified. Emulsification is an important process in the absorption of fats in foods.

fauces (faw'ses) [L the throat] The aperture leading from the mouth into the pharynx, or cavity of the throat.

The ant. pillars of the fauces are known as the *glossopalatine arch*, and the post. pillars, as the *pharyngopalatine arch*. SEE *jossa*.

faucial [L fauces, the throat]. Pert. to the fauces.

f. reflex. Gagging or vomiting resulting from irritation of fauces.

faucitis (faw-si'tis) [+ G. -itis, inflammation]. Inflammation of the fauces.

favellate (fav-e'o-lät) [L *faveolus*, little honeycomb]. Honeycombed. SYN *alveolate*.

faveolus [L little honeycomb] A depression or small pit, esp. on the skin.

favism. A condition common in Sicily and Sardinia resulting from sensitivity to a species of bean, *Vicia faba*. It is characterized by fever, anemia, abdominal pain, and may lead to prostration and coma. It is caused by ingestion of the beans, or inhalation of the pollen.

favus (fa'vus) [L honeycomb] Contagious skin disease characterized by pinhead to pea-sized, saucer-shaped, yellowish crust usually over hair follicles and accompanied by musty odor and itching. It may spread all over the body.

ETIOL Fungus, *Achorion Schonleini*.
SYM As stated.

PATH Invasion of hair shafts and epidermis.

PROG. Good.

TREATMENT X-rays for hair surfaces. Ointments containing sulfur, oleate of mercury, ammoniated mercury, chrysarobin, iodine.

SYN *crusted* or *honeycomb ringworm*, *tinea favosa*.

F. C. S. Abbr. for Fellow of the Chemical Society.

F.D. Abbr. for local distance.

Fe. Chem. symb. for iron (*ferrum*).

fear [A.S. *jaer*]. PSY. Primitively, the emotional reaction to an environmental threat, it now also presents itself frequently as an indicator of inner problems; fright, dread.

A partial fear reaction may be considered the expression of somatic disease. Fear is met with clinically, esp. in anxiety neuroses, anxious psychotic pictures (e. g., depression), and in toxic deliria (e. g., delirium tremens). At the somatic level, hyperthyroidism and hyperadrenalism may strongly stimulate the fear state. SEE *emotion*.

febrifuge (feb'-ri-sid) [L *febris*, fever, + *caedere*, to kill]. Destructive to fever. SYN *antipyretic*.

febricula [L. little fever] Mild fever of short duration without other pathology.

febrifacient (feb-ri-fa'si-ent) [L. *febris*, fever, + *facere*, to make]. Producing fever.

febrific (fê-brif'ik) [+ *facere*, to make]. Producing or conveying fever.

febrifugal (feb-rif'u-gal) [+ *jugare*, to put to flight]. Reducing fever.

febrifuge (feb'-ri-füj) [+ *jugare*, to put to flight] That which lessens fever. SYN *antipyretic*.

feb'rite [L. *febris*, fever]. Feverish; pert. to a fever. SEE *fever*.

f. state. A term used to describe constitutional symptoms which accompany a rise in temperature. Pulse and respiration usually rise with headache, pains, malaise, loss of appetite, concentrated and diminished urine, constipation, restlessness, hot dry skin, insomnia, irritability.

febriphobia [+ G. *phobos*, fear]. Anxiety or fear induced by a rise in body temperature.

febris (fe'bris) [L]. Fever.

f. acmastica. Continued fever.
f. castrensis. Typhus and remittent fever.

f. enterica. Typhoid fever.

f. flava. Yellow fever.

f. lactea. Milk fever.

f. remittens. Remittent fever.

f. undulans. Malta fever.

f. variolosa. A form of smallpox.

fe'cal [L *faeces*, feces] Pert. to, or of the nature of, feces.

f. vomit. Feces in vomitus.

ETIOL Strangulated hernia or intestinal obstruction preventing anal outlet.

fecalith (fe'kal-ith) [+ G. *lithos*, stone].

A fecal concretion. SYN *coprolith*.

fecaloid (fe'kal-oid) [+ G. *eidos*, form]. Resembling feces.

fecaloma (fe-kal-o'mä) [+ G. *ōma*, tumor] [L *faeces*, feces] SYN: *Copromoma*, *scatoma*, *stercoroma*. A large mass of accumulated feces in the rectum resembling a tumor.

fecaluria [+ G. *ouron*, urine] Fecal matter in the urine.

feces (fe'sez) [L *faeces*]. Stools, excreta; dejecta; excrement. Body waste, such as food residue, bacteria, epithelium, and mucus discharged from the bowels by way of the anus.

AMOUNT or Twenty-five to fifty Gm. of solid, or 100-200 Gm. of moist substance on a mixed diet, per day. From 0.5-0.9 Gm. per day of nitrogen is excreted on a non-nitrogenous diet.

COLOR or The color of the feces may be indicative of various disorders as shown by the following. **Black** May follow intestinal hemorrhage, or the use of drugs such as bismuth, iron, tannin, manganese, or charcoal. **Bloody** May indicate hemorrhoids, cancer of the rectum, ulcers, fissures, abraded rectal membrane from dry feces, eroded rectal polypus, acute proctitis, foreign bodies, colitis, and intussusception or strangulated hernia in children. May also result from cancer of the colon, rupture of abdominal aneurysm, typhoid fever, phosphorus poisoning, jaundice, yellow fever, dengue, septicemia and yellow atrophy of the liver. **Clay-colored**: May denote impaired bile formation or obstruction, phosphorus poisoning or yellow atrophy of the liver. Rarely indicates tumor or movable kidney. **Green**: Seen as the result of increased flow of bile, the use of calomel, and commonly, diarrhea in young children. In the latter cases, may be due to bacterial growth.

COMPOSITION: Residue of food, water, products of secretions, of bacterial de-

composition, indol, skatol, cholesterol, mucous and epithelial cells, purin bases, pigment, microorganisms, inorganic salts, and sometimes foreign substances.

DIAGNOSIS BY The reducing effect of the intestinal flora upon the feces is considered an index of intestinal conditions, the less reduction indicating the best condition. Low reduction may be caused by green vegetables, fruits, and milk, while meat and egg protein result in the opposite condition.

FORM AND CONSISTENCY (a) Normally, soft and formed, (b) hard, nodular, or scybalous in constipation, (c) fluid or mushy in diarrhea, (d) flattened or ribbonlike in rectal obstruction or spastic colitis; (e) frothy in fermentative conditions, (f) easy in jaundice, etc.

INSPECTION OF This should include the color, the formation, their odor, and the presence of any observable foreign substances, including calculi.

MUCUS Always important, and should be reported. Normally, none seen. May occur (a) As superficial gelatinous streaks or blobs, (b) mixed with the stool, and only apparent on making a thin paste with water, (c) mixed with blood, as in dysentery, (d) composing almost the entire stool, sometimes as firm bands or cords.

ODOR This varies much with disease and dietary differences. It is most marked on a meat diet, and almost absent on a milk diet. Variations, such as sour, pungent, putrid, etc., occur in different diseases. **Offensive** Obtain in jaundice, acute indigestion, enteritis, erysipelas, typhoid fever, rachitis, and occasionally in constipation. **Putrid** May be the result of syphilitic or carcinomatous ulceration of the rectum or gangrenous dysentery. **Sour** Normal stools of infants.

PARASITES The presence of various intestinal parasites can be determined by examination of the feces. Gross examination may reveal the presence of nematodes or tapeworms, however, microscopic examination is necessary to determine the presence of protozoa, helminth ova, or larvae. In examination of feces, stools are collected in clean, dry, containers. For microscopic examination, representative bits of feces, or mucus are emulsified in saline solution on a clean slide, then spread evenly and covered with a coverglass. Enterobiasis is best diagnosed by examination of scrapings from the anal and perianal regions.

REACTION The normal reaction is neutral or slightly alkaline. An acid reaction usually indicates some fermentation in the gut or an excess of vegetables in the diet. The stools of infants are usually acid.

f., sheep. Small masses broken off from stone-like feces remaining in colon too long.

feces, words pert. to: acoprosis, acoprous, anus, bilifecia, colon, constipation, defecation, defecta, elimination, excreta, excretion, hypostasis, impaction, intestine, meconium, melanorrhoea, melena, rectum, scatocratia, scybalum, sigmoid, skatol, steatorrhoea, stercoraceous, stercoremia, stool.

Fe(C₂H₃O₂)₂. Ferrous lactate; lactate of iron.

Fe(C₂H₃O₇). Citrate of iron.

Fechner's law (fek'nerz). The magnitudes of sensation produced by given stim-

uli form an arithmetical progression, the stimuli forming a geometrical progression. **Syn.** psychophysical law.

FeCl₂. Ferrous chloride.

FeCl₃. Ferric chloride.

FeCO₃. Ferrous carbonate, c of iron.

fec'ula [L. *jaecula*, dregs]. 1 Sediment. 2 Starch.

feculent (fek'u-lent) [L. *jaecula*, dregs]. Having sediment.

fecundate (fe'kun-dät) [L. *fecundäre*, to bear fruit]. To fertilize or impregnate or render fertile.

fecundation (fe-kun-da'shun) [L. *fecundäre*, to bear fruit]. Impregnation, fertilization.

f., artificial. Impregnation by injecting the seminal fluid into the uterus by mechanical means.

fecundity (fe-kun'dit-i) [L. *fecundäre*, to bear fruit]. Ability to produce offspring; fertility.

feeblemind'edness [L. *febilis*, tearful, + A.S. *gemynd*, to think]. Arrested mental development as distinguished from temperamental abnormality. **Amentia.** On the basis of intelligence tests, feeble-minded individuals are classified into three groups, **morons** (I.Q. 50-70), **imbeciles** (I.Q. 20-50), **idiots** (I.Q. below 20).

feed'ing [A.S. *fedan*, to give food to]. Taking or giving nourishment, esp. extra-orally.

The latter is sometimes necessary because the patient either refuses or is unable to eat.

f., artificial. This is accomplished through the *nostrils*, the *esophagus*, and the *rectum*, also through *gastrostomy* or *duodenostomy*.

f., colonic. Less useful with psychotic than with physically sick patients but at times it can be utilized. It is now somewhat questionable owing to the limited ability for absorption in the colon.

f., esophageal. Used after operations on tongue or jaw, diseases of mouth, in mental cases, and for forcible feedings. Mouth gag needed in last 2 cases. Also used for test meals.

f., forcible. This is by way of esophagus or rectum.

f., nasal. Largely used for children, and when unable to take nourishment normally, such as in delirium, coma, and stupor, diseases of mouth and pharynx. Any strained liquid food that will pass through catheter can be used. Temperature of feeding, 100° F. Olive oil and swabs needed for cleaning nostrils.

f., rectal. Commonest form used although it is admitted that little nourishment can be absorbed through colon. Normal saline often used with glucose, making a 5-10% solution by adding ½ to 1 oz of glucose to 10 oz of normal saline. Rectal washout should be given once in 24 hr. from 10 to 11 A. M.

f., tube. Done through the mouth or nostril, the latter requiring a much smaller tube and a little more dexterity, but less likely to be successfully resisted. With patient lying, arms bound to body by encircling sheets, the lubricated (glycerine) tube is gently passed into pharynx and, avoiding the larynx, it is projected into the stomach. Entry into the larynx produces struggling and cyanosis. Sugar, eggs, cereals, whiskey, etc., are added to milk and then slowly introduced.

feel'ing [A S *fēlan*, to feel]. The conscious phase of nervous activity. The (a) emotions or centrally stimulated f's and (b) those sensations peripherally produced by excitation of peripheral nerves including those of the special senses

feet (pl. of foot) [A S. *fetl*]. The pedal extremities of the legs

RS *carpodal spasm*, *chilblain*, *chiro-podalgia*, *chiropodist*, *chiro-pody*, *extremity*, *foot*.

Fehl'ing's solution. A solution used for detecting the presence of sugar in urine. It consists of equal parts of Solutions A and B prepared as follows: Solution A—dissolve 34.65 Gm. of copper sulfate in water and make up to 500 cc. Solution B—dissolve 125 Gm. of potassium hydroxide and 173 Gm. of potassium sodium tartrate (Rochelle salt) in water and make up to 500 cc. Mix equal portions of solutions A and B immediately before using

fel [L.] Bile

f. bo'vis. Ox gall. USP. Dried fresh bile of the ox, used principally in form of an extract

ACTION AND USES. A laxative, intestinal antiseptic, chologogue.

DOSAGE. 6 gr. (0.4 Gm.).

SYN. *bilis bovina*

fellatio (fel-a'shi-o). A form of sex perversion in which gratification is accomplished by buccal intromission of the penis, buccal coitus.

Fell-O'Dwyer's method (George E. Fell, Buffalo physician, born 1850, Joseph O'Dwyer, New York physician, 1841-1898). Artificial respiration by means of a bellows, forcing air through an intubation tube into the lungs

fel'on [A S. *feloun*, malignant]. Suppuration of terminal joint of a finger. SYN. *paronychia*. * *runround*, *whitlow*.

felt'work [Ger. *falten*, to join, + A S. *worc*, to make] 1 Fibrous network. 2 A plexus of nerve fibrils. SYN. *neuropilem*.

fe'male [L. *femella*, little woman] 1 A woman or girl-child. 2 Pert. to a woman. SEE *gentilina*, *femala*.

f. sex hormone. H. secreted by the ova which develops the uterus, vagina, and breasts at puberty, aids in regeneration of mucosa following menstruation, stimulates uterine contraction. SYN. *estrin*, *estrogen*.

fem'inism [L. *femina*, woman] 1 The female character. 2 Possession of female characteristics by the male. 3 Social movement for female independence

feminiza'tion [L. *femina*, woman]. Acquiring or adoption of female characteristics

fem'oral [L. *femur*, *femor-*, thigh]. Pert. to the thigh bone or femur

f. artery. One beginning at *ext. iliac a.*, terminating behind the knee as the popliteal a., on inner side of femur

f. reflex. Extension of knee and flexion of foot resulting from irritation of skin over upper ant. third of thigh

f. vein. Continuation of the popliteal vein upward toward the *ext. iliac vein*. SYN. *crural vein*.

fem'orocele [L. *femur*, thigh, + G. *kēlē*, hernia]. Femoral hernia.

femorotib'ial [" + *tibia*, pipe]. Rel. to the femur and tibia.

fe'mur [L.]. The thigh bone.

It extends from the hip to the knee and is the longest and strongest bone in the skeleton.

RS *calcar femorale*, *cavalry bone*, *cotyloid cavity*, *femoral*, *trochanter*.

THE FEMUR

1 Internal condyle. 2 Internal tuberosity. 3 Lesser trochanter. 4 Neck of femur. 5 Head. 6 Greater trochanter. 7 Intertrochanteric line. 8 External tuberosity. 9 External condyle

fen'es'tra (pl. *fenestrae*) [L. window] 1. An aperture frequently closed by a membrane. 2. An open area, as in the blade of a forceps

f. ovalis. An oval opening on the inner wall of the middle ear or tympanum leading to the vestibule, into which the base of the stapes fits. Also called *fenestra vestibuli*

f. rotunda. Leading into the cochlea. It is closed by a membrane, the secondary tympani membrane. Also called *fenestra cochleae*

fen'estrated [L. *fenestra*, window]. Having openings

f. membrane of Henle. Elastic tissue layer in intima of larger arteries

fenestra'tion [L. *fenestra*, window]. 1. Condition of having fenestra. 2. An operation in which an artificial opening is made into the labyrinth of the ear. Resorted to in cases of otosclerosis

ferment' [L. *fermentum*, from *fervere*, to ferment] 1. To decompose. 2. (fer-ment). A substance capable of producing fermentation in other substances. 3. A catalytic agent which is capable of inducing fermentation in substances with which it comes in contact. SYN. *enzyme*, *q. v.*

RS bromelin, cacozyne, chymase, cholesterase, enzyme, hydrolase, myopain, panceratin, steapsin, trypsin, trypsinogen, tyrosinase, yeast

fermentation [L] fermentum, leaven].

The oxidative decomposition of complex substances through the action of enzymes or ferments, produced by microorganisms. Bacteria, molds, and yeasts are the principal groups of organisms involved in fermentation. Fermentations of economic importance are those involved in the production of alcohol, lactic and butyric acids, and the baking of bread.

RS acid, acetic f., alcohol, autolysis, autolytic, azymic, digestion, enzyme, ferment

f. **acetic**. The production of acetic acid by the bacterial oxidation of ethyl alcohol under aerobic conditions.

f. **alcoholic**. The production of ethyl alcohol from carbohydrates usually through the action of yeasts.

f., **amylolytic**. The process of hydrolyzation of starch with the formation of sugar.

f., **autolytic**. One in the tissues which disintegrates them after death.

f. **butyric**. Formation of butyric acid from bacterial action on carbohydrates under anaerobic conditions.

f. **citric acid**. Formation of citric acid from action of molds on carbohydrates.

f., **invertin**. One that converts cane sugar into dextrose and levulose by invertin.

f., **lactic**. That which sours milk.

f. **lactic acid**. Formation of lactic acid from carbohydrates by action of lactic acid bacteria. The genera *Streptococcus* and *Lactobacillus* are the forms usually involved. Lactic acid is responsible for the souring of milk.

f. **oxalic acid**. Formation of oxalic acid from carbohydrates from the action of certain molds, esp. *Aspergillus*.

f. **propionic acid**. Formation of propionic acid from carbohydrates from action of certain bacteria.

f. **test**. A confirmation test for sugar in the urine. Gas forms in the fermentation tube if sugar is present.

f., **viscous**. Production of gelatinous material by different forms of bacilli.

fermentoid [f' + G *oidos*, form] A ferment without fermentive power.

fermentum (fer-men'tum) [L] Yeast, a ferment.

fern. A plant belonging to the class Filicinae, of the division Tracheophyta (formerly phylum Pteridophyta).

f. **male**. *Aspidium filix-mas*, from the rhizomes and stipes of which is obtained oleoresin, a polyhydric phenol, the most commonly used antihelmintic for all species of tapeworms.

-**ferous** [L] Suffix meaning producing.

ferrated. Combined with iron or containing iron.

ferri-, ferro- [L *ferrum*, iron] Prefix used to indicate presence of iron.

fer'ric [L *ferrum*, iron]. SYN *ferruginous* 1. Pertaining to or containing iron. 2. Denoting a compound containing iron in its trivalent form.

fer'ric ammonium cit'rate. USP Thin, garnet-red crystals, containing about 17% of iron.

USES: As a pleasant chalybeate, given in solution.

DOSAGE. 10-30 gr (0.6-2 Gm.).

f. **amm. cit. virides**. USP. Thin green scales or granules, containing approximately 15% iron.

USES: Intramuscularly, in anemia.

DOSAGE $\frac{1}{4}$ - $\frac{1}{2}$ gr (0.015-0.1 Gm.).

INCOMPATIBILITIES. Mineral acids, vegetable astringents, fixed alkalies.

f. **chloride** (FeCl₂) USP. Used principally in form of tincture.

ACTION AND USES. An astringent, used in application of throat, also as a hematinic.

DOSAGE 10 m (0.6 cc) freely diluted.

INCOMPATIBILITIES Tea (tannin), magnesium sulfate, sodium bromide.

ferricyanide. A salt of hydroferricyanic acid.

ferrihemoglobin. Methemoglobin, a reduced form of hemoglobin.

fer'rin. An iron-containing compound isolated from liver tissue.

ferrit'in. An iron-phosphorus-protein complex containing about 23% iron. It is formed in the intestinal mucosa by the union of ferric iron with a protein, *apoferritin*. Ferritin is the form in which iron is stored in the tissues, principally in the reticulo-endothelial cells of the liver, spleen and bone marrow.

ferrom'eter [L *ferrum*, iron, + G *metron*, measure] Device for estimating proportion of iron in the blood.

ferropectic (fer-o-pek'tik) [f' + G *pēxis*, fixation] Pert to fixing iron.

ferropexia (fer-o-pek'si-ā) [f' + G *pēxis*, fixation] Iron fixation.

ferroprotein. A protein combined with an iron-containing radical. Ferroproteins are important oxygen-transferring enzymes e.g. Warburg's enzyme cytochrome oxidase) q v.

ferrous (fer'ous) [L *ferrum*, iron] SYN *ferruginous* 1. Pertaining to iron. 2. Denoting a compound containing iron of a lower valence than three.

fer'rous carbonate (FeCO₃) Iron carbonate, used chiefly in form of Blaud's pills.

ACTION AND USES. To increase number of red blood cells, indicated in anemia.

DOSAGE 5-10 gr.

f. **iodide** (FeI₂) USP. An unstable preparation of iron used in form of syrup. Should be transparent, pale or yellowish-green liquid.

ACTION AND USES. Same properties as iron and iodide.

DOSAGE 15 m (1 cc).

INCOMPATIBILITIES Codeine, quinine.

f. **sulfate** (FeSO₄) USP. Green vitriol. Pale, bluish-green crystals.

ACTION AND USES. Internally, same as other preparations of iron, also in preparation of Blaud's pills.

DOSAGE 2-5 gr (0.13-0.32 Gm.).

INCOMPATIBILITIES Alkalies, chlorides, tannic acid, and oxidizing agents.

ferruginous (fēr-rū'jin-ūs) [L *ferrugo*, iron rust] SYN *chalybeate* 1. Pertaining to or containing iron. 2. Of the color of iron rust.

fer'rule [L *viriola*, little bracelet]. A band or ring of metal applied to the end of root or crown of a tooth to strengthen it.

fer'rum [L *iron*] SYMB: Fe, Iron.

fer'tile [L *fertilis*, from *ferre*, to bear] 1. Impregnated. 2. Capable of reproduction.

fertility (fūr-tīl'i-tī) [L *fertilis*, from *ferre*, to bear]. Quality of being productive or fertile.

fertiliza'tion [L *fertilis*, from *ferre*, to bear]. 1. Fecundation, impregnation of an ovum with the spermatozoon of the male, the male sex cell being carried in the seminal discharge.

This usually takes place in the fallopian tube. Spermatozoa have been found in the tube alive 48 hours after

the last coitus. On meeting the ovum the head of the spermatozoon penetrates it and its tail drops off. Cell division begins and the fertilized ovum enters the uterus.

2. Bor. The union of the male and female gametes. In higher plants, when the pollen tube enters the ovule, two gametes emerge, one uniting with the egg to form the zygote, from which the embryo develops; the other uniting with two endosperm nuclei to form a primary endosperm cell from which the endosperm (reserve food) develops. RS' chemiogenesis, coitus, conception, impregnation, ovum, spermatozoa, sterile, sterility.

fertilizin. A substance, possibly a glycoprotein, extracted from eggs, which when added to a suspension of sperms causes agglutination of the sperms. It probably aids in fertilization by fixing sperm to the egg membrane. It is complementary to *antifertilizin*, a substance extracted from sperm which agglutinates eggs.

fervescence (fer-ves'ens) [L. *fervere*, to grow hot] Increase of fever.

fes'ter [L. *fiatula*, ulcer]. To become inflamed and suppurate.

festina'tion [L. *festinare*, to hasten]. Morbid acceleration of gait seen in some nervous afflictions such as paralysis agitans.

festoön (fes-töön') [L. *festum*, decoration]. The wreathlike curvature of the gums around the necks of the teeth.

fe'tal [L. *foetus*, fetus]. Pert to a fetus.

f. circulation. The course of the flow of blood in a fetus. Significant differences between fetal and postnatal circulation are the presence in the fetus of (a) *umbilical arteries* and *vein* which carry blood to and from the placenta, (b) *foramen ovale*, an opening in the interatrial septum, and (c) *ductus arteriosus*, a vessel connecting the pulmonary artery with the aorta. The latter two enable the blood to by-pass the lungs which are nonfunctional in the fetus. See: Fig of fetal circulation p. F-13.

fetalism (fe'tal-izm) [" + G. *ismos*, condition]. Retention of fetal structures after birth.

feta'tion [L. *foetus*, fetus]. Pregnancy.

feticide (fe'ti-sid) [" + *caedere*, to kill]. Intentional destruction of fetal life.

fet'id [L. *fetere*, to stink]. Rank or foul in odor.

fetish, fetich (fe'tish) [Portug. *feticco*, from L. *factitius*, artificial]. That which

attracts one of the opposite sex to another, or which excites the libido.

It may be the hair, the lips, or the dress. Undue value set upon such a fetish is called "fetishism." q.v. Religious fetishism sees divine attributes in its idols and holy images. The fetish becomes a symbol. See *libido*.

fe'tishism [" + G. *ismos*, state] 1. Belief in some object as possessing power, or being capable of inspiring a stimulus. 2. Substitution for a normal love object (a person) of parts or possessions of such a one. Libido gratification from contact with articles of dress, braid of hair, etc.

A form of masochism which finds a sex stimulus at the sight of a woman's shoe or glove, or other article of apparel, or of some part of the body such as the hair, esp. the pubic hair. To the masochist, all such symbols are indicative of the woman's domination.

fetom'etry [L. *foetus*, fetus, + G. *metron*, measure] Estimation of size of the fetus or its head before delivery.

Development of Fetal Tissue

Ectoderm

1. Epidermis
2. Epithelium of:
External and internal ear
Nasal cavity.
Mouth.
Anus
Amnion, chorion
Distal part of male urethra.
3. Nervous tissue.

Mesoderm

1. Connective tissues.
2. Male and female reproductive tracts
3. Blood vessels, lymphatics
4. Kidneys, ureters, trigone of bladder.
5. Pleura, peritoneum, pericardium.
6. Muscles

Entoderm

1. Respiratory tract except nose.
2. Digestive tract except mouth and anus.
3. Bladder except trigone.
4. Male urethra, proximal portion.
5. Female urethra.

fetoplacental [“ + *placenta*, a flat cake, from G. *plakous*]. Pert. to the fetus and its placenta.

fe'tor [L. *fetere*, to stink]. Stench; an offensive odor.

f. ex. ore. Offensive breath, halitosis

f. oris. Halitosis

fo'tus [L. *foetus*]. The child *in utero* after the 3rd month of development

fetus. 1 The latter stages of the developing young of an animal within the uterus or within an egg 2 In humans, the child *in utero* from the third month to birth

f. amorphus. A shapeless fetal monster, one scarcely recognizable as a fetus

f. calcified. A lithopedion, *qv*

f. compressus. A *f. papyraceous*, *qv*
f. in feto. Condition in which a small imperfect fetus called *parasite*, is contained with the body of another fetus, the *autostic*

f. mummified. A dead fetus which was assumed a mummified form upon failure of resorption to occur.

f. paper doll . . . f. papyraceous, qv

f. papyraceous. In twin pregnancy, the dead fetus pressed flat by the development of the living twin.

RS. *ambloma*, *amnion*, *amniotic sac*, *bag-of-waters*, *capitones*, *cephalotripsy*, *crithonosis*, *flrity*, *lanugo*, *vernix caseosa*, *viable*.

fe'ver [A S. *fēter*, from L. *fervere*, to grow warm] 1 Pyrexia, or elevation of temperature above normal, 98.6° F 2 A disease which is characterized by an elevation of body temperature, such as typhoid fever, yellow fever

CLASSIFICATION (Wunderlich) (a) Subfebrile, 99.5°-100.4°; (b) slightly febrile,

FETAL CIRCULATION

1. Placenta 2. Umbilical cord 3. Left hypogastric artery 4. Bladder 5. Umbilicus 6. Right lobe of liver 7. Liver 8. Umbilical vein 9. Ductus venosus 10. Left lobe of liver 11. Right atrium 12. Right lung 13. Superior vena cava 14. Right subclavian artery 15. Right common carotid 16. Left common carotid 17. Arch of the aorta 18. Aorta 19. Pulmonary artery 20. Auricle or left atrium 21. Left ventricle 22. Right ventricle 23. Aorta 24. Inferior vena cava 25. Aorta 26. Common iliac arteries 27. External iliac artery.

100.4°-101.3°; (c) moderately febrile, 101.3°-103.1°; (d) decidedly febrile, 103.1°-104°; (e) highly febrile, 103.1° A. M., 104.9° P. M.; (f) hyperpyretic, above 106°.

Error. In the young, moderate increase in body temperature may result from minor causes and is of less significance than in the adult. After childhood, fevers may be caused by (a) a hot environment or the generation of body heat by physical means, (b) neurogenic factors such as injury to the diencephalon or mid-brain. The diencephalon contains reflex centers regulating heat loss. (c) dehydration such as occurs after excessive diuresis, (d) chemical substances such as caffeine or cocaine when injected into the blood stream, (e) the injection of proteins or their products, or the breakdown of necrotic tissue. These are the *aseptic fevers* such as follow surgery or coronary occlusion. (e) infectious diseases or inflammation. Fever is the result of the breakdown of bacterial proteins or toxins liberated by the disease organisms which

tivity of the toxin giving rise to the fever, (c) to the rapidity of tissue change, (d) to the extent of circulatory disturbance, and (e) to the previous habits of the individual.

f., induced. That artificially produced to favorably modify the course of a disease, notably paresis. Sustained fever of 105° F., or even higher, maintained for 6 to 8 or 10 hours may be induced by the use of medical diathermy, etc. The production of malaria, and of rat-bite fever permit of a series of fever-reactions of fairly long duration, while protein injections are capable of arousing only acute and, at times, dangerous febrile reactions.

f., intermittent. As in malaria and Malta fever with minimum normal or subnormal temperature, and with marked diurnal variation.

f., remittent. As in typhoid fever, septic fever, or remittent fever, with minimum temperature above normal, and with marked diurnal variation.

f., septic. One due to septic matter in the body.

affect the heat-regulating centers (f) severe hemorrhage.

PERIODS. *Invasion or onset of fever.* While temperature is rising and until maximum is reached, gradual, as in typhoid, or sudden, as in scarlet fever. *Fastigium or stadium.* When the fever is more or less stationary with possible variations often reaching the maximum. *Defervescence:* During which the fever declines until normal. When sudden it is known as *crisis*, as in *lobar pneumonia*, when gradual, *lysis*, as in *measles*.

Sym. Face flushed; hot, dry skin; anorexia, headache, nausea and sometimes vomiting, constipation and sometimes diarrhea; aching all over, scant, highly-colored urine, tissue waste. Delirium possible if temperature is over 105° F. or with some, less. Convulsions may follow, esp. in children; coma.

f., childbed. Puerperal sepsis. An infection of the genital tract following childbirth. **Sx:** *puerperium*.

f., continuous. As in scarlet fever, typhus, or pneumonia, in which there is a slight diurnal variation.

f., delirium. It corresponds to (a) the degree of temperature, (b) to the ac-

fever, words pert. to: adustion, afebrile; ague, alexipyretic, algid, pernicious; amphibolia, anetis, antepyrctic, antifebrile, antipyresis, apyretic, apyrexia; apyrogenetic, athermic, athermous, Baruch's sign, cauma, crisis, defervescence, dengue, febricula, febrificant; febrifuge, iervescence, food f., gastric f.; hectic, hectic flush, intermittent f.; lysis; marasmopyria; name of fever; pulse, "pyr-" words, quartan, quintan; quotidian, respiration, subsultus; synochus, temperature vesicular, worm.

f'at (pl. *f'ant*) [L] "Let there be made," a term used in writing prescriptions.

f'iber [L *fibra*]. Threadlike or filmlike element, as a nerve fiber. A neurone or the axonal portion of a neurone.

RS *chondrosfibroma, cilia, cimbria, cingula, "fibr-" words, filament, filamentous, filiform, filum.*

f., accelerator. One causing increased heart pulsations.

f., afferent. One carrying incoming impulses to nerve cells.

f., efferent. One carrying outgoing impulses.

f., epicritic. One carrying sensations of heat and cold, making possible tac-

tile discrimination and light pressure sensation, each according to its separate fibers.

f., inhibitory. One causing slower heart action.

f., medullated; f., myelinated. Nerve fiber in which axis cylinder is sheathed in myelin.

f., nonmedullated; f., unmyelinated. Nerve fiber in which there is no myelin sheath bet axis cylinder and neurilemma.

f., nerve. The part of a nerve cell which carries impulses. **See:** nerve.

f., protopathic. One causing sensation of heat, cold, or pain.

f. bra [L.] A fiber.

f. bralbu'min [' + *albumen*, white of egg]. Globulin

f. bre'mia (fi-bre'mi-ä) [' + *G. aima*, blood]. Fibrin formed in the blood, causing embolism or thrombosis. **Syn** *mosemia*.

f. bril [L. *fibrilla*, little fiber]. A small fiber. A very small filamentous structure, oftentimes the component of a cell or a fiber

f. muscle. A myofibril, an extremely minute fibril found within the cytoplasm of smooth muscle cells and in the sarcoplasm of striated and cardiac muscle fibers.

f. nerve. A neurofibril; delicate fibrils found in the cell body and processes of a neuron

fibril'la (pl *fibrillae*) [L.]. A fibril or small fiber

fibril'lar, fibrillary [L. *fibrilla*, little fiber]. Pert. to, or consisting of, fibrils

fibrillated [L. *fibrilla*, little fiber]. Composed of minute fibers. **Syn** *fibrillar, fibrous*

fibrillation (fi-bril-a'shun) [L. *fibrilla*, little fiber] 1 The formation of fibrils. 2 Quivering of muscular fibers 3 Tremor or rapid action of the heart

f. auricular. Extremely rapid, incomplete, contractions of the atria resulting in fine, rapid, irregular, and uncoordinated movements Also called *atrial f.*

f. ventricular. A condition similar to auricular fibrillation resulting in rapid, tremulous, and ineffectual contractions of the ventricles. May result from (a) mechanical injury to the heart, (b) occlusion of coronary vessels, (c) effects of certain drugs such as excess of digitalis or chloroform, and (d) electrical stimuli

fibrillolysis (fi-bril-ol'is-is) [' + *G. lysis*, dissolution]. Dissolution of fibrils.

fibrillolytic [' + *lysis*, dissolution]. Dissolving fibrils.

fibrin [L. *fibra*, fiber] A whitish, filamentous protein formed by the action of thrombin on fibrinogen. The conversion of fibrinogen, a hydrosol into fibrin, a hydrogel is the basis for the clotting of the blood The fibrin is deposited as fine interlacing filaments in which are entangled red and white cells and platelets, the whole forming a coagulum or clot

RS: blood clot, clotting, fibrinogen, prothrombin, thrombin.

f. ferment. The substance in shed blood that converts fibrinogen to fibrin. **Syn** *thrombin*.

f. film. A pliable, elastic, film prepared from fibrin isolated from human blood plasma. Used in neurosurgery as a substitute for the dura mater

f. foam. A spongelike substance prepared from human fibrin When impregnated with thrombin it is used

in surgery as a hemostatic agent. Especially useful in neurosurgery and in injuries to parenchymatous organs. It is slowly absorbed.

fibrination (fi-brin-a'shun) [L. *fibra*, fiber]. Abnormal amt. of fibrin in the blood.

fibrinemia (fi-brin-e'mi-ä) [' + *G. aima*, blood]. Presence of fibrin in the blood. **Syn** *fibremia*.

fibrinogen (fi-brin'o-jen) [' + *G. gennan*, to produce] A protein present in the blood plasma which through the action of thrombin in the presence of calcium ions is converted into fibrin; this brings about the clotting of the blood **See:** blood, clotting of, coagulation

fibrinogen'ic, fibrinog'enus [' + *G. gennan*, to produce]. Producing fibrin.

fibrin'ogenop'en'ia. Reduction in the amount of fibrinogen in the blood usually the result of a liver disorder

fibrinoid [' + *G. eidos*, form] Resembling fibrin

f. material. A fibrous substance which develops in the placenta, increasing in quantity as the placenta becomes older Its origin is attributed to the degenerating decidua and trophoblast Its forms an incomplete layer in the chorion and decidua capsalis and also occurs in the form of small irregular patches on the surface of the chorionic villi In late pregnancy, the material may have a striated or canalized appearance to which the term *canalized fibrinoid* is applied

fibrinolysin (fi-brin-ol'is-in) [' + *G. lysis*, dissolution] A substance formed in the blood by pathogenic streptococci which dissolves fibrin

fibrinol'ysis [' + *lysis*, dissolution] Due to the action of a proteolytic enzyme which converts insoluble fibrin into soluble substances

fibrinolytic [' + *lysis*, dissolution]. Pert. to the splitting up of fibrin

fibrinop'en'ia [' + *G. penia*, poverty]. Fibrin and fibrinogen deficiency in the blood

fibrinoplas'tic [' + *G. plassem*, to form]. Of the nature of fibrinoplastin.

fibrinopu'ulent [' + *purulentus*, festering]. Consisting of pus and fibrin

fibrinos'copy [' + *G. skopein*, to examine]. Physical and chemical examination of the fibrin of blood clots and exudates **Syn** *inoscopy*.

fibrino'sis [' + *G. ósis*]. Excess of fibrin in the blood.

fibrinous (fi-brin-us) [L. *fibra*, fiber] Pert. to, of the nature of, or containing, fibrin

fibrinuria (fi-brin-u'ri-ä) [' + *G. ouron*, urine]. Passage of fibrin in the urine.

fibro- [L.]. Prefix. Relation to fibers or fibrous tissues.

fibroadenia (fi-bro-a-de'ní-ä) [L. *fibra*, fiber, + *G. aden*, gland]. Fibrous degeneration of glandular tissue

fibroadenoma (fi-bro-ad-e-no'mä) [' + ' + *óma*, tumor] Adenoma with fibrous tissue forming a dense stroma

fibroadip'ose [' + *adeps*, adip-, fat]. Being fibrous and fatty

fibroangio'ma [' + *G. aggeton*, vessel, + *óma*, tumor]. A fibrous tissue angioma

fibroareolar (fi-bro-ar-e-o-lar) [' + *areola*, little space]. With fibrous tissue and areolar arrangement.

fibroblast [' + *G. blastos*, germ]. Any cell or corpuscle from which connective tissue is developed. **Syn:** *desmocyte, fibrocyte*.

fibroblast. SYN: *fibrocyte*, *desmocyte*. A type of cell found in nearly all forms of connective tissues. Connective tissue fibers are formed either within fibroblasts or from material outside of but close to and under the influence of fibroblasts.

fibroblastoma (fī-bro-blas-to'mă) [' + " + *ōma*, tumor]. Tumor of connective tissue or fibroplastic cells.

fibrobronchi'tis [' + G. *brochia*, air tubes, + *itis*, inflammation]. Croupous bronchitis.

fibrocarcino'ma [' + G. *karkinos*, cancer, + *ōma*, tumor]. A carcinoma in which the trabeculae are resistant and thickened with granular degeneration of the cells.

f. cysticum. A f. with enclosed cysts **fibrocartilage** [' + *cartilagō*, gristle]. A type of cartilage in which the matrix contains thick bundles of white or collagenous fibers. Found in the intervertebral discs.

fibrocell'ular [' + *cellula*, little cell]. Both fibrous and cellular. SYN *fibroareolar*.

fibrochondritis (fī'bro-kon-dri'tis) [' + G. *chondros*, cartilage, + *itis*, inflammation]. Inflammation of fibrocartilage.

fibrochondro'ma [' + " + *ōma*, tumor]. Tumor of fibrous tissue and cartilage.

fibrocyst [' + G. *kystis*, cyst]. A fibrous tumor that has undergone cystic degeneration or one which has accumulated fluid in the interspaces.

fibrocystic (fī-bro-sis'tik) [' + G. *kystis*, cyst] 1. Consisting of fibrocysts. 2. Fibrous with cystic degeneration.

f. disease of pancreas. SEE *cystic fibrosis*.

fibrocysto'ma [' + " + *ōma*, tumor]. Fibroma combined with cystoma.

fibrocyte (fī'bro-sit) [' + *kytos*, cell]. A fibrous tissue cell. SYN *desmocyte*, *fibroblast*.

fibroelas'tic [' + G. *elastikos*, elastic]. Pertaining to connective tissue containing both white, nonelastic, collagenous fibers and yellow elastic fibers.

fibroenchondroma (fī-bro-en-kon-dro'mă) (pl. *fibroenchondromata*) [' + G. *en*, in + *chondros*, cartilage, + *ōma*, tumor]. An enchondroma containing fibrous elements.

fibroglio'ma [' + " + *ōma*, tumor]. A fibroma partly glioma.

fibroid [' + G. *eidōs*, form]. 1. Containing or resembling fibers. SEE *degeneration*. 2. A colloquial term for fibroma, esp. fibroma of the uterus. SYN *fibroma*.

f., interstitial. Tumor in muscular wall of uterus which may grow inward and form a *polypoid fibroid*, or outward and become a *subperitoneal fibroid*.

f., uterine. The cause is unknown as is the case of other tumors.

Testosterone propionate and progesterone have inhibited their development, experimentally.

fibroidectomy (fī-broi-dek'to-mī) [' + " + *ektomē*, excision]. Surgical removal of a fibroid tumor.

fibrolipo'ma [' + G. *lipos*, fat, + *ōma*, tumor]. A lipoma having much fibrous tissue.

fibro'ma (pl. *fibromata*) [' + G. *ōma*, tumor]. A fibrous, encapsulated, connective tissue tumor.

A fibroma is irregular in shape and slow in growth. Consistency firm. Painless except by pressure or cystic degeneration. May be found in the periosteum. May affect the jaws, the occiput, pelvis, vertebrae, ribs, long bones and sternum.

f. of breast. A benign tumor, non-ulcerative and painless.

f., intramural. Located in muscle tissue of uterus bet. peritoneal coat and endometrium.

f. molluscum pedunculum of vulva. A pedunculated fibroid tumor of the vulva.

f., submucous. Encroaching upon endometrial cavity; sessile or pedunculated.

f., subserous. Lying beneath peritoneal coat of uterus, often pedunculated.

f., uterine. A fibroid tumor of the uterus.

Path. A benign tumor varying in size from a millet seed to a size large enough to fill the entire abdominal cavity. May be single or multiple. These tumors are completely encapsulated by a fibrous connective tissue capsule in which the blood vessels that supply the tumor are found. They are subjected to numerous benign degenerations, such as necrobiotic changes (red and gray degeneration), hyaline changes, telangiectatic and lymphangiectatic changes, calcareous degeneration, fatty degeneration, and infection. Occasionally, a fibroid will show sarcomatous degeneration.

Sym. In the white race, fibromata rarely cause symptoms before the age of 30, but in the colored they may appear at any time during the active sex life. Although the cardinal symptoms of fibroid tumors are supposed to be dysmenorrhea, menorrhagia, and leukorrhea, these symptoms are found only infrequently and the symptomatology is directly related to the location of the tumors in the uterus. Following this contention, tumors that encroach upon the bladder region cause frequency and dysuria,* those pressing on the rectum cause a rectal tenesmus,* those that encroach upon the endometrium cause menorrhagia* and dysmenorrhea,* and very large subserous growths may be absolutely symptomless.

Treatment. Fibromata producing no symptoms should be left in place and the patient kept under observation. If unusually rapid growth is evidenced, they should be removed. Tumors that produce symptoms need intervention. The type of treatment depends upon age of patient, location, and size of tumor, and symptoms present. In general, wherever possible, conservation of the menstrual function should be considered. Tumors larger than a fetal head are better treated by surgical removal than by radiotherapy. Fibromectomy is clearly indicated in patients who hope subsequently to become pregnant.

SEE *fibrosis uteri*.

fibromatosis (fī'bro-mă-to'sis) [L. *fibra*, fiber, + G. *ōma*, tumor, + *ōsis*] SYN: *fibrosis*. The development simultaneously of many fibromas.

fibromatous (fī-brō'mă-tūs) [' + G. *ōma*, tumor]. Pert. to, or of the nature of, a fibroma.

fibromectomy (fī-bro-mek'to-mī) [' + " + *ektomē*, excision]. Removal of a fibroid tumor.

fibromembranous [' + *membrana*, web]. Having both fibrous and membranous tissue.

fibromus'cular [' + *musculus*, muscle]. Consisting of muscle and connective tissue.

fibromyl'itis [' + G. *mys*, *my-*, muscle, + *itis*, inflammation]. Inflammation of

the muscular system followed by fibrous degeneration of muscular fibers and atrophy.

fibromyoma (fi-bro-mi-o'mă) [' + " + ōma, tumor]. 1. Fibrous tissue myoma. 2. GYN A fibroid tumor of the uterus that contains more fibrous than muscle tissue.

fibromyomectomy (fi-bro-mi-o-mek'to-mī) [' + " + ektōmē, excision] Removal of a fibromyoma from the uterus, leaving that organ in place

fibromyositis [' + " + -itis, inflammation] Chronic muscular inflammation with hyperplasia of connective tissue SYN *myositis*.

fibromyotomy (fi-bro-mi-ot'o-mī) [' + " + tomē, incision] Opening of a fibroid tumor

fibromyxoma (fi-bro-miks-o'mă) [' + G. *myxa*, mucus, + ōma, tumor] A fibroma that has partially undergone myxomatous degeneration

fibromyxosarcoma [' + " + sarx, flesh, + ōma, tumor] 1 A sarcoma containing fibrous and myxoid tissue 2 A mucoid degenerated sarcoma

fibroneuroma (fi'bro-nu-ro'mă) [' + G. *neuron*, nerve, + ōma, tumor] A mixed neuroma and fibroma SYN *inoneuroma*

fibrosteoma (fi'brō-ōs-tē-ō'mă) [' + G. *osteon*, bone, + ōma, tumor] Tumor containing bony and fibrous elements

fibropapilloma (fi'bro-pā-pī-lo'mă) [' + *papilla*, nipple, + G. ōma, tumor] A mixed fibroma and papilloma sometimes occurring in the bladder

fibropericarditis [' + G. *peri*, around, + *kardia*, heart, + -itis, inflammation]. Fibrous pericarditis

fibropia'sia [L *fibra*, fiber, + G. *plasis*, a molding] The development of fibrous tissue, as in wounds

fibroplastic [' + G. *plassein*, to form]. Giving formation to fibrous tissue

f. tumor. Small spindle-celled sarcoma

fibroplastin (fi-bro-plas'tin) [' + G. *plassein*, to form] A globulin in blood serum and other body fluids. SYN *fibrinoplastin*, *paraglobulin*.

fibrosammo'ma [' + G. *psammos*, sand, + ōma, tumor] A tumor containing fibromatous and psammomatous tissue

fibropurulent [' + *purulentus*, festering]. Pus containing flakes of fibrous tissue

fibrosarcoma [' + G. *sarx*, flesh, + ōma, tumor] A spindle-celled sarcoma containing much connective tissue

fibrosis (fi-bro'sis) [' + G. *ōsis*]. Abnormal formation of fibrous tissue.

f., arteriolo-capillary. Arteriolar and capillary fibroid degeneration

f. of lungs. Formation of scar tissue in connective tissue framework of lungs following inflammation, pneumonia, and in pulmonary tuberculosis

f. uteri. A condition of the uterus manifested by excess of fibrous tissue, predominating symptom being menorrhagia.*

The uterus may be large or small. The endometrium* may be normal, atrophic, or in the larger number show hyperplastic and hypertrophic glandular and interstitial endometritis of vascular origin.

Error. Not definitely known, but it is seen in patients with syphilis, those who have had a number of pregnancies, and in conditions where venous stasis has been present over a long period, such as in chronic retroversion with or without infection and procidentia.

TREATMENT. May be surgical or by means of x-ray or radium.

fibrositis (fi-bro-si'tis) [' + G. *itis*, inflammation] Nonsuppurative inflammation of white fibrous connective tissue anywhere in the body

f. bursal. F of a bursa, bursitis

f. intramuscular. F of fibrous sheaths of muscles, muscular rheumatism, interstitial myositis

f. periarticular. F of the fibrous tissue of the articular capsule

f. perineural. F of the fibrous sheath surrounding nerves, esp., the sciatic nerve, sciatica

f. subcutaneous. F of the subcutaneous tissue, panniculitis

fibrous (fi'brus) [L *fibra*, fiber] Composed of or containing fibers, as in contradistinction to (osseous) bony composition

fibrotic [L *fibra*, fiber] Marked by or pert to fibrosis

fibula [L pin] BNA Calf bone (*peroneal bone*) One of the longest and thinnest bones of the body. The outer and smaller bone of the leg from the ankle to the knee, articulating above with the tibia, and below with the tibia and astragalus. See *peroneal*, *peroneus*, *tibia*.

fibular [L *fibula*, pin] Rel to the fibula.

fibulocalcaneal (fi'b'u-lo-kal-ka'ne-al) [' + *calcaneus*, pert. to the heel] Pert to the fibula and calcaneus, or *os calcis*

field [A.S. *feld*] A specific area in relation to an object

f., auditory. The hearing or distance within the limit of hearing

f. of vision. That portion of space which the fixed eye can see

fifth cranial nerve. Trigeminal or trifacial n. q.v.

f. ventricle. Space separating layers of septum lucidum

fig [L *fecus*, fig] A fruit of *Ficus carica*. AV SERVING (dried) 45 Gm Pro 1.8, Fat 0.1, Carbo 33.4 Vit A+, B+, G+ (Fresh): 75 Gm. Pro 1.1, Carbo. 14.1 Vit A+ to ++, B+, C variable, G+. ASH CONST (dried) Ca 0.162, Mg 0.071, K 0.964, Na 0.046, P 0.116, Cl 0.043, S 0.056, Fe 0.0030 ASH CONST (fresh) Ca 0.053, Mg 0.022, K 0.303, Na 0.012, P 0.036, Cl 0.014, S 0.010 See *dates*, *figs*.

figure. A body, form, shape, or outline

f. achromatic. In mitosis or meiosis, the spindle fibers and the asters

f. chromatic. The chromosomes or the chromatin material

fila (fi'lă) [L. *filum*, thread]. Plural of *filum*, q.v.

f. coronaria. A fibrous band extending from the base of the medial cusp of the tricuspid valve to the aortic annulus

f. olfactoria. Groups of fibers consisting of the axons of olfactory cells which form the olfactory nerves. These pass from the olfactory epithelium through the cribriform plate and terminate in the olfactory bulb

filaceous (fi-lă'she-us) [L. *filum*, thread]. Composed of filaments. SYN *filamentous*

filament [L. *filum*, thread]

f. axial. A fine filament forming the central axis of the tail of a spermatozoan

filamentous [L. *filum*, thread] BROT Made up of long, interwoven or irregularly placed filaments

Filaria (fi-lă'ri-ă) [L. *filum*, thread]. Term formerly applied to a genus of nematodes belonging to the superfamily Filarioidea.

- F. bancrofti.** *Wuchereria bancrofti*, q v. *loa, loa, q v.*
F. medinensis. *Dracunculus medinensis*, q v.
F. sanguinis hominis. *Wuchereria bancrofti*, q v.
- filaria.** A long filiform nematode belonging to the superfamily Filarioidea. The adults live in vertebrates including man, inhabiting man, being found in the lymphatic vessels and lymphatic organs, circulatory system, connective tissues, esp. subcutaneous tissues, and serous cavities. Typically, the female produces larvae called *microfilariae* which may be sheathed or sheathless. These reach the peripheral blood or lymphatic vessels where they may be ingested by a blood sucking arthropod (mosquitos, gnats, flies) in the intermediate host, they transform into a *rhabditoid larva*, which metamorphoses into an infective filariform larvae. These migrate to the proboscis and are deposited in or on the skin of the vertebrate host. The species of filaria which are parasitic in man all belong to the family *Acanthocheilone-matidae*.
- filarial** [L. *filum*, thread]. Pert. to or caused by filariae.
- filariasis** (fil-ar-i-as-is) [L. *filum*, thread]. A chronic disease due to one of the filariae.
- filicidal** [“ + *caedere*, to kill]. Pert. to that which is destructive to filaria.
- Filaria's disease.** An exanthematous affection resembling scarlatina analogous to German measles.
- F.'s spots.** Koplik's spots.
- fil'bert.** A small nut. AV. SERVING: 35 Gm. Pro. 55, Fat 22.9, Carbo. 4.5 Ca 0.287, Mg 0.140, K 0.618, Na 0.019, P 0.354, Cl 0.067, S 0.198, Fe 0.0041. Vit. B+++, G+++. A and C lacking. FUZZ VALUE 15 Gm. = 100 cal.; 1 lb. = 3040 cal.; 100 Gm. = 667 cal.
- fil'iform** [L. *filum*, thread, + *forma*, form]. 1. Biol. Pert. to a growth that is uniform along the inoculation line in stab or streak cultures. 2. Hairlike, filamentous.
- f. papillae.** Smallest tongue papillae.
- fil'ipuncture** [“ + *punctura*, a piercing]. Insertion of a slender wire or thread in an aneurysm to induce coagulation.
- fil'let** [L. *filum*, thread]. 1. A bandage shaped like a loop. 2. Two bundles of sensory fibers in the medulla, pons, and brain SYN *lemniscus*.
- f. of corpus callosum.** Fibers forming white substance of the gyrus fornicatus.
- f., olivary.** Nerve fasciculus surrounding olivary body.
- fill'ing** (fil'ing) [A.S. *fyllan*, to fill]. 1. The material for insertion in a tooth cavity; usually gold, amalgam, or cement. 2. The operation of filling tooth cavities.
- film.** 1. A thin skin, membrane, or covering. 2. A thin sheet of material, usually cellulose, coated with a light sensitive emulsion used in taking pictures. 3. In microscopy, a thin layer of blood or other material spread on a slide or cover slip.
- fil'opressure** [L. *filum*, thread, + *pressura*, pressure]. Pressure on a blood vessel caused by a ligature.
- filovari-cosis** (fil'o-var-ik-o'sis) [“ + *varix*, a dilated vein, + G. *osis*]. Dilatation or thickening of the axis-cylinder of a nerve fiber.
- filter** [L. *filtrare*, to strain through]. 1. To pass a liquid through any porous substance which holds solid particles.
2. Device for filtering liquids, light rays, or radiations. SEE: *absorption, osmosis*.
- f. bed.** Large scale filter to purify the water supply.
- f., Berkefeld.** One of diatomaceous earth which will not pass bacteria.
- f., infrared.** Cell of water and red glass which confines radiation to spectral region from 600 to 1400 mu, red glass alone from 600 to 4000 mu.
- f., Kitasato's.** Suction variety of filter, using porcelain dilator.
- f., Pasteur-Chamberlain.** Filters of unglazed porcelain capable of retaining bacteria and some viruses, a force either pressure or suction is required to force or draw the liquid through the filter.
- f. paper.** Coarse form of paper used in filtering solutions.
- fil'ters** [L. *filtrare*, to strain through]. In radiation therapy, screens or various substances which permit passage of some wave lengths while absorbing others.
- fil'trable** [L. *filtrare*, to strain through]. Capable of passing through the pores of a porcelain filter, through which bacteria cannot pass.
- fil'trate** [L. *filtrare*, to strain through]. The fluid which has been passed through a filter. The residue is the *precipitate*.
- f. glomerular.** The fluid which passes from the blood through the capillary walls of the glomeruli of the kidney. It is a protein-free plasma from which urine is formed.
- fil'tra'tion** [L. *filtrare*, to strain through]. The process of straining through a filter. SEE: *absorption, filter*.
- f. of roentgen rays.** The absorption of some of the relatively longer wave lengths of roentgen radiation by placing in the path of the rays some absorbing medium, such as aluminum, copper, or zinc.
- filtratometer** (fil-tra-tom'et-er) [“ + G. *metron*, measure]. Device for measuring gastric filtrates.
- fil'trum** [L.]. A filter.
- fil'um** [L.]. A threadlike structure.
- f. terminale.** A long, slender filament forming end of spinal cord.
- fimbria** (fim'bri-ä) (Pl. *fimbriae*) [L. fringe]. Any structure resembling fringe.
- f. ova'rica.** The longest fringelike extremity of the fallopian tubes, extending from the infundibulum close to the ovary.
- f. tubae.** Fringelike portion at abdominal end of the fallopian tubes.
- fimbriate** (fim'bri-ät) [L. *fimbria*, fringe]. 1. Biol. Having fingerlike projections. 2. Fringed.
- f. body.** Corpus fimbriatum.
- fim'briated** [L. *fimbria*, fringe.] Fringed.
- fimbria'tum** [L. fringed] 1. Outer end of the oviduct. 2. White band on edge of the cornu inferius of lateral ventricle of the brain. SYN *corpus fimbriatum*.
- fim'briocèle** (fim'bri-o-sél) [L. *fimbria*, fringe, + G. *kêlē*, hernia]. Hernia including the fimbriated portion of the oviduct.
- fin'ger** [A.S.]. A digit of the hand.
- f., dislocation of the.** First, be certain that there is no fracture. Dislocations occur only at a joint. If there has been a crushing injury, assume that a fracture is present until an x-ray has been made. Dislocations of a finger are usually easily diagnosed and quite easily reduced. They may be caused by blows, falls, and similar causes.

If there is no fracture, it may be treated by asking the patient to steady and support his own wrist (or getting somebody else to do so) for countertraction. Then take hold of the finger beyond the dislocated muscles and tendons, and with the other (free) hand slip the dislocated bone into place.

This is to be followed by an application of a splint from the tip of the finger well into the palm of the hand. This may be made of cigar box wood, wire, tongue depressors, heavy cardboard, etc.

Do not under any circumstances attempt to reduce a dislocation of the thumb joint nearest to the palm of the hand.

f. print. An imprint made by the cutaneous ridges of the fleshy portion of the distal end of a finger. Finger prints are used for purposes of identification.

f. stall. A finger cot.

finger, words pert. to: acroataxia, acrodynia, arachnoidactyly, baseball f., campitodactylia, dactyl, dactylus, digit, digitate, nail, phalanges, phalanx.

Finsen light. Blue and violet light with heat waves excluded. Used in treatment of lupus and other skin affections.

fire [*AS fyr*]. Flame producing heat.
f. emergencies. If a person's clothing catches fire, he should be rolled in a rug or blanket to smother flames. It may be necessary to tip him to prevent his running about, as this only fans the flames.

If patient is trapped in a burning building, this particular room should have doors closed to prevent cross breezes from increasing the fire. The window should be opened if patient is to be rescued by lowering him, using any appropriate carry. Do not open any door more than a few inches to ascertain possibility of escape. A burst of flame or hot air may push door in and asphyxiate anyone in the room. Wet cloths or towels should be held over mouth and nostrils to keep out smoke and gases. *SEE burn, flame, gases, transportation*.

f., St. Anthony's. Erysipelas. Also called *St. Francis' fire*.

first aid. The administration of emergency assistance to individuals who have been injured or otherwise disabled, prior to the arrival of a doctor, or transportation to a hospital or doctor's office. In no sense assume to be the substitution for medical care.

first aid, words pert. to: antidote, apoplexy, artificial respiration, asphyxia, bites, burn, coma, dislocation, drowning, emetic, fainting, flames, food poisoning, foreign bodies, fracture, freezing, frost bite, fumes, gases, insect bites, laceration, name of poison, poison, shock, snake bite, unconsciousness.

first cranial nerve. Olfactory n., q.v.

fish poisoning. A form of food poisoning caused by eating poisonous fish. Some fish are inherently poisonous, others become poisonous through decomposition, infection, by feeding on other poisonous forms, or by poisonous metabolic substances produced during the spawning season.

The symptoms are very similar to those of meat poisoning, but perhaps more intense. Headache, vertigo, thirst, indigestion, vomiting, cramps, diarrhea and skin eruptions. Convulsions may occur.

SHELL FISH: The onset is very rapid, but seldom are there gastrointestinal symptoms. Collapse may ensue and death occur in a few hours. Other fish poisonings only differ in degree in gastrointestinal symptoms from meat poisoning.

TREATMENT: Emetics, purgatives, and stimulants. Medical treatment for convulsions. Follow treatment with oatmeal or barley water, esp. if nauseated; later, water with a pinch of salt. *SEE food poisoning, meat poisoning*.

fish skin. A condom made of a fish bladder.

f. s. disease. A disease of the skin characterized by increase of the horny layer and deficiency of the skin secretions. *SYN ichthyosis, q.v.*

fission (*fish'un*) [*L fissio*, from *findere*, to cleave]. 1 Splitting into 2 or more parts. 2 A method of asexual reproduction seen in bacteria, protozoa, and other lower forms of life in which the cell or the body divides into two or more parts each of which develops into a complete individual.

fissip'arous [*L fissio*-, *findere*, to cleave, + *parere*, to bring forth]. Reproducing by fission.

fissura (*fis-u'rā*) (*pl fissuræ*) [*L*]. Fissure. *SYN cleft, sulcus*.

fis'ural [*L fissura*, fissure]. Pertaining to a fissure.

fissure (*fish'ur*) [*L fissura*]. 1 A groove or natural division, cleft or slit, deep furrow in the brain, liver, spinal cord, and other organs. 2 Ulcer or crack-like sore. 3 A break in the enamel of a tooth.

f. anal. A linear ulcer on the margin of the anus.

f., auricular. F of petrous portion of the temporal bone.

f. of Bichat. A fissure below the corpus callosum in the cerebellum.

f., Broca's. Fissure encircling the 3rd left frontal convolution.

f., Burdach's. F connecting lateral surface of insula and inner surface of operculum.

f., calcarine. F extending from the cerebri occipital end to the occipital f.

f. callosomarginal. A conspicuous sulcus in mesial surface of cerebral hemisphere running above and concentric with the curved upper surface of the corpus callosum.

f., central. *SEE Rolando's f.*

f., Cleverger's. F the inferior occipital fissure.

f. collateral. F on inferior surface of cerebral hemisphere separating subcalcarine and suboccipital gyri.

f., Henle's. Connective tissue areas bet the muscular fibers of heart.

f., hippocampal. F of brain extending from post. part of corpus callosum to the tip of temporal lobe.

f. inferior orbital. A fissure at the apex of the orbit through which pass the infraorbital blood vessels and maxillary branch of the trigeminal nerve; the sphenomaxillary fissure.

f., interparietal. F separating parietal convolutions of the brain.

f. longitudinal. A fissure on the lower surface of the liver.

f., occipitoparietal. The fissure bet. the occipital and parietal lobes of the brain. Upper and lower eyelids.

f., palpebral. Opening separating the

f., portal. The opening into the liver on its under surface; continues into the liver as the portal canal.

f., Rolando's. F. separating frontal and parietal lobes.

f., sphenoidal. F. separating the wings and body of the sphenoid

f. of Sylvius. The lateral cerebral fissure. A f. separating the frontal and parietal lobes from the temporal lobe of the brain

f. transverse. 1 The fissure bet. the cerebellum and cerebrum of the brain 2 A f. on lower surface of the liver which serves as the hilum transmitting vessels and ducts to the liver

f. umbilical. Ant portion of liver's longitudinal fissure which contains the round ligament, the obliterated umbilical vein

f., Wernicke's. F dividing the temporal and parietal lobes from the occipital lobe.

fistula (fist'u-la) [L a pipe] An abnormal tubelike passage from a normal cavity or tube to a free surface or to another cavity. May be congenital due to incomplete closure of parts or may result from abscesses, injuries, or inflammatory processes

f., anal. F. near the anus.

f., biliary. One through which bile is discharged after a biliary operation.

f., blind. One open at only 1 end

f., cervical. 1 An abnormal opening into the cervix uteri 2 An opening in the neck leading to the pharynx, resulting from incomplete closure of the brachial clefts

f., cervicovaginalis laqueatica. Fistula in the vaginal portion of the cervix uteri bet. the uterine canal and the vagina

f., complete. F with both external and internal opening.

f., enterovaginal. One bet. the bowel and vagina.

f., fecal. One in which there is a discharge of feces through the opening

f., metropertitoneal. F between uterine and peritoneal cavities

f., parotid. One through which there is an abnormal leakage of saliva onto ext surface of cheek.

f., perineovaginal. Opening from vagina through the perineum.

f., rectovaginal. Opening bet. rectum and vagina

f., ureterovaginal. Opening bet ureter and vagina.

f., vesicouterine. Opening bet. uterus and bladder

f., vesicovaginal. Opening from bladder into the vagina.

fistulotome (fist'u-la-tōm) [" + G tomē, incision]. Instrument for incising a fistula.

fistulectomy (fist'u-lek'to-mī) [" + G ek-tomē, excision] Excision of a fistula

fistulization (fist'u-li-zā'shun) [L. fistula, pipe] Becoming fistulous

fistuloenterostomy (fist'u-lo-en-ter-os'to-mī) [" + G enteron, intestine, + stoma, opening]. Operative closure of a biliary fistula and formation of new passage of bile into the intestine.

fistulous (fist'u-jus) [L. fistula, pipe]. Pert. to, or containing, a fistula

fit (fit) [A.S. *fiti*] A sudden attack, convulsion or paroxysm.

F. A. TREATMENT. Do not try to stop attack. Prevent patient from hurting or injuring self. Place a pad between teeth to prevent biting tongue or cheeks. Allow patient to sleep. SEE: *cataplexy, cataleptiform, epilepsv.*

fixa'tion [L. *fixus*, from *figere*, to fasten]. 1. The act of holding or fastening in a fixed position. The condition of being

fixed Immobilizing, making rigid 2. **PSYCH** A phase of psychosexual development in which the libido is arrested at an inferior or presexual level For example father or mother fixation.

f. of complement. The action of a complement, a constituent of fresh blood serum, on an antigen, which, in turn, has been acted on by its antibody. During the uniting of antigen, antibody, and complement, the complement is rendered inactive or destroyed, and this process is known as f. of complement The basis of the Wassermann and Kolmer tests for syphilis and other tests for infectious diseases

f. forceps. Forceps for holding a part.

f. point. Point of clearest vision, for which eye accommodation is focused

fixa'tion of eyes. The movement of the eyes for the most acute vision in which they are directed toward an object so that the visual axes meet and the image of the object falls on corresponding points of each retina

f., field of. The widest limits of vision in all directions within which the eyes can fixate

f. point. The fovea or the point on the retina where the visual axes (fixa'tion lines) meet the point of clearest vision.

fixa'tive [L. *fixus*, from *figere*, to fasten]. 1. A substance that serves to make firm or fixed 2 One used to harden and preserve pathological specimens.

fix'ing [L. *fixus*, from *figere*, to fasten] Rapid killing of tissue elements so that their normal living form is preserved

fix'ity [L. *fixus*, from *figere*, to fasten] Os The stage when the head of the fetus enters the mother's pelvis

Fl. ABBR for fluid **Symb** of fluorine

flabel'ium [L. fan] White fibers in form of a fan-shaped bundle in corpus striatum.

flaccid (flak'sid) [L. *flaccidus*, flabby] Relaxed, flabby, having defective or absent muscular tone

flagellant [L. *flagellum*, whip]. 1 Pert to flagella 2 Pert to stroking in massage 3 One who practices flagellation.

flagellate (flaj'el-āt) [L. *flagellum*, whip]. 1. With 1 or more flagella 2. A protozoan with 1 or more flagella

f. cell. One with long cilia for propulsion.

flagella'tion [L. *flagellum*, whip]. 1. Flogging 2. Massage by strokes 3. Applying electricity by tapping the body. 4. A form of sexual perversion through which the libido is stimulated by striking the gluteal region with a whip or lashes

It was practiced during the 13th and 15th centuries as an atonement, and to kill the desires of the flesh, but instead it stimulated sensuality and so it was discontinued

Spanking children should be avoided, as the first excitation of the sex instinct is sometimes aroused as a result. It is practiced by masochists on the opposite sex. The pervert sometimes subjects himself to this form of castigation to stimulate the libido.

flagellum (flaj-el'um) (pl. *flagella*) [L. whip] 1 A hairlike, motile process on the extremity of a bacterium or protozoan The locomotor organ of sperm cells

flail joint. A joint with excessive mobility after resection.

flames, inhalation of. **SYM** Intense irritation of nose, throat, pharynx, wind-pipe and lungs; with choking, coughing, interference with respiration; intense

swelling of throat; breathing is markedly limited. Shock.

TREATMENT Administration of oxygen; occasionally tracheotomy necessary. Pain relieved by spraying nose and throat with a local anesthetic of low toxicity. Follow with oil sprays. Steam inhalations are very soothing, and may have to be kept up for long periods of time. SEE *burn*, *fire*, *gases*.

flank [Fr *flanc*, side] The part bet ribs and upper border of ilium. SEE: *latus*. Also loosely used to refer to the outer side of the thigh, hip, and buttock.

flap [Dutch *flappen*, to strike]. A mass of partly detached tissue attached at the base after resection.

f. amputation. A flap covering the end of a part left after an amputation.

f. extraction. Removal of cataract so as to make a flap in the cornea.

flare. A flush or spreading area of redness which surrounds a line made by drawing a pointed instrument across the skin. It is the second reaction in the "triple response" *q.v.* and due to dilatation of the arterioles.

flarmeter. A modified spirometer for estimating vital capacity, blood pressure, heart rate, etc.

flash method. Means of pasteurizing milk by rapidly raising temperature of milk to 178° F., maintaining it there for a few minutes and letting it fall to 40° F.

f. point. The temperature at which a substance will burst into flame.

flatfoot. Abnormal flatness of sole and arch of foot.

The inner longitudinal and ant. transverse metatarsal arches are those that may be depressed. It may be *acute*, *subacute*, or *chronic*. SYN. *pes planus*, *splyfoot*.

f. spasmodic. The foot is held everted by spasmodic contraction of the peroneal muscle.

flatness. Resonance heard on percussing over solid organs, or fluid in the thoracic cavity.

flatulence (flat'u-lens) [L. *flatulentia*, a blowing]. Gas in the digestive tract due to fermentation or decomposition.

NP. If of the stomach, sit patient upright, apply heat to epigastrium or a counterirritant. Give sodium bicarbonate in hot water to be sipped slowly, or peppermint water or ginger tea.

If in intestines, have patient lying down for ½ hr. before and after meals. No fluids with meals but hot water may be sipped afterwards. Give carminatives, carminative enema if needed, or pass a flatus tube. SEE: *distention*, *gastrointestinal decompression*, *Wangenstein method*.

flatulent (flat'u-lent) [L. *flatulentia*, a blowing]. Affected with or caused by gas in the alimentary tract.

flatus [L. a blowing]. 1. Gas in digestive tract. 2. Expiration of air; eructation. SEE: *borborygmus*.

f. tube. A rectal tube to procure expulsion of flatus in distention and before a saline enema.

NP. It may be passed 6-8 inches. It may be left in position for 20-30 minutes. Patient on back or side. Lubricate tube and insert gently. Lower end of tube is placed in a deodorant solution in vessel beside the bed.

f. vaginalis. GYN: Expulsion of air from a voluminous vagina.

flatworm. A worm belonging to the phylum Platyhelminthes, *q.v.*

flav'edo [L. *flavus*, yellow]. Yellowness, as of the skin, sallowness; jaundice.

flavescent (fla-ves'ent) [L. *flavus*, yellow]. Yellowish.

flav'iclin, flav'acin, flav'o'cin. An antibiotic substance obtained from certain fungi, esp. *Aspergillus flavus*.

flav'in. One of a group of natural water-soluble pigments occurring in milk, yeasts, bacteria, and some plants. All contain the flavin or isoxanthoxazine nucleus and are yellow in color. Present in riboflavin and in Warburg's yellow enzyme.

flavism [" + G ismos, condition]. Having a yellow tinge to the hair.

flavo- [L. *flavus*, yellow]. Prefix yellow.

Flavo'bacter'ium. A genus of rod-shaped bacteria belonging to the Achromobacteriaceae. They are found in soil and water and produce an orange-yellow pigment in cultures.

flavo'pro'tein. One of a group of conjugated proteins which constitute the yellow enzymes essential in cellular respiration.

flaxseed. Seed of *Linum usitatissimum*. SYN. *linseed*.

f. poultice. A soft, usually hot and moist paste for external application, such as a flaxseed poultice, linseed meal, bran, flour, or hops boiled with water and wrapped in cheesecloth or other fabrics.

PURPOSE: (a) Action is mainly through heat; (b) counterirritant effect is slight; (c) used for inflammations, abscesses, relief of pain, and pulmonary congestion.

PROPORTIONS: One part flaxseed meal and 1½ parts boiling water. One cup of meal and 1½ cups of water make a poultice approximately 6 x 4 x 1.

ARTICLES NEEDED (a) Flaxseed meal; (b) boiling water; (c) saucpan; (d) large spoon; (e) one teaspoonful of soda bicarbonate powder; (f) old muslin, size in proportion to that of affected area; (g) bandage or binder; (h) hot water bottle and cover or flannel protector, (i) cup for measuring.

PROCEDURE: (a) Put the required amount of water on to boil. (b) Collect the necessary articles. Fill the hot water bottle, 125° F. (c) Spread the muslin on the table. (d) When the water is boiling briskly, add flaxseed gradually and stir vigorously. Cook until it drops from the spoon. When removed from the stove, add one teaspoonful of soda bicarbonate powder. (e) Beat well to incorporate air. (f) Spread it on the old muslin about 1 inch thick and fold the muslin in envelope fashion. Fill the saucpan with water. (g) Obtain the hot water bottle and carry the poultice to the patient between the folds of the hot water bottle. (h) Test the temperature of the poultice by applying it to the back of the wrist. Apply the poultice to the area slowly and lay the hot water bottle over it. (i) Secure poultice with binder or bandage. If previous poultices have been applied and the hot water bottle is over the area, remove it, place the poultice, and refill and replace the bottle.

When the treatment is discontinued, remove the poultice, dry the part, and place the hot water bottle or flannel over the area for 2 or 3 hours.

fl. dr. Abbr. of *fluidram*.

flea (flā) [A.S. *flea*]. Fleas of the genus *Xenopsylla* transmit the bacillus of plague (*Pasteurella pestis*) from rats to humans. Fleas may transmit other

diseases such as tularemia, endemic typhus, and brucellosis, and they serve as intermediate hosts for the cat and dog tapeworms

SEE: *Ctenocephalides*

f. bites. Hemorrhagic puncta* surrounded by erythematous* and urticarial patches, as the result of the injection of their saliva.

PREVENTION: Dust the skin with powdered camphor or naphthalene.

f. cat. *Ctenocephalides felis*

f. chigger. *Tunga penetrans*. Also called chigger, jigger, and sand fleas.

f. dog. *Ctenocephalides canis*.

f. human. *Pulex irritans*.

f., rat. *Xenopsylla cheopis*.

flea (flem) [Fr. *flemme*, from G. *phleps*, vein]. Lancet used in venesection.

Fleischig's areas (flek'h'zig). Ant., lateral, and post areas of each lateral half of the medulla.

fleece of Stilling. Meshwork of white fibers that surrounds the dentate nucleus of the cerebellum.

flesh (A.S. *flæsch*). The soft tissues of the animal body, esp the muscles. SEE *carnivorous*, *carnophobia*, *meat*, *meat poisoning*.

f., examination of animal. General rule: Examine for (1) Color, (2) consistency, (3) proportion of fat, (4) odor, (5) taste

Color: Yellow—May be produced by food. In disease due to biliary compounds. Brown—Rare, except in old meat undergoing decomposition. Dark Purple—May indicate animal has died a natural death, suffered from acute fever, tuberculosis, or rinderpest. Avoid

Dark Reddish-Brown—May indicate animal has been hunted or overdriven, poisoned, drowned or suffocated. Avoid.

Scarlet—Rare. Indicates arsenic or monoxide poisoning. Diffused redness—Indicates that animal may have been poisoned, or the meat frozen. Green or Violet—Indicates the beginning of putrefaction. Dangerous. Safron—Indicates

artificial coloring or smoked pork. Brilliant Red—Due to poisonous bacteria. Gray—Usually in sausages. Due to bacteria. Phosphorescent Flesh—Not due to putrefaction. Usually found in fish and shellfish. Sometimes in meat, esp veal. Due to bacteria and generally transmitted from fish kept in the same place with meat. Increased by warmth.

White—Rare, except in calves. Found in certain diseases. Avoid

GENERAL TEST Color—Neither very pale nor dark purple. Appearance—Marbled. Consistency—Firm and elastic. Not flabby or sodden. Should hardly moisten the finger. Odor—Free from odors.

f. goose. Cutis anserina, q v

f., proud. 1 Fungous growth 2. Excessive granular tissue in a wound or ulcer.

fletcherism. Taking small amounts of food at a time with excessive mastication.

flex [L. *flexus*, from *flectere*, to bend]. To bend upon itself, as a muscle; flexion, bending

flexibilitas cerea (fleks-i-bil'it-as se're-a) [L.]. A cataleptic state in which a subject maintains the limbs in the position in which they are placed. Characteristic of cataleptic patients.

flexibility [L. *flexus*, from *flectere*, to bend]. Quality of being bent without breaking; adaptability. SYN: *pliability*.

flex'ible [L. *flexus*, from *flectere*, to bend].

Capable of being bent without breaking. **flexile** (fleks'ill) [L. *flexus*, bent]. Pliant; flexible.

flexion (flek'shun) [L. *flexus*, bent]. The act of bending or condition of being bent, in contrast to extending. SEE *ante curvature*, *clawfoot*, *clawhand*.

flex'oglass. Window glass substitute for transmitting antirachitic rays of sunlight.

flex'or [L. *flectere*, to bend]. A muscle that bends a part, in a generally proximal direction; as opposed to an extensor.

flex'ure, flex'ura [L. *flexura*, a bending]. A bend.

f., duodenojejunal. Curve at meeting point of jejunum and duodenum.

f., hepatic. The bend on right side forming junction of the ascending with the transverse colon

f., sigmoid. The s-like loop (in left iliac fossa) of the descending colon as it meets the rectum. SEE *colon*

f., splenic. Bend at junction of transverse with descending colon

flick'er. The sensation of alternating intervals of brightness caused by interruptions in light stimuli

flight of ideas. PSY Continuous but fragmentary stream of talk

Connection can be followed but direction is frequently changed, often by chance stimuli from the environment.

flint disease. Deposit of fine particles in the lungs. SYN *chalcosis*

floating [A.S. *flota*, a raft]. Moving about. Out of normal location

f. kidney. One movable from its normal bed of fat

Error. A blow, a sudden movement, laxity of the peritoneum complicated by inflammation, kinking of ureter and damming of urine

SYM: Dragging pain in loin, chronic indigestion, albuminuria, painful urination, urine scanty and frequent. Neurasthenic complaints

TREATMENT: Rest in bed. Diet to increase weight. A kidney pad may be ordered. If so, adjust before getting out of bed. Patient should not be told nature of condition. *Nephropexy* may be indicated if kidney is healthy; otherwise, possible *nephrectomy*.

f. ribs. The 11th and 12th ribs which do not articulate with the sternum.

floats [A.S. *flota*, a raft]. Glass capsules containing labels to float in an exposed liquid to designate its nature.

foc'cillation, foc'cillation (flok-si-la'shun, -ta'shun) [L. *focculus*, little tuft]. Semi-conscious pricking at bedclothes in fevers and stupors. SYN *carphologia*, *carphology*.

foc'cose (flok'os) [L. *foccosus*, full of wool tufts]. BOT: Pert to a growth made up of short and densely but irregularly interwoven filaments

foc'cular [L. *focculus*, little tuft]. Pert to the focculus of the cerebellum.

foc'culence [L. *focculus*, little tuft]. State of being focculent or resembling shreds or tufts of cotton

foc'culent (flok'u-lent) [L. *focculus*, little tuft]. Resembling the white portion of "floating island" or a fluid or culture containing whitish shreds of mucus.

focculoreac'tion [' + re, again, + agere, to act]. Floculation of a serum reaction.

foc'culus (pl. *focculi*) [L. tuft]. 1. A lobe below and behind the middle peduncle of the cerebrum on each side of the

median fissure. 2. A small tuft of wool-like fibers.

f. retinae. Ciliary process of retina.

flooding (flood'ing) [A.S. *flood*]. Profuse uterine bleeding.

Flood's ligament. A band of ligaments attached to lower part of lesser tuberosity of the humerus

floor. The surface which forms the lower limit of a cavity or space, as the floor of the cranial cavity, fourth ventricle, mouth, nasal fossa, or pelvis

flora (floo'ra) [L. *flor*, *flor*-, flower]. 1. Plant life as distinguished from animal life.

2. Plant life occurring or adapted for living in a specific environment.

flour [A.S. flower of meal, from L. *flor*, *flor*-, flower]. Finely ground meal obtained from wheat, or other grain; any soft fine powder. *See* bread, cereal.

Flourens' theory (floo-ronz'). That thought is a process dependent upon the entire cerebrum

flow [A.S. *floowan*, to flow]. 1. Action of flowing; said of liquids. 2 The menstrual discharge. Bleeding from the uterus, but not as profusely as in flooding. *See* cholerrhagia, cholorrhea, osmosis.

flower [L. *flos*, *flor*-, flower] That part of a plant which comprises the organs of reproduction. *Ex* *anthesis*, *arnica*, *matricaria*. A complete flower includes a calyx, corolla, stamens, which produce pollen, and a pistil which produces the ovule

flucticuli (fluk-tik'ü-li) (sing *flucticulus*) [L. "little waves"] Wavelike markings on lateral wall of 3rd ventricle.

fluctuation [L. *fluctuäre*, to flow in waves]. A wavy impulse felt in palpation and produced by vibration of body fluid

Diap If felt over lower bowel ascites usually is present. May be caused by peritoneal hemorrhage. If confined to limited portion of abdomen tuberculous peritonitis is indicated, over central portion, bladder distention. In lower abdomen in women, an ovarian cyst or pregnancy. In right hypochondria, a hydatid cyst; abscess of liver, distended gallbladder, over left hypochondria, cysts or abscess. Above umbilicus, dilated colon or stomach partly filled with fluid and gas.

fluid [L. *fluidus*]. A nonsolid, liquid, or gaseous substance

f., amniotic. Gyn: The fluid that fills the fetal membranes in pregnancy. A clear, yellowish fluid. Spec. grav. 1.006. It is composed of albumin, salts (chiefly urea), and water, and suspended in it are lanugo, epidermal cells, *vernix caseosa*, and meconium. * It is derived from the cells of the amnion, although some claim it comes from the fetal urine and others that it is derived from the maternal circulation. Its chief function is protection for the fetus. *See* amnion.

f. cerebrospinal. That found in central canal of spinal cord and in the ventricles of the brain, also in the subarachnoid space about the brain and spinal cord. It is formed by the choroid plexuses of the ventricles.

f. diet. One for postoperative cases for the first 2 days following an operation, carbonated water, ginger ale, tea, albumin, water, beef tea, broth, coffee. Raw fruit juices and milk should not be given unless ordered. *See* liquid diet.

f. extracellular. The tissue fluid or the fluid occupying spaces between the tissue cells; interstitial fluid

f. extravascular. All the body fluids outside the blood vessels, includes tissue fluid, fluids within the serous and synovial cavities, the cerebrospinal fluid, and lymph

f. interstitial. The tissue fluid.

f. intracellular. The fluid contained within cells, and comprising about 50% of body weight

f. intracocular. The fluid within the ant and post. chambers of the eye.

f. retention. Failure to expel fluids of the body normally. *Opp.* fluid balance.

It occurs in nephritis with massive albuminuria. When protein content of plasma falls below 4% fluid cannot be attracted back into the blood stream and edema occurs. This is why a high protein diet was indicated by Epstein in chronic parenchymatous nephritis. Fluid is retained in congestive heart failure. It should be detected by decreased urinary output. Retention of salt is another cause of fluid retention. Salt retention attracts fluid to maintain the isotonic concentration. A salt-free diet is indicated in fluid retention.

f. serous. A fluid in the serous cavities

f. synovial. Pl. *synovia*. The fluid contained within synovial cavities, bursae, and tendon sheaths

f. tissue. The interstitial or extracellular fluid

f. water balance. Regulation of amount of water in the body by its controlling mechanism. The balance is upset when fluids are lost by vomiting, bleeding, or when dehydration occurs. When vital reflexes are disorganized, as in shock, collapse, septicemia, and toxemias, dehydration ensues. Increased fluid intake is indicated, but vitality may be so low fluid may pool in stomach, or if given rectally may be in colon and not be absorbed. Intravenous, subcutaneous, and intraperitoneal injections may then be indicated

fluidextract, fluidextractum (floo-ek'trak't) [L. *fluidus* + *extractum*, extract] Solution of the soluble constituents of organic drugs of such strength that each cc. represents 1 Gm of the drug

The majority contain a comparatively large percentage of alcohol and many of these give precipitates with water. Most of them contain tannic acid and should not be used with agents incompatible with that drug. Twenty-five fluidextracts are official

fluidounce. Eight fluidrams. *Syms* 1 3.

fluidram. Measure of capacity equal to 57 1 gr of distilled water, equal to 3 70 cc *Syms* 1 3.

fluke (hook) [A.S. *floc*, flatfish] A parasitic worm belonging to the class Trematoda, phylum Platyhelminthes. Those parasitic in man belong to the order Digenea. Most flukes have complex life cycles which include asexual generations that live in a mollusc (small or bivalve). Stages of a typical fluke include adult, egg, miracidium, sporocyst, redia, cercaria, and metacercaria

f. blood. A schistosome. Flukes of the genus *Schistosoma*. *S. haematobium*, *S. mansoni*, and *S. japonicum*. Adults live principally in the mesenteric and pelvic veins. They cause schistosomiasis and schistosome dermatitis (swimmer's itch)

f. intestinal. Species of intestinal flukes infesting man include *Gastrodiscoides hominis*, *Fasciolopsis buski*, *Heterophyes heterophyes*, *Metagonimus yokogawai*.

f. liver. Flukes which live in the liver and bile ducts. Species infesting man include. *Clonorchis sinensis*, *Fasciola hepatica*, *Dicrocoelium dendriticum*, and *Opisthorchis felinus*.

f. lung. Only one species is common in man, namely *Paragonimus westermani*.

flumina pilo'rum [L. rivers of hair]. The curved lines along which the hairs of the body are arranged, esp in the fetus.

flu'or albus [L. white flow]. White discharge from the uterus or vagina SYN leukorrhea.

fluorescein (flü-or-es'ein). A red crystalline powder.

USES: Chiefly in diagnostic purposes, detecting foreign bodies in the eye, or corneal lesions.

DOSAGE. Two per cent solution in sodium bicarbonate solution.

fluorescence (flu-or-es'ens) [L. *fluere*, to flow]. Luminescence of a substance when acted on by short wave radiation.

Usually ultraviolet, first noted in fluor spar; caused by absorption of certain wave lengths and simultaneous emission of a longer wave length, which terminates simultaneously with the cessation of the incident exciting radiation.

fluorescent (flu-or-es'ent) [L. *fluere*, to flow]. 1 Biol. Having 1 color by transmitted light and another by reflected light. 2 Luminous when exposed to other rays.

f. screen. 1. A sheet of cardboard, paper, or glass coated with a material which fluoresces visibly, such as calcium tungstate, used as the chief part of a fluoroscope when roentgen rays, radium rays, or electrons impinge upon it, a substitute for a fluoroscope in a darkened room. 2. A sheet of cardboard, paper, or glass, coated with anthracene or other fluorescing materials, to observe ultraviolet radiations.

fluoridation (flü-ör-l-dä'shün). The addition of fluorides to a water supply as a means of preventing dental caries.

fluoride (flu'or-id) [L. *fluere*, to flow]. A compound of fluorine with a radicle, a salt of hydrofluoric acid.

fluorine (flu'or-en) [L. *fluere*, to flow]. Gaseous, chemical element SYMS F. Atomic weight, 19.

This is found in the soil in combination with calcium. It seems absolutely necessary to plant life and in animal life it helps to form the bones and teeth. Insoluble mineral elements must be absorbed by plant life and taken into the animal body as food before they can be assimilated, but f. was liquefied by Moissan and Dewar in 1897. It is found in cow's milk, yolk of egg, and brain.

fluorometer (flu-o-rom'et-er) [" + G. *metron*, to measure]. Device for adjusting the shadow in skiagraphy.

fluoroscope (flu'or-ö-sköp or flu-or-o-sköp) [" + G. *skopein*, to examine]. A device consisting of a fluorescent screen suitably mounted, either separately or in conjunction with a roentgen tube, by means of which the shadows of objects interposed between the tube and the screen are made visible.

fluorocopy [" + G. *skopein*, to examine]. The use of a fluoroscope for medical diagnosis or for testing various materials by roentgen rays.

fluorosis (flu-or-o'sis) [" + G. *ösis*]. Chronic fluorine poisoning, sometimes marked by mottling of tooth enamel.

Often results from too much fluoride in drinking water.

flush [A.S. *fluschen*, to fly up]. Sudden redness of the skin.

f., hectic. Redness of the cheeks seen in some chronic affections, such as pulmonary tuberculosis, and due to rise of temperature.

f., hot. One accompanied with sensation of heat; common in neuroses and psychoneuroses and during menopause.

flutter [A.S. *floterian*, to fly about]. A tremulous movement, esp of the heart as auricular and ventricular flutter.

f. auricular. Condition in which contractions of the atrium become extremely rapid (200-400 per min.). In pure flutter, a regular rhythm is maintained, in impure flutter, the rhythm is irregular.

flux [L. *fluxus*, a flow]. 1 An excessive flow or discharge from an organ or cavity of the body, diarrhea. 2 Discharge from the bowels.

f., bloody. Dysentery.

fly [A.S. *fleoge*] An insect belonging to the order Diptera, characterized by possessing sucking mouth parts, one pair of wings, and incomplete metamorphosis. Term is sometimes applied to insects belonging to other orders (ex. May fly, dragon fly). SEE Diptera.

f. black. *Simulium* q.v.

f., blow. Flies of the family Calliphoridae. They breed in dung or the flesh of dead animals. Also called *bluebottle flies* SFR. Calliphora vomitoria.

f., bot. Botfly, q.v.

f. flesh. The Sarcophagidae, q.v.

f., house. *Musca domestica*, q.v.

f. sand. *Phlebotomus*, q.v.

f. screwworm. A fly belonging to the families Calliphoridae and Sarcophagidae, q.v.

f., tsetse. *Glossina palpalis*. One which transmits African sleeping sickness or trypanosomiasis.

SEE blister.

f. warble. The Oestridae, q.v.

foam. A mixture of finely divided gas bubbles interspersed in a liquid.

F. M. (*fl'at mist'ra*). [L.] Abbr for "let a mixture be made".

fo'cal [L. *focis*, hearth]. Pert to a focus.

f. infection. One occurring near a focus, such as the cavity of a tooth.

f. lesion. A limited central lesion.

fo'cus (pl. *foci*) [L. the hearth]. The point of convergence of light rays or waves of sound.

f., real. Point at which convergent rays intersect.

f., virtual. The point at which divergent rays would intersect if prolonged backward.

fog'ging, fog'ging system. A method of testing vision, used particularly in testing astigmatism, and in postcycloplegic examination.

fold [A.S. *foltan*, to fold]. A ridge, a doubling back SYN plica.

f., amniotic. Folded edge of the amniotic membrane where it rises over and finally encloses the embryo of birds, reptiles and some mammals.

f., genital. Fold of skin in the embryo on each side of the genital tubercle which develops into the labia minora in the female.

f., mesenteric. Fold of peritoneum supporting the uterus.

fo'lia (pl. of *folium*) [L.]. 1. A leaf or leaflike structure. 2. One of the folds

- or gyri seen on the surface of the cerebellum
- foliaceus** (fo-li-a'she-us) [L. *folia*, leaves]. Resembling or pert. to a leaf.
- folic acid** (fô'lik). Pteroylglutamic acid. Found in liver, yeast, and green leaves. Used in treating pernicious anemia, macrocytic anemia, celiac syndrome, and sprue.
- folie** (fol-e') [Fr foolish, mad]. Mania; psychosis.
- f. circulaire**. Syn *circular insanity*. Frequent repetition of excited and depressed phases of manic-depressive psychosis.
- f. du doute** (fol-e' du doot). Abnormal doubts about ordinary acts and beliefs, inability to decide upon definite standards of conduct.
- folium** (pl. *folia*) [L. leaf]. Thin, broad, leaflike structure.
- f. vermis, f. cacuminis**. A fold on the posterior part of the upper surface of the vermis of the cerebellum.
- follicle** [L. *folliculus*, little bag] 1 A small secretory sac or cavity 2 A lymphatic node, (nobs).
- f. aggregated**. Peyer's patch. *q.v.*
- f. atretic**. An ovarian follicle that has undergone degeneration or involution.
- f. graafian**. GYN Small excretory organ in the cortex of the ovary. The complete development of the primary oocyte to the stage where the ovum is fully developed. See *ovary*.
- f. growing**. A developing follicle of the ovary.
- f. hair**. An invagination of the epidermis from which a hair develops.
- f. nabothian**. Dilated cyst of the glands of the cervix uteri.
- f. ovarian**. A spherical structure in the cortex of the ovary consisting of an oogonium, or an oocyte and its surrounding epithelial (follicular) cells. Follicles are of three types. 1 *Primary*, consisting of an oogonium and a single layer of follicular cells 2 *Growing*, in which the follicle cells proliferate forming several layers and the first maturation division occurs 3 *Vesicular*, or *Graafian* follicle which possesses a cavity (*antrum*) containing the follicular fluid (*liquor folliculi*). The oocyte lies in the *cumulus oophorus*, a mass of cells on the inner surface. The cells lining the follicle constitute the *stratum granulosum*. The follicle is a secretory structure producing estrogens.
- f., sebaceous**. Oil gland of the skin.
- f. solitary**. A single lymph node of the intestine.
- f. thyroid**. Spherical or ovoid structure found in the thyroid gland lined with a single layer of cuboidal epithelial cells which secrete the thyroid hormone. The follicles are filled with *colloid*, a viscid substance rich in iodine.
- f. vesicular**. One containing a cavity, a mature ovarian or Graafian follicle.
- follicle** (fol'ik-lis) [L. *folliculus*, little bag]. Indolent papulonecrotic lesion, esp on the extremities and possibly the face.
- follicular** [L. *folliculus*, little bag]. Pert. to a follicle or follicles.
- f. tonsillitis**. Inflammation of follicles on surface of the tonsil which become filled with pus.
- f. tumor**. A sebaceous cyst.
- folliculin** [L. *folliculus*, little bag]. An internal secretion of the ovary which,

- with lutein and ovulin, forms the oophorin hormone. See *estrin*.
- folliculitis** (fol-ik-u-lit'is) [“ + G. *-itis*, inflammation]. Inflammation of a follicle or follicles.
- f. barbae**. Inflammation of the follicles of the bearded parts. See *syccosis vulgaris*.
- f. decalvans**. Purulent follicular inflammation of the scalp resulting in irregular alopecia and scarring. Syn *acne decalvans*, *Quinquad's disease*.
- f. etiol**. Essential cause unknown. Affects mostly males between 2nd and 4th decades.
- Sym**. Initial inflammatory papule or pustule at mouth of follicle pierced by a hair is followed by crusting and desiccation, when it drops off along with loosened hair. Bald patches, with slight depressed whitish center surrounded by inflamed margin. Extends peripherally.
- Path**. Perivascular, particularly lower half of follicle sheaths, sebaceous gland atrophy and flattened papillae.
- Progn**. Baldness is permanent, though extension may be arrested.
- Treatment**. Tonics internally. Externally, ointments, frequent shampoos, and daily antiseptic.
- f. sebacea**. Inflammation of the sebaceous glands, with accumulation of secretion. Syn *acne*.
- folliculoma** (fol-ik-u-lo'mă) [“ + G. *ōma*, tumor]. A tumor of the ovary originating in a graafian follicle, in which the cells resemble the cells of the *stratum granulosum*.
- folliculose** (fol-ik'u-lōs) [L. *folliculus*, little bag]. Composed of follicles.
- folliculo'sis** [“ + G. *-ōsis*]. Presence of an abnormal quantity of lymph follicles.
- folliculus** (fô-lik'u-lus) (pl. *folliculi*) [L. little bag] A follicle.
- f. oophorus vesiculosus**. A graafian follicle. *q.v.*
- fomentation** (fo-men-tă'shun) [L. *fomentare*, to apply a poultice]. A hot, wet application for the relief of pain or inflammation. See *stupe*.
- f., boracic**. This may be prepared with boracic lint, which is already impregnated with boracic acid, and is colored pink as a distinguishing mark; or boracic acid may be added to lint, either in form of powder or crystals, and then wrung out of boiling water as before.
- f., medical**. Instead of lint, 2 or 3 thicknesses of flannel are used, and the fomentation is applied to unbroken skin, otherwise procedure is same as for a surgical fomentation, it is unnecessary to boil it, flannel is used because it retains the heat better than lint. This fomentation is also called a *stupe, a.o.*
- f., surgical**. See *hot moist dressing*.
- fomes** (pl *fomites*) [L. tinder]. Any substance that absorbs and transmits infectious material.
- fom'ites** (sing *fomes*) [L. *fomes*, tinder]. Plural of *fomes* and transmitting infectious material.
- Fontan'a's spaces**. Spaces bet. the processes of ligamentum pectinatum of the iris. These convey the aqueous humor sinus venosus sclerae.
- fontanel, fontanelle** (fon-tan-el') [Fr. *fontanelle*, little fountain]. An unossified space or "soft spot" lying between the cranial bones of the skull of a fetus. They include the frontal anterior or greater occipital posterior or lesser sphenoidal ant lateral and mastoid post lateral fontanels the last two being paired.

THE FONTANELS
B. Anterior fontanel.
A. Posterior fontanel.

f., anterior. At the junction of the coronal, frontal, and sagittal sutures.

f., posterior. At the junction of the sagittal and lambdoid sutures.

fonticulus (fon-tik'u-lus) [L little fountain] *Syn* fontanel

food. Sing. of foods, *q.v.*

food accessories. Nutrient substances which do not provide energy but furnish substances essential for the growth and well-being of the body. Includes water, mineral salts, and vitamins.

food allergies. Allergic reactions resulting from ingestion of foods to which a person has become sensitized. One may become sensitive to almost any food but shellfish, pork, eggs, milk, spinach, lettuce, strawberries and tomatoes are the most common offenders.

Syn Urticaria (hives), certain exzemas, nausea, vomiting, diarrhea, and intestinal cramps. A syndrome (angio-neurotic edema) characterized by a transient swelling of various parts of the body and spasm of the intestine may result.

food ball. Gastric stone made up of fruit and vegetable skins, seeds and fibers. *Syn* phytobezoar

f., course of (through the alimentary canal). Foods enter the mouth and in the buccal area reduced to a pulp or semifluid mass through the processes of mastication and insalivation (the mixing of food with saliva). Swallowing or deglutition then occurs. In swallowing, the food mass or *bolus* passes into the *pharynx* and then through the *esophagus* to the *stomach*, the entrance of which is guarded by the cardiac sphincter.

Stomach. In the stomach the food is stored and mixed with gastric juice. After it attains a certain fluid consistency, it passes through the *pyloric sphincter* into the small intestine.

Small intestine. In the first portion or *duodenum* the intestinal contents, now called *chyme* is mixed with bile, secreted by the liver, and the pancreatic juice, both of which enter through the opening of the common bile duct. In the next two portions, the *jejunum* and *ileum*, the chyme is

mixed with the intestinal juice secreted by the intestinal glands or crypts of Lieberkuhn. In the small intestine, digestion is completed and the end products of digestion (simple sugars, amino acids, fatty acids and glycerol) are absorbed into the capillaries and lacteals of the intestinal mucosa.

Large intestine. Undigestible material passes from the small intestine into the large intestine (colon) through the *ileocecal valve* located at the junction of the ascending colon and the cecum, a blind pouch which terminates in the vermiform appendix. The material continues through the colon (ascending, transverse, descending and sigmoid) to the *rectum* from which it is discharged through the *anal canal* as the feces, at the anus or anal orifice. In the large intestine, the major portion of the water of the intestinal contents is absorbed. Digestive changes are limited to the action of bacteria which bring about putrefaction and fermentation of incompletely digested foods. No enzymes are secreted by the glands of the large intestine.

f. enriched. F to which have been added vitamins or minerals removed in refining and processing, foods in which the vitamin and (or) mineral content has been increased either by addition or by irradiation.

food fever. Sudden rise in temperature accompanying digestive disturbances in children, supposed to be result of intestinal autointoxication. Lasts from 3 or 4 days to several weeks.

food infections. Illness resulting from infectious organisms which enter the body in food or drink. Among the organisms which may be ingested are (1) bacteria, esp. those of the salmonella group and certain staphylococci and streptococci, typhoid, paratyphoid, and dysentery bacilli, (2) the eggs, encysted forms or larvae of animal parasites such as *Trichinella* tapeworms, and other parasitic worms.

food. **Nutrient substances;** substances which in the body serve as a source of energy or provide materials for the growth and repair of tissue. Foods are organic substances (proteins, carbohydrates, fats) present in animal and plant tissues. Nutrient substances which do not provide energy are called **food accessories**, *q.v.* The term "foods" is commonly used to refer to any substance taken into the body which serves a nutrient function.

food poisoning. An attack of illness or a digestive disorder resulting from the ingestion of foods containing poisonous substances. True food poisoning includes mushroom poisoning, shellfish poisoning, poisoning resulting from foods contaminated with poisonous insecticides or other poisons, milk sickness (due to milk from cows that have fed on certain poisonous plants), and occasionally poisoning resulting from eating foods that have undergone putrefaction or decomposition. It may also be due to bacteria, especially paratyphoid bacilli and staphylococci ingested in food.

f. protective. Foods which are the richest sources of basic nutritional needs (water, proteins, vitamins, essential fatty acids, inorganic salts). These include milk, milk products, eggs, fruits and leafy vegetables.

f. rashes. In those with an idiosyncrasy to some protein certain rashes may be

ORGANIC

Proteins			
Elements	Symbol	Per Cent	End Products
1. Carbon	C	.53 %	Urea, uric acid, H_2SO_4 , CO_2 , H_2O . Salts set free Proteins are tissue, muscle, nerve and brain builders and also furnish heat and energy
2. Hydrogen	H	.07 %

the only symptom of toxemia. They may be in form of *urticaria*, *erythema*, or *papules*, or a combination of these.

It is ordinarily assumed that an average man in health performing light to moderate muscular work requires per day about 0.25 pound protein and 3050 calories of energy, the latter being supplied in small part by protein, but mostly by fat and carbohydrates. Men in professional life, by performing less muscular work, require smaller amounts.

The commonly accepted American dietary standard for such men calls for 0.22 pound protein and 2700 calories of energy in the daily food. The amount of mineral matter required is not stated, since there is little accurate information available on this point.

A diet made up of ordinary foods and supplying the necessary amounts of protein and energy would undoubtedly supply an abundance of mineral matter. It has been found that women and children consume somewhat less food than men. The assumption is usually made that, provided a woman is engaged in some moderately active occupation, she requires about eight-tenths as much as a man with a similar amount of work.

In calculating the results of dietary studies (which may be most conveniently expressed in amounts for 1 man for 1 day), it is further assumed that a boy 13-14 years old and a girl 15-16 years old also require about eight-tenths as much food as a man at moderately active muscular labor, a boy of 12 and a girl 13-14 years old, about seven-tenths, a boy 10-11 and a girl 10-12 years old, about six-tenths, a child 6-9 years old, about five-tenths, one 2-5, about four-tenths, and an infant under 2 years, about three-tenths.—U. S. Dept. Agriculture.

food requirements (showing daily quantities of the principal foods for a patient weighing about 132 lb.).

Water	3000 c c	

Minerals as follows: calcium 0.8 Gm., phosphorus 1.5 Gm., sodium 3 to 6 Gm., potassium 2 to 4 Gm., sodium chloride 5 to 15 Gm. and vitamins, *q v*.

Seven Basic Food Groups as recommended by the U. S. Dept. of Agriculture are 1. Leafy Greens and Yellow Vegetables, 2. Citrus fruit, tomatoes, raw cabbage, 3. Potatoes and other vegetables and fruits, 4. Milk, cheese, ice cream, 5. Meat, poultry, fish, eggs, dried peas, beans, 6. Bread, flour,

cereals, whole grain or enriched, 7. Butter and fortified margarine.

foods [A.S. *jóda*]. Nutritive substances necessary to nourish, protect, and maintain the body.

See *names of condiments, drinks, and foods, according to alphabetical order*.

foot [A.S. *fōt*] (*pes*). The terminal portion of the lower extremity. The bones of the foot include the *tarsus*, *metatarsus*, and *phalanges*. See *skeleton*.

f. arches. Four arches: (a) Int. longitudinal, (b) outer l., and (c) 2 transverse ones.

f. athlete's. See *athlete's foot*.

f. bath, mustard. AIM To aid action of hot water in relieving congestion in some distant part of the body.

ARTICLES NEEDED Bath blanket. Small rubber sheet and large bath towel. Foot tub with water at 110° F. and bath thermometer which is left in tub during treatment. Mustard. Old muslin about 6 in. square. Tablespoon. Hot water bottle filled and covered. Pitcher of extra very hot water.

PROCEDURE 1 Measure mustard in the proportion of 1 tablespoonful to 1 gallon of water and tie in the square of muslin. 2 Put in tub and add water. Rub mustard bag between fingers to dissolve mustard and allow it to diffuse through the water. 3 Loosen upper bedding at foot of bed and turn back to patient's knees. 4 Flex knees. 5 Place rubber sheet covered with bath towel across bed under patient's feet. 6 Put tub on towel and place feet in tub, arranging patient as comfortably as possible. 7 Cover knees, feet and tub with bath blanket, tucking under tub so it does not drop into water. 8 Lay upper bedding down over blanket and tub but do not tuck in. 9 Continue treatment 20 minutes unless patient complains of burning sensation. In that case stop it at once. 10. As bath cools add hot water from pitcher. Lift feet out before doing this. Check temperature with thermometer. 11. Watch patient and if she feels faint stop treatment at once. The swift withdrawal of blood from head to feet may cause syncope. 12 At end of treatment lift feet, draw tub toward you and put feet down on towel. Remove tub. Dry feet well. 13 Put hot water bottle at foot of bed if desired and permitted. Arrange bedding and make patient comfortable. 14 Clean and replace equipment. 15 Record treatment.

f. cleft. Condition in which a cleft extends between the digits to the metatarsal region, usually due to a missing digit.

f. contracted. Clawfoot or *pes cavus*, *q v*.

f. flat. Flatfoot *q v*; *pes planus*.

f. immersion. Condition resulting from prolonged immersion of the feet in water.

f., Madura. Bone hypertrophy and degeneration, frequently followed by suppuration or gangrene.

foot candle. Amt. of light radiated 1 ft. from a standard candle. SYN: *light u*.

footdrop. A falling or dragging of the foot from paralysis of the flexors of the ankle.

foot/ing presentation. Presentation of feet foremost in labor.

foot plate. Base of the stapes; an ossicle of the tympanum. It fits into, and closes, the *fenestra vestibuli* (oval window).

foot pound. Amt. of energy required to raise 1 pound 1 foot from a level.

foot print. An impression of the foot, esp., an ink impression used for identification of infants

f. splay. Flatfoot accompanied by extreme eversion of the foot

f. weak. Condition resulting from weakened muscles, or from faulty walking habits. Results in chronic eversion of the foot

forage (for-azh') [Fr. boring] Cutting a channel by diathermy through an enlarged prostate

foramen (for-a'men) (pl. *foram'ina*) [L. an opening]. A passage or opening, an orifice, a communication between 2 cavities of an organ, or a hole in a bone for passage of vessels or nerves

f., intervertebral. Opening bet every 2 articulated vertebrae for passage of nerves to and from spinal cord.

f. magnum. It pierces the occipital bone through which passes the spinal cord from the brain lateral ventricles.

f. of Monroe. Opening bet. 3rd and

f. obturator. Large oval f. below acetabulum bounded by the pubis and ischium. SEE *Magendie's f.*

f. ova'le. 1 Opening at lower post. of septum in fetus, bet 2 cardiac auricles. 2 Oval opening in post. margin of great sphenoidal wing, for inf. maxillary nerve and small meningeal artery

force, unit of. Amount of force necessary to move a weight of 1 Gm. 1 cm. in 1 second SYN *dyne*.

forceps (for'seps) [L. a pair of tongs]. Pincers for holding, seizing or extracting. There are at least 100 distinct varieties of forceps, varying according to the operation for which they are intended.

FOOT

B

TARSAL AND METATARSAL BONES AND PHALANGES

1. 3rd Phalanges. 2. 2nd Phalanges.
3. 1st Phalanges. 4. Metatarsals. 5.
External Cuneiform. 6. Cuboid. 7.
Os Calcis. 8. Tibia. 9. Fibula. 10.
Astragalus. 11. Scaphoid. 12. Middle
Cuneiform. 13. Internal Cuneiform.

1. Astragalus. 2. Scaphoid. 3. Internal
Cuneiform. 4. Middle Cuneiform.
5. 3rd Phalanges. 6. 2nd Phalanges.
7. 1st Phalanges. 8. Metatarsals. 9.
External Cuneiform. 10. Cuboid. 11.
Os Calcis. 12. Astragalus (talus).

forcipate (for'sip-ät) [L. *forceps*, *forcip-*, tongs]. Forceps shaped.

forcipressure [' + *pressura*, pressure]. Arresting hemorrhage by pressure on an artery with forceps.

fore- [O.Eng.]. Prefix meaning *before* or *in front of*.

forearm (för'arm) [A.S. *fore*, in front, + *arm*, arm]. The part of arm between elbow and wrist.

MUSCLES OF FOREARM, WRIST, AND HAND

forebrain (för'brän) [' + *bregen*, brain]. Ant. portion of the brain of the embryo. SYN: *prosencephalon*.

forefinger [' + *finger*, finger]. The first or index finger.

foregut [' + *gut*, a pouring]. First part of the embryonic digestive tube whence pharynx, esophagus, stomach, and duodenum are formed. SYN: *protogaster*.

forehead (för'ed) [' + *heä'od*, head]. The brow. SYN: *frons*, *metopon*.

foreign bodies. Slivers, cinders, dirt, or small objects in the skin, ears, eyes, nose and internally frequently lead to infection, and if not removed lead to unsightly marks or tattooing of the skin and inflammation of the organ involved.

F. A. TREATMENT Carefully aseptize the areas involved. Foreign material can be carefully removed piece by piece, or by vigorous swabbing with gauze or brush, using a soapy solution. Follow with an antiseptic dressing.

SEE *ear*, *esophagus*, *eye*, *nose*, *stomach*, *throat*.

f. b., extracting a small. In attempting to remove a small foreign body, first cover area with an antiseptic, sterilize a clean needle by heating it to a dull or bright red heat in a flame. This can be done with a single match, inasmuch as both ends of the needle get hot it is wise to hold the far end in a nonconductor of heat, such as folds of paper, sticking it in a cork, or in the edge of a small book, allow it to cool and disregard black deposit on the needle which is sterile carbon and will not interfere with procedure. Then introduce the needle at right angles to the direction of sliver and lift it out.

Most persons attempt to stick the needle in direction of the foreign body and consequently have to thrust many times before they manage to lift sliver out. When removed, apply an antiseptic and cover wound with a sterile dressing.

f. b. in the ear. If any vegetable matter, such as a bean, pea, etc., is in the ear, water should not be introduced, as it may cause the body to be pushed further in the ear or cause it to swell and become firmly embedded.

F. A. TREATMENT Place a globule of glue on the end of a match stick or an applicator, gently introduce it until it touches the foreign body and then remove gently.

f. b.; insects in the ear. SYN Loud buzzing, pain, dizziness. **TREATMENT** Flood ear with warm oil or water, letting insect float out.

f. b. in wounds. They are often present in wounds and generally should be left undisturbed if a surgeon is available within a short time. If small, as a sliver, it may be desirable to remove it. If large, it may be very dangerous to try any method of removing, inasmuch as it might be embedded in large blood vessels, muscles, etc., and removing it might result in much loss of blood or might cause breaking off of splinters, particles of rust, dirt, etc., within a very few moments tissue juices, blood, and the natural reaction of swelling would tend to fill in the wounds and cover this foreign material, making it exceedingly difficult for the doctor to care for the patient.

In such instances, it is much wiser when possible, to leave the large foreign body in position, and obtain the services of a doctor promptly.

forensic (for-en'sik) [L. *forensis*, pert. to a forum]. Pert. to the law; legal.

f. medicine. Legal medicine or medicine in relation to the law.

fore/pleasure [A.S. *fore*, before, + L. *placere*, to please]. That derived from any action that induces or intensifies sexual desire, such as kissing or stimulating any erogenous zone in the female, esp before cohabitation.

fore/skin [" + *skinn*, skin]. Prepuce* or loose skin at and covering the end of the penis.

Excision of the prepuce constitutes circumcision. *Smegma* praeputi* is secreted by Tyson's glands and collects under the foreskin. SEE *circumcision*.

NP: In infant cases the nurse must see that the prepuce is not adherent or interfering with urination. Abnormalities must be reported to the doctor.

-form [L. *forma*]. Suffix meaning *having the form of*.

formaldehyde (for-mal'de-hid). USP. A colorless, pungent, irritant gas commonly made by oxidation of methyl alcohol, the simplest member of the group of aldehydes*. It is used in medicinal form of a solution of 40% formaldehyde or formalin HCHO.

ACTION AND USES A germicide, and disinfectant, also a preservative and fumigant. A 10% solution is useful as an astringent.

A 1% or 2% solution used for cleansing dishes, instruments, or fabrics. Formaldehyde is a powerful germicide, esp in the form of gas, because of its penetrating power, but it is active only in the presence of an abundance of moisture. The solution is germicidal in the strength of from 1% to 2%, but the action may be delayed from 20-30 minutes. It hardens tissues and is often used in histology for this purpose. It has a similar hardening effect on the living skin, it is very irritating to mucous membranes and produces reddening, inflammation and necrosis, if applied repeatedly or continuously. It is sometimes used in soap for disinfection of the hands. A 10% solution is used for sterilizing feces, urine, and sputum; 5% to 10% for clothing and towels. SEE: *fumigation*.

POISONING SYM Local irritation of eyes, nose, mouth, throat, respiratory and gastrointestinal tracts and central nervous system, causing vertigo, stupor, abdominal pain, convulsions, unconsciousness, renal damage.

F. A TREATMENT Administration of dilute aromatic splits of ammonia, very dilute ammonia water, as ammonium acetate which seems to combine with the formaldehyde, forming nonpoisonous methenamine. Otherwise symptomatic treatment.

f., casein. Antiseptic product.

f., gelatin. Antiseptic wound dressing.

for/malin. Wood alcohol with a 40% content of formaldehyde. SEE *aldehyde*.

formate (for-mät). A salt of formic acid.

formatio (for-ma'shi-ö [L. *formatio*]). A structure with definite arrangement and shape.

f. reticul'aris. Dorsal part of the *formation*. 1. A structure, shape, or figure. 2. The giving of form or shape to, or the development of a structure.

f., reticular. SYN *formatio reticularis, substantia reticularis*. A reticular structure formed of gray matter and interlacing fibers of white matter found in the medulla oblongata between the pyramids and the floor of the 4th ventricle. It is also present in the spinal cord, midbrain, and pons.

forme fruste (form früst) [Fr. from L. *forma*, form, + *frustra*, without effect]. An aborted form of disease arrested before running its course.

for'mic [L. *formica*, ant]. Pert. to ants and to formic acid.

for'mic acid. H.COOH, a clear, pungent, liquid obtained from the oxidation of formaldehyde or wood alcohol. It was originally obtained from the distillation of the bodies of red ants, and is probably the cause of the pain and swelling resulting from the bites or stings of certain insects or the irritation from nettles.

f. aldehyde. Formaldehyde.

f. ether. Volatile anesthetic liquid ethyl formate.

formica'tion [L. *formica*, ant]. A sensation as of ants creeping upon the body, a form of paresthesia.

formiciasis (for-mis'-as-is) [L. *formica*, ant]. Symptoms caused by ant bites.

formlase (for-mil-äs). A ferment which converts acetic acid into formic acid.

formin (for'min). SEE *methenamine*.

for'mula [L. a little form]. 1. A rule prescribing ingredients with proportions for the preparation of a compound. 2. CHEM. An expression by symbols of the constitution of a molecule consisting of letters, each denoting 1 atom of 1 elementary substance, with figures denoting the number of atoms present.

Collections of atoms which constitute a group by themselves (radical) are often separated by periods or parentheses, and in this case figures prefixed or appended to the parentheses or placed before an expression contained within periods apply to all the symbols embraced by the parentheses or periods.

In all other cases, a figure prefixed to a symbolical expression for a molecule, like a coefficient in an algebraical *f.*, is understood to be a multiplier of all the symbols following.

f., Arne'th's. Method of estimating number of immature leukocytes by means of an elaborate differential blood count.

f., dental. F. showing the number and arrangement of the teeth. For the permanent teeth,

$$1 \frac{2}{2}, c \frac{1}{1}, pm \frac{2}{2}, m \frac{3}{3} = \frac{8}{8} \times 2 \ 32$$

f., empirical. The *f.* of a compound which shows the atoms and their numbers in a molecule, as H₂O.

f., official. One in a pharmacopeia.

f., structural. The formula of a compound which shows the relations of the atoms to each other in a molecule. The atoms are shown joined by valence bonds, for example: H-O-H.

form'ulary [L. *formula*, a little form] A book of formulas.

f., national. One issued by the American Pharmaceutical Association.

formyl. The radical of formic acid, HCO.

for'nicate [L. *fornix*, arch; brothel]. 1. Arched or vaultlike. 2. To indulge in unlawful cohabitation.

fornica'tion [L. *fornix*, brothel]. The act of illicit sexual intercourse.

for'niculum [L. *fornix*, arch, + *columna*, column]. The ant pillar of the fornix.

fornicommissure (for-ni-kom'-is-ür) [" + *commissura*, a joining together]. The commissure or body of the fornix uteri.

for'nix (pl *fornices*) [L. arch]. 1. A fibrous vaulted band connecting the cerebral lobes. 2. Any body with vaultlike or arched shape.

f. conjunctivae. ОФТН: Loose fold connecting palpebral and bulbar conjunctivae.

f. uteri. Ant. and post. spaces into which the upper vagina is divided. These recesses are formed by protrusion of the cervix uteri into the vagina.

f. vaginae. The f. uteri, *q.v.*

fortification spectrum. Appearance of dark patch with zigzag outline in visual field. *SYN* scintillating scotoma, *teichopsia*. [ment of tularemia]

Foshay's serum. One used in the treatment of *(fos'a)* (pl *fossae*) [L. ditch]. A furrow or shallow depression.

f., axillary. The armpit.

f., Claudius'. Triangular area harboring the ovary

f., iliac. One of the concavities of the iliac bones of pelvis. The right one contains the appendix

f. lacrimalis. Hollow of frontal bone holding the lacrimal gland

f. navicularis. One bet the hymen and fourchette.

f. ovals. 1. BNA. Opening in thigh for large saphenous vein 2 Remnant of embryonic foramen ovale in right cardiac auricle

f., Rosenmuller's. Depression in pharynx posterior to opening of eustachian tube

f. supratonsillar. Space bet. anterior and posterior pillars of the fauces above the tonsil

fossette (fos-et') [Fr a little ditch]. 1. A small depression or fossa. 2 A small but deep corneal ulcer

foulage (fo-lazh') [Fr. impression]. Kneading with pressure of the muscles.

fourchet, fourchette (foor-shet') [Fr. *fourchette*, a fork] A tense band or transverse fold of mucous membrane at the post commissure of the vagina, connecting the post. ends of the labia minora

The *fossa navicularis*, a more or less deep *cul-de-sac* anterior to the fourchette, separates it from the hymen. It disappears after defloration or parturition, leaving a more open vulva below and behind. *SYN* *frenulum labiorum pudendi*.

fourth cranial nerve. Trochlear n., *q.v.*

fovea (fo've-a) [L. pit]. A pit or cuplike depression. *SEE* *fossa*.

f. centralis. Pit in the middle of macula lutea.

foveate (fo've-ät) [L. *fovea*, pit]. Pitted; having depressions.

foveation (fo-ve-a'shun) [L. *fovea*, pit]. Pitting, as in smallpox.

foveola (fo-ve'o-la) [L. little pit]. A minute pit or depression.

Fowler-Murphy method. Elevation of head of bed with tube through an incision in right iliac fossa for drainage in diffuse suppurative peritonitis. Continuous rectal irrigation with a physiological salt solution accompanies the treatment.

Fowler's position. This places the patient in a semi-sitting position

The head of bed may be raised on blocks, pins, or other support, or the back rest may be elevated, or patient may rest upon 4 or 5 pillows. It is more easily maintained if the patient sits in a swing or hammock, made by folding a bedsheet lengthwise, placing center of sheet tightly across the buttocks, with 1 end on each side. The ends are fastened securely at head of the bed, or as high as ends will reach.

This position may be ordered if patient is suffering from dyspnea,* after a thyroid, or an abdominal operation and where there is drainage expected. Some pneumonia cases are placed in this position. In many instances it is contraindicated

F.'s solution. One containing 1% arsenic trioxide.

USES Largely in chorea, as an alternative; in malaria, etc.

DOSAGE: Average, 3 m (0.2 cc.).

INCOMPATIBILITIES Alkaloidal salts, iodides, tannic acid, iron salts, quinine, etc

fraction. One or more of the separable parts of a substance

fractional. Pertaining to a fraction or a portion of a whole

fractional test meal. "Fractional examination of stomach contents" A method for the collection and examination of stomach contents as follows: First the residual contents are removed and then the test meal given. After the meal, samples are removed every 15 min for two hours, examined and submitted to chemical tests.

Free hydrochloric acid, bile, blood, starch, mucus, and the total of acids are looked for. Free hydrochloric and total acids are normally small in amt.

In peptic ulcers there is a high acid curve, and a low one in carcinoma, and an absence of acid in pernicious anemia

fracture (frak'tur) [L. *fractura*, *frangere*, to break] 1 A sudden breaking of a bone 2 A broken bone

RS *agmatology*, *buttonhole f.*, *cerclage*, *extension*, *green stick f.*, *Lucas-*

FOWLER'S POSITION.

Championnière's method, malunion, name of bone fractured, splint, thrypsis.

f., cause of:

1. *By direct violence*, when the bone is broken directly at the spot where the force was applied, as in fracture of the tibia by being run over.

2. *By indirect violence*, where the bone is fractured by a force applied at a distance from the site of fracture and transmitted to the fractured bone, as in a clavicle fractured by falling on the outstretched hand.

3. *By muscular contraction*, when the bone is broken by a sudden violent contraction of the muscles. The patella is the bone most frequently fractured in this way.

In certain diseases and conditions bones break easily with scarcely any violence, *e.g.* osteomalacia, syphilis, osteomyelitis, etc.

f., varieties of:

1. *Simple*. The bone is broken, but there is no external wound.

2. *Compound*. The bone is broken, and there is an external wound leading down to the site of fracture.

3. *Complicated*. The bone is broken, and has injured some internal organ, *e.g.*, a broken rib piercing a lung.

4. *Comminuted*. The bone is broken or splintered into pieces.

5. *Impacted*. The bone is broken, and one end is wedged into the interior of the other.

6. *Incomplete*. The line of fracture does not include the whole bone.

7. *Green Stick*. The bone is partially bent and partially broken, as when a green stick breaks. It occurs in children, especially in those with rickets.

8. *Depressed*. When a piece of the skull is broken and driven inwards.

9. *Separation of an epiphysis* takes place between the shaft of a bone and its growing end, and occurs only in young patients.

f., signs of:

(a) Loss of power of movement.

(b) Pain with acute tenderness over the site of fracture.

(c) Swelling and bruising.

(d) Deformity and possible shortening.

(e) Unnatural mobility. The nurse should never try to obtain this sign.

(f) Crepitus or grating which is heard when the ends of the bone rub together. The nurse should never try to obtain this sign.

To find out the kind of fracture and its exact position the x-rays are used. By this means a skiagraph of the bone is taken, showing the fracture and its extent.

f., treatment of:

1. **FIRST AID TREATMENT**. In simple fractures the limb or part must be kept immovable by means of splints, such as folded newspapers or umbrellas, or proper wooden splints if they are at hand. The clothing should not be removed unless there is dangerous hemorrhage.

If it is an upper extremity it should be supported in a sling, and the patient may then walk. If a lower limb is injured the patient should remain lying, and no attempt to walk should be made.

2. LATER TREATMENT:

(a) Reducing the fracture, *i.e.*, placing the fragments in proper position.

(b) Keeping the bone in position by means of splints until union has taken place.

(c) Restoring the limb's former functions under instruction.

In compound fractures, before treating the fracture any bleeding must be arrested, the wound is then washed and cleaned with some antiseptic lotion, and when quite clean a sterilized dressing is put on and secured by a bandage. Splints are then applied as in simple fractures.

fragilitas (fra-jil'i-tas) [L. brittleness]. Fragility.

f. crin'ium. Brittleness, as of the hair, showing splitting and breaking of the shaft. Cause unknown.

TREATMENT. Scalp cleanliness with occasional petrolatum rub. Clipping may retard splitting of distal ends. Singeing is harmful.

f. oss'ium. Brittleness of bones. **SYN:** osteopsathyrosis.

f. sanguinis. Blood fragility.

fragil'ity [L. *fragilitas*, brittleness]. State of brittleness.

f., capillary. Breaking down of capillaries due to changes in saline content of the blood.

SYM. May be oozing of blood through skin of the legs.

f. of the blood. Tendency of blood corpuscles to divide up or dissolve.

f. test. If red blood cells are placed in distilled water, they rapidly swell and burst, since they normally are suspended in a solution of much greater osmotic pressure. This phenomenon is called *hemolysis*. If they are suspended in a solution of normal saline, the cells retain their normal shape and do not burst. If they are placed in successively weaker solutions of saline, a point is reached at which some of the cells burst and liberate their hemoglobin within a given length of time, while others do not (*partial hemolysis*). Finally, at a given dilution, all of the cells have burst within the allotted time, which is usually 2 hours. The cells of normal blood begin to hemolyze in about 0.44%, and complete hemolysis occurs in about 0.35% saline. If the cells are abnormally "fragile," hemolysis occurs in stronger solutions of saline.

fragmenta'tion [L. *fragmentum*, *frangere*, to break]. Breaking up into fragments.

frambe'sia [L. *framboesia*, raspberry]. Infectious tropical disease. **SYN.** yaws.

frambesioma (fram-be-z'i-o-mă) [+ + G. *ōma*, swelling]. Primary lesion of yaws.

Frankenhäuser's ganglion (frang'ken-hoy-zerz). A nerve ganglion sometimes found in lateral walls of the cervix uteri.

Franklin glasses. Bifocal spectacles.

Franklinic electric'ity. Electricity produced by friction. **SEE:** *electricity, static*.

Fraunhofer's lines (frown'hö-fer). Absorption bands or lines seen in a spectrum, caused by the absorption of groups of light rays in their passage through solids, liquids, or gases.

freckle (freck'l) [Old Norse *frecken*, a freckle]. Small local pigmentation, brownish or yellowish, of the skin.

ETIOI. Exposure to sun in majority. Universal types are probably symptomatic (anemia, abdominal disorders, etc.).

Sym: Minute circumscribed brownish pigmentary macules appearing chiefly on face and dorsal surfaces of hands, more marked in spring and summer. In *lentigo senilis* the forearms are affected in individuals showing other senile skin changes.

Treatment: Protection from the sun. Locally, mercuric chloride-alcohol-water with circumspection, symptoms of dermatitis to be controlled by calamine lotion or cold cream. **Syn:** *lentiginos*, *lentigo*, *ephelis*.

free association. 1. Uncontrolled ideas when not under mental restraint or direction. 2. **Psy** The procedure which requires the patient to speak aloud his thought flow, word for word, without censorship.

freezing [*A.S. frēosan*, to freeze]. Frigidity of a limb due to cold.

Most common in the debilitated, the exhausted, and those accustomed to alcoholic beverages.

Sym: Paleness, cyanosis, coldness. Unconsciousness usually develops.

F. A. Treatment: Vigorous massage, application of dry heat with gradual increase in temperature. Sudden applications of heat undesirable. Hot drinks and stimulants but no alcohol. **See:** *frostbite*.

f. microtome. One for cutting frozen objects.

f. mixtures (for ice bags). 5 oz sal ammoniac, 5 oz niter and 1 part of water.

Equal parts of sal ammoniac, salt, and niter.

f. point. Temperature at which liquids freeze.

Frei's disease. Venereal disease affecting the inguinal area, chiefly, with formation of buboes. **Syn:** *lymphogranuloma inguinale* or *venerea*, *Nicolas-Favre disease*.

F.'s test. Test given to confirm diagnosis of lymphogranuloma inguinale.

Consists of injecting an extract from the lymph nodes of a patient with lymphogranuloma into the skin. Positive reaction is evidenced by marked reddening and thickening of the skin about the site of the injection.

fremitus (*frem'it-us*) [*L.* a clashing]. Vibratory tremors felt by palpation through the chest wall.

Varieties: Vocal or tactile, friction, hydatid, rhonchal or bronchial, cavernous or succussion, pleural, pericardial, tussive, thrills. **See:** *palpation*.

f. vocal. Vibrations of the voice transmitted to the ear on auscultation of the chest of a person speaking. In determining the vocal fremitus observe following precautions: Palpate symmetrical parts of chest; make firm pressure; when comparing use the same pressure on the 2 sides, apply hands as nearly parallel to ribs as possible; remember the fremitus is normally increased over the right apex. Is decreased in. (1) Pleural effusions—air, pus, blood, serum, or lymph. (2) emphysema, (3) pulmonary collapse from an obstructed bronchus; (4) pulmonary edema; (5) morbid growths of the lung.

fre'nal [*L. fraenum*, bridle]. Pert. to the frenum.

frenose'cretory [*'' + secernere*, to secrete]. Exercising an inhibitory power over the secretions.

frenotomy (*fre-not'o-mi*) [*'' + G. tomē*, incision]. Division of any frenum, esp. for tongue-tie.

frenulum (*pl. frenula*). [*L.* a little bridle] **Syn.** *vinculum*. 1. A small frenum.

2. A small fold of white matter on the upper surface of the anterior medullary velum extending to the corpora quadrigemina.

f. clitoridis. The union of inner parts of the labia minora on undersurface of the clitoris, *q.v.*

f. labiorum pudendi. Fold of membrane connecting post ends of labia minora.

f. linguae. A fold of mucous membrane which extends from the floor of the mouth to the inferior surface of the tongue along its midline.

f. praeputii. One that unites the foreskin (prepuce) to the glans penis.

f. of tongue. One attaching lower side of tongue to the gum.

frenum (*fre'nūm*) (*pl. frenā*) [*L. fraenum*, bridle]. A fold of mucous membrane which connects two parts, one more or less movable and which serves to check the movement of this part. **See:** *frenulum*.

f. clitoridis. A stringlike structure at lower border of the 2 layers of the 2 labia minora forming the *praeputium clitoridis*.

f. glandis. Median folds connecting lower surface of glans penis with skin of the body of penis.

f. linguae. Fold on lower side of tongue attached to the gum.

f. pudendi. The fourchette, *q.v.*

frenzy. A state of violent mental agitation, maniacal excitement.

frequency [*L. frequens*, often, constant].

1. The number of repetitions of a phenomenon in a certain period of time as the *f* of heart beat, *f* of sound vibrations. 2. In biometry, the ratio of the number of individuals falling into a single group to the total number of individuals classified. 3. The rate of oscillation or alternation in an alternating current circuit, in contradistinction to periodicity in the interruptions or regular variations of current in a direct current circuit.

The frequency is computed on the basis of a complete cycle, a complete cycle being one in which the current rises from zero to a maximum, returns to zero, and rises to an opposite maximum and returns to zero.

Freud, Sigmund (*froyd*). A famous Austrian psychoanalyst, whose teachings stress the theory

1. Of the existence of a subconscious mind.

2. That psychical processes are never accidental or due to chance, but are determined by laws, and are physical events.

3. That emotional processes have the attributes of quantity, and can be displaced from one idea to another.

That the sex instinct does not develop at puberty, but that the child experiences a rich sexual life, and from this is derived the later stages of narcissism or self-love, homosexuality or attraction to the same sex, heterosexuality, which is the normal attraction to the opposite sex. **See:** *Oedipus complex*.

5. That dreams are fulfillments of wishes which find no realization in waking hours, theories are also formulated with regard to the importance of sex in dreams.

6. Freud also suggests that forgetting, misplacing articles, and slips of the tongue or pen are the outward mani-

festation of repression. SEE: *abreaction*, *psychoanalysis*, etc.

freudian (froy'di-an). Pert. to Sigmund Freud or his theories of unconscious or repressed libido or past sex experiences or desires as the cause of various neuroses, the cure for which is the restoration of such conditions to consciousness through psychoanalysis.

Freund's operation (froyndz). Total abdominal hysterectomy for cancer of uterus. SYN *laparohysterectomy*.

friable [L *friare*, to crumble]. Easily broken or pulverized

fric'tion (in massage) [L. *fricare*, to rub]. Strong, circular manipulations always followed by centripetal stroking.

Given with the thumb or the tips of the fingers. The aim is to squeeze pathologically changed parts, and by carrying the diseased tissues into the healthy substances, expose them to a firm stroking, so as to have them absorbed by the lymphatics. In hydrotherapy, friction is used in drying patients after tonic baths, shampoos, salt glows, wet mitten friction and drip sheet rubs.

f., dry. F. using no liquid

f., moist. F. using a liquid or oil.

f., murmur, *f.*, sound. A frictional sound heard in pleurisy

fric'tional electricity. Electricity produced by friction SEE *electricity*, *static*.

Friedländer's bacillus (fred'len-derz). *Bacterium pneumonae*.

F.'s disease. Extreme degree of fibrous tissue in the intima closing the lumen. SYN *endarteritis obliterans*.

Friedman's test. The injection, in 4 cc. doses twice a day for 2 days, of the urine of a woman suspected of pregnancy into an unmated female rabbit will cause the formation of corpora lutea and corpora hemorrhagica in the rabbit at the end of 2 days if the woman is pregnant.

Friedmann's disease. Relapsing infantile spastic spinal paralysis.

Friedreich's ataxia (freed'rix). Rare disease resembling locomotor ataxia occurring in the children of a family, esp. girls. SYN *family ataxia*, *hereditary ataxia*.

F.'s disease. SEE: *F.'s ataxia*.

F.'s sign. Sudden collapse of the cervical veins previously distended, at each diastole, caused by an adherent pericardium. The lowering of the pitch of the percussion note during inspiration which occurs over an area of cavitation

fright [A.S. *fryhto*, fear]. Extreme sudden fear.

f., neuroses. Traumatic hysteria.

f., precordial. Anxiety felt before melancholic frenzy.

frigid (fri'id) [L. *frigor*, cold]. 1. Cold. 2. Irresponsive to emotion, applied esp. to the inability to feel sex desire on the part of a woman

frigid'ity [L. *frigor*, cold]. In the female, absence of sexual desire. Inability to have an orgasm. TREAT Massage or exercise of the pubococcygeus muscle.

frigolabile (fri-go-la'bl) [L. *frigor*, cold, + *labilis*, unstable]. Capable of being destroyed by low temperature.

frigorific (frig-o-rif'ik) [" + *jacere*, to make]. Generating cold.

frig'orism [" + G. *ismos*, condition]. A condition due to long exposure to cold.

frigostabile (fri-go-sta'bl) [" + *stabilis*, firm]. Incapable of being destroyed by low temperature.

frigo'therapy (frig-o-ther'ä-pl) [" + G. *therapeia*, treatment] The use of cold in treatment of disease.

Frisch's bacillus. *Klebsiella rhinoscleromatis*, a gram-negative encapsulated bacillus found in the lesions of rhinoscleroma

frit [Fr. *fritte*, *frire*, to fry] 1. The material from which glass or the glazed portion of pottery is made 2. A similar material for making the glaze of artificial teeth

frog'belly. Flaccid abdomen in children afflicted by rickets, and atony of abdominal cells resulting from dyspepsia, accompanied by flatulence

f., face. Flatness of face resulting from intranasal disease

Froehde's reagent (freh'dez). A test for alkaloids; 1 part of sodium molybdate in 1000 parts of strong sulfuric acid

Froehlich's syndrome (frä'liks). Dystrophia adiposogenitalis, a condition characterized by adiposity of the female type, atrophy or hypoplasia of the gonads, and altered secondary sex characteristics. Due to lesions of the hypothalamus and hypophysis

Froin's syndrome (fio-wan's) Yellow cerebrospinal fluid which rapidly coagulates. It contains an excess of lymphocytes, and also globulin

frolement (frol-mon') [Fr.] 1. Very light friction with the hand in massage * 2. A sound resembling rustling heard in auscultation

Frommann's lines (from'mahnz). Transverse lines in the axis-cylinder of medullated nerve fibers after being stained by silver nitrate.

frons (fronz) [L.] The forehead

fron'tad [L. *frons*, front-, blow, + *ad*, toward] Toward the frontal aspect.

frontal (fron'tal) [L. *frons*, front-, brow]. 1. Anterior. 2. Pertaining to the forehead bone.

f., bone. Forehead bone

f., lobe (of the cerebrum). Four main convolutions in front of the central sulcus.

f., plane. A plane parallel with the long axis of the body and at right angles to the median sagittal plane

f., sinuses. A pair of hollow spaces in the frontal bone lying above the orbits. They are lined with mucous membrane, contain air, and communicate with the middle nasal meatus by means of the nasofrontal duct

fronto- [L. *frons*, front-, brow] Prefix. Ant position or relationship with the forehead

frontomalar [" + *mala*, cheek]. Rel. to the frontal and malar bones

frontomaxillary [" + *maxilla*, jaw]. Rel. to the frontal bone and maxillary bones.

frontoparietal (fron'to-pä-rî-è-täl) [" + *parietalis*, pert. to a wall]. Pert. to the frontal and parietal bones.

frontotemporal [" + *tempora*, the temples]. Pert. to frontal and temporal bones.

front-lap reflex. Contraction of gastrocnemius muscles resulting from percussing stretched muscles of extended leg.

frost'bite. Freezing or effect of freezing of a part of the body.

The nose, fingers, and toes are usually the parts affected.

SYN Tingling, redness, followed by paleness and numbness of affected area.

It is of 3 degrees: (a) Transitory hyperemia following numbness; (b) formation of vesicles, and (c) gangrene

F. A. TREATMENT The Red Cross now advises rapid warming of frostbitten parts of the body of persons who have suffered prolonged exposures to cold. Stimulate with tea, coffee, beef tea. Artificial respiration if unconscious. Cases have been known to recover when parts were black and all hope had been given up, except amputation

f.-itch. Itching skin disease in cold climates. *SYN* *pruritus hiemalis*.

frottage (fro-tazh') [Fr. rubbing] 1. A condition of *hyperesthesia sexualis* often associated with lowered virility inducing an irresistible impulse of pressing up behind women in crowds, thus producing an orgasm. 2. Massage technic using rubbing.

frotteur (fro-ter') [Fr. frottage, rubbing]. One who practices frottage

frozen sleep. Hypothermia, *q.v.*

fructose [L. fructus, fruit]. Levulose. Fruit sugar.

A monosaccharose and a hexose, having the same empirical formula as glucose, $C_6H_{12}O_6$, and found in corn syrup, honey, fruit juices, and in the syrup resulting from the inversion of sucrose, an invert sugar. It produces glycogen and maintains normal content of glucose in the blood. In the liver, it may be converted into glycogen which, in turn, may be converted into glucose. *SEE* *disaccharose*

fructosuria (fruk'-to-sū'rī-ā) [' + G. ouron, urine]. Fructose in the urine.

fruit [L. fructus, fruit] *Bot.* A ripened ovary consisting of a seed or seeds and the surrounding tissue. *Ex pod of a bean, nut, grain, pome, or berry*. The edible product of a plant consisting of ripened seeds and the enveloping tissue

COMP. Carbohydrates in the form of fruit sugar form the chief nutritive value of fruits. Seventy-five per cent of it is a mixture of dextrose and levulose. Proteins and energy factors are variable. Good source of vitamins and mineral elements. Iodine content, 6 to 120 parts per billion. **Pectose bodies:** The principle in fruits that causes them to jelly. **Pectose**, found in unripe fruit. **Pectin**, found in ripe fruit. **Pectic acid**, from pectose, in cooked fruit. **Pectic acid**, from pectin, in fruit cooked a long time

PRINCIPAL ACIDS IN FRUITS AND OTHER FOODS: 1. Acetic, in wine and vinegar. 2. Citric, in lemons, oranges, limes, citron, etc. 3. Malic, in apples, pears, apricots, peaches, currants, gooseberries, etc. 4. Tannic, in gallnuts. 5. Oxalic, in rhubarb, sorrel, cranberries, etc. 6. Tartaric, in grapes, pineapples and tamarinds. 7. Salicylic, in currants, cranberries, cherries, plums, grapes, crabapples and berries. **Combined acids** (a) Citric; (b) malic, in raspberries, strawberries, gooseberries, cherries, etc. (a) Citric, (b) malic, (c) oxalic in cranberries. They contain iron and other mineral substances. Some of the fruit acids, esp. citric and malic acids, when oxidized in the body leave an alkaline residue and thus have an alkalinizing effect.

ONE CLASSIFICATION OF FRUITS 1. Watery, acidulated fruits. 2. Sugar-containing fruits. 3. Amylaceous or oil fruits. The water of fruits possesses special properties similar to mineral spring water.

fruit sugar. Fructose, levulose, *q.v.*

frumentaceous (fru-men-ta'she-us) [L. *frumentum*, grain]. Resembling or belonging to grain

frumenti, spiritus [L. essence of grain]. Whisky.

frumentum (fru-men'tum) [L. grain]. Wheat or other grain

frustration [L. *frustrā*, in vain]. 1. The failure of libido to find adequate outlet.

2. The condition which results from the thwarting or prevention of acts which if performed would bring satisfaction or gratification of physical or personality needs

FSH. The follicle stimulating hormone secreted by the ant lobe of the hypophysis

Ft. Abbr. of L. *fiat*, or *fiant*, let there be made. Also for *florentium*

fuel value. Energy to be produced by oxidation of edible foods after eating. *SEE:* *calory, energy, food requirements*

-fuge [L. | Suffix meaning to expel.

fugitive (fu'jit-iv) [L. *fugitivus*, wandering]. 1. Temporary, transient. 2. Wandering, pert to constant symptoms

fugue (fūg) [L. *fuga*, flight]. 1. Flight automatism. Leaving home and surroundings on a hysterical impulse generally with loss of memory as to identity and the past. 2. *PSY* A form of consciousness similar to that produced by dual or multiple personality, purpose and direction of conduct and action being retained

Fuld's test. A test for the antipyretic power of the blood serum

fulgurant (ful'gu-rant) [L. *fulgurāre*, to lighten]. Severe and sudden, as a *f* pain.

fulgurating [L. *fulgurāre*, to lighten]. Pert to fulguration. *SYN* *fulgurant*.

fulguration (ful-gu-ra'shun) [L. *fulgurāre*, to lighten]. Destruction of tissue by means of long high frequency electric sparks. *SEE* *electrodesiccation*.

fuliginous (fu-lij'in-us) [L. *fuligō*, spot]. Resembling soot, esp. in color.

fulling [A.S. *fullian*, to fill]. A movement in massage, kneading

Palms hold a limb bet them, the fingers extended, the limb being rolled backward and forward

full term. Normal end of pregnancy, when the fetus is 20-21 in. long, has finger and toenails reaching to end of digits, and, if a boy, with both testicles descended. It should weigh from 7 lb. upward and have been nourished in the womb for not less than 40 weeks

ful'minant [L. *fulmināre*, to lighten]. Fulgurant. Coming in lightninglike flashes of pain, as in tabes dorsalis

ful'minating [L. *fulmināre*, to lighten]. Fulgurant, occurring with very great rapidity, said of certain pains

fumes [L. *fumus*, smoke]. Vapors, esp. those having irritating qualities.

f., nitric acid. Used in various chemical processes

SYM. Choking, gasping, swelling of mucous membranes, tightness in chest, cough and shock. Symptoms may last for 1 week or more.

TREATMENT. Allow patient to inhale aromatic spirits of ammonia, followed by steam inhalations at intervals and oily spray repeatedly. Oxygen may be necessary because of limited space for air exchange.

fumig'ant. An agent used in fumigation. Common fumigants are hydrocyanic acid, calcium cyanids, methyl bromide, sulfur dioxide, naphthalene, and ortho- and paradichlorobenzene.

fumig'ation [L. *fumigare*, to fumigate]

1. The use of poisonous fumes or gases to destroy living organisms, esp. rats, mice, insects, and other vermin. Fumigants are relatively ineffective against bacteria and viruses, consequently the practice of terminal disinfection of the sick room, formerly a common practice, has been discontinued. 2. The disinfecting of rooms by gases.

fum'ing [L. *fumus*, smoke] Having a visible vapor

function (fŭng'shŭn) [L. *functio*, *fungi*, to perform] 1. The action performed by any structure. In a living organism this may pertain to a cell or a part of a cell, tissue, organ, or system of organs. 2. The act of carrying on or performing a special activity. Normal function is the normal action of an organ. Abnormal functioning or the failure of an organ to perform its function are the bases of disease or disease processes. Structural changes in an organ constitute pathological changes and are common cause of malfunctioning although an organ may function abnormally in the absence of observable structural changes.

function, words pert. to: absorption, anabolism, analogue, assimilation, atelic, catabolism, catabolism, catabolic, cholecystography, digestion, excretion, metabolism, secretion, syzygiology.

func'tional [L. *functio*, *fungi*, to perform]

1. Pertaining to function. 2. A word applied to disturbances of function in a variety of ways.

The disturbance of function of one organ by structural change in another is at times termed functional, but incorrectly, as it represents organic change. Disturbances of function resulting from unfortunate conditioning of the organism to an external situation may more suitably be called functional, though this "conditioning" may be purely structural.

f. disease. One not organic, or in which changes of an organ are not in evidence, a disturbance of any organ's functions.

f. psychosis. One exhibited in psychosis, in which no pathology of the central nervous system is apparent.

funda (fun'dā) [L. a sling] A four-tailed bandage.

fundal (fun'dal) [L. *fundus*, base]. Pert. to a fundus.

fund'ament [L. *fundamentum*, foundation].

1. A foundation. 2. The anus.

fund'ic. Pertaining to a fundus.

fund'iform [L. *fundus*, sling, + *forma*, shape] Sling-shaped or looped.

fund'us (pl. *fundi*) [L. base] 1. The larger part, base, or body of a hollow organ.

2. The portion of an organ most remote from its opening.

f. glands. Minute tubelike glands of the gastric mucosa in the cardiac section.

f. uteri. The body of the uterus from the internal os of the cervix upward above the fallopian tubes.

f. oculi. Post. inner part of eye as seen with ophthalmoscope.

fundusectomy (fun-dus-ek'to-mī) [" + G. *ektomē*, excision] Excision of the fundus of the stomach. SYN: *cardiotomy*.

fun'gate [L. *fungus*, mushroom]. To grow like a fungus.

fungating (fun'gāt-ing) [L. *fungus*, mushroom] Growing rapidly like a fungus, applied to certain tumors.

fungi (fun'ji) [L. *fungus*, mushroom].

1. Plural of fungus. 2. A division of

plants which includes the bacteria, slime molds, algalike fungi, sac fungi, club fungi, and imperfect fungi. They were formerly considered as a subdivision of the Thallophytes. Fungi are simple dependent plants lacking chlorophyll. Their bodies show little differentiation and they have relatively simple life cycles. They include the molds, rusts, mushrooms, toadstools, lichens, and yeasts. Many forms are pathogenic to plants and animals.

f. fission. The bacteria or Schizomycetes.

f. imperfect. The Fungi Imperfecti (Class *Deuteromycetes*). A group of fungi so-called because their life cycles are only partly known, the sexual stage being absent. Many species are parasitic causing disease.

f. slime. The slime molds (*Myxomycetes*).

f. true. Fungi with a plant body composed of hyphae. Include the algal fungi (*Phycomycetes*), sac fungi (*Ascomycetes*), club fungi (*Basidiomycetes*) and imperfect fungi (*Fungi Imperfecti*).

fungicide (fun'ji-sīd) [" + *caedere*, to kill] Bactericide, that which destroys bacteria or fungi.

fung'icid'in. An antibiotic obtained from *Streptomyces griseus* which possesses fungistatic and fungicidal properties. It is not antibacterial.

fungiform (fun'ji-f-orm) [" + *forma*, shape] Fungus-shaped.

f. papillae. Small, rounded eminences on middle and ant. parts of dorsum and esp. along sides of tongue.

fungista'sis [" + G. *stasis*, a halting]. A condition in which the growth of fungi is inhibited. SEE *fungicide*.

fun'gista't [" + G. *statikos*, standing]. That which inhibits the growth of fungi.

fungista'tic [" + G. *statikos*, standing]. Inhibiting the growth of fungi.

fungoid (fun'goid) [" + G. *eidos*, form]. Having the appearance of a fungus.

f., chignon. Bacterial growth of the hair. SEE *chignon*.

fungosity (fun-gos'it-i) [L. *fungus*, mushroom] A soft excrescence.

fungous (fun'gus) [L. *fungus*, mushroom].

1. Fungoid, q.v. 2. Swiftly growing, as a soft excrescence.

fungus (fun'gus) [L. *mushroom*]. 1. A vegetable cellular organism that subsists on organic matter, such as bacteria and molds. 2. A plant belonging to the division Fungi. 3. A sponge-like morbid excrescence on the body resembling fungus. SEE: *actinomycosis*, *cladosporiosis*.

f. haematomas. Malignant bleeding growth.

fun'ic [L. *funis*, cord]. Pert. to the umbilical cord.

f. souffle. SYN: The purring sound heard over the pregnant uterus, and having the same rate as the fetal heart beat.

fun'icle [L. *funiculus*, little cord]. A small, threadlike structure. SYN: *funiculus*.

funicular (fū-nik'ū-lar) [L. *funiculus*, little cord] Pert. to the spermatic, or umbilical cord.

f. process. That part of the tunica vaginalis that covers the spermatic cord.

funiculitis (fu-nik-u-lit'is) [" + G. *-itis*, inflammation] Inflammation of the spermatic cord.

funiculopathy (fū-nik'ū-lo-peks-i) [" + G. *pēsis*, fixation]. Suturing the spermatic cord to the tissues in cases of undescended testicle.

funiculus (fu-nik'u-lus) [pl *funiculi*] [L. little cord]. 1. Any small structure resembling a cord. 2. A division of the white matter of the spinal cord consisting of fasciculi or fiber tracts lying peripherally to the gray matter. Differentiated into dorsal, lateral, and ventral funiculi. 3. Old term for the umbilical cord or the spermatic cord. 4. Formerly a synonym for *fasciculus*, *q.v.*

fu'niform [L. *funis*, cord, + *forma*, shape]. Cordlike.

fu'nis [L. cord]. 1. A cordlike structure. 2. The umbilical cord.

fun'nel [L. *fundere*, to pour]. Conical, wide, open-mouthed device for pouring through its open tube at end into another vessel.

f. drainage. Drainage by funnels.

f. breast. Sternal depression of chest walls resembling a funnel.

funny bone. The internal condyle of the humerus.

fur [Fr. *forre*, covering]. A deposit forming on the tongue, *q.v.*

furacin. Trade name for *nitrofurazone*, *q.v.*

fur'cal [L. *furca*, fork]. Forked.

furcula. The hypobranchial eminence, an elevation in the floor of the embryonic pharynx at the level of the 3rd and 4th branchial arches. It gives rise to the epiglottis and the aryepiglottic folds.

furfur (fur'fur) [L. bran]. Scurf, dandruff.

furfuraceous (fur-fu-ra'shus) [L. *furfur*, bran]. Scaly, or resembling scales.

furi'bund (fûr'i-bund) [L. *furiundus*, *furere*, to rage]. Maniacal; raging, as in certain types of insanity.

fu'ror [L. rage]. Psy: Extremely violent outbursts or anger, often without provocation.

f. amatorius. Insatiable sexual desire.

f. epilepticus. Epileptic insanity, or sudden anger as expressed by epileptics.

f. femininus. Nymphomania.*

f. genitalis. Erotomania.*

f. uterinus. SEE *f. femininus*.

furuncle (fu'rung-kl) [L. *furunculus*, a boil]. A boil. SYN *furunculus*.

furunc'ular [L. *furunculus*, a boil]. Pert. to a boil.

furunculoid (fû-rung'kü-loid) [f' + *G. eidos*, form]. Resembling a furuncle or boil. SYN *furunculosis*.

furunculosis (fû-rung-kû-lo'is) [f' + *G. ôsis*]. A condition resulting from boils.

furunc'ulous [L. *furunculus*, boil]. Pert. to or of the nature of a boil or boils.

furunculus (fu-rung'ku-lus) [L. a boil]. Boil, furuncle. Acute, deep-seated phlegmonous inflammation formed in the skin usually ending in suppuration and necrosis.

ETIO: Bacterial, promoted by lessened resistance to microbial invasion, trauma, irritation (chemical), excessive sweating, focal infection.

SYM: Neck, axillae, face, buttocks and legs are sites of predilection, beginning in hair follicle or sudoriparous gland as subcutaneous swelling or acuminate pustule around hair shaft, skin smooth and shining, with pain and tenderness. Lesion may come to head, or become boggy and fluctuant, or regression may take place before suppuration, resulting

in disappearance by absorption (blind boil). Lesion ruptures on maturity, discharging core, necrotic tissue, and pus; healing follows.

TREATMENT: Eradication of systemic disease. Yeast, autogenous vaccines, sodium citrate. Locally, hot, moist, antiseptic dressings to hasten maturity followed by radical incision when lesion is walled off. Soft poultices to be avoided. Alpine sun lamp, x-rays, calf liver diet, insulin in presence of blood sugar.

Fusarium (fû-zar'i-um) [L. *fusus*, a spindle]. A genus of fungus.

fuscin. A brown pigment, a melanin, present in the outermost layer (pigmented epithelium) of the retina.

fuse [L. *fusus*, *fundere*, to pour]. A safety device comprising a strip of wire of easily fusible metal, the conductance of which is predetermined. The metal fuses and breaks circuit when excess of current passes through. Convenient forms mounted in plugs, bet. hard metal ends under screwheads.

fu'sible [L. *fusus*, a thing poured]. Capable of being melted.

fu'siform [L. *fusus*, spindle, + *forma*, shape]. 1. Tapering at both ends.

Spindle-shaped. 2. Brod. Pert. to gelatin which liquefies in perspiration form.

Fusiformis [f' + *forma*, shape]. A genus of *Mycobacteriaceae* containing spindle-shaped organisms.

F. acnes. *Corynebacterium acnes*.

F. dentium. Long spindle-shaped organisms associated with *Borrelia vincenti* in ulcerative stomatitis.

fusion (fu'shun) [L. *fundere*, to pour]. Meeting and joining together through liquefaction by heat. The process of fusing of uniting.

f. faculty. Blending of the images of binocular vision into a single perception having the quality of depth.

f. spinal. The fusion of two or more vertebrae, an operation resorted to in the treatment of certain deformities of the spine.

Fus'obacter'ium. A genus of nonspore forming, nonencapsulated, nonmotive, gram-negative bacteria usually found in necrotic lesions, associated with spirochaetes.

F. plauti-vincenti. A species found in lesion of the buccal cavity.

fusocel'ular [L. *fusos*, spindle, + *cellulus*, little cell]. Spindle celled.

fusospirillois (fû'so-spir-il-o'sis) [f' + *spirillum*, coil, + *G. -ôsis*]. Vincent's angina.

fusospirochet'al (fû'zo-spi-ro-ke'tâl) [f' + *G. speira*, coil, + *chaî'té*, hair]. Pert. to fusiform bacilli and spirochetes such as found in Vincent's angina.

fusospirocheto'sis [f' + " + " + *-ôsis*]. Infection with fusiform bacilli and spirochetes.

fusostreptococcosis (fû'so-strep'to-kok-ko'sis) [f' + *G. streptos*, twisted, + *kokkos*, berry, + *-ôsis*]. Infection with fusiform bacteria and streptococcus.

fustiga'tion [L. *fustigare*, to beat with a rod]. In massage, beating with light rods.

fututio (fû-tû'shî-o). Sexual intercourse.

fututrix (fû-tû'triks). A girl or woman who practices tribadism, *q.v.*

G

G. 1. A constant in Newton's law of gravitation. **2** In aviation physiology, **G** is a unit of force resulting from acceleration or centrifugal motion.

Ga. Chemical symb. for *gallium*.

gad'fly. An insect which lays eggs under the skin of its victim, which cause swellings simulating a boil. Multiple furuncles appear with hatching of larva. A fly belonging to the family Tabanidae. **q.v.** Includes horseflies, deerflies, and other blood-sucking flies.

TREATMENT. Evacuate larva and apply antiseptics of benzoic and carbolic acid type. See *botfly*.

gadolinium (gad-o-lin'i-um). **Syms:** Gd. A very rare element; at. wt., 157.3.

Gaffiya (gaf'ki-ä) A genus of bacteria of the family Micrococcaceae

G. tetra'gena. **SYN** *Micrococcus tetragenus* Found associated with the tubercle bacillus and present in lesions of the respiratory passageways, in the blood and spinal fluid. Of low pathogenicity

gag [imitative] 1. Device for keeping the jaws open or forcibly opening the mouth. **2** To retch or cause to retch

g. reflex. Gagging and vomiting resulting from irritation of fauces

gait (gät) [AS *geat*, gate, door]. Manner of walking

CHARACTERISTIC 1. Body leans backward and feet are widely separated in pregnancy, obesity, ascites, and large abdominal tumors. 2. Lumping or hobbling gait is seen in rheumatism, sciatica, hip or knee joint disease or injury, metatarsal neuralgia, and affections of lower extremities. 3. When standing with feet close together in locomotor ataxia, aural vertigo, disease of middle cerebellar lobe, patient sways extremely and may fall. 4. Gait is slovenly in the weak, anemic, and apathetic, and in chronic mental or physical defects

SEE *asynergia*, *adiadochokinesis*, *brachybasia*, *dysmetria*, *steppage*, *walking*.

g., ataxic. Raising foot high, striking ground suddenly with entire sole.

g., brachybasic. Shuffling gait of partial paraplegia.

g., cerebellar. A staggering movement

g., cow. Swaying due to knock-knees.

g., equine. Raising foot by flexing thigh on abdomen. Characteristic of peroneal paralysis. Slow, awkward.

g., festinating. Body bent forward and rigid. Walks on toes as though pushed. Starts slowly, increases and does not stop until patient meets an obstruction. Seen in paralysis agitans.

g., flat-footed. Toes everted, legs often bowed

g., frog. That of infantile paralysis; hopping.

g., hemiplegic. Patient abducts paralyzed limb, swings it around and brings it forward so foot comes to ground in front of him.

g., Huntington's chorea. A few normal paces, a long slow one, and then one or two hops.

g., multiple neuritis. That of a high-stepping horse. Steppage gait, *q.v.*

g., paralysis agitans. Tendency to begin slowly, then rapidly, falling forward.

g., paralytic. Feet dragged with slow movements. Stumbles easily. Seen in chronic myelitis.

g., scissor. One in which legs cross in walking

g., spastic. A stiff movement, toes seeming to catch and drag, legs held together, hips and knee joints slightly flexed. Seen in spastic paraplegia, sclerosis of lateral pyramidal columns of cord. Also in tumor of spinal cord and arachnoiditis

g., steppage. Foot and toes lifted high, heel brought down first. Seen in peripheral neuritis, late stages of diabetes, alcoholism, chronic arsenical poisoning.

g., waddling. Feet wide apart and walk resembling that of a duck. Seen in coxa vera and double congenital displacement of hip when lordosis is present

galact-, galacto- [G.]. Combining forms, pert. to milk

galactacrasia (gal-ak-tä-krä'zi-ä) [G. *gala*, milk, + *krasis*, mixture]. An abnormal composition of milk

galactan (gal-ak'tan) [G. *gala*, milk] A complex carbohydrate forming galactose upon hydrolysis

galact'ase [G. *gala*, milk] An enzyme or proteolytic ferment of milk

galacte'mia, galacthemia (gal-ak-the'mi-ä) [' + *aima*, blood] Milky condition of the blood

galactic (gal-äk'tik) [G. *gala*, milk]. Pert. to flow of milk

galactidrosis (gal-ak-ti-drö'sis) [' + *idros*, sweat]. A milklike sweat

galactin (ga-lak'tin) [G. *gala*, milk]. A basic amorphous substance in milk. **SYN.** *prolactin*.

galactischia (gäl-äk'tis-ki-äh) **SYN.** *galactoschesis* Suppression of the secretion and flow of milk

galactoblast (gal-ak'to-blast) [' + *blastos*, germ]. Body found in mammary acini, contains fat globules

galactocoele (gal-ak'to-säl) [' + *kêlē*, hernia]. 1. A tumor caused by the retention of fluid in a milk duct. 2. Hydrocele containing a milklike liquid

galactagogue (gal-ak'to-gog) [' + *agôgos*, leading]. Agent that promotes the flow of milk

galact'oid. Resembling milk.

galact'olip'in. A phosphorus-free nitrogenous combined with galactose; a cerebroside

galactoma (gal-ak-to'ma) [' + *ôma*, tumor]. Cystic tumor of female breast. **SYN:** *galactocoele*, 1.

galactom'eter [' + *metron*, measure].

Device for measuring amt of cream in milk by its specific gravity and degree of opacity *SYN lactometer*.

galactopathy [gal-ak-to-pa-thy, disease]. 1. Treatment of nursing infants by drugs administered to the mother 2 Therapeutic use of milk

galactopexic [G *gala*, milk, + *pēxis*, fixation]. Making galactose permanent.

galactopezy [gal-ak-tof'is-is] [+ *pēxis*, fixation]. The fixation of galactose

galactophagous (gal-ak-tof'ag-us) [+ *phagein*, to eat]. Feeding upon milk.

galactophylis (gal-ak-tof'is-is) [+ *phylis*, eruption]. 1 Eruption of vesicles containing milklike contents 2 Infantile seborrhea of scalp. *SYN crusta lactea*.

galactophore [+ *pherein*, to bear]. A milk duct.

galactophoritis (gal-ak-tof-or-i'tis) [+ *-itis*, inflammation]. Inflammation of a milk duct.

galactophorous (gal-ak-tof'or-us) [+ *pherein*, to bear]. Giving milk *g. ducts*. Excretory ducts of the mammae

galactophthisis (gal-ak-tof'this-is) [+ *phthisis*, wasting]. Debility and emaciation as result of excessive milk secretion.

galactophygous (gal-ak-tof'ig-us) [+ *phygē*, flight]. Arresting flow of milk.

galactoplania (gal-ak-top-la'ni-ā) [+ *planē*, wandering]. Secretion of milk in some abnormal part due to suppression of normal lactation

galactopoeitic (gal-ak'to-poy-et'ik) [+ *poiein*, to make]. Having to do with the production of milk.

galactopyra (gal-ak-to-pi'rā) [+ *pyr*, fire]. Milk fever

galactorrhea (gal-ak-tor-e'ā) [+ *roia*, flow]. 1. Continuation of lactation, or flow of milk at intervals after cessation of nursing 2. Excessive flow of milk

galactoschesia, **galactoschesis** (gal-ak-tos-ke-si-ā, -tos-ke-sis) [+ *schesis*, suppression]. A stopping of the milk secretion

galactoscope (gal-ak'to-skōp) [+ *skopein*, to examine]. Device for measuring quality of milk. *SYN galactometer, lactoscope*.

galactose (gāl-āk'tōs) [G. *gala*, milk] $C_6H_{12}O_6$ a monosaccharide or simple hexose sugar

Galactose is an isomer of glucose and is formed along with glucose, in the hydrolysis of lactose It is dextrorotatory and reduces alkaline copper solutions such as Fehling's solution It is a component of cerebroside in the digestive tract, galactose is readily absorbed, in the liver it is converted into glycogen

g. tolerance test. Patient fasts overnight and then empties bladder. 40 Gm of galactose in 500 cc. of water are taken orally, then specimens of urine are collected hourly for five hours and the amount of galactose excreted determined A normal person will excrete up to 3 Gm. in this period Amounts esp. above 6 Gm. in excess of this indicate impairment of liver function.

galactosis (gal-ak-to'sis) [+ *ōsis*]. The secretion of milk.

galactostasis (gal-ak-tos'ta-sis) [+ *stasis*, a stopping]. Cessation or checking of milk secretion. *SYN galactoschesia*.

galactosuria [+ *ouron*, urine]. Galactose in the urine.

galactotherapy (gal-ak-to-ther'ā-pi) [+ *therapeia*, treatment]. Treatment of a nursing infant by drugs administered to the mother *SYN galactopathy*.

galactotoxin (gal-ak'to-toks'in) [+ *toxikon*, poison]. A poison in milk produced by bacteria

galactotoxism [+ *ismos*, state of]. Milk poisoning.

galactotrophy (gal-ak-tof'ro-fi) [+ *trophē*, nourishment]. Feeding with nothing but milk

galactoxism (gal-ak-toks'izm) [+ *toxikon*, poison, + *ismos*, state of]. Poisoning by milk. *SYN galactotoxism*.

galactozymase (gal-ak-to-zī'mās) [+ *zyme*, leaven]. A starch hydrolyzing ferment in milk

galacturia [+ *ouron*, urine]. The passing of milky urine. *SYN chyluria*.

ga'lea [L helmet] The epicranial aponeurosis which connects the bellies of the occipitofrontal muscle

galeanthropy (ga-le-an'thro-pi) [G *galē*, cat, + *anthrōpos*, man] A delusion that one has become transformed into a cat.

Ga'len, **Claudius**. (130-200?) A noted Greek physician and medical writer, born in Mysia and later residing in Rome Recognized as the "authority" on medicine until the Middle Ages Called the father of experimental physiology

galen'ic. Pertaining to Galen or his teachings

galenicals, **galenics** (gā-lēn'i-kāls, -iks) 1 Herb and vegetable medicines 2 Crude drugs and medicinals as distinguished from pure active principles contained in them 3 A medicine prepared according to an official formula

Ga'len's veins. The veins running through the tela chorioidea formed by the joining of the terminal and choroid veins, and forming the v. cerebri magna which empties into the straight sinus

galeophilia (gal-e-o-fī'lī-ā) [G. *galē*, cat, + *philein*, to love]. Fondness for cats

galeophobia (gal-e-o-fō'bi-ā) [+ *phobos*, fear]. Abnormal aversion to cats.

galeropia, **galeropsia** (gal-er-o'pī-ā, -rop-si-ā) [G *galeros*, cheerful, + *opsis*, vision]. Unusual clearness of vision.

gall [AS *galla*]. 1. An excoriation. 2. The bitter secretion of the liver stored in the gallbladder bile

It has no ferments and it assists in the emulsifying of fats. It also stimulates intestinal action and multiplies the action of the pancreatic juice threefold It is discharged through the cystic duct into the duodenum

RS. words, bile duct, calculus; "chol-" words, colic, biliary, cystic duct, vesica fellea

gall'bladder [AS *galla* + *blaeddre*, bladder, blister]. Pear-shaped sac on undersurface of right lobe of liver holding bile from the liver until discharged through cystic duct, 3-4 in. long, 1 in. greatest diameter, capacity 50-75 cc. concentrated bile equivalent to 1½ pt. liver bile

DIET IN DISEASES OF: In decreased flow, low fat diet using emulsified fats. In distress aggravated by peristalsis, use a low residue diet. Five small meals a day for all disorders of gallbladder. Eggs have a tendency to empty the gallbladder. Avoid chocolate, fats, ice cream, and foods containing them. No condi-

ments or strong coffee, small amount of salt allowable, no strongly flavored vegetables. No fried foods.

SYN: *vesica fellea*.

GALLBLADDER

A Ampulla in duodenal wall into which both ducts open B Fundus C Gallbladder D Cystic duct E Common hepatic duct F Bile duct G Pancreatic duct

gall'duct [*"* + *L. ductus*, a passage]. Tube carrying bile from the liver and gallbladder

gal'l'on. Four quarts, 231 cubic inches.

gal'l'stone [*AS galla*, bllc, + *stān*, stone]. Concretion formed in the gallbladder or bile ducts generally after 35th year.

Gallstones may be classified as (1) *pure*, consisting of either cholesterol, calcium bilirubin, or calcium carbonate, or (2) *mixed*, consisting of cholesterol in combination with one or more of the other constituents. In addition to the substances named, gallstones may contain albuminates, cellular debris, or foreign substances such as bacteria, esp., typhoid bacilli. So called "soft" stones (those consisting principally of cholesterol) can be visualized by x-ray only under optimal conditions by cholecystography.

SYM Stone may remain dormant and give little distress unless inflammation and distention of the gallbladder take place or unless it enters and is unable to pass through the biliary ducts, when colic ensues. The pain may radiate to the back and right shoulder, usually several hours after eating and when the stomach is empty, flatulence, jaundice usually absent.

TREATMENT: Hot turpentine fomentation over region of gallbladder, hypodermic of morphine under physician's directions, surgical aid. Surgery.

NP (postoperative) Position, propped up in bed to prevent pneumonia, to permit free drainage, and relieve pressure on diaphragm. Lavage if vomiting is persistent. Only liquids in small amt.

given. Note character of drainage and stools for color and nature of contents, and for proper discharge of bile. Protect drainage from all areas. Use cradle if no dressing is permitted, and absorbent pad at side for discharge SYN: *biliary calculus*.

RS *bilifuscin*, *biliphein*, *biliprasin*, *calculus*, *cholecystiditis*, *cholelithiasis*.

GALLSTONES (After Sears)

Diagram showing the positions in which gallstones may be found 1 Gallstone impacted at entrance of bile duct into duodenum 2 Duodenum 3 Cystic duct 4 Gallbladder with stones 5 Liver 6 Hepatic duct 7 Common bile duct 8 Pancreas 9 Pancreatic duct with pancreatic calculus

Gal'ton's whistle. A whistle with which a note may be changed, used to test the hearing.

galvan'ic. Pert to galvanism

g. battery. A series of cells, giving a combined effect of all the units, and generating electricity by chemical reaction.

g. cell. One of a series of cells generating electricity through chemical reaction.

gal'vanism. Therapeutic use of direct current of electricity.

galvanization (*gal-van-i-za'shun*). Employment of a galvanic current.

galvanocau'tery. Cauterization of tissue by means of an electric current. SEE: *electrocautery*.

galvanocontracti'lity. Capability of a muscle of contracting under a galvanic stimulation

galvanofaradiza'tion. Combined use of galvanic and faradic current made possible by use of a De Wetteville switch

galvanom'eter. An instrument that measures current by electromagnetic action.

It may consist of a magnetic needle delicately suspended in the center of a permanent coil of wire, or a suspended coil between the poles of a fixed mag-

net. When the current is applied to the coil, the needle is deflected over a calibrated scale.

Galvanometers detect current and enable one to determine its direction, amperage, and voltage. The d'Arsonval form is more common, in which a coil moves in a permanent magnetic field. The instrument is called a voltmeter when used in series with a high resistance to measure voltage.

galvanonervous. Pert. to the effect of a galvanic current upon a nerve.

galvanopalpation. A method of measuring tactile sensibility of the nerves of the skin by the electric current.

galvanopuncture. Introduction of needles to complete a galvanic current.

galvanoscope (gal-van'o-skop). Instrument which shows the presence and direction of a galvanic current.

galvanosurgery. Use of galvanism in surgery.

galvanotaxis. The tendency of a living organism to arrange itself in a medium so that its axis bears a certain relation to the direction of the current in the medium.

galvanotherapeutics, galvanotherapy. Treatment by means of electricity. *SYN electrotherapy*.

galvanothermy. Treatment by the heat from a galvanic battery.

galvanotonus. Tonic contractions caused by a galvanic current.

galvanotropism. The tendency of an organism to grow, turn, or move into a certain relation with an electric current.

gamete (gam'et) [G. *gametēs*, spouse]. A male or female reproductive cell, the spermatozoan or ovum, *q.v.*

RS anisogamy, chromosome, conception, embryo, fertilization, gene, maturation, ovum, spermatozoan

The ovum (1/125 in. in diameter) and the spermatozoan (1/500 in. in length). Each mature human germ cell has 48 chromosomes or 24 pairs which are reduced to one-half the number during maturation.

gametic [G. *gametēs*, spouse]. Pert. to gametes.

gametocide (gam'et-o-sid) [+ L. *caedere*, to kill]. An agent destructive to malarial gametocytes.

gametocyte (gam'et-o-sit) [+ L. *kytos*, cell]. The sexual cell forming the gamete. An oocyte or spermatoocyte.

gametogenesis. For formation of gametes' oogenesis or spermatogenesis. *SEE maturation*

gametogony. The phase in the life cycle of the malarial parasite (*Plasmodium*) in which male and female gametocytes, which infect the mosquito, are formed.

gametophyte. In plants, the sexual or gamete-producing generation which alternates with the asexual or spore-producing generation.

Gamgee tissue. A dressing made of a thick layer of absorbent cotton between 2 layers of absorbent gauze, used for surgical dressing.

gam'ic. Sexual, esp. as applied to eggs which develop only after fertilization in contrast to those which develop parthenogenetically.

gam'ma (G. letter γ). 1. Third letter of the Greek alphabet. 2. In Chem., used to designate the third of a series, as the third carbon atom in an aliphatic chain. 3. One microgram, or one thousandth of a milligram (0.001 mg), one millionth of a gram.

g. globin. A protein formed in the blood. Ability to resist infection is related to concentration of such proteins.

g. rays. Electro-magnetic waves of extremely short wave-length emitted by radio-active substances. They are thought to be of the same nature as X-rays. They have greater penetrating power than alpha or beta rays, and, when passing through a magnetic field, are not deflected. *SEE rays*

gam'macism [G. *gamma*, γ , + *ismos*, state of]. Inability to pronounce correctly *g* and *k* sounds.

Gam'ma's disease. Splenomegaly with slow, progressive enlargement of the spleen.

G's. nodules. Nodules stained yellow or brown in certain varieties of splenic enlargement. *SEE G's disease*.

gamo- [G.]. Combining form from *gamos*, sexual union.

gam'ont [+ *ontos*, being]. A sexual form of certain protozoans.

gamophobia (gam-o-f'o'bi-ā) [+ *phobos*, fear]. Psychoneurotic aversion to the marriage relationship.

gampsodactylia (gamp'so-dak-til'i-ā) [G. *gampsos*, curved, + *daktylos*, finger]. Deformity of the toes resembling claws. *SYN claupect*.

ganglial (gang'gli-āl) [G. *gagglion*, ganglion]. Pert to a ganglion. *SYN ganglionic*.

gangliated (gang'gli-at-ed) [G. *gagglion*, ganglion]. 1. Having ganglia. 2. Inter-mixed. [nervous system]

g. cord. Main trunk of sympathetic gangliectomy [+ *ektomē*, excision]. Excision of a ganglion.

gangliform (gang'gli-form) [+ L. *forma*, shape]. Formed like a ganglion.

ganglioform (gang'li-o-form) [+ L. *forma*, shape]. Shaped like a ganglion. *SYN gangliiform*.

ganglioglia'ma [+ *glia*, glue, + *ōma*, tumor]. A ganglion cell glioma.

ganglioglioneuroma (gang'gli-o-gl'i'o-nū-rō-mā) [+ *neuron*, nerve, + *ōma*, tumor]. Ganglion cells, glia cells, and nerve fibers in a nerve tumor.

ganglioma (gang-li-o-mā) [+ *ōma*, tumor]. 1. Tumor of a lymphatic gland. 2. A swelling of lymphoid tissue.

ganglion (gang'gli-on) [pl. *ganglia*] (G. *gagglion*, ganglion). 1. A mass of nervous tissue composed principally of nerve-cell bodies and lying outside the brain or spinal cord; e.g. the chain of ganglia which form the main sympathetic trunks, the dorsal root ganglion of a spinal nerve. 2. Cystic tumors developing on a tendon or aponeurosis; sometimes occur on the back of the wrist due to strain, such as excessive practice on the piano.

g. abdominal. Any one of the abdominal ganglia.

g. ant. cerebral. Corpus striatum. Corpus striatum and corpus lenticulare together.

g. aorticorenal. A g. lying near to the lower border of the celiac g. It is located near the origin of the renal artery.

g. Arnold's auricular. Tiny g. located beneath foramen ovale. *SYN otic g., otoganglion*.

g. auricular. *SEE Arnold's auricular g.*

g., autonomic. A ganglion of the autonomic division of the nervous system.

basal. Mass of gray matter beneath 3rd ventricle. Consisting of the caudate, lentiform, and amygdaloid nuclei and the claustrum.

g., basal optic. Mass of gray matter beneath 3rd ventricle.

g., cardiac. SYN *ganglion of Wrisburg*. Tiny g. toward which converge the fibers of superficial cardiac plexus. It lies on the right side of the ligamentum arteriosus.

g., carotid. G. formed by filamentous threads from the carotid plexus beneath the carotid artery.

g., celiac. SYN *semilunar g.* One of a pair of prevertebral or collateral ganglia located near the origin of the celiac artery. They form a part of the celiac plexus.

g., cerebral. Main cerebral nerve centers.

g., cervical. Three pairs of ganglia (superior, middle, inferior) located in the neck region. They are the ganglia of the cervical portion of the sympathetic trunk.

g., cervico-uterine. SYN *Frankenhäuser's ganglion*. G. of uterine cervix.

g., cervico-uterine. G. of uterine cervix.

g., ciliary. Tiny g. located in the rear portion of the orbit.

g., coccygeal. A g. located in the coccygeal plexus and forming the lower termination of the two sympathetic trunks, sometimes absent.

g., collateral. A prevertebral ganglion, *q.v.*

g., dorsal root. SYN *posterior root g.* *spinal g.* A g. located on the dorsal root of a spinal nerve. Contains the cell bodies of sensory neurons.

g., Gasserian. SYN: *semilunar g.* It lies on the sensory root of the trigeminal nerve and from it arise the three branches (ophthalmic, maxillary, mandibular).

g., geniculate. A ganglion on the pars intermedia, the sensory root of the facial nerve. It lies in the ant. border of the ant. geniculum of the facial nerve.

g., inf. mesenteric. A prevertebral sympathetic ganglion located in the inf. mesenteric plexus near the origin of the inf. mesenteric artery.

g., interpeduncular. SEE *nucleus, interpeduncular*.

g., intervertebral. A spinal ganglion, *q.v.*

g., jugular. A g. located on the root of the vagus nerve and lying in upper portion of jugular foramen.

g., lateral. One of a chain of ganglia forming the main sympathetic trunk, also called vertebral ganglion.

g., lenticular. SEE *ciliary g.*

g., lumbar. G. usually four in number in the lumbar portion of the sympathetic trunk.

g., Meckel's. SEE *sphenopalatine ganglion*.

g., nodosum. G. of the trunk of the vagus nerve. Located immediately below jugular ganglion. It makes connections with the spinal accessory nerve, hypoglossal nerve, and the sup. cervical ganglion of the sympathetic trunk.

g., ophthalmic. *g., optic.* SEE *ciliary g.*

g., otic. SYN: *Arnold's g.* A small ganglion located deep in the zygomatic fossa immediately below the foramen ovale. It lies medial to the mandibular nerve. It supplies postganglionic parasympathetic fibers to the parotid gland.

g., petrosus. G. located on lower margin of temporal bone's petrous portion.

g., pharyngeal. G. in contact with the glossopharyngeal nerve.

g., phrenic. One of a group of ganglia joining the phrenic plexus.

g., renal. One of a group of ganglia joining the renal plexus.

g., sacral. Four small ganglia located in the sacral portion of the sympathetic trunk. They lie on the anterior surface of the sacrum and are connected to the spinal nerves by gray rami.

g., semilunar. 1. The Gasserian g. *q.v.* 2. The celiac g. *q.v.*

g., sphenopalatine. A g. associated with the great superficial petrosal nerve (branch of facial) and the maxillary nerve. It transmits both sympathetic and parasympathetic fibers to the nasal mucosa, palate, pharynx and orbit.

g., spinal. SYN *dorsal root g.* *post root g.* Ganglionic enlargement of spinal nerves' dorsal roots.

g., spiral. A long coiled ganglion in the cochlea of the ear. It contains bipolar cells, the peripheral processes of which terminate in the organ of Corti. The central processes form the cochlear portion of the acoustic nerve and terminate in the cochlear nuclei of the medulla.

g., submaxillary. A g. lying between the mylohyoides and hyoglossus muscles and suspended to the lingual nerve by two small branches. Peripheral fibers pass to the submaxillary and sublingual glands and the mucous membrane of floor of mouth.

g., superior mesenteric. A prevertebral ganglion of the sympathetic nervous system which lies close to the celiac ganglion and with it forms a part of the celiac (solar) plexus. It lies close to the base of the sup. mesenteric artery.

g., suprarenal. G. situated in the suprarenal plexus.

g., sympathetic. Those of the thoracolumbar (sympathetic) division of the autonomic nervous system. Include vertebral or lateral ganglia (those forming the sympathetic trunk) and prevertebral or collateral ganglia, more peripherally located.

g., temporal. Tiny g. joining the ant. branches of sup. cervical g.

g., terminal. A ganglion of the autonomic division of the nervous system which lies close to or within the organ innervated.

g., thoracic. One of 12 ganglia of thoracic area of sympathetic nerve.

g., tympanic. On tympanic portion of the glossopharyngeal nerve.

g., vestibular. SYN: *Scarpa's ganglion*. A bilobed g. located on the vestibular branch of the acoustic nerve at the bottom of the int. acoustic meatus. Its peripheral fibers arise in the maculae of the sacculus and utriculus and the cristae of the ampullae of the semicircular ducts.

ganglionated (G. *gagghon*, ganglion). SYN. ganglated. Having or consisting of ganglia.

ganglionectomy (gang-II-o-nek'to-mi) [' + *ektomē*, excision]. Excision of a ganglion.

ganglioneuroma (gang'gil-o-nū-ro'mā) [' + ' + *ōma*, tumor]. A neuroma containing ganglion cells.

ganglionic (gang-II-on'ik) [G. *gagghon*, ganglion]. Pert. to or of the nature of a ganglion.

ganglionitis (gang-II-on-i'tis) [' + -itis, inflammation]. Inflamed condition of a ganglion.

ganglioside. A cerebroside present in the brain and containing neuraminic acid, a particular type of fatty acid.

gangosa. A lesion of the nose and hard palate, regarded as a late stage of yaws, rhinopharyngitis mutilans.

gangrene (gan'grēn) [*G. gangraina*, an eating sore]. The putrefaction of soft tissue, a form of necrosis. **SYN:** mortification.

Etiol: Usually results from cutting off of blood supply to an organ or tissue, which may result from inflammatory processes, injury, or degenerative changes such as arteriosclerosis. It is commonly a sequela of boils, frostbite, crushing injuries, or diseases such as diabetes, tuberculosis, syphilis, and Raynaud's disease. The part that dies is known as a *slough*. If the soft tissues are involved, or a *sequesterum*. If it is a bone that dies. It must be removed before healing can take place.

g., anemic. G. resulting from an obstructed circulation in the part.

g., angioneurotic. State resulting from thrombotic arteries and veins.

g., diabetic. Moist gangrenous condition arising in some diabetics.

g., dry. This results when the part that dies has little blood and when it remains aseptic. The arteries but not the veins are obstructed. The tissues dry and drop off, the process continuing for weeks or months. **SYM** Pain in early stages. The part is cold and black and begins to wither. The toes are generally first affected spreading to the knee. Usually seen in advanced diabetes and arteriosclerosis.

g., embolic. Gangrenous condition arising subsequent to an embolic obstruction.

g., gas. This is gangrene in a wound infected by a gas bacillus, the most common etiologic agent being *Clostridium welchii*.

Most recent method of treatment to prevent amputation has been the combined use of antiserum, sulfanilamide or sulfapyridine, and irradiation. Inhalations of concentrated oxygen have also been somewhat successful.

g., hospital. Moist gangrene due to wound contamination by putrefactive bacteria. It was common in hospitals in the days when overcrowding and lack of cleanliness were the rule.

g., humid. See *moist g.*

g., idiopathic. When the cause is unknown.

g., infective. Due to infection, as in carbuncle necrosis, cancrum oris and cancrum noma.

g., moist. This occurs after a crushing injury, usually at distal part of an extremity, or when dry gangrene is infected with putrefactive bacteria, and when the part is full of blood. **SYM:** The part is hot, red, later cold and bluish, commencing to slough. It spreads rapidly and there is an offensive odor. The process is known to the layman as "mortification." Death may result in a few days.

g., primary. G. developing in a part without previous inflammation.

g., secondary. G. developing subsequent to local inflammation.

g., senile. G. developing in the limbs of the senile. Supposed to be due to arteriosclerosis.

g., symmetric. G. on opposite sides of the body in corresponding parts. Usually the result of vasomotor disturbances. Characteristic of Raynaud's and Buerger's disease.

g., traumatic. Result of extensive injuries.

g., white. Moist gangrene developing in patients with anemia and lymphatic obstruction.

gangrenosis (gang-gren-o'sis) [" + -osis]. Condition of mortification or gangrene.

gangrenous [*G. gangraina*, an eating sore]. Of the nature of gangrene.

gan'oblast [*G. ganos*, brightness, + *blas-tos*, cell]. An enamel cell. **SYN:** *ameloblast*.

Ganser's syndrome (gan'zerz sin'drōm). "Nonsense syndrome." Absurd acts and speech seen in prison psychosis, hysteria, and other states.

gap. An opening or a break; an interruption in continuity.

g., auscultatory. A period of silence which occurs in the determination of blood pressure by the auscultatory method. Exact cause unknown.

g., cranial. A congenital fissure in the skull.

g., silent. A silent period noted in blood pressure determination by the auscultatory method although no interruption is noted in palpation at the wrist.

gargarism (gar'gar-izm) [*G. gargarisma*, a gargle]. A gargle or throat wash.

gargle (gar'gl) [*L. gurgulio*, windpipe]. 1. A wash for the throat. 2. To wash out the throat with a throat wash.

gargoylism. **SYN** *lipochondrodystrophy, Hurler's disease*. A condition usually congenital characterized by dwarfism, kyphosis, and other skeletal abnormalities, disturbances in lipid metabolism, and usually mental deficiency.

garlic [*AS gar*, spear, + *leak*, the leek]. An edible, strongly flavored bulb, of *Allium sativum* used mainly for seasoning. **COMPR** The active principle of garlic is sulfide of allyl.

ACRON: It is a gastric stimulant and an intestinal antiseptic. Slightly diuretic and an irritant for the kidneys, stimulating them as well as the circulation and the nerves.

INDICATIONS: Its sulfurated essence is anticeptarrhal.

gar'rot [*Fr garroter*, to tie fast]. A form of tourniquet.

Gart'ner's duct. A small duct, the mesosalpinx lying parallel to the uterine tube. It is a vestigial structure representing the persistent mesonephric duct. Also called duct of the epoophoron, ductus epoophori longitudinalis.

gas. 1. A fluid substance which not only takes the shape of the containing vessel but expands and fills the vessel no matter what its volume. 2. An airlike fluid subject to expansion and convertible into a liquid by cooling or compression.

Among the common important gases are oxygen, illuminating gas; exhaust gas, sewer gas, which contains carbon monoxide (*g.v.*), carbon dioxide (*g.v.*); the anesthetic gases (see *anesthesia*); ammonia (*g.v.*), the poison war gases, etc. Liquids and solids when heated often give off fumes which may be poisonous, among the more common are the mineral acids, ammonia water, mercury and its compounds, cyanides, zinc-containing metals, etc. See *gases*.

g. bacillus. See *gangrene*.

g. (in the) blood. The principle gases found in the blood are oxygen, nitrogen, and carbon dioxide. They may be dissolved in the plasma or they may exist in loose chemical combination with other compounds, as oxygen combined with hemoglobin.

g., digestive tract. Among the gases in the digestive tract are oxygen, nitrogen, hydrogen, carbon dioxide, methane, and in decomposition of proteins, hydrogen sulfide, indol, skatol, ammonia, etc.

g., distention. Abdominal distention is result of abnormal gaseous, fluid, or solid accumulation in abdominal cavity. It may be (a) acute; (b) chronic, (c) local, or (d) general. The abdominal wall, the cavity, or the intraabdominal viscera may be involved. **Postoperative:** Result of complication following an operation. Limited to lower part of small, and all of large intestines. Careless administration of anesthesia may be a cause, as is degree of peritonitis. **Pre-operative.** Enema is a preventive. **TREATMENT** No cold fluids, change of posture, insertion of rectal tube, enemata only as advised by surgeon.

g. excretions. Oxidation produces carbon dioxide or carbonic acid gas, from one-half to two-thirds of a cubic ft. per hr. being produced by an adult male of average weight. Activity increases the amount. Ordinarily only water vapor and carbon dioxide are given off.

g. gangrene. That caused by the gas bacillus. See *gangrene*.

g., illuminating. This is a mixture of various combustible gases including hydrogen and carbon monoxide. Its poisonous effects are largely due to carbon monoxide, *q.v.* **TREATMENT** Resuscitation, *q.v.*

g. in the blood. Dissolved gases are found in the blood in the form of oxygen, nitrogen, and a small portion of carbon dioxide, with carbonic acid from the tissues.

g., laughing. Nitrous oxide.

g., marsh. Methane.

g., mustard. Poisonous gas used in warfare (dichlorethyl sulfide).

g., refrigerant. A number of these gases are used in ordinary household mechanical refrigerators. Poisoning due to leaks, faulty connections or breakage, and gas dissipated into the atmosphere. Among these gases are methyl chloride, ammonia, sulfur dioxide and more than 20 other gases. Most of these are toxic. Careful researches are now being carried on to develop nontoxic gases. Warning agents mixed with these gases are not a guarantee of protection to infants, children, hospital patients, firemen and refrigerator workers, therefore, instead of merely adding a protective agent, it would be wiser to have a nontoxic refrigerant. Methyl chloride is responsible for more poisoning than other refrigerant gases. **Sulfur dioxide:** As this is a respiratory irritant it is easily detected, so serious poisoning is not likely to occur.

g., fear. A gas that irritates the conjunctiva and which produces a flow of tears.

gas'ator. Device for adm. chlorine gas for respiratory infections.

gaseous (gas'e-us). Of the nature or form of gas.

gases, war. Any chemical substances whether solid, liquid, or vapor, used to produce poisonous or irritant effects. They can be classified as *lacrimators*, *sterminators*, *lung irritants*, *vesicants*, and those that act as a systemic poison. Some gases have multiple effects.

They are known as persistent or non-persistent, *i. e.*, those which diffuse and are dispersed fairly rapidly, and those which linger and evaporate slowly.

It is of the greatest importance that those rendering first aid should avoid becoming casualties, precautions must be taken, masks worn, as well as being applied to the patients. Strict discipline must be maintained during gas raids in order to avoid panic. If gas training has been thorough and if organization is good, much may be done to lessen the effect, and maintain a good morale.

Decontamination centers are essential and nurses must understand that thorough decontamination of clothing, boots, ambulances, etc., is vitally necessary, and they should make themselves familiar with the necessary detail.

g., lewisite. Contains arsenic and smells of geraniums.

SYM. Similar to those of vesicant gas, *q.v.*, but come on at once and as a rule are not so severe. Arsenic can be recovered from the serum of the blisters and symptoms of arsenic poisoning may occur.

TREATMENT Similar to that for vesicant gas, *q.v.*

g., lung irritant. Ex: *Chlorine and phosgene*.

SYM. Burning sensation of the eyes, nose, and throat, bronchitis and pneumonia, sometimes followed by edema of the lungs and probably death.

TREATMENT. Remove patient from exposure, apply respirator, if there has been exposure to phosgene (smells like musty hay) the symptoms may be delayed and the patient may collapse later. It is important, therefore, to provide complete rest, remove patient on a stretcher, and provide warmth, oxygen may be required in large quantities over a fairly long period.

g., mustard. Dichlorethyl sulfide. See: *g., vesicant*.

g., nose irritant. Diphenylchlorarsine. An irritant smoke.

SYM: Intense pain in the nose, throat, and air passages and sneezing followed by headache and aching in teeth and jaws, acute mental depression, and sometimes vomiting.

TREATMENT: Casualties must be reassured that no permanent harm is done and should be warned against removing respirator in spite of the fact the symptoms may get worse after donning it. This is a gas likely to lead to "panic." Nasal douching with warm sodium bicarbonate is helpful.

g., suffocating. Made from chlorine compounds.

g., tear. Substance which, when dispersed into the air, causes the eyes to be blinded by tears. Ex: *Bromoacetone*.

SYM. Causes much inconvenience. Irritation of the nose and eyes, and free lacrimation so that it is impossible to see.

TREATMENT As a rule, none is necessary, for upon removal from the infected area, the symptoms tend gradually to subside.

g., toxic. Hydrocyanic acid type.

g., vesicant. Attack every part of body; clothing and boots are infected and a source of danger.

Ex. mustard g., lewisite.

SYM: Do not appear at once; may be 6 hr. or longer before the patient is aware of anything wrong. Pain in the eyes, lacrimation, and discharge may be the first evidence, the eyelids swelling and the patient being unable to see;

there is a deep redness of the skin, followed by blistering and ulceration.

Prog: Healing is very slow, but generally follows if treatment is prompt and efficient.

TREATMENT: Decontamination is essential and must be thorough. Bathe eyes freely with normal saline or plain water; a drop or 2 of castor oil will prevent lips sticking; no bandage should be worn. The patient should be scrubbed, if possible, under a hot or warm shower for 10 minutes. Bleach cream or powder, if ordered, should be applied first, and left in contact with the skin for 5 minutes. If, in spite of these precautionary measures, blisters arise, they may be successfully treated with tannic acid.

g. vomiting. That induces emesis, specifically chloroform.

gasoline. A product of the destructive distillation of petroleum.

Most motor fuel contains ethyl lead, ethyl antimony or ethyl arsenic combinations which increase the toxicity markedly. Slightly antiseptic if free from these compounds, and may be used to wash grease out of wounds, although ether is better.

Sym. or Poisoning Giddiness, headache, intoxication, nervous disturbance, muscular tremors, difficulty in respiration, paralyzes, convulsions, cyanosis, unconsciousness, pulmonary hemorrhage. Usually no local disturbance of stomach.

F. A. TREATMENT Fresh air, inhalation of oxygen and carbon dioxide, artificial respiration when necessary. Otherwise treat symptoms.

gasometric. Pert to measurement of gases.

gasometry (gas-om'et-ri) [G. *metron*, measure] Estimation of amount of gas present in a mixture.

gasp. To catch the breath; to inhale and exhale with quick, difficult breaths, the act of gasping.

gasserec-tomy (gas-er-ek'to-mi) [G. *ektome*, excision]. Excision of the gasserian ganglion.

gasserian arteries. A branch from the int. carotid a. and one of the middle meningeal a. to the gasserian ganglion. See *ganglion*.

gas'ing. The use of war gases, *q.v.*

gaster, gastero, gastro. Combining forms meaning "pertaining to the stomach or the region of the stomach."

gastralgia [G. *gastēr*, belly, + *algos*, pain]. Pain in the stomach.

gasterangiemphraxis (gas'ter-an"ji-em-fraks'is) [G. + *ageion*, vessel, + *emphraxis*, obstruction]. 1. Congestion of blood vessels of stomach. 2. Pyloric obstruction.

gasterasthenia (gas-ter-as-the-ni-ā) [G. + *asthēna*, weakness]. Debility of stomach. Syn *gastrasthenia*.

gasterhysterotomy (gas'ter-his-ter-ot'o-mi) [G. + *ystera*, uterus, + *tomē*, incision]. Incision of uterus through abdomen. See *cesarean operation*.

gastorrhagia (gas-tor-a'ji-ā) [G. + *rēgnunai*, a bursting forth]. Hemorrhage from the stomach.

gastradenitis (gas-trad-en'i'tis) [G. + *adēn*, gland, + *-itis*, inflammation]. Inflammation of the stomach glands.

gastralgia (gas-tral'ji-ā) [G. + *algos*, pain]. Paroxysmal epigastric pain without gastric lesion.

Sym. Pain radiates to the back when stomach is empty. Warm foods and drinks, and pressure over painful area

relieve pain. Not to be confused with other gastric disturbances. Dilatation never present. Hyperacidity obtains in certain forms; hematemesis absent. In females, it is most frequent near the menopause.

gastralgocenosis (gās-trāl'gō-sēn-ōs'is) Gastric pain due to emptiness of stomach; hunger pangs due to hunger contractions, powerful peristaltic contractions which sweep over the stomach.

gastralgokenosis (gas-tral-go-ken-ō'sis) [G. + *kenōsis*, emptiness]. A sensory neurosis of the stomach.

gastraneuria (gas-tra-nū'ri-ā) [G. + *neurōn*, nerve]. Defective action of nerves of the stomach.

gastrasthe'nia [G. + *asthēna*, weakness]. Debility of the stomach. Syn *gasterasthenia*.

gastratrophia (gas-tra-tro'fi-ā) [G. + *atrophia*, atrophy]. Atrophy of the stomach.

gastrēctasia, gastrec'tasis [G. + *ektasis*, dilatation]. Dilatation of the stomach. May be acute or chronic.

Etiol. Obstruction of pylorus, atony, overeating, congenital weakness, imperfect peristalsis, omental hernia, periduodenal adhesions, gastroptosis.

Sym Chronic Vomiting of food taken several days before, vomitus sour, contains fatty acids, mucus, bacteria. Acute Severe, sudden pain accompanied by collapse. Small, rapid pulse, temperature subnormal, upper abdominal pain resembling ague pectoris. Distended and tympanic abdomen. Vomiting of fluids and eructation of gas.

gastroctomy (gās-trēkt'ō-mi) [G. *gaster*, belly, + *ek-tomē*, excision]. Surgical removal of a part or the whole of the stomach.

gas'tric [G. *gaster*, stomach]. Pert to the stomach.

g. analysis. Determines quality of secretion, amount of free and combined hydrochloric acid, absence or presence of blood, bile, bacteria, fatty acids. Esp. necessary if gastric ulcer or carcinoma is suspected.

g. digestion. 1. As food passes through the cardiac orifice into the stomach, it tends to accumulate in the lowest part of the major curvature. 2. Successive portions of food are added to this, tending to accumulate in the innermost portion of the mass. The walls of the stomach gradually relax receptive relaxation adapting themselves to the amount of the contents. This is the result of a *gastric feeding reflex* which also inhibits peristalsis in the remaining portion of the stomach. 3. Within the mass, salivary digestion continues for a short time, but in those portions touching the stomach wall, the salivary ptyalin is destroyed by the acid.

CHEMICAL ASPECTS During the meal, nervous impulses from the brain are carried to the stomach by way of the vagi, they result from the sensations of sight, smell, and taste. In addition, the stretching of the stomach wall excites the gastric glands by local nervous mechanisms, and chemical substances initially present in the food (preformed secretagogues) or produced during the digestion of the food (derived secretagogues) are absorbed and further stimulate the gastric glands.

The following changes occur in the food while in the stomach. Pepsin acts on proteins of high molecular weight hydrolyzing them to proteoses and peptones. Pepsin also coagulates milk. Hydrochloric acid is essential for the ac-

tivity of pepsin. It also dissolves collagen, disintegrates nucleoproteins, hydrolyzes double sugars, and is responsible for the antiseptic action of the gastric juice. Gastric lipase acts on emulsified fats reducing them to fatty acids and glycerol but its action is limited.

MOTOR ASPECTS: After the initial relaxation, the stomach increases its pressure upon its contents. The cardiac sphincter closes firmly to prevent regurgitation into the esophagus. The pyloric part of the stomach begins to exhibit wavelets of contraction which run toward the pylorus. They become deeper, and their focus of origin shifts in the direction of the cardia.

At first the pylorus, like the cardia, remains firmly closed, and the wavelets result only in mixing and in facilitating the chemical comminution and solution. Now the pylorus begins to open occasionally, allowing the acid chyme to spurt at intervals into the duodenum. The further course of the chyme is described under *duodenal digestion*.

g. fever. Fever accompanied by gastric disturbances.

g. glands. Cardiac, fundic or oxyntic, and pyloric glands of the stomach.

These are tubular glands lying in the mucosa of the wall, and the gastric juice exudes from them just as sweat drips from one's forehead. The general result of gastric digestion is the reduction of the ingested mass to a mushy, gray mixture called "acid chyme."

They contain (a) chief, zymogenic, or peptic cells which secrete pepsinogen, the inactive form of pepsin, (b) parietal border, or oxyntic cells which secrete hydrochloric acid, and (c) mucous cells found in the neck of the gland, which secrete mucin.

g. juice. The digestive juice of the gastric glands of the stomach. It contains pepsin, hydrochloric acid, mucin, small quantities of inorganic salts, and the "intrinsic factor" of the antianemic principle. It is strongly acid having a pH of 0.9 to 1.5. It is a thin colorless fluid, its total acidity being 0.45-0.60% and free HCl, 0.40-0.50%. It has a specific gravity of 1.002-1.004. The amount secreted in 24 hours varies greatly. In a fasting stomach secretion occurs at a rate of 8 to 15 cc. per hour.

The mixture of acid and pepsin has effects which neither substance has alone, and dissolves some proteins with remarkable speed. Rennin is the cause of the normal clotting of milk in the stomach. There is also a lipase which can release butyric fat from butter fat, and thus gives the characteristic odor to vomitus.

Diag. (findings): *Carcinoma* Lactic acid, blood, Boas-Oppler bacilli, sarcinæ, and sometimes tumor cells are present; frequently no hydrochloric acid is found. *Hyperacidity* May indicate gastric ulcer. *Lactic Acid* Present in carcinoma. *Pus Cells* Indicate severe damage to stomach. *Red Cells:* Same significance as pus cells.

RS. *gastric analysis, hydrochloric acid, hyper- and hypochlorhydria, stomach, digestion in.*

g. lavage. Washing out of the stomach.

Uses: 1. To empty stomach when contents are irritating, as in prolonged postanesthetic vomiting, and in some cases of regurgitant vomiting in acute intestinal obstruction. 2. To clean cavity

before an operation is performed upon it. 3. To remove poison in cases in which this method of treatment is indicated. 4. For removal of a test meal.

METHOD. If possible patient is propped up in bed; a rubber sheet and towel are placed around neck and arranged to protect clothing in front. The apparatus required is: An esophageal tube, with glass connection, a length of rubber tubing and a funnel, several pints of solution and a solution thermometer, glycerine to lubricate tube, a towel and receiver for vomit, which patient may be allowed to hold, a pint measure and pail for returned fluid, a receiver for stomach contents, and sodium bicarbonate solution, a dram to the pint. Condy's fluid, 1-10,000, normal saline solution, or other solution may be used, which should be prepared at a temperature of 100° F.

The procedure is explained to the patient if he is capable of understanding. His mouth is cleaned and he is asked to swallow the lubricated tube which is placed in his mouth. He is encouraged to try and control the desire to retch. As the tube is swallowed the nurse will gently help to pass it along. When a special mark on the tube is on a level with the patient's lips the tube may be expected to be in the stomach, and the funnel is then inverted to empty the stomach of its contents, if nothing is seen, the tube should be passed farther in until it is found to be in the stomach.

If possible collect stomach contents in receiver provided. Then pinch the tube below funnel and fill the funnel with solution, expel air from the tube by pinching and rubbing it upwards towards the funnel. Let fluid run in very slowly, using from ½ to 1 pint at a time; invert funnel and let this run out, repeat until all fluid has been used or until it returns clear. When the treatment is finished, pinch tube and withdraw it quickly, giving patient a mouth-wash immediately, and then place soiled tube in a basin of tepid water.

The siphoned gastric contents should be examined, and the amount of returned solution measured and inspected for blood, bile, and mucus. If necessary, it should be saved for the doctor's inspection.

g. motor meals. These meals are used to test the motor activity of the stomach and intestines. **See:** *Boas motor m., test m., Von Leube m.*

g. mucin (mu'sin). A fine, straw-colored powder, prepared from hog stomach.

Uses As a protective in peptic ulcer.

DOSAGE Varies according to the severity, from 1 teaspoonful to 1 tablespoonful in warm water or milk ½ hour before meals.

g. ulcer. An ulcer of the stomach. **SYN.** *peptic ulcer, g.v.*

gastricism (gas'tris-izm) [*G. gastēr, belly, + -ismos, state*] Any gastric disorder.

gas'trin [*G. gastēr, belly*] A hormone that stimulates secretion of the glands in the cardiac end of the stomach. It is formed at the pyloric end of the stomach.

gastritis (gas'tri'tis) [*" + -itis, inflammation*]. Inflammation of the stomach. Characterized by epigastric pain or tenderness, thirst, nausea, vomiting, and diarrhea. The mucosa may be atrophic or hypertrophic.

Etiol: Generally unknown. May result from infection, excessive indul-

gence in alcoholic beverages, dietary indiscretions. Pain in the region of the stomach may be due to causes other than gastritis, such as cancer. Gastritis may be due to an excess or a deficiency of hydrochloric acid, and a remedy suitable for one would not be proper for the other condition. The type must first be determined before medication.

g., acute. *SYM.* Moderate fever; anorexia, coated tongue, intense pain in epigastrium, persistent vomiting, thirst, prostration. *PROG.* Good. *TREATMENT.* Absolute rest. In severe cases no food by mouth till stomach becomes retentive. Thirst allayed with cracked ice.

g., atrophic. Chronic g. with atrophied mucosa and glands.

g., chronic. *SYM.* Weight and distress after eating, often tenderness on palpation. Eructations of gas and some liquid, nausea and vomiting frequently, constipation. *PROG.* Good. *TREATMENT.* Hygienic conditions, regulated diet.

g., excess acid (hyperchlorhydria). *SYM.* Pain more intense than in acid deficiency. Good appetite. *TREATMENT.* Milk, water, and eggs for 2 weeks; olive oil, baking soda, alkaline foods and water.

g., hypertrophic. G. combined with glandular hypertrophy and infiltration.

g., phlegmonous. Acute g. with supuration of the mucosa and submucosa.

g., polypous. G. characterized by knoblike projections on the surface.

g., pseudomembranous. G. marked by membranous patch formation.

gastro- [*G. gastēr, stomach*]. Used in compounds to denote the stomach.

gastroanastomosis (gas'tro-an-as'to-mo'sis) [" + *ana*, up, + *stoma*, mouth, + *-ōsis*]. Formation of passage bet. 2 pouches of stomach for relief of hour-glass contraction.

gastroblennorrhœa (gas'tro-blen-or-e-ä) [" + *blennos*, mucus, + *roia*, flow]. Excessive secretion of gastric mucus.

gastrobrosis (gas'tro-bro'sis) [" + *brōsis*, eating]. Perforating ulcer of the stomach.

gastrocele (gas'tro-sēl) [" + *kēlē*, hernia]. Hernia of the stomach.

gastrochronorrhœa (gas'tro-kron-or-e-ä) [" + *chronos*, time, + *roia*, flow]. Chronic gastric disease marked by permanent hypersecretion with dilatation and thickening of stomach walls and hypertrophy of glands. *SYN.* *Reichmann's disease*.

gastrocnemius (gas-trok-ne'mi-us) [" + *knēmē*, leg]. The large muscle of the leg. Extends foot and helps to flex knee upon thigh.

gastrocol'ic [" + *kōlon*, colon]. Pert. to stomach and colon.

g. omentum. The great omentum. *SYN.* *epiploon*.

g. reflex. Peristaltic wave in colon induced by entrance of food into fasting stomach.

gastrocoll'itis [" + " + *-itis*, inflammation]. Inflammation of stomach and colon.

gastrocoloptosis (gas'tro-kol-op-to'sis) [" + " + *ptōsis*, dropping]. Downward prolapse of stomach and colon.

gastrocolostomy (gas'tro-kol-os'to-mi) [" + " + *stoma*, opening]. Establishment of permanent passage bet. stomach and colon.

gastrocolotomy (gas'tro-ko-lot'o-mi) [" + " + *tomē*, incision]. Incision into stomach and colon.

gastrocolpotomy (gas'tro-kol-pot'o-mi) [*G. gastēr*, belly, + *kolpos*, vagina, + *tomē*, incision]. An incision of abdomen into upper part of vagina.

gastrodiaphane (gas'tro-di'af-ān) [" + *dia*, through, + *phainomai*, to show]. Device for electrically illuminating stomach interior, making visible its outlines through the abdomen.

gastrodiaphanoscopy, gastrodiaph'any [" + " + " + *skopein*, to examine]. Examination of interior of the stomach by rendering its walls translucent by an electric light introduced into the organ.

gastrodisciasis (gās-trō-dis-kē-ās'is). Infestation by a fluke, *Gastrodiscoides hominis*.

gastrodiscoides (gās-trō-dis-kē-id'-ās). A genus of flukes belonging to family Gastrodiscidae, sub-order Amphistomata.

g. hominis. A species of flukes commonly infesting hogs but occasionally found in man.

gastroduodenitis (gas'tro-dū-od-en-i'tis) [" + *L. duodenum*, duodenum, + *G. -itis*, inflammation]. Inflammation of stomach and duodenum.

gastroduodenostomy (gas'tro-du-o-denos'to-mi) [" + " + *G. stoma*, mouth]. Formation of an artificial opening between the stomach and duodenum.

gastrodynia (gas'tro-din'i-ā) [" + *odynē*, pain]. Pain in the stomach. *SYN.* *gastroalgia*.

gastroelytrotomy (gas'tro-el-it-rot'o-mi) [" + *elytron*, vagina, + *tomē*, incision]. Cesarean section through linea alba into upper portion of vagina. *SYN.* *gastrocolpotomy*.

gastroenter'algia (gas'tro-en-ter-al'ji-ā) [" + *enteron*, intestine, + *algos*, pain]. Pain in stomach and intestines.

gastroenter'ic [" + *enteron*, intestine]. Pert. to stomach and intestines or to a condition involving them both.

gastroenteritis (gas'tro-en-ter-i'tis) [" + " + *-itis*, inflammation]. Inflammation of the stomach and bowels.

gastroenterocolitis (gas'tro-en'ter-o-kol-i'tis) [" + " + *kōlon*, colon, + *-itis*, inflammation]. Inflammation of stomach, small intestine, and colon.

gastroenterocolostomy (gas'tro-en-ter-o-ko-lot'o-mi) [" + " + " + *stoma*, opening]. Creation of a passage bet. stomach, small intestine, and colon.

gastroenterol'ogy [" + " + *logos*, study]. The pathology of the stomach and intestine.

gastroenteroptosis (gas'tro-en-ter-op-to'sis) [" + " + *ptōsis*, a dropping]. Pro-lapse of stomach and intestines.

gastroenterostomy (gas'tro-en-ter-os'to-mi) [" + " + *stoma*, opening]. Surgical anastomosis between the stomach and small bowel.

This operation is required for patients who are suffering from carcinoma or cicatricial stricture of pyloric orifice of the stomach.

NP. The procedure of preparation is the same as for appendectomy up to the stage of exposure of the viscera.

gastroenterot'omy [" + " + *tomē*, incision]. Incision of stomach and intestine through abdominal wall.

gas'troepiplo'ic [*G. gastēr*, belly, + *epiploon*, omentum]. Pert. to stomach and great omentum.

gastroesophagitis (gas'tro-e-sof-aj-i'tis) [" + *esophagos*, gullet, + *-itis*, inflammation]. Inflammation of stomach and esophagus.

gastroesophagostomy (gas'tro-es-o-fa-gos'to-mī) ["+" + *tomē*, incision]. Formation of passage from the esophagus into the stomach

gastrogastronomy (gas-tro-gas-tros'to-mī) ["+" + *gastēr*, belly, + *stoma*, opening]. Formation of passage in hourglass contraction bet the 2 gastric pouches SYN: *gastroanastomosis*

gastrogavage (gas-tro-ga-vazh') ["+" + *Fr. gaver*, to gorge fowls]. Artificial feeding through an opening into the stomach

gastrogenic ["+" + *gennan*, to produce]. Having its origin in the stomach

gastrograph (gas-tro-graf) ["+" + *graphein*, to write]. Device for determining the stomach's mechanical action

gastrohelcosis (gas'tro-hel-ko'sis) ["+" + *eklosis*, ulceration] Ulcer of the stomach

gas'trohepa'tic ["+" + *ēpar*, *ēpat-*, liver]. Pert to stomach and liver

gastrohepatitis (gas-tro-hep-ā-ti'tis) ["+" + *-itis*, inflammation]. Combination of gastritis and hepatitis at same time

gastrohydrorrhea (gas-tro-hi-dro-re-ā) ["+" + *ydōr*, water, + *roia*, flow]. Excretion of much watery fluid, other than gastric juice, into the stomach

gastrohysterectomy (gas-tro-his-ter-ek'-to-mī) ["+" + *ystera*, uterus, + *ektomē*, excision]. Removal of the uterus through an abdominal incision

gastrohysteropexy (gas'tro-his'ter-o-peks'i) ["+" + *pēxis*, fixation]. Ventrofixation of the uterus

gastrohysterorrhaphy (gas-tro-his-ter-or'-af-i) ["+" + *raphē*, suture]. Fixation of uterus to the abdominal wall. SYN: *gastrohysteropexy*

gastrohysterotomy (gas-tro-his-ter-ot'o-mī) ["+" + *tomē*, incision]. Incision of uterus through abdomen SYN: *gastrohysterotomy*

gastroiliac (gas-trō-ī-lī-ak) ["+" + *L. iliacus*]. Pert to stomach and ileum
g. reflex. Physiologic relaxation of ileocecal valve resulting from food in stomach

gastrointes'tinal ["+" + *L. intestinum*, intestine]. Pert to stomach and intestine

g. decompression. Drainage of gases from the body cavities and tissues by use of suction through a tube inserted through the nostrils and into the digestive tract SEE *Wangensteen method*.

gastrojejunosotomy (gas-tro-je-ju-nos'to-mī) ["+" + *L. jejunus*, empty, + *G. stoma*, opening]. Surgical anastomosis between the stomach and jejunum

gastrolith (gas'tro-lith) [*G. gastēr*, belly, + *lithos*, stone]. A concretion in the stomach

gastrolithiasis (gas'tro-lith-lā-sis) ["+" + *lithos*, stone]. Formation of calculi in the stomach

gastrology (gas-trol'o-jī) ["+" + *logos*, study]. Study of function and diseases of the stomach

gastrolysis ["+" + *lysis*, loosening]. Breaking adhesions bet stomach and adjoining structures

gastromalacia (gas-tro-mal-ā-si-ā) ["+" + *malakia*, softening]. Softening of the stomach walls

gastromegaly (gas-tro-meg-ā-ī) ["+" + *megas*, *megal-*, large]. Enlargement of the stomach.

gastromenia (gas-tro-me-ni-ā) ["+" + *mēn*, month]. A form of vicarious menstruation through the stomach

gastromycosis (gas-tro-mi-ko'sis) ["+" + *mykēs*, fungus, + *-osis*]. Disease of the stomach due to fungi.

gastromyotomy (gas-tro-mi-ot'o-mī) ["+" + *mys*, muscle, + *tomē*, incision]. Incision of circular muscular fibers of stomach.

gastromyorrhea (gas-tro-miks-or-e-ā) ["+" + *myxa*, mucus, + *roia*, flow]. Excessive secretion of gastric mucus.

gastronephritis (gas-tro-nef-ri'tis) ["+" + *nephros*, kidney, + *-itis*, inflammation]. Inflammation of the stomach and kidney at same time

gastroneostomy (gas-tro-nes-te-os'to-mī) ["+" + *nestis*, jejunum, + *stoma*, opening]. Formation of communication bet jejunum and stomach SYN: *gastrojejunostomy*

gastropancreatitis (gas'tro-pan'kre-ā-ti'tis) ["+" + *pagkreas*, pancreas, + *-itis*, inflammation]. Inflammation of the stomach and pancreas at same time

gastroparalysis (gas'tro-par-al'i-sis) ["+" + *paralyein*, to loose from sides]. Paralysis of the stomach

gastroparesis (gas'tro-par-e-sis) ["+" + *paresis*, paralysis]. Mild form of gastroparalysis

gastropathy (gas-trop-ā-thī) [*G. gastēr*, belly, + *pathos*, disease]. Any disorder of the stomach

gastroperidodynia (gas'tro-per'i-o-din'i-ā) ["+" + *peridos*, period, + *odynē*, pain]. Periodic pain in the stomach. SYN: *gastralgia*.

gastropezy, **gastropexis** (gas-tro-peks'e, -is) ["+" + *pēxis*, fixation]. Suture of the stomach to the abdominal walls for correction of displacement

Gastrophilus (gās-trōfī-lūs) A genus of botflies belonging to the family *Oestridae*, order of *Diptera*. The larvae infest horses and occasionally man.

G. hemorrhoidalis. In which eggs are laid on lower lip and jaws of equines

G. intestinalis. In which eggs laid on inner side of legs and abdomen. Moisture from tongue stimulates hatching of eggs, larvae then being transferred to the mouth from which they migrate to stomach and intestines. In man, larvae enter the skin and infest subcutaneous regions causing a creeping eruption (larva migrans) *q v*

G. nasalis. The chin fly. Eggs are laid on shafts of hairs on lower lip and jaw

gastrophrenic (gas-tro-fren'ik) ["+" + *phrēn*, diaphragm]. Rel to the stomach and diaphragm

gastroplasty (gas-tro-plas'tī) ["+" + *plastēin*, to form]. Plastic operation on the stomach

gastroplegia (gas-tro-ple'jī-ā) ["+" + *plēgē*, stroke]. Paralysis of the stomach

gastroplication (gas-tro-pli-ka'shun) ["+" + *L. plicāre*, to fold]. Stitching the walls of the stomach to reduce dilatation.

gastroptosis, **gastroptosis** (gas-trop-to'-si-ā, -sis) ["+" + *ptōsis*, a dropping]. Abnormal falling of the stomach, Glé-nard's disease

Usually accompanied by the displacement of other organs, the abdomen being pendulous SEE *bathygastria*.

gastroptyxis, **gastroptyxis** (gas-trop-tiks'-is, -ī) ["+" + *ptyxis*, a folding]. Reduction of a dilated stomach. SYN: *gastroptroplication*.

gastropylorotomy (gas-tro-pi-lor-ek'to-mī) ["+" + *pyloros*, pylorus, + *ektomē*, excision]. Excision of stomach at pyloric end.

gastropyloric ["+" + *pyloros*, pylorus]. Rel. to stomach and pylorus

gastroradulitis (gas-tro-rad-ik-ū-l'i'tis) ["+" + *L. radix*, root, + *G. -itis*, inflammation]. Inflammation of the post. spi-

nal nerve roots, the sensory fibers of which supply the stomach.

gastrorrhagia (gas-tror-ra'jī-ā) [' + *rēgmina*, to burst forth]. Hemorrhage from stomach.

gastrorrhaphy (gas-tror'ā-flī) [G. *gastēr*, belly, + *raphē*, suture]. Suture of a stomach wall

gastrorrhea (gas-tror-re'ā) [' + *roia*, flow]. An excessive secretion of gastric juice.

gastrosalpingotomy (gas-tro-sal-pin-got'o-mī) [' + *salpīgē*, tube, + *tomē*, incision]. Incision of the oviduct by abdominal section

gastrostschisis (gas-tros'kis-is) [' + *schisis*, cleft]. A congenital fissure in wall of abdomen which remains open.

gastroscope (gas'tro-skōp) [' + *skopein*, to examine]. Device for inspecting stomach's interior.

gastros'copy [' + *skopein*, to examine]. Examination of the stomach and abdominal cavity

gastro'sia [G. *gastēr*, belly] Excessive hydrochloric acid in the stomach. SYN: *gastroxia*.

g. fungo'sa. Gastrostia in which fungi in the stomach give rise to organic acids

gastro'sis [' + -ōsis, disease]. Any disease of the stomach

gastrospasm [' + *spasmos*, spasm]. A gastric spasm

gastrosplen'ic [' + *splēn*, spleen]. Of or pert to stomach and spleen

gastrostaxis (gas-tro-staks'is) [' + *staxis*, trickling] Hemorrhage of blood from membrane of the stomach

gastrostenosis (gas-tro-sten-o'sis) [' + *stenōsis*, narrowing] Contracted state of the stomach

g. cardiaca. Stenosis of cardiac orifice.

g. pylorica. Stenosis of pylorus.

gastrostogavage (gas-tros'to-gā-vazh') [' + *stoma*, opening, + *Fr gaver*, to gorge fowls] Injection through a gastric fistula, of food.

Peptonized milk, albumen water, or eggnog during first week, soft diet the second week with more liberal diet with improvement TEMPERATURE 100° F. SEE *gavage*.

gastros'toma [G. *gastēr*, belly, + *stoma*, opening] A fistula of the stomach.

gastros'tomize [' + *stoma*, opening]. To perform a gastrostomy

gastrostomy (gas-tros'to-mī) [' + *stoma*, opening] Surgical creation of a gastric fistula through the abdominal wall

It is necessary in carcinoma, and in some cases of cicatricial stricture of the esophagus; made for purpose of introducing food into stomach.

NF Teach patient to care for self after hospitalization Help patient to make mental adjustment Care of mouth.

gastrosuccor'rhoea (gas-tio-suk-or-e'ā) [' + *L. succus*, juice, + *G roia*, flow]. An excessive secretion of gastric juice with increased acidity, hypersecretion.

gastrother'apy [' + *therapeia*, treatment]. 1. Treatment of gastric diseases. 2. Treatment with extract of gastric mucosa, used esp in pernicious anemia.

gastro'tome (gas'tro-tōm) [' + *tomē*, incision]. Instrument for incising stomach or abdomen

gastro'tomy (gas-trot'o-mī) [' + *tomē*, incision] Gastric or abdominal incision.

gastrotonometer (gas-tro-to-nom'e-ter) [' + *tonos*, tension, + *metron*, measure]. Instrument for measuring intragastric

pressure by insufflation of air or carbonic acid gas.

gastrotrachelotomy (gas-tro-tra-kel-ot'o-mī) [' + *trachelos*, neck, + *tomē*, incision]. Cesarean section in which the uterus is opened by a transverse incision across the cervix.

gastro'trop'ic [' + *tropikos*, turning]. Attracted to or affecting the stomach.

gastro'tubotomy (gas-tro-tu-bo'to-mī) [' + *tuba*, tube, + *G tomē*, incision]. Incision into fallopian tube through abdomen SYN *gastrosalpingotomy*.

gastro'tympanites (gas'tro-tim-pan-i'tes) [' + *tympanon*, drum]. Gaseous distention of the stomach

gastro'x'ia [' + *orys*, sour]. Abnormal acidity of contents of stomach.

gastro'xynsis (gās-trōks-in'sis) [' + *orynein*, to sharpen] Excessive hydrochloric acid secretion by stomach SYN *hyperchlorhydria*.

gastrula (gas'tru-lā) [L. dim. G. *gastēr*, belly] Stage in embryonic development following the blastula in which the embryo assumes a two-layered condition The outer layer being the *ectoderm* or *epiblast*, the inner layer, the *endoderm* or *hypoblast* The latter lines a cavity, the *gastrocoel* or *archenteron* which opens to the outside through an opening, the *blastopore*.

gastrula'tion [L. *gastrula*, little belly] The development of the gastrula

Catch bed. A bed in which the patient can be raised and held into a half-sitting position

gath'ering [AS *gaderian*, to collect] An abscess or swelling

ga'tism [Fr *gate*, to spoil]. Vesical or rectal incontinence

gatophilia (gat-o-fīl'i-ā) [G. *gatos*, cat, + *philein*, to love] Abnormal love for cats.

gatophobia (gat-o-fō'bī-ā) [' + *phobos*, fear] Aversion to cats. SYN: *ailurophobia*, *galeophobia*.

Gaucher's disease (go-shāz'). Primary epithelioma of the spleen or splenic anemia.

gauge (gā) [Fr. a measuring rod] Device for measuring size, capacity, amount or power of an object or substance, a standard of measurement

English, French and American systems of measurement English now little used as standard French number may be found by multiplying diameter in millimeters by 3. The American by multiplying by 2.

Gault's reflex (galt). Contraction of orbicularis palpebrarum muscle resulting from sudden noise being produced near ear

gauntlet (gawnt'let). A glove-like bandage which fits the hand and fingers

gauss (gaws). The unit of intensity of a magnetic flux.

Gauss' sign (gaws). Unusual mobility of the uterus in the early weeks of pregnancy.

gauze (gawz) [Fr. *gaze*, gauze]. Thin, transparent fabric used in surgery.

g., absorbent. G. from which only matter and sizing has been removed

g., antiseptic. G. containing antiseptic material

g., aseptic. 1 A gauze sterilized and packaged in an aseptic container and ready for surgical use 2 A gauze rendered free of microorganisms

gavage (ga-vazh') [Fr. *gaver*, to gorge fowls] Feeding with a stomach tube, or with a tube passed through the nares, pharynx, and esophagus into the stom-

ach; the food is in liquid or semiliquid form at a temperature of about 100° F. *See gastrostogavage.*

Gavard's muscle (ga-varz'). The oblique muscular fibers of the stomach's coat.

Gawalowski's test (gav-al-ov'ski). Test for sugar made by use of ammonium molybdate and indicated by a blue color.

Gayet's disease (gā-yas'). A lethargic sleep resembling sleeping sickness. It is rare and fatal.

Gay-Lussac's law. All gases on heating expand equally and on cooling contract equally, according to temperature relation. *See Charles' law.*

Geigel's reflex (gī'gel). Reflex in females resembling cremasteric reflex* in males.

Geisbock's disease or syndrome (gis-beck). Abnormal number of red corpuscles in blood with cardiac hypertrophy and elevated blood pressure, without splenic enlargement. *SYN polycythemia hypertonica.*

gel (jel) [L. *gelāre*, to congeal]. 1. A semisolid condition of a precipitated or coagulated colloid. Jelly. A jellylike colloid. 2. Congulum of a sol.

gelatin (jē'lā-tin) [L. *gelatina*, gelatin]. A derived protein obtained by the hydrolysis of collagen present in the connective tissues of the skin, bones, and joints of animals.

Uses As a food, in preparation of pharmaceuticals, as a medium for culture of bacteria, and as agent to speed up coagulation of blood.

g. culture. Gelatinous base for bacterial growth.

g. disk. G. circlet for eye therapy.

g. peptone. Digestive product of gelatin.

g. sponge. A spongy sheet of gelatin prepared for use as a hemostatic.

g., nutrient. *See g. culture.*

gelat'inase [L. *gelatina*, gelatin]. An enzyme that liquefies gelatin.

gelatiniferous (jel-at-in-ī'fer-us) ["" + *ferre*, to bear]. Producing gelatin.

gelatinize (jel-at'in-iz) [L. *gelatina*, gelatin]. To convert into gelatin.

gelatinoid (jel-at'in-oid) ["" + G. *eidos*, resemblance]. Resembling gelatin.

gelatinolytic (jel-at'in-o-lit'ik) ["" + G. *lysis*, dissolution]. Dissolution or splitting up of gelatin.

gelat'inotho'rax ["" + G. *thōraz*, chest]. Injection of gelatin solution intrapleurally.

gelatinous (jel-at'in-us) [L. *gelatina*, gelatin]. Containing or of the consistency of gelatin.

gelation (jel-a'shun) [L. *gelāre*, to congeal]. The transformation of a colloid from a sol into a gel.

Gellé's test (zhel-ā'). A tuning fork is connected with a rubber tube inserted in the ear. Pressure is produced by an attached bulb and, if ear is normal, vibrations are felt. *See test.*

gelodiagno'sis [L. *gelāre*, to congeal, + G. *dia*, through, + *gnōsis*, knowledge]. Identification of bacteria by means of a gelose culture medium.

gelose (jē'lōs) [L. *gelāre*, to congeal]. 1. Gelatinous element of agar, C₆H₁₀O₅. 2. Bacterial culture medium.

gelosis (jel-o'sis) ["" + G. *ōsis*]. A hard lump appearing to be frozen.

gelotherapy (jel-o-ther-ā-pi) [G. *gelōs*, laughter, + *therapeia*, treatment]. Inducing hilarity in treatment of certain morbid states of the mind.

gelotripsy (jel'o-trip-si) [L. *gelāre*, to congeal, + G. *tripsis*, a rubbing]. The massaging away of indurated swellings.

-gels. A termination to indicate colloids in a solid state.

Gély's suture (zhā-lē'). One for closing intestinal wounds employing cross stitches. *SYN. cobbler's suture.*

gemellus (jem-el'us) [L. twin]. Either of 2 muscles inserted in the obturator internus tendon.

geminate (jem'i-nāt) [L. *geminātus*, paired]. In pairs.

gemination. Development of two teeth within a single alveolus.

gem'ma. 1. A small budlike, reproductive structure, produced by lower forms of life. 2. Any small budlike structure such as a taste bud or end-bud.

gemmation (jem-ma'shun) [L. *gemmaire*, to bud]. Fission by budding.

Budlike processes or daughter cells, each containing chromatin, separate from the mother cell from which the bud is projected.

gemmule (jem'ul) [L. *gemma*, little bud].

1. A gemma, *qv* 2. One of numerous minute processes present on the dendrites of a neuron.

gena (je'na) [L. *gena*, cheek]. The side of the face or cheek.

genal (je'nal) [L. *gena*, cheek]. Pert. to the cheek. *SYN. buccal.*

gen (jēn) [G. *gennan*, to produce]. *SYN. gen.* *qv* 1. An hereditary determiner.

2. A factor present in the gametes which is responsible for the transmission of hereditary characteristics to the offspring. Genes are self-reproducing ultramicroscopic particles found within cells and located at definite points on chromosomes. They are capable under certain circumstances of giving rise to a new character, such a change being called a mutation.

g., epistatic. One of a pair of factors which masks the expression of another pair.

g., holandric. A gene located in the nonhomologous portion of the Y-chromosome.

g., inhibiting. A gene which prevents the expression of another gene.

g., lethal. A gene which when in a homozygous condition brings about an effect which results in the death of an individual.

g., modifying. A gene which influences or alters the effect of another gene.

g., multiple. A group of genes which have more or less equal and cumulative effects upon the same character.

g., sex-linked. A gene contained within the X- or sex chromosome.

gen'era. Plural of genus.

gen'eralize [L. *genus*, race]. 1. To become or render general. 2. To become systematic, as a local disease.

gen'erating plate. That plate which is chemically acted upon in an electric cell.

generation (jen-er-a'shun) [L. *generāre*, to beget]. 1. An act of forming a new organism. 2. A group of animals or plants the same distance removed from an ancestor, as the first filial (F₁) generation. 3. The average span between one generation and the next, for humans, approximately thirty-three years.

4. The production of an electric current.

g's., alternation of. A mode of reproduction in which a sexual generation alternates with an asexual generation, characteristic of all plants above the Thallophytes. It also occurs in some of the lower animals.

g., asexual. Reproduction which occurs without the union of sexual ele-

ments or gametes, such as reproduction by fission, or spore production

g., F₁. The first filial generation; the offspring of a given mating or cross.

g., sexual. Reproduction by the union of male and female cells.

g., spontaneous. *SYN: abiogenesis*
The theory that living things can originate from nonliving matter

g., viviparous. Normal method of g. among higher animals, of bringing forth live offspring

generative (jen'er-a-tiv) [L. *generāre*, to beget]. Concerned in reproduction of or affecting the species.

generic (jen-er'ik) [L. *genus*, *gener-*, kind] 1 General. 2 Pert to a genus. 3. Distinctive

FEMALE GENITOURINARY SYSTEM

genes (sing. *gene*) (jēns) [G. *gennan*, to produce] The hypothetical units controlling heredity which are believed to be situated in the chromosomes. There are specific points on the chromosomes for genes governing each characteristic. Genes on different chromosomes are transmitted independently; genes on the same chromosome are said to be linked. The genes occur in pairs, corresponding to the pairing of the chromosomes, one derived from each parent, and each pair of genes determines the individual's genotype for the trait in question. SEE *chromosome*, *heredity*

gene'sial, **genes'ic** [G. *genesis*, origin].

Pert to generation

genesiology (jen-e-sl'ol'o-jī) ["" + *logos*, science]. The science of reproduction

genesis (jen'es-is) [G. origin] 1. Act of reproducing, generation. 2. The origin of anything

SIDE VIEW

FRONT VIEW

MALE GENITOURINARY SYSTEM

genetic (jen-et'ik) [G. *genesis*, origin]. Pert. to generation.

geneticist (jen-et'i-sist) [G. *gennan*, to produce]. One who specializes in genetics.

genetics [G. *gennan*, to produce]. The science that accounts for natural differences and resemblances among organisms related by descent. 2. The study of heredity and its variation.

genetopathy (je-ne-top'ath-i) [G. *genesis*, origin, + *pathos*, disease]. Disease affecting the generative function.

genetous (jen'e-us) [G. *genesis*, origin]. From birth. SYN *congenital*, *q.v.*

genial (je'n-i-al) [G. *gencion*, chin]. Rel. to the chin.

g. tubercle. A nodule on the lower jawbone on either side of the symphysis.

geniculate (jen-ik'u-lät) [G. *geniculäre*, to bend the knee]. 1. Kneec 2. Bent as a knee. 3. Pert. to the ganglion or geniculum of the facial nerve.

g. ofalgia. Pain transmitted from the facial nerve to the ear.

geniculum (jen-ik'u-lum) [L *little knee*]. A structure resembling a knot, or a knee.

genion (je'n-i-on) [G. *gencion*, chin]. Apex of the spina mentalis.

genioplasty (je'n-i-o-plas'ti) [G. + *plassein*, to form]. Plastic surgery of the chin or cheek.

genital (jen'i-tal) [L. *genitalis*, genital]. Pert. to the genitals.

g. reflex. Functional nervous manifestations, masturbation, and convulsions, resulting from any form of genital irritation.

genitalia, gen'itals (jen-it'al'i-ä) [L *genitalis*, genital]. Organs of generation; reproductive organs.

g., female. Those concerned with reproduction.

The *external genitalia* collectively are termed the *clitoris*, *penis*, and *perineum* and include the mons veneris, labia majora, labia minora, clitoris, fourchet, fossa navicularis, vestibule, vestibular bulb, Skene's glands, glands of Bartholin, hymen and vaginal introitus, and perineum.

Internal are the 2 ovaries, the fallopian tubes, the uterus, and vagina.

g., male. Two bulbourethral (Cowper's) glands, 2 ejaculatory ducts, 2 glandular organs producing spermatozoa (the testes or gonads), 1 penis with urethra, 2 seminal ducts (vasa deferentes or ductus deferentes), 2 seminal vesicles, 2 spermatic cords, 1 scrotum, 1 prostate gland, *q.v.*

genitoplas'ty [L. *genitalis*, genital, + G. *plassein*, to form]. Reporative surgery on the genital organs.

gen'itourinary [G. + G. *ouron*, urine]. Pert. to the genitals and the urinary organs.

g. system. Organs and parts concerned with the kidneys, urinary bladder, and organs of generation and their accessories.

genodermatosis (jen'o-der-mä-to'sis) [G. + *derma*, skin, + *-osis*]. Any congenital disease of the skin.

genioplasty (jen'o-plas-ti) [L. *gena*, cheek, + G. *plassein*, to form]. Any plastic surgery of the cheek.

genotype (jen'o-tip) [G. *gennan*, to produce, + *typos*, type]. 1. Basic hereditary combination of genes of an or-

ganism. 2. A type species. 3. Group marked by same hereditary characteristics. The hereditary make-up of an individual as determined by his genes. Each pair of genes determines the genotype for a different characteristic.

Genoul's disease (zhahn'soolz). Ludwig's angina.

gentian (jen'shi-än). USP. Dried rhizome roots of the plant *Gentiana lutea*.

g., violet. A dye derived from coal tar. Used in indelible pencils and in 5% solution in treatment of burns and indolent ulcers. Widely used as a stain in histology, cytology, and bacteriology.

gen'tianophil'e, gen'tianoph'ulous. Easily and readily staining with gentian violet.

genu (je'nu) [L *knee*]. 1. The knee. 2. Any structure of angular form resembling a bent knee.

g. extrorsum. See *g. varum*.

g. introrsum. See *g. valgum*.

g. recurvatum. Hyperextension at the knee joint.

g. valgum. Knock-knee.

g. va'rum. Bowleg.

geni-clast (jen'u-kläst) [G. + G. *klan*, to break]. Instrument for breaking knee joint adhesions.

genuc'ubital [G. + *cubitus*, elbow]. Pert. to the elbows and knees.

g. position (knee-elbow). One with the patient on the knees, thighs upright, body resting on elbows, head down on hands, employed when not possible to use the knee-chest position.

genupectoral (jen'u-pek'to-ral) [G. + *pectus*, breast]. Pert. to the chest and knees.

g. position. Knee-chest position, *q.v.* for illustration.

A position assumed by the female patient in which the patient is supported upon her knees and chest, and when the vaginal lips are open the vagina fills with air. This position is used for purposes of examination, treatment, and as an orthopedic aid in retroversion of uterus.

ge'nus [G. *genos*, race] Biol. The division between the species and the family.

gemyantralgia (jen'I-an-tral'ji-ä) [G. *genys*, jaw, + *antron*, cave, + *algos*, pain]. Pain in the antrum of Highmore.

gemyantritis (jen'I-an-tri'tis) [G. + *-itis*, inflammation]. Inflammation of the antrum of Highmore.

genyoplasty (jen'I-o-plas-ti) [G. + *plassein*, to form]. Any plastic operation on the chin.

geode (je'öd) [G. *geodēs*, earthenlike]. A lymph space connected with the lymphatic system.

geographical tongue. Numerous scaly patches on dorsal surface of tongue coalescing into gyrate figures.

geophagia, geophagism, geophagy (je-o-fa'ji-ä, -of'a-jizm, -of'a-ji) [G. *gē*, earth, + *phagein*, to eat]. A condition in which the patient eats inedible substances, as chalk or earth. SYN *chthonophagia*.

geotragia (je-o-tra'ji-ä) [G. + *trōgein*, to chew]. Earth eating. SYN *chthonophagia*, *geophagism*.

geotrich'o'sis. Infection by a fungus, *Geotrichum* which usually attacks the lungs. Symptoms resemble those of chronic bronchitis or tuberculosis. May also infect the mouth or intestine.

Geotrichum. A genus of fungi belonging to the family Eremasaceae; the causative agent of geotrichosis, *q.v.*

geophyrophobia (jef-I-rō-fō'bi-ā) [G. *gephyra*, bridge, + *phobos*, fear]. Aversion to bodies of water, or to crossing over bridges over water, or to traveling on boats.

geratic (je-rat'ik) [G. *gēras*, old age]. Rel. to old age.

geratology (je-rā-to'lō-jī) [“ + *logos*, study]. The study of old age. **SYN:** *gerology*.

Gerdy's fibers (zher'dēz). The superficial transverse ligament of the fingers.

gerology (je-re-ol'ō-jī) [G. *gēras*, old age, + *logos*, study]. The science of old age.

geriatrics (jer-I-at'riks) [“ + *iatrikē*, medical treatment]. Study and treatment of the diseases of old age.

Gerlach's valve. An inconstant valve present at the opening of the vermiform process (appendix) into the cecum.

Gerlier's disease (zher-le-āz'). Paralyzing vertigo.

SYN: Pains in head and neck, disturbance of vision, vertigo, ptosis, weakness of muscles of the neck and of extremities.

germ [L. *germen*, a microbe]. 1. The first rudiment of an organism, or organ. 2. An ovum. 3. A microorganism, esp. one that causes disease.

g. cell. An ovum or spermatozoon.

g., dental. The rudimentary structure from which a tooth develops, includes the dental papilla and the enamel organ. Also called *tooth germ*.

g., disease. A disease which is caused by a microorganism.

g. epithelium, g. ridge. Ridge of epithelium in the embryo from which develop the sexual portions of the body.

g., hair. The rudimentary structure from which a hair develops. Consists of an ingrowth of epidermal cells called *hair peg* which pushes into the corium.

g. layers. Three primary layers of cells in an embryo from which the organs and tissues develop. They are the *ectoderm*, *mesoderm*, and *endoderm*, *q v*.

g. plasm. The reproductive tissues in contrast to the non-reproductive tissues which constitute the *soma*.

g. theory. (of disease). The hypothesis that disease is the result of the presence of microorganisms or their products in the body.

German measles. Acute contagious disease with rash of short duration, resembling measles and scarlet fever. **SYN:** *rōtheln*, *rubella*.

germicide (jerm-I-si'dal) [L. *germen*, microbe, + *caedere*, to kill]. 1. Destructive to germs. 2. Pert. to an agent destructive to germs.

germicide (jer'mis-id) [“ + *caedere*, to kill]. A substance that destroys germs.

Germicides are chemical preparations designed to kill bacteria, the most common being carbolic acid, 1. 1000, bichloride of mercury, 1. 2000, potassium permanganate, 1. 800, boric acid, chloride of lime, cresol, formaldehyde, hexylresorcinol, hydrogen peroxide, iodine, iodoform, mercurochrome, and silver nitrate.

Bacteria and spores may be killed by boiling for 30 minutes, by dry heat at 160° to 170° F. for an hour, by steam at 121° C. for 20 minutes.

germinal [L. *germen*, microbe]. Pertaining to a germ or reproductive cells, egg or sperm, or to germination.

g. center. A light area of lymphocytopenic cells which occupies the center of lymphatic nodules of the spleen, tonsils, and lymph nodes.

g. disc. A disc of cells on the surface of the yolk of a teloblastic egg from which the embryo develops; the blastoderm.

g. epithelium. 1. The epithellum which covers the surface of the genital ridge of an embryo. 2. The epithellum which covers the surface of a mature mammalian ovary.

g. vesicle. Nucleus of oocyte, *q v*.

germination [L. *germināre*, to sprout]. 1. Development of an impregnated ovum into an embryo. 2. The sprouting of the spore or seed of a plant.

gerocomia (jer-o-ko'mi-ā) [G. *gerōn*, old man, + *komein*, to care for]. The hygiene of old age, or old men.

geroderma, gerodermia (je-ro-der'mi-ā) [“ + *derma*, skin]. An appearance of senility brought about by premature loss of hair, wrinkling of the skin, and general atrophy.

geromaras'mus. Emaciation which accompanies extreme old age.

geromorphism (je-ro-mor'fiz'm) [“ + *morphē*, form, + *ismos*, state of]. Appearance of age in youth.

gerontal (jē-ron'tal) [G. *gerōn*, old man]. Pert. to an old man or to the aged. **SYN:** *senile*.

gerontology (je-ron-to'lō-jī) [“ + *logos*, study of]. The study of the phenomena of old age. **SYN:** *geriatrics*.

gerontophilia. Fondness or love for old people.

gerontopia (je-ron-to'pi-ā) [“ + *ops*, vision]. Second sight due to change in the refractive power of the lens. **SYN:** *senopia*.

gerontoxon (jē-ron-toks'on) [“ + *toxōn*, bow]. Degenerative circle about corneal exit surface seen in the aged. **SYN:** *arcus senilis*.

Gerota's capsule. The perirenal fascia.

gestaltism. The theory that the objects of mind come as wholes which cannot be split up into parts and which are unanalyzable.

gestation (jes-ta'shun) [L. *gestāre*, to bear]. Period of intrauterine fetal development. **SYN:** *fetation*, *gravidity*, *pregnancy*.

g., abdominal. Ectopic g in which the product of conception is lodged in the peritoneal cavity.

g., cervical. The temporary retention of the ovum within canal of cervix uteri after its expulsion from the uterus in abortion.

g., cornual. G in an ill-developed cornu of a bicornuate uterus.

g., ectopic. Conception outside the uterus.

g., interstitial. Tubal g in which the ovum is developed in that portion of oviduct that traverses wall of uterus.

g., ovarian. A form of ectopic g. in the ovary.

g., plural. G. with more than 1 embryo.

g., prolonged, g., protracted. G. prolonged beyond the usual period.

g. sac. The amnion and its contents.

g., secondary abdominal. Extrauterine g. in which the fetus, originally situated in oviduct or elsewhere, has become lodged in abdominal cavity because of the rupture of the fetal sac.

g., secondary. The ovum becomes lodged from original seat of implanta-

tion, and continues to develop in a new situation.

g., tubal, g., tubarian. Ectopic g. in which the product of conception is lodged in the oviduct.

g., tuboabdominal. Extrauterine g. in which fetal sac is formed partly of the abdominal extremity of the oviduct and partly of plastic exudation in the neighborhood.

g., tuboövarian. Extrauterine g. in which the fetal sac is made up of the ovary and the abdominal end of the oviduct.

g., uterotubal. G. in which the ovum is developed partly in uterine portion of oviduct and partly within cavity of uterus.

gestosis (jes-to'sis) [L. *gestäre*, to bear, + G. *ōsis*]. Any disorder of pregnancy.

gher'kin. A form of pickle. **Comp:** It is more of a condiment than a vegetable or a food.

Action. An appetizer and probably a gastric stimulant to a small degree.

Ghon's primary lesion. A bean-shaped shadow in the x-ray of the lung seen in certain cases of pulmonary tuberculosis in children.

ghost corpuscle. Depigmented red blood corpuscle. **SYN** *phantom corpuscle*.

giant cell. One of large size with several nuclei, appearing to be made up of many cells, but not clearly outlined, found in both kinds of marrow, esp. in red marrow and spleen, a megakaryocyte.

g., c. tumor. Rare, benign, encapsulated tumor in lower jaw or on alveolar process of upper jaw in the young.

gigantism (ji-'an-tizm) [G. *gigas*, *gigant-*, giant]. Abnormal development of the body or its parts. **SYN** *gigantism*.

Gianuzzi's cells or crescents (jan-oot'sez). Crescent-shaped groups of serous cells found in the mixed salivary glands. They appear as darkly-staining cells forming a caplike structure on the alveoli. Also called *demi-lunes of Heidenhain*.

Giardia (gi-'ar-di-ä). A genus of protozoa possessing flagella which inhabit the small intestine of man and other animals. They are pear-shaped, possess two nuclei and four pairs of flagella. They attach themselves to the cells of the intestinal mucosa, from which they absorb their nourishment.

G., enterica, G. intestinalis, G. lamblia. Form with 4 pairs of flagella and a sucking disk, with a shape like a pear. **SYN:** *Cercomonas intestinalis*, *Lambdia intestinalis*.

G., intestinalis, G. lamblia. Species of *Giardia* found in man. They were formerly considered nonpathogenic but evidence indicates that they interfere with the absorption of fats, their presence being connected with recurring attacks of diarrhea and the passage of stools containing large amounts of unabsorbed fats and quantities of yellow mucus. They form cysts intermittently.

giardiasis (gi-'ar-di-'as-iz). Infection with *Giardia lamblia*. **SYN** *lambliasis*.

Gibbon's hydrocele (gib-'ōn). A hydrocele and large hernia combined.

gibbos'ity [L. *gibbosus*, humped]. 1. Condition of having a humpback. 2. A hump or gibbus, as the deformity of Pott's disease.

gibbous (gib'buz) [L. *gibbus*, humped]. Humped; protuberant or humpbacked.

gid'diness. State of dizziness. **SYN:** *vertigo*.

Glenssa's stain (gēm-'zah). A stain for staining blood smears. Used for differ-

ential leucocyte counts and for the detection of parasitic microorganisms.

Gifford's reflex (giff'ord). Pupillary contraction resulting from endeavoring forcibly to close eyelids which are held apart.

gigantism [G. *gigas*, *gigant-*, giant, + *ismos*, state of]. Abnormal development of the body or of a part. **SYN** *gigantism*.

g., acromegalic. G. in which acromegalic features (overgrowth of the bones of the hands, feet, and face) are present. Due to excessive production of the growth hormone after full skeletal growth has been attained.

g., eunuchoid. G. accompanied by eunuchoid features and sexual insufficiency.

g., normal. G. of the body in which the bodily proportions and functional activities are normal. Usually the result of hypersecretion of the growth.

gigantoblast [' + *blastos*, germ]. A very large nucleated red corpuscle.

gigantocyte (ji-'gan-'to-sit) [' + *kytos*, cell] 1. A giant cell. 2. A very large red blood corpuscle.

gigantosoma (ji-'gan-to-so-'mā) [' + *sōma*, body]. Abnormal size of the body. **SYN:** *gigantism*, *gigantism*.

Gimbernat's ligament (zham-bär-nahz'). Ligamentum lacunare.

ging'ger. **USE.** Dried rhizome of the plant *Zingiber officinale*.

Action and Uses. A carminative, aromatic and stimulant. Chiefly in form of tincture.

Dosage 10 m (0.6 cc.)

gingiva (jin-'ji-vā) [L. *gum*]. The gum; the tissues which surrounds the necks of the teeth and covers the alveolar processes of the maxilla and mandible.

g., labial. G. covering labial surfaces of the teeth.

g., lingual. G. covering lingual surface of the teeth. [to the gums]

gingival (jin-'ji-v-al) [L. *gingiva*, gum]. **Rel.** **gingival'gia** [' + *G. algos*, pain]. Pain in the gums. [gums]

gingiv'ally [L. *gingiva*, gum]. Toward the **gingivectomy** (jin-'ji-vek-'to-mi) [' + *G. ektomē*, excision]. Excision of gum tissue in pyorrhea. **SYN** *ulotomy*.

gingivitis (jin-'ji-vi-'tis) [L. *gingiva*, gum, + *G. -itis*, inflammation]. Inflammation of the gums, characterized by redness, swelling, and tendency to bleed. **SYN** *ulitis*.

Etiol. May be local due to improper dental hygiene, poorly fitting dentures, or appliances, poor occlusion, or it may accompany generalized stomatitis associated with mouth and upper respiratory infections. May also occur in deficiency diseases such as scurvy, blood dyscrasias, or metallic poisoning.

g., expulsive. Osteoperiostetitis of a tooth in which the tooth is expelled from its socket.

g., gravidum. Gingivitis of pregnancy. Characterized by generalized hypertrophy of the gums which may progress to the state of tumor-formation.

g., interstitial. Inflammation of the gums and alveolar processes which precede pyorrhea.

g., phagedenic. A rapidly spreading ulceration of the gums accompanied by extensive ulceration and sloughing of tissue.

gingivoglossitis (jin-'ji-vo-glos-si-'tis) [' + *G. glossa*, tongue, + *-itis*, inflammation]. Inflammation of the gums and tongue. **SYN:** *stomatitis*.

ginglyform (jin-'gil-form) [G. *gigglymos*, hinge, + *L. forma*, shape]. In the form of a hinge. **SYN:** *ginglymoid*.

gin'glymo-artthro'dial [ˈɡɪŋɡlɪmoʊˈɑːrθroʊdiəl] [+ *arthrōdia*, gliding joint]. Pert. to a joint that is both hinged and arthrodial. SEE: *arthrodia*.

ginglymoid (jɪŋɡlɪˈmɔɪd) [+ *eidos*, form]. Pert. to or shaped like a hinged joint.

ginglymus (jɪŋɡlɪˈmʌs) [G. *gigglymos*, hinge]. A hinge joint, diarthrosis. * SEE *joint*.

Giraldés' organ (zhɪr-əl-dās'). A vestige of the wolfman body at post side of the testicle. SYN *paradidymis*.

girdle (ɡɪrˈdel) [A.S. *gyrdell*] 1 A zone or belt; cingulum, the waist 2 A structure which resembles a circular belt or band

g. anesthesla. A portion around the body without sensation

g., Nephene. Stimulating or heating compress of linen covered by flannel encircling trunk from lower end of sternum to pubes

g. pain. Painful sensation around the body

g., pelvic. The portion of the lower extremities to which the lower limbs are attached Composed of the two innominate or hip bones

g. sensation. Same as g. pain

g., shoulder. The portion of the upper extremities to which the upper limbs are attached Composed of the two clavicles and two scapulae

g. symptom. A symptom in tabes as of a tight girdle, such as a feeling of constriction about the chest, also found in compression of the cord due to collapse of the vertebrae as in Pott's disease.

glab'el'a [L. *glaber*, smooth]. The smooth surface of the frontal bone lying between the superciliary arches, the portion directly above the root of the nose

glab'rate [L. *glaber*, smooth]. 1. Bald. 2. Smooth

glab'rificin (glab-rif-is'in) [+ *facere*, to make] A variety of antibody which exposes a capsulated bacterium to the action of lysin

glab'rous [L. *glaber*, smooth]. 1. Bald. 2. Smooth. SYN *glabrate*.

glacial (glā'shal) [L. *glacialis*, icy]. Glassy, resembling ice.

glad'iate [L. *gladius*, sword]. Sword-shaped. SYN *ensiform*, *xiphoid*.

gladi'oline. An alkaloid from tissue of the brain.

gladiolus (glad-i'o-lus) [L. *gladiolus*, little sword]. The intermediate and principal segment of the sternum, *q.v.*

glair'in (glār'in) [L. *glair*, mucus] Gelatinous substance in water of some sulfur springs.

glair'y [L. *glair*, mucus]. Viscous, mucoid. **glad** [L. *glans*, gland-, kernel]. 1. A secretory organ or structure 2 A cell or a group of cells which has the ability to manufacture a substance (secretion) which is discharged and used in some other part of the body or is excreted.

On the basis of complexity of structure, glands may be *simple* (consisting of one or a few secreting units) or *compound* (consisting of many secreting units whose secreting leave the gland by a common duct) Simple tubular glands may be *straight*, *coiled*, or *branched*

Glands consisting of one cell are called *unicellular*, those of more than one cell, *multicellular*.

On the basis of their secretion, glands are *mucous* (those producing a viscous, slimy secretion), *serous* (those producing a clear watery secretion) or *mixed* (those producing both).

On the basis of the presence or absence of ducts, glands are *exocrine* (those which possess ducts which carry the secretions to an epithelial surface) and *endocrine* (those without ducts and whose secretions enter the blood or lymph)

On the basis of the shape of the secreting units, glands are *tubular* (secreting portions engorged with a narrow lumen) or *saccular* (secreting portion in the form of a sac or flask) If the lumen of the secreting portion is wide, it is termed an *alveolus*, if narrow, an *acinus* Glands composed of these types of units are termed *alveolar* and *acinar*, respectively

On the basis of the manner by which secretion is accomplished, glands are *macrocrine* (secretion forms within cells and is passed through cell membranes into excretory ducts), *apocrine* (secretion forms in apical ends of cells which break off and form a part of the secretion) Ex *mammary gland*

Holocrine (entire cell with its contents is extruded as the secretion Ex *sebaceous glands*)

Glands may be *simple* (tubular or saccular), opening by a single duct upon a surface, or *compound*, consisting of many tubular or saccular cavities The secretory glands are of 2 kinds: (a) Ductless or endocrine, (b) having ducts. In those without a duct, the secretion leaves the duct by way of the lymph or blood They are The *gonads* or sex glands, the *pineal*, *pituitary*, *thyroid*, *parathyroid*, *thymus*, and *adrenal* glands.

GLANDS PECULIAR TO THE FEMALE: Bartholin's g., Duverney's g., nabothian g., ovaries, Skene's g., uterine g., glans clitoridis, mammary g.

GLANDS PECULIAR TO THE MALE Cowper's g., seminal g., prostate g., Tyson's gland.

g., absorbent. Any one of the lymphatic glands

g., accessory. Gland functioning as an accessory to another gland

g., acinotubular. A gland structurally midway bet an acinous and a tubular g.

g., acinous. A g whose secreting units are composed of sacklike structures each possessing a narrow lumen

g., adrenal. An endocrine gland lying above each kidney SEE *adrenal glands*

g's., aggregate. Lymphatic glands in patch formation found mainly in ileum. SYN *Peyer's patches*.

g's., agminated. SEE *aggregate g's.*

g's., albuminous. Digestive tract glands secreting a fluid containing albumin.

g., anal. Glands in the region of the anus

g., apocrine. A gland whose cells lose some of their cytoplasmic contents in the formation of the secretion Ex *mammary gland*, *some sweat glands*

g., areolar. SYN: *glands of Montgomery*. Large sebaceous and rudimentary milk glands present in the areola surrounding the nipple of the female breast.

g's., auricular. External otic lymph nodes

g's., axillary. Axillary lymph nodes. **g's., Bartholin's**. SYN *major vestibular glands* Numerous glands which open into the vestibule of the female Homologous to bulbourethral glands of the male.

g's., Blandin's; g's., Blandin-Nuhn's. Tiny racemose g's. secreting mucus and saliva, near the tip of the tongue on the undersurface.

g's., Bowman's. Simple, branched, tubular glands present in the olfactory mucosa of the nasal cavity.

g's., brachial. Glands in the arm and forearm.

g's., bronchial. Mixed glands lying in the submucosa of the bronchi and bronchial tubes.

g's., Bruch's. Conjunctival lymph nodes in lower lids

g's., Brunner's. Glands in the duodenal submucosa secreting intestinal juice.

g's., buccal. Acinous glands in the cheek tissue.

g., bulbourethral. Cowper's gland. Two small glands above the bulb of corpus spongiosum, whose secretion forms part of seminal fluid.

g., cardiac. Glands of the stomach near the cardiac orifice of the esophagus.

g's., carotid. Tiny gland at fork of carotid artery.

g's., cecal. Cecal lymph nodes.

g's., ceruminous. Glands in auditory canal excreting cerumen.

g's., cervical. Lymph glands situated in the neck.

g., ciliary. SEE *Moll's g's.*

g., circumanal. The anal glands, *q.v.*

g's., Cobell's. Glands in the esophageal mucosa.

g., coccygeal. SEE *Luschka's glands.*

g., compound. A *g.* consisting of a number of branching duct systems which open into the main excretory duct.

g., compound tubular. *G.* composed of numerous minute tabules leading to a lone duct.

g., conglobate. Lymphatic gland

g., conglomerate. SEE *acinous gland.*

g., Cowper's. SEE *bulbourethral g.*

g., cutaneous. Glands of the skin, esp. the sebaceous and sudoriferous glands. Also includes modified forms such as the ciliary, ceruminous, anal, preputial, areolar, tarsal glands.

g., cytogenic. A gland whose product is living cells, such as the testis or ovary.

g's., decidual. Glands possessing no secretory duct

g., ductless. A gland which lacks an excretory duct, an endocrine gland, *q.v.*

g's., duodenal. SEE *Brunner's g's*

g's., Duverney's. SEE *Bartholin's g's.*

g., Ebner's (g. of von Ebner) Serous glands of the tongue located in the region of the vallate papillae, their ducts opening into the furrows surrounding the papillae

g., endocrine. An organ or structure which secretes a hormone that is absorbed into the blood or lymph; a ductless gland. The principal endocrine glands are the hypophysis, thyroid, and testes, *q.v.* SEE *endocrine glands*

g's., Frankel's. Tiny glands located below the margin of the vocal cords.

g., fundic. Glands of the body and fundus of the stomach, gastric glands which secrete gastric juice.

g's., Gay's. Multiple sweat glands developed to a great extent

g., genal. Gland in buccal submucosa.

g's., genital. SEE *sexual g's.*

g's., gingival. Glands at gum margins.

g's., hair. Sebaceous glands opening into each hair follicle.

g's., haversian. Glands secreting synovial fluid.

g's., hematopoietic. Glands participating in blood production.

g's., hemolymph. Modified glands containing blood and lymph sinuses, which

probably participate in the formation of the leukocytes and the destruction of red blood corpuscles

g's., hepatic. Lymph nodes located in front of the portal vein.

g's., inguinal. Lymph nodes in the inguinal region.

g., interscapular. Embryonic lymphatic tissue.

g., interstitial. *G.* in connective tissue of seminiferous tubules of testes and which produce internal secretions
SYN *interstitial* or *Leydig's cells*

g's., intestinal. Simple or branched tubular glands of the intestine which secrete the succus entericus. Include Brunner's glands, and crypts of Lieberkuhn

g's., jugular. SEE *cervical g.*
g. (or) Krause's. Small glands in the conjunctiva of the eyelids, also called accessory lacrimal glands

g's., labial. Multiple acinous glands bet. the mucosa of the lips and the opening on the inner lip.

g., lacrimal. A compound tubuloalveolar gland, located in the roof of the orbit which secretes tears

g., lactiferous. SEE *mammary glands*

g's., Lieberkuhn's. Tiny tubular glands on the intestinal mucosa

g., lingual. Glands of the tongue, includes the ant. lingual glands (*g's* of Nuhn), post. lingual glands (*g's* of von Ebner) and mucous glands at the root of the tongue

g's., Littre's. Tiny mucous glands in the urethral mucosa in the cavernous portion

g's., lumbar. Lymphatics located behind the peritoneal region and the lower section of the diaphragmatic post. part.

g., Luschka's. *G.* located near the coccygeal tip.

g., lymph. *g., lymphatic.* Nodule of lymphatic tissue, found along the path of a lymphatic vessel

g., mammary. A compound alveolar gland which secretes milk

g., mandibular. The submaxillary gland, *q.v.*

g's., Meibobian. Glands situated in the eyelid secreting sebaceous substance which keeps the lids from adhering. Tarsal glands

g., merocrine. A gland in which the cells remain intact in the process of the elaboration and discharge of their secretion

g's., Mery's. SEE *Cowper's g's.*

g's., Moll's. Modified sweat glands in the eyelid

g's., Montgomery's. Areolar glands, *q.v.*

g's., Morgagni's. SEE *Littre's g's.*

g's., muciparous, g's., mucous. *G's.* secreting mucus

g's., nabothian. Dilated mucous glands in the uterine cervix.

g's., odoriferous. *G.* exuding odoriferous materials, as those around the prepuce or anus.

g's., oxyntic. Gastric glands usually found in the abdominal cardiac region

g's., pachionian. Small masses along the surface of the dura mater in the cranium.

g's., palatine. Mucous glands in the tissue of the palate

g., parathyroid. SEE *parathyroid.*

g's., paraurethral. Small rudimentary glands which open on either side of the posterior portion of the urethral orifice in the female; Skene's glands.

g., parotid. Largest salivary gland located in front of the ear. It is a compound tubuloacinous, serous gland.

g's., Peyer's. SEE: aggregate glands.
g., pineal. Tiny glandular body of conical shape located bet. 2 sup. quadrigeminal bodies, connected with the thalamus, but not a part of the brain.
g., pituitary. The hypophysis cerebri, *q.v.* Also see *pituitary*.
g's., prostatic. SEE: Tyson's gland.
g., prostate. G. surrounding male bladder neck and urethra. SEE: *prostate*.

g's., pulmonary. Glands in lung tissue.

g's., pyloric. Gastric glands near the pylorus secreting gastric juice.

g., racemose. SEE: acinous *g.*

g's., Rivini's. SEE: sublingual *g's.*

g., saccular. An alveolar gland.

g., salivary. Any gland secreting saliva, as parotid, sublingual and submaxillary. SEE: *salivary glands*.

g., sebaceous. A simple or branched alveolar gland of which secretes sebum. They are found in the skin. Their ducts usually opening into hair follicles.

g's., seminal. Testicles.

g's., serous. SEE: albuminous *g's.*

g., sex. Old term for a gonad, the ovary, or testis.

g's., Skene's. The paraurethral glands, *q.v.*

g's., solitary. SEE: intestinal *g's.*

g's., sublingual. Tiny salivary glands situated on either side of the tongue.

g's., submaxillary. Tiny salivary glands on either side of the tongue in the submaxillary triangles.

g's., sudoriferous. *g's.* sudoriparous. Glands secreting perspiration situated in the skin. Sweat glands, *q.v.*

g., suprarenal. The adrenal gland, *q.v.*

g's., sweat. SEE: sudoriferous *q.v.*

g., tarsal. Meibomian glands, *q.v.*

g., thymus. The thymus body or thymus, *q.v.*

g., thyroid. Ductless *g.* situated in the neck in front of the trachea.

g's., tracheal. Acinous *g's.* of the tracheal mucosa.

g., tubular. *g.* whose terminal secreting portions are narrow tubes.

g's., Tyson's. Tiny sebaceous glands found on the inner surface of the prepuce and on the glands of the penis.

g's., urethral. SEE: Littre's *g's.*

g's., vaginal. Acinous *g's.* in the vaginal mucosa. These are found only in uppermost portion near the cervix.

The major portion of the vaginal mucosa is devoid of glands.

g's., vestibular. *G's.* of the vaginal vestibule. They include the *minor vestibular glands* and the *major vestibular glands* (glands of Bartholin).

g's., vulvovaginal. SEE: Bartholin's *g's.*

g's., Waldeyer's. *G's.* in the eyelid.

g's., Weber's. *G's.* in the tongue mucosa.

g's. of Zeis. Large sebaceous glands found in the eyelids. They are associated with the follicles of the eyelashes.

g., Zuckerkind's. Tiny tawny lobe occasionally seen bet. geniohyoid muscles.

gland, words pert. to: acinous, "aden-" words, admaxillary, "adreno-" words, anadenia, apophysis, autoactivation, biennadenitis, bubonadenitis, bubononcus, bubonopanus, bulbivestibuli, bulbo-urethral, chondroadenoma, chorioadenoma, deradenitis, endocrine, fibroadenia, gastric, glands, holocrine, name of each gland, pituitrin, seborrhea, sebum, semen, "sial-" words.

glanders (gian'derz) [*L. glans, gland-, kernel*]. SYN *farcy, equinia*. Contagious infection of *Malleomyces mallei* in horses and mules, communicable to man.

SYN *Fever*, inflammation of the skin and mucous membranes esp., those of the nasal cavity, with formation of ulcers and abscesses. Small subcutaneous nodules (farcy buds) develop which break down giving rise to ulcers. Beginning as small areas, these tend to spread and coalesce involving large areas and giving rise to a viscid, mucopurulent discharge with a foul odor. May occur in acute or chronic form. In the acute form, prognosis is grave, the disease often ending fatally.

glandula (gian'du-la) (*pl glandulae*) [*L. little kernel*]. A small gland. SYN: *glandule*.

glandular [*L. glandula, little kernel*]. Pert. to or of nature of a gland.

g., therapy. Treatment of disease with endocrine glands or their extracts. SYN: *organotherapy*.

glandule (gian'dul) [*L. glandula, little kernel*]. A small gland. SYN: *glandula*.

glans [*L. kernel*] 1. A gland. 2. Goiter. 3. A nut.

g., clitoridis. The head of the clitoris.

g. penis, g. phall. Bulbous end of the penis. SEE: *clitoris, penis*.

glare [*ME glaren, to glow*] Temporary blurring of vision, with possible permanent injury to retina from intense light (visible radiation) emanating from highly reflecting objects, such as sunlight reflected from water or snow, or projected by automobile headlight, or by a therapeutic lamp.

glase'rian artery. SYN: *tympanic artery*. A branch of internal maxillary artery, goes to tympanum.

g., fissure. A fissure in the temporal glass, polarized. A medium that permits the exiting light waves to vibrate in only one direction.

g., swallowing. F A TREATMENT: SEE *cotton-wool sandwiches*.

g., ultraviolet transmitting. Glass designed to admit ultraviolet radiation through it.

The best transmits from 50 to 60% of the solar radiation, between 290 and 320 millimicrons. With age the transparency to these rays drops off 50%.

glass'es [*AS glacs, glass*] 1. Transparent refractive device worn to correct eye defects. 2. Device worn to protect eyes from glare. Federal specifications are "shade No. 3 filter lens."

g., bifocal. Those in which the refracting power of the lower portion differs from that in the upper portion, the lower portion being used for viewing near objects, or reading the upper portion for distant objects.

glas'sy [*AS glacs, glass*]. Hyaline; vitreous, like glass smooth and shiny.

Glau'ber's salt. Crystalline salt used as a hydragogue purgative.

glauco'ma [*G. glaukos, green, + oma, swelling*]. Disease of eye characterized by increase in intraocular pressure which results in atrophy of optic nerve and blindness of 2 general types, *primary*, which sets in without known cause, and *secondary*, in which there is an increase in intraocular pressure due to other eye disease. The acute type often attended by acute pain. The chronic type has an insidious onset. Normal tonometer reading is 13 to 22. Error: Closing of the canal of Schlemm.

TREATMENT: *Nonoperative* Miotics (eserine, pilocarpine), phospholine iodide, massage, heat, sedatives, elimination.

Operative Paracentesis of cornea, iridectomy (broad peripheral), cyclo-dialysis, ant sclerotomy, sclerotomy with inclusion of iris as iridotaxis or iridocleisis, sclerectomy, Elliott's trephine or Lagrange enucleation.

SEE *ciliotomy*

g. absolutum. Eye completely blind, cornea insensitive, ant chamber shallow, excavated optic disc, eye as hard as stone, extremely painful

g., chronic. Pressure up to 45-50, enlargement of ant. ciliary veins, cornea clear, dilated pupil, pain, poor vision during attacks, field may be normal, no cupping early.

g., infantile. Buphthalmos resulting in uniform enlargement of eye with increased pressure.

g. simplex. Pressure not high, contracted field, glaucomatous cupping, blindness, no acute attacks **TRIGLIMNT** Prostigmia.

glaucomatous (glaw-ko'ma-tus) [' + *ōma*, swelling] Pert to glaucoma.

gleet [Fr. *glette*, slime] A mucous discharge from the urethra in chronic gonorrhea.

Glénard's disease (gla-narz') Prolapse of 1 or more of the internal organs **SYN** *enteroptosis, splanchnoptosis*.

glenohumeral (gle-no-hu'mer-āl). Pert to the humerus and the glenoid cavity

g. ligaments. Three ligaments in shoulder

gle'noid [G. *glēnē*, cavity, + *eidos*, form]. Having the appearance of a socket

g. cavity. The socket which receives the head of the humerus, below the acromium at the junction of the superior and axillary borders

g. fossa. The mandibular fossa, which receives the capitulum of the mandible

gli'a [G. *glue*]. The neuroglia, *q v*: the non-nervous or supporting tissue of the brain and spinal cord

g. cells. Neuroglia (cells, includes astrocytes, oligodendroglia (oligoglia), and microglia **SEE** *cell, neuroglia*

gliocyte (gli'as-it) [' + *kytos*, cell]. A neuroglia cell

gli'adin [G. *glia*, glue]. A protein separable from the gluten of wheat.

It is deficient in lysine. It contains 94.11% amino acid

glial (gli'al) [G. *glia*, glue]. Concerning glia or neuroglia.

gliarase (gli'ar-ās) [G. *glia*, glue] Astrocytic mass with fission of cytoplasm

glibacte'ria [' + *baktērion*, little rod]. A zooglear mass containing bacilli

glioblasto'ma [' + *blastos*, germ, + *ōma*, tumor] A neuroglia cell tumor. **SYN** *glioma*.

g. multiforme. A neoplasm of the central nervous system, esp., the cerebrum, consisting of a variety of cellular types

Gliocladium, Aspergillus, and Penicillium. It is highly bacteriostatic towards Gram-positive bacteria and is effective against certain plant pathogens

gilococ'cus [' + *kokkos*, berry] A micrococcus in a mass of zooglea

gliocyte (gli'o-sit) [' + *kytos*, cell]. A neuroglia cell **SYN** *gliocyte*.

gliocyto'ma [' + " + *ōma*, tumor]. A neuroglia cell tumor.

gliogenous (gli-oj'en-us) [' + *gennan*, to produce]. Of the nature of neuroglia.

gli'o'ma (pl. *gli'o'mata*) [' + *ōma*, tumor]. 1. A sarcoma of neuroglial origin. 2. Neoplasm or a tumor composed of neuroglia cells.

g. retinae. Malignant tumor of retina; occurs in children under 5 years of age; metastasizes late. **SEE** *pseudoglioma*.

gliomatosis (gli-o-mat-o'sis) [' + " + *ōsis*] Formation of a glioma

gliomatous (gli-o'ma-tus) [G. *glia*, glue, + *ōma*, tumor] Affected with or of the nature of a glioma

gliomyoma (gli-o-mi-o-mā) [' + *mys*, myo-, muscle, + *ōma*, tumor] A mixed glioma and myoma

glioneuroma (gli-o-nu-ro-mā) [' + *neuron*, nerve, + *ōma*, tumor] A tumor having the characteristics of glioma and neuroma

gliosarco'ma [' + *sarx*, flesh, + *ōma*, tumor] Glioma combined with fusiform cells of sarcoma

gliosis (G. *glia*, glue, + *-osis*) Proliferation of neuroglial tissue in the central nervous system

gliosome (gli'o-sōm) [' + *sōma*, body]. One of the rounded bodies seen in neuroglia cells

gliotoxin. An antibiotic obtained from several different fungi, esp. *Trichoderma*

glischrin (glis'krin) [G. *glischros*, gluev] Mucinous substance formed in urine by *Bacillus glischrogenes*

glischruria (glis-ku'ri-ā) [' + *ouron*, urine] Glischrin in the urine

glisso'nian cirrhosis. Inflammation of peritoneal coat of the liver **SYN** *perihepatitis*.

glissoni'tis [G. *-itis*, inflammation] Inflammation of Glisson's capsule

Glisson's capsule (glis'uns). The outer capsule of fibrous tissue investing the liver. **SYN** *capsula fibrosa hepatis*

glo'bin [L. *globus*, globe] A protein constituent of hemoglobin It is a histone and yields histidine upon hydrolysis

g. insulin. **SEE** *insulin, globin*

globinometer [' + G. *metron*, measure] Device for estimating the number of blood corpuscles in a given amount of blood **SYN** *cytometer*

glo'boid [' + G. *eidos*, form] Spheroid, resembling a globe

g. bodies. Minute ultramicroscopical microorganisms such as pathogens of poliomyelitis

globular (glob'u-lar) [L. *globus*, a globe]. Resembling a globe or globule, spherical.

globule (glob'ul) [L. *globulus*, globule] Any small rounded body

globulicidal (glob'u-lis-i'dal) [' + *caedere*, to kill]. Destructive to red blood corpuscles

globulin'eter [' + G. *metron*, measure]. Device for determining relative proportions of hemoglobin

globulin (glōb'ū-lin) [G. *globulus*, globule] One of a group of simple proteins insoluble in pure water but soluble in neutral solutions of salts of strong acids with strong bases

Ex serum, globulin, fibrinogen, myosinogen, lactoglobulin, legumin

g., Ac. Accelerator globulin, a globulin present in blood serum which speeds up the conversion of prothrombin to thrombin in the presence of thromboplastin and calcium ions

g., antihemophilic. **SYN:** *Thromboplastinogen; thrombocytolytic factor.* A clotting component present in the plasma which is essential for the normal agglutination and disintegration of blood platelets It is deficient in the blood of hemophiliacs.

g. gamma. That fraction of serum globulin with which most of the immune antibodies are associated. Most of the antibodies to viruses, bacterial agglutinogens, exotoxins, and injected foreign proteins are contained in the gamma globulin fraction. They are thought to arise from plasma cells.

g., human immune. A preparation of globulins and antibodies obtained from the human placenta. It contains the antibodies or immune factors against measles and is used in the prevention, modification, and treatment of measles.

g., serum. Globulins present in blood plasma or serum, the fraction of the blood serum which antibodies are associated. By electrophoresis, they can be separated into alpha-, beta-, and gamma-globulins, which differ in their isoelectric points.

glob'ulism [' + G. *ismos*, state] 1. Abnormal amt. of red corpuscles in the blood. 2. Administration of medicine in globules.

globulolysis (glob-u-lol'is-is) [' + G. *lysis*, dissolution]. Red blood corpuscle destruction. SYN *hematolysis*.

globulolytic (glob-u-lol-it'ik) [' + G. *lysis*, dissolution]. Capable of destroying red blood corpuscles.

globulose (glob'u-lös) [L. *globulus*, globe]. Albumose or proteid produced by the digestion of globulins.

globu'lysis [L. *globus*, globe, + G. *lysis*, destruction]. Destruction of red blood corpuscles. SYN *globulolysis*, *hemolysis*.

globus [L.] A globe or sphere.

g. hystericus. A lump in the throat in hysteria and other neuroses.

Error. Probably due to functional disturbance of the 9th cranial nerve, and spasm of the pharyngeal muscles.

g. major. Head of epididymus.

g. minor. Lower end of epididymus.

g. pallidus. Pale section within the lenticular nucleus. SEE *paleostriatum*.

glomangioma (glöm''än-jl-ö'mä) A benign tumor which develops from an arteriovenous glomus of the skin.

glomer'ate [L. *glomeräre*, to wind into a ball]. Conglomerate, clustered, grouped.

glomer'ular [L. *glomerulus*, little skein]. Clustered. Pert to a glomerulus.

glomerule (glöm'er-ul) [L. *glomerulus*, little skein]. A glomerulus.

glomer'uli (sing. *glomerulus*) [L. *glomerulus*, little skein]. 1. Small structures in the malpighian body of the kidney made up of capillary blood vessels in a cluster and enveloped in a thin wall, giving off uriniferous tubules. 2. Flexures of capillaries. Twisted secretory parts of sweat glands.

glomerulitis (glöm'er-ü-l'itis) [' + G. *-itis*, inflammation]. Inflammation of glomeruli, esp. of the renal glomeruli. SYN *glomerulonephritis*.

glomerulonephritis [L. *glomerulus*, little skein, + G. *nephros*, kidney, + *-itis*, inflammation]. SYN *glomerulitis*. A form of nephritis in which the lesions involve primarily the glomeruli. May be acute, subacute, or chronic. Etiology is unknown but it frequently follows other infections, esp. those of the upper respiratory tract. Characterized by hematuria, edema, hypertension, and in severe cases, dyspnea, delirium, convulsions, and coma.

glomerulus (pl. *glomeruli*) (L. little skein). 1. A small rounded mass or spherical structure. 2. A small tuft of capillary loops enclosed within Bowman's capsule, the expanded end of a renal tubule, and two comprising a Malpighian body or renal corpuscle. It serves as a

filtering structure in the formation of urine.

g. olfactory. A rounded body found in the olfactory bulb formed by the numerous terminal branches of the dendrites of a mitral cell intertwining with the terminal fibers of several olfactory receptor cells.

glomus (glö'mus) [L.]. A small, round swelling made up of tiny blood vessels and found in a stroma containing many nerve fibers.

g., caroticum. The carotid body. *q. v.*

g., choroideum. An enlargement of the choroid plexus at its entrance into the inferior cornu of the lateral ventricle.

g., coccygeum. The coccygeal body. *q. v.*

glos'sa [G. tongue]. The tongue.

glos'sal [G. *glossa*, tongue]. Rel. to the tongue.

glossalgia (glos-sal'ji-ä) [' + *algos*, pain]. Pain in the tongue. SYN *glossodynia*.

glossectomy (glos'ek'to-mi) [' + *ektome*, excision]. Partial or complete excision of tongue. SYN *linguotomy*, *Kocher's operation*.

Glossina. A genus of flies called tsetse flies. Includes about 20 species of bloodsucking flies which are confined principally to central and southern Africa. They transmit the trypanosomes (*Trypanosoma gambiense*, *T. rhodesiense*) the causative agents of sleeping sickness in man and other trypanosomes which infect wild and domestic animals. Important species are *Glossina palpalis*, *G. morsitans*, *G. tachinoides*, and *G. swynnertoni*. SEE *Trypanosoma*, *sleeping sickness*.

glossi'tis [' + *-itis*, inflammation]. Inflammation of the tongue.

g., acute. Associated with stomatitis, *q. v.* The tongue is covered with ulcers and is tender and painful. Another form affects the parenchyma of tongue and is characterized by edema, which may spread to surrounding structures, producing asphyxia and necessitating tracheotomy operation.

SYM. Tongue is painful, saliva thick and viscid, rendering swallowing difficult. Marked malaise, and often a rise in temperature.

TREATMENT: Oral cleanliness by frequent use of antiseptic mouthwashes. Potassium chlorate orally because it is excreted by the salivary glands and acts as a salivary antiseptic. Fluid food, to avoid discomfort and pain. Bowels kept open by using saline aperients.

g. areata exfoliativa. Geographical tongue.

g., chronic. Sometimes while suffering from chronic ill health, chronic dyspepsia, and septic teeth, this condition arises.

SYM. Tongue is large, pale, and flabby, and shows indentation marks from teeth pressure. Mouth is uncomfortable and there may be an unpleasant taste or foul odor.

TREATMENT: Improvement of the general health, relief of constipation, careful attention to oral hygiene.

g. desic'cans. A painful, raw, and fissured tongue.

g. median rhomboidal. An inflammatory area, somewhat diamond shaped, found on the dorsum of the tongue anterior to the vallate papillae.

g. Moeller's. *Glossodynia exfoliativa*, *q. v.*

g. parasit'ica. Black tongue. SYN: *glossophytia*.

- glosso-** [G. *glōssa*, tongue]. Prefix: Signifies *pert. to the tongue*.
- glossocoele** (glos'so-sēl) [G. *glōssa*, tongue, + *kēlē*, swelling]. Swelling and protrusion of the tongue due to disease or malformation.
- glossodynamometer** (glos'so-din-a-mom'e-ter) [+ *dynamis*, power, + *metron*, measure]. Device for measuring contractile power of the tongue muscles.
- glossodynia** (glos-o-din'i-ā) [+ *odynē*, pain]. Pain in the tongue. SYN *glossalgia*.
- g. exfoliativa**. Moeller's glossitis. A chronic superficial inflammation of the tongue characterized by burning or pain and increased sensitivity to hot and spicy foods.
- glos'soepiglot'tic** [+ *epi*, upon, + *glōt'tis*, back of tongue]. Pert to the ligament bet base of tongue and epiglottis.
- glossoepiglot'tidean** (glos'o-ep-i-glō-tid'e-an) [+ " + *glōt'tis*, back of tongue]. Rel. to the tongue and epiglottis.
- g. folds**. Three mucous membrane folds from base of tongue to the epiglottis. SYN *pluvae epiglotticae*.
- g. ligament**. Elastic band from base of tongue to the epiglottis in middle g fold.
- glossograph** (glos'o-graf) [+ *graphem*, to write]. A graph for showing the tongue's movements in speaking.
- glossohyal** (glos-o-h'yal) [+ *yooidēs*, U-shaped]. Rel to tongue and hyoid bone SYN *hyoglossal*.
- glosso'kin'esthet'ic**. Pertaining to movements of the tongue, esp, those in speech.
- glosso'la'b'i'al**. Pertaining to the tongue and lips.
- glossolalia** (glos-so-la'i'ā) [+ *lalia*, babble]. Repetition of senseless remarks not related to the subject or situation involved.
- glossology** (glos-sol'o-jī) [+ *logos*, study]. 1 Study of the tongue and its diseases. SYN *glottology*. 2 Science of nomenclature SYN *onomatology*.
- glossolysis** (glos-sol'is-is) [G. *glōssa*, tongue, + *lysis*, loosening]. Paralysis of tongue. SYN *glossoplegia*.
- glosso'pal'atine**. Pertaining to the tongue and the palate.
- glossopathy** (glos-sop'ā-thī) [+ *pathos*, disease]. Disease of the tongue.
- glossopharyngeal** (glos'o-far-in'je-āl) [+ *pharynx*, pharynx]. Rel. to tongue and pharynx.
- g. nerve**. Ninth cranial n. FUNCT Special sensory (taste), visceral sensory, motor ORG by several roots from the medulla oblongata DISTR Pharynx, ear, meninges, tongue, tonsils BAS Carotid, tympanic, pharyngeal, lingual, tonsillar, and sinus nerve of Hering.
- glossohyilia** (glōs-sō-π'i'ā) SYN *hyperkeratosis linguae*. Black or hairy tongue, characterized by the appearance on the dorsum of the tongue of a dark furlike patch consisting of hypertrophied filiform papillae, pigment, and shed epithelial cells. Cause unknown.
- glossoplasty** (glos-so-plas'tī) [+ *plassein*, to form]. Reporative surgery of the tongue.
- glossoplegia** (glōs-sō-plē'jī-ā). SYN *glossolysis*. Paralysis of tongue, usually unilateral. EROT. Cerebral hemorrhage, disease, or injury which involves the hypoglossal nerve.
- glossopto'sis** [+ *ptōsis*, a dropping]. A dropping of the tongue downward out of normal position.
- glosso'pyros'is**. A burning sensation of the tongue.
- glossorrhaphy** (glos-sor'ā-flī) [+ *raphē*, suture]. Suture of wound of the tongue.
- glossos'copy** [+ *skopein*, to examine]. Inspection of the tongue.
- glossospasm** (glos'so-spazm) [+ *spasmos*, spasm]. Spasmodic contraction of muscles of the tongue.
- glossotomy** (glos-ot'o-mī) [+ *tomē*, incision]. Incision of tongue.
- glosso'trich'ia**. Hairy tongue, due to greatly elongated filiform papillae which gives the tongue a hairy appearance.
- glos'sy** (M.E. *glōse*). Smooth and shining.
- g. skin**. Shiny appearance of the skin due to atrophy or injury to nerves.
- glot'tic** [G. *glōt'tis*, back of tongue]. Of or pert. to the tongue, or the glottis.
- glottis** (glōt'tis) [G. *glōt'tis*, back of tongue]. The sound-producing apparatus of the larynx consisting of the two vocal folds and the intervening space. the *rima glottidis*. A leaf-shaped lid of fibrocartilage (the epiglottis) protects this opening.
- g. edema**. The accumulation of fluid in the tissues lining the larynx. It may result from irritation of the larynx from improper use of the voice, excessive use of tobacco or alcohol, chemical fumes, acute infections, or more serious conditions such as tuberculous or syphilitic laryngitis.
- SYM Hoarseness, and later complete aphonia, extreme dyspnea at first on inspiration, but later on expiration also. Stridulous respiration, barking cough when epiglottis is involved.
- g. spuria**. Space situated bet. the false vocal cords.
- glottit'is** [+ *-itis*, inflammation]. Inflammation of the tongue. SYN *glossitis*.
- glottol'ogy** [+ *logos*, study]. The study of the tongue and its diseases SYN *glossology*.
- glucose** (glu'kās) [G. *glukus*, sweet]. An old term for a ferment converting starch into glucose.
- glucatonia** (glu-ka-to'ni-ā) [+ *a-*, priv. + *tonos*, tone]. Reduction of blood sugar brought about by insulin therapy.
- Insulin shock**
- glucide** (glū'sid) [G. *glukus*, sweet]. 1 One of a large class of organic compounds including the carbohydrates and glucosides. 2 USP. White crystalline powder 500 times sweeter than sugar having no food value. Uses Substitute for sugar in diabetes One-quarter gr. (0.015 Gm.) in the place of an ordinary lump of sugar.
- gluciphore** (glū'sī-fōr) [+ *phorein* to carry]. An atomic group which, when combined with other tasteless atoms called auxoglucos, forms sweet compounds. SEE *auxogluc*.
- glucose'mia** [+ *ama*, blood]. Sugar in the blood SYN *glycosemia*.
- gluco'neogenesis** [G. *glukus*, sweet, + *neos*, new, + *genesis*, origin]. The formation of glucose from noncarbohydrate sources such as proteins, and possibly fats. It occurs in the liver under such conditions as low carbohydrate intake or starvation.
- glu'cose** [L. *glucosum* from G. *glukus*, sweet]. 1 A liquid obtained from the incomplete hydrolysis of starch. It is a thick syrupy liquid, sweet in taste, containing d-glucose (dextrose), dextrins and other carbohydrates. It is used for nutritive purposes and in various pharmaceuticals and food preparations. 2. Dextrose (C₆H₁₂O₆), a crystalline monosaccharide, more specifically dextro- or d-glucose.

Glucose is the most important carbohydrate in body metabolism. It is formed during digestion from the hydrolysis of di- and polysaccharides, esp., starch, and absorbed into the blood of the portal vein. In its passage through the liver excess glucose is converted into glycogen (*glycogenesis*). The concentration of sugar in the blood is approximately 0.1 per cent (100 mg) the amount being maintained at a fairly constant level (80 to 120 mg) through the action of insulin produced by the Islets of Langerhans of the pancreas. Failure of the pancreas to produce adequate insulin results in *hyperinsulinism* in which the blood sugar (glucose) level may rise to 200 mg or higher. When above the renal threshold (about 180 mg), glucose appears in the urine (*glycosuria*), a symptom of diabetes. Inadequate production of insulin or injection of insulin as in insulin shock treatment, reduces the blood sugar below normal, a condition known as *hypoglycemia*, *q.v.*

In the tissue glucose may be (a) converted into glycogen, (b) converted into fat, or (c) oxidized to carbon dioxide and water. Free glucose is not used in the tissues until phosphorylated by ATP (adenosinetriphosphate). This occurs through the action of an enzyme, hexokinase, with the resultant production of glucose-6-phosphate. Through a complex series of reactions involving several enzymes, the action of certain hormones, and the formation of several intermediate products including lactic and pyruvic acids, oxidation to carbon and water is brought about. Hormones of and ant. lobe of the hypophysis, the adrenal gland (cortex and medulla) thyroid and the gonads play a role in carbohydrate metabolism.

When the blood sugar is below normal fats are consumed. Incomplete combustion leads to the formation of ketone bodies, also a symptom of diabetes. Blood sugar acts as a protein sparer, *q.v.* Nervous tissue is especially dependent upon glucose as its source of energy, the brain being able to oxidize glucose directly.

g. chemistry findings: The glucose found in the blood stream has a dual origin. First, glucose is present normally in both the whole blood and plasma; secondly, the greater percentage of the normal glucose concentration has an exogenous origin—that is, from the food intake. **A. Normal:** 80 to 120 mgm per 100 cc. **B. Increased:** (1) Acromegaly, (2) Adrenal tumors, (3) Cortical or medullary, (4) Diabetes mellitus, (5) Hemochromatosis, (6) Hyperthyroidism, (7) Hyperpituitarism, (8) Hyperadrenalism, (9) Intracranial pressure, (10) Severe exercise. **C. Decreased:** (1) Addison's disease, (2) Adenoma or carcinoma of islets of Langerhans, (3) Cretinism, (4) Hyperinsulinism, (5) Hypopituitarism, (6) Hypothyroidism, (7) Insulin shock, (8) Muscular dystrophy, (9) Myxedema.

glucose tolerance test. In suspected cases of hyperinsulinism, the test is prolonged to six hours with samples of blood being drawn hourly and analyzed for sugar content. If the blood-sugar level continues to drop after 3 hours, falling below 80 mgs per 100 cc, hyperinsulinism is indicated although other conditions may produce a deficiency in blood sugar (*hypoglycemia*).

glucosidase. An enzyme which catalyzes the hydrolysis of a glucoside.

glucoside (glu'ko-sid) [G. *glykus*, sweet]. A substance glycoside, which upon hydrolysis, yields a sugar, glucose, and

one or two additional products. They are numerous and widely distributed in plants. Many glucosides have medicinal properties, for example digitalin and strophanthin, present in digitalis and strophanthus respectively, which have a specific effect upon the heart. **See** *glycoside*.

glucosin (glu'ko-sin) [G. *glykus*, sweet]. Any one of a series of bases derived by action of ammonia on glucose.

glucosuria (' + *ouron*, urine). Abnormal amt. of sugar in the urine. **Syn:** *glycosuria*.

glielike tumor. Glioma. Also a colloid degenerative cancer or colloma.

Gluge's corpuscles. Granular cells containing fat droplets, usually found in degenerating nervous tissue.

glu'side. Saccharin, said to be 300 times as sweet as cane sugar. **Syn:** *glusidum*.

DOSAGE ½ gr. (0.03 Gm.)

glutamic acid. **Syn:** *Glutamic acid*. An amino acid ($\text{COOH}(\text{CH}_2)\text{CHNH}_2\text{COOH}$) formed in the hydrolysis of proteins.

glutaminase. An enzyme which catalyzes the breakdown of glutamine into glutamic acid and ammonia.

glutamine. The mono-amide of aminoglutaric acid. It is present in the juices of many plants and is essential in the metabolism of certain bacteria. It is also present in animal tissues such as the brain, liver and kidney.

glutathione (glu'ta-thi-on) [G. *theon*, sulfur]. A tripeptide of glutamic acid, cysteine, and glycine.

Found in small quantities in active animal tissues, takes up and gives off hydrogen, fundamentally important in cellular respiration.

gluteal (glu'te-äl) [G. *gloutos*, buttock]. Pertaining to the buttocks.

g. fold. Crease between the thigh and the buttocks. **See** *rump*.

g. reflex. Contraction of gluteal muscles from stimulation of their skin.

glutelin (glu'te-lin). A simple protein found in grain seeds, soluble in alkalies and dilute acids, but not in neutral solutions. **See** *protein*.

glu'ten [L. *glue*]. Vegetable albumin, a protein which can be prepared from wheat, corn, and other grain.

glu'tin [L. *glue*]. The viscid portion of wheat gluten. **Syn:** *gladin*.

glutinous (glu'tin-us) [L. *glutinösus*, gluey]. Adhesive; sticky.

gluti'tis [G. *gloutos*, buttock, + *-itis*, inflammation]. Inflammation of muscles of buttocks.

glu'tolin. An albumoid substance found in small amts. in paraglobulin.

glycase (gli'käs) [G. *glykus*, sweet]. The enzyme that converts maltose into dextrose. **See** *enzyme*, *ferment*.

glycemia (gli-se'mi-ä) [' + *aima*, blood]. Sugar or glucose in the blood. **Syn:** *glycoemia*.

glyceride (gli's'er-id) [G. *glykus*, sweet]. An ester of glycerin compounded with an acid.

glycerine (gli's'er-in) [G. *glykus*, sweet]. **USP** **Syn** *glycerol*. A trihydric alcohol, tri-hydroxy-propane ($\text{C}_3\text{H}_8(\text{OH})_3$) present in chemical combination in all fats. It is an oil, colorless, liquid soluble in all proportions in water and alcohol. It is made commercially by the hydrolysis of fats, esp., during the manufacture of soap.

Uses: Extensively as a solvent, as a preservative, as an emollient in various skin diseases, and in form of suppositories as an evacuant.

glycerite (gli's'er-it) [G. *glykus*, sweet]. Drug dissolved in glycerin. Four official.

glyceritum (pl. *glycerita*) [L. glyceritel]. Medicinal substance mixed or dissolved in glycerin.

glycerol (gli's'er-ol) [G. *glykus*, sweet]. Clear, colorless, syrupy liquid formed by hydrolysis of fat. SYN *glycerin*, *q.v.*

g. trinitrate. Nitroglycerin, USP.

Made by the action of nitric acid on glycerin in presence of sulfuric acid.

Used internally in form of spirit which is 1% in alcohol, and in form of tablets.

ACTION AND USES. To dilate blood vessels in some cases of angina pectoris.

DOSEAGE: 1 m (0.6 cc) Tablets, 1/100 gr. (0.6 mg.).

glyceryl. The trivalent radical CaH_5 of glycerol.

glycine (gli'sēn) [G. *glykus*, sweet]. Amino-acetic acid* derived from gelatin and from many proteins. SYN *glycocin*, *glycocol*.

glyco-. Prefix from G. *glykus*, sweet Used in chemical compounds to indicate presence of glycerol or similar substance.

glycocin. Glycerin, *q.v.*

glycoelastic [G. *glykus*, sweet, + *klassein*, to break]. Pert. to the hydrolysis and digestion of sugars.

glycogen (gli'kō-jēn) [G. *glykus*, sweet, + *gennan*, to produce]. It is a polysaccharide ($\text{C}_6\text{H}_{10}\text{O}_5$)_x and is commonly called "animal starch", a whitish powder which can be prepared from mammalian liver and muscle, and other animal tissues.

Formation of glycogen from carbohydrate sources is called *glycogenesis*, from noncarbohydrate sources, *glycogenesis*. The conversion of glycogen to glucose is called *glycogenolysis*.

It is the form in which carbohydrate is stored in the animal body for future conversion into sugar, and for subsequent use in performing muscular work or for liberating heat.

It is formed from sugar and a part of the fat and protein in the blood. It is converted when needed by the tissues into glucose. It is a muscle food, and with the contraction of the muscles it breaks down into lactic acid, causing fatigue. Oxygen is then needed to convert lactic acid back into glycogen, at which time some of the lactic acid is burned, producing carbonic acid and heat. Sugar from the blood takes the place of the lactic acid consumed.

Oxygen and sugar are necessary to prevent fatigue from muscular exertion long continued. SEE *azoamyly*.

glycogenase (gli'kō-jen-ās) [" + *gennan*, to produce]. An enzyme in the liver which hydrolyzes glycogen.

Its end product is dextrose.

glycogenesis (gli'kō-jen'es-is) [" + *genesis*, formation]. The formation of glycogen, as occurs in man after the eating of a carbohydrate meal.

glycogenetic [" + *gennan*, to produce]. Pert. to the formation of glycogen.

glycogenic [" + *gennan*, to produce]. Rel. to glycogen.

glycogenolysis (gli'kō-jen-ol'is-is) [" + " + *lysis*, solution]. Conversion of glycogen into dextrose in the liver.

glycogenolytic (gli'kō-jen-o-lit'ik) [" + " + *lysis*, dissolution]. Pert. to the hydrolysis of glycogen.

glycogenesis (gli'kō-jen-o'sis) [" + " + *genesis*]. Abnormal amt. of glycogen in children resulting in an enlarged liver. SYN *von Gierke's disease*.

glycogeusia (gli'kō-ju'si-ā) [" + *geusia*, taste]. A sweet taste.

glycohemia (gli'kō-he'mi-ā) [" + *aima*, blood]. Abnormal amt. of sugar in the blood. SYN *glycosemia*.

glycol (gli'kol) [G. *glykus*, sweet]. Any one of the dihydric alcohols related to ethylene glycol, $\text{C}_2\text{H}_4(\text{OH})_2$. The general formula is $\text{C}_2\text{H}_4\text{n}(\text{OH})_2$.

The glycols are thick, colorless, water soluble liquids similar to glycerol.

glycolipid (gli'kō-lip'id) [" + *lipos*, fat]. Compound of fatty acids with a carbohydrate, containing nitrogen, but no phosphoric acid.

Found in myelin sheath of nerves. SYN *cerebroside*.

glycolysis (gli'kol'i-sis) [" + *lysis*, dissolution]. Hydrolysis of sugar by a ferment in the body.

glycolytic [" + *lysis*, dissolution]. Pert. to hydrolyzing sugar.

g. enzyme. An enzyme which catalyzes the hydrolysis of sugars.

glycometabolic [" + *metabolē*, change]. Rel. to the metabolism of sugar.

glycometabolism (gli'kō-mēt-ab'ō-lizm) [" + " + *-ismos*, process]. Utilization of sugar* by the body. SYN *saccharometabolism*. SEE *metabolism*.

glyconeogenesis (gli'kō-ne-o-jen'e-sis) [" + *neos*, new, + *genesis*, formation]. The formation of carbohydrates from noncarbohydrates, such as fat or protein.

glyconucleoprotein [" + L. *nucleus*, kernel, + G. *prōtos*, first]. A carbohydrate group unduly developed in a nucleoprotein.

glycopenia (gli'kō-pe'ni-ā) [" + *penia*, poverty]. Having a tendency to hypoglycemia.

glycoperle [" + *pēsis*, fixation]. Pert. to the fixing or storing of sugar.

glycoperis [" + *pēsis*, fixation]. The storing of glycogen in the liver.

glycophe'ol [G. *glykus*, sweet]. Saccharin, a very sweet crystalline substance. SYN *gluside*.

glycophilia (gli'kō-fil'i-ā) [" + *philein*, to love]. A condition in which there is a marked tendency to hyperglycemia.

glycopolyuria (gli'kō-pol-i-ū'ri-ā) [" + *polys*, much, + *ouron*, urine]. Diabetes mellitus with polyuria greater than glycosuria.

glycopri'val, **glycopri'vous** [" + L. *privus*, deprived of]. Lacking in or without carbohydrates.

glycoprotein (gli'kō-pro'te-in) [" + *prōtos*, first]. A compound or conjugated protein such as mucin. SEE *protein*.

glycotyalism (gli'kō-ti'al-izm) [" + *tytalion*, saliva, + *ismos*, state of]. Excretion of glucose in the saliva.

glycoregulation [" + L. *regula*, rule]. The dietary and insulin control of sugar metabolism.

glycoregulatory [" + L. *regula*, rule]. Rel. to glycoregulation.

glycorrhachia (gli'kō-rak'i-ā) [" + *rachis*, spine]. Sugar in the cerebrospinal fluid.

glycorrhea (gli'kō-re-ā) [" + *roia*, flow]. Discharge of sugar from the body.

glycosecretory (gli'kō-se-kre'to-ri) [" + L. *secretus*, from *secerere*, to separate]. Pert. to or determining the secretion of glycogen.

glycose'mia [" + *aima*, blood]. Abnormal amount of sugar in the blood.

glycosialia (gli'kō-si-al'i-ā) [" + *sialon*, saliva]. Sugar in the saliva.

glycosialorrhoea (gli'kō-si-al-or-re-ā) [" + *roia*, flow]. Excessive secretion of saliva containing sugar.

glycoside. A substance derived from plants which upon hydrolysis yields a

sugar and one or more additional products. Depending on the sugar formed, glycosides are designated *glucosides*, *galactosides*, etc. **See:** *glucoside*.

glycosom'eter [' + *metron*, measure]. Device for determining proportion of sugar in urine in glycosuria.

glycosuria (gli-ko-su'ri-ä) [' + *ouron*, urine]. The presence of sugar (glucose) in the urine.

Traces of sugar, particularly glucose, may occur in normal urine, but are not detected by ordinary qualitative methods. In routine urinalyses the presence of a reducing substance is suspicious of diabetes mellitus until proven otherwise. Glycosuria is a pronounced symptom of diabetes mellitus when the blood sugar level exceeds the renal threshold (about 170 mg per cent). Normal conditions should show 0.01% of glucose in the blood **SYN** *glycosuria*.

Glycosuria may result from (a) pancreatic (insulin) insufficiency, (b) disorders of the endocrine glands esp., hypophysis adrenals, thyroid, or ovaries, (c) excessive carbohydrate intake, (d) excessive glycogenolysis, (e) reduction of renal threshold.

g., alimentary. Following ingestion of large amounts of starches or sugars.

g. diabetic. G. resulting from hyposecretion of insulin.

g. emotional. G. resulting from emotional states such as worry, or anxiety.

g. pituitary. G. resulting from dysfunction of the ant pituitary.

g. phloridzin. G. resulting from the injection of phloridzin which reduces the renal threshold for glucose.

g., renal. When glucose is persistent and not accompanied by hyperglycemia.

glycuresis (gli-ku-re'sis) [' + *ourēsis*, urination]. Presence of sugar (glucose) in the urine. **SYN** *glycosuria*.

glycuronuria (gli-kū-ro-nu'ri-ä) [*glycuronic acid* + *G. ouron*, urine]. Glycuronic acid in the urine.

glycylglycine (glis-il-glis'in). The simplest form of a polypeptide.

glycyltryptophan (glis'il-trip'tof-än). A dipeptide of glycine and tryptophan.

glycyrrhiza (glis-i-ri'zä) **The licorice root** **See** *licorice*.

glyoxalase. An enzyme which catalyzes the conversion of methylglyoxal to lactic acid by the addition of water.

Gm. Abbi for *gram*.

gnat. Any of a number of small insects belonging to the order Diptera, suborder Orthorrhapha. Term applied generally to insects smaller than mosquitoes. Includes black flies, midges, and sand flies.

g. buffalo. A small dipterous insect belonging to the family Simuliidae, *q.v.*

gnathalgia (nath-al'ji-ä) [*G. gnathos*, jaw, + *algos*, pain]. Pain in the jaw. **SYN** *gnathodynia*.

gnathic (nath'ik) [*G. gnathos*, jaw]. Pert. to an alveolar process or to the jaw.

gnathion (nath'ion) [*G. gnathos*, jaw]. Lowest point of middle line of lower jaw, a craniometric point.

gnathitis (na-thi'tis) [' + *-itis*, inflammation]. Inflammation of the jaw or adjacent soft parts.

gnatho- (nath'o) [*G.*]. Prefix. Pert. to jaw or cheek.

gnathocephalus (nath-ō-sēf'äl-üs). A monster in which the head consists principally of the jaws.

gnathodynia (nath-ō-din'ti-ä) [*G. gnathos*, jaw, + *odynē*, pain]. Pain in the jaw. **SYN** *gnathalgia*.

gnathoplasty (nath'o-plas-ti) [' + *plasma*, to form]. Reparative surgery of jaws or cheek.

gnathoschisis (nath-os'kis-is) [' + *schizem*, to split]. Congenital jaw cleft.

Gnathostoma (nä-thōs'tō-mä). A genus of Nematode worms which infests the stomach walls of domestic and wild animals. They occasionally accidentally infest man.

gnathostomiasis (nath-ō-stō-mi'ä-sis). Infestation with *Gnathostoma*, *q.v.*

gnosia (no'si-ä) [*G. gnōsis*, knowledge]. The perceptive faculty of recognizing persons, things and forms.

goat-leap pulse. Term applied to an irregular and bounding pulse. **See** *pulse*.

goat milk. Milk of a goat. **AV. SERVING** 240 Gm. **Pro** 9.6, **Fat** 14.4, **Carbo** 12.0 **Ca** 0.128, **Mg** 0.013, **K** 0.145, **Na** 0.079, **P** 0.103, **Cl** 0.014, **S** 0.037. **Vit A** +++ **See** *buttermilk*, *milk*.

goblet cell. **SYN** *mucous cell*. A type of secretory cell found in the epithelium of the intestinal and respiratory tracts, a unicellular gland which secretes mucus. Mucin droplets accumulate in the distal end of the cell, forming a large ovoid mass which causes the cell to become swollen and distorted in shape. The free surface of the cell finally ruptures liberating the mucus. **See** *cell*, *gland*, *secretion*, *mucus*.

goggle eyed. Having an abnormally protruding eye. **SYN** *exophthalmic*.

goiter (goi'ter) [*L. guttur*, throat]. An enlargement of the thyroid gland.

Error. It may be due to lack of iodine in diet, thyroiditis, or inflammation from infection, to tumors, or hyper- or hypofunction of the thyroid gland. **SYN** *Derbyshire neck*, *struma*.

g., aberrant. Supernumerary thyroid enlargement.

g., acute. G. growing rapidly.

g., adenomatous. Thyroid enlargement due to growth of encapsulated adenomata. Nodular goiter.

g., basedowified. **See** *toxic g.*

g., colloid. One in which there is a great increase of follicular contents.

g., cystic. A g. in which a cyst or a number of cysts are formed. May result from the degeneration of tissue or liquefaction within an adenoma.

g., diffuse. G. in which the thyroid tissue is diffuse in contrast to its nodular form as in adenomatous goiter.

g., diver, g., diving. Movable g.

g., endemic. G. development in certain localities, especially those in which iodine is deficient in food and water.

g., exophthalmic. **SYN** *Grave's*, *Parry's* or *Basedow's disease*, *hyperthyroidism*, *thyrotoxicosis*. A disease resulting from the excessive secretion of the thyroid hormones.

Error. Unknown. Nervous shock, or strain, worry, and fright, may be precipitating factors. Occurs in constitutionally predisposed individuals. Incidence higher in females.

SYN Bulging eyeballs generally present. Many eye signs, enlarged thyroid, delayed coagulation time, tremor of fingers and muscles of hands, tachycardia, increased metabolism, vomiting and diarrhea, profuse perspiration, nervous irritability, skin eruptions, emaciation, anemia, hyperglycemia. Goiters are more prevalent in fresh water and lake countries, and less so on the sea coast, probably due to the lack of iodine in fresh water. Iodine and iodized salt are used as remedies and preventatives.

g., fibrous. G. with hyperplastic capsule and stroma of the thyroid gland.

g., follicular. **See** *parenchymatous g.*

g., hyperplastic. SYN: *parenchymatous goiter*. Condition in which number of secreting cells esp. those lining the follicles is greatly increased.

g., intrathoracic. G. in which a portion of the thyroid tissue lies within the thoracic cavity.

g., lingual. Hypertrophied mass forming a tumor at post portion of dorsum of tongue.

g., parenchymatous. G. characterized by multiplication of cells lining the follicles or alveoli. There is usually a reduction in colloid and the follicular cavities assume various sizes and are often obliterated by infoldings of their walls. Fibrous tissue may increase markedly. Iodine content of gland is low. Goiter usually there is an excessive

g., perivascular. G. surrounding a large blood vessel.

g., retrovascular. G. development behind a large blood vessel.

g., simple. Thyroid gland hyperplasia unaccompanied by constitutional symptoms.

g., substernal. Enlargement of lower part of thyroid isthmus.

g., suffocative. G. causing shortness of breath due to pressure.

g., toxic. Exophthalmic goiter or goiter in which there is an excessive production of the thyroid hormone.

g., vascular. G. due to distention of blood vessels.

gold-beaters' skin. A membrane from the cecum of the ox for surgical use.

Goldberger's diet. One for pellagra. Eggs, lean meat, and brewer's yeast.

Goldflam's disease. Excessive tiring of voluntary muscles and rapid decrease of contractility. SYN *myasthenia gravis pseudoparalytica*.

gold seed. Thin capillary glass tube covered with gold containing some form of radium.

Golgi apparatus. The internal reticular apparatus of Golgi. A network of irregular wavy threads present in the cytoplasm, of all nerve cells, and many other cells esp. secretory cells.

Golgi's cells. Multipolar nerve cells in the cerebral cortex and post horns, of spinal cord. There are two types. Type I, those that possess long axons and Type II, those that possess short axons.

Golgi's corpuscle. A sensory nerve ending or receptor found in tendons, or sponeuroses, an end organ of muscle sense. Also called *organ of Golgi*.

Goll's tract (golz). One in post white column of spinal cord. SYN *fasciculus gracilis*.

gomphi'asis [G. *gomphos*, molar tooth]. Loosening of the teeth.

gomphosis (gom-fo'sis) [G. *gomphos*, nail, + *osis*]. A conical process fitting into a socket in immovable (synarthrosis*) joint. SEE *joint*.

gon'ad [G. *gonē*, semen]. A generic term referring to both the female sex glands, or ovaries, and the male sex glands, or testis. The embryonic sex gland before differentiation into definitive testis or ovary.

Each forms the cells necessary for reproduction, *spermatozoa* from the testes, *ova* from the ovaries.

INTERNAL SECRETIONS: Female. The vesicular follicles of the ovaries secrete estrogen, which maintains the nutrition and mature size of the female generative organs, also the *corpus luteum*, producing the luteal secretion (progesterone) which sensitizes the interior membrane of the uterus to contact with the ovum to assist in the implantation of the fertilized ovum.

Male: The interstitial cells of the testes secrete an internal secretion containing androgens which stimulates metabolism, increases muscular strength and develops secondary sex characteristics.

Hormones from both sexes have been isolated and standardized, and are used in the treatment of conditions arising from an insufficiency of these hormones: SEE *ovary*, *testicle*.

gonadal (gon-ā-dal) [G. *gonē*, seed]. Pert. to a gonad. SYN *gonadal*.

gonadectomy (gon-ā-dek'to-mī) [" + *ektomē*, excision]. Excision of a testis or ovary.

gonad'ial [G. *gonē*, semen]. Pert. to reproductive gland. SYN *gonadal*.

gonadogen (gon-ad'ō-jen) [" + *gennan* to produce]. Commercial gonadotropin substance from pregnant mare's serum. Induces ovulation and in male growth of genitalia and secondary sex characteristics.

gonadop'athy [" + *pathos*, disease]. A disease of the sexual glands.

gonadother'apy [" + *therapeia*, treatment]. Treatment by injection of extracts containing testicular or ovarian hormones.

gonadotrope (gon-ad'ō-trōp) [" + *tropein*, turning]. One dominated by the sex instinct.

gonadotrophic (gō-nād-ō-trōf'ik) [G. *gonē*, semen]. Relating to stimulation of the gonads.

g., hormones. Gonadotrophins, *g.* or gonad-stimulating hormones.

gonadotrophin [G. *gonē*, semen, + *tropein*, turning]. A gonad-stimulating hormone.

g's., ant. pituitary. Those produced by the anterior lobe of the hypophysis. Include (a) follicle-stimulating hormone (FSH), (b) leuteinizing hormone (LH). In the male this is called the interstitial cell stimulating hormone (ICSH), (c) luteotrophic hormone (LTH).

g., chorionic. G's. produced by the chorionic villi of the placenta. They are present in the blood and urine of pregnant women and in the blood of pregnant mares. Their presence in urine is the basis of the Aschheim-Zondek, Friedman, and other pregnancy tests. Also called ant. pituitary like hormone, pregnancy hormone.

gonadotropism (go-nad-ō'tro-pizm) [" + *ismos*, state of]. Domination by the sex impulse.

gon'aduct [" + *L. ductus*, canal]. The seminal duct or the oviduct.

gonagra (gon-a-grā) [G. *gonu*, knee, -*agra*, seizure]. Gout in the knee.

gonal'gia [" + *algos*, pain]. Pain in the knee.

gonangiectomy (gon-an-jī-ek'to-mī) [G. *gonē*, seed, + *aggeion*, vessel, + *ektomē*, excision]. Excision of the vas deferens or a part of it. SYN *vasectomy*.

gonarthrit'is (gon-ar-thrīt'is) [G. *gonu*, knee, + *arthron*, joint, + *-itis*, inflammation]. Inflammation of knee joint.

gonarthrocace (gon-ar-throk'ā-se) [" + *kakē*, evil]. White swelling of knee joint.

gonarthromeningitis (gon-ar'thro-men-in-jīt'is) [" + *mēnigz*, membrane, -*itis*, inflammation]. Synovitis of knee joint.

gonarthrotomy (gon-ar-throt'ō-mī) [" + *tomē*, incision]. Incision of knee joint.

gonatag'ra [" + *agra*, seizure]. Gout in the knee.

gonatocele (gon-at'o-sēl) [" + *kēlē*, swelling]. White swelling; tumor of the knee.

gonecyst, **gonecystis** (gon'e-sist, gon-e-sis'tis) [G. *gonē*, semen, + *kystis*, a bladder]. A seminal vesicle.

gonocystitis (gon-e-sis-ti'tis) [" + " + -itis, inflammation]. Inflammation of seminal vesicles.

gonecystolith (gon-e-sis-to-lith) [" + " + *lithos*, stone]. A concretion or calculus in a seminal vesicle.

gonecystopyosis (gon-e-sist-o-pi-o'sis) [" + " + *pyōsis*, suppuration]. Suppuration in a seminal vesicle or gonecyst.

gonitis (go-ne-i'tis) [G. *gonu*, knee, + -itis, inflammation]. Inflammation of the knee.

gonopolesis (gon-e-poi-e'sis) [G. *gonē*, semen, + *poien*, to make]. The secretion of the semen.

Gongylonema (gōn-jō-lō-nē'mā). A genus of nematode worms belonging to the suborder Spirurata. They are parasitic in wall of the esophagus and stomach of domestic animals. Occasionally, they are accidental parasites in man. *G. pulchrum* is the species most frequently involved.

goniometer (gon-i-om'et-er) [G. *gōnia*, angle, + *metron*, measure]. Apparatus to measure joint movements and angles.

gonion (go'ni-on) [G. *gonia*, angle]. Point of angle of the mandible or lower jaw.

gonioscope (go'ni-o-skōp) [" + *skopein*, to examine]. An instrument for inspecting angle of ant. chamber of eye and for determining ocular motility and rotation.

gono-, **gon-** [G.]. Prefix meaning *generation*, *offspring*, *semen*.

gonocide (gon'o-sid) [G. *gonē*, semen, + *L. caedere*, to kill]. Destructive to the gonococcus.

gonococ'cal [" + *kokkos*, berry]. Rel. to or caused by gonococci.

gonococcemia (gon-o-kok-se'mi-ā) [" + *aima*, blood]. Gonococci in the blood.

gonococcic (gōn-ō-kōk'sik) [" + *kokkos*, berry]. Pert. to the gonococcus.

g. smears. Gonococci are in pairs and tetrads, never in chains. They are biscuit-shaped with concave adjacent surfaces, Gram negative and intracellular. *Stains*. Gram's method, methylene blue.

gonococcide (gon-o-kok'sid) [" + " + *L. caedere*, to kill]. Destructive to or that which kills gonococci.

gonococcin (gon-o-kok'sin) [" + *kokkos*, berry]. A glycerin extract of gonococci used in the cutireaction test for gonorrhea.

gonococ'cicide [" + *kokkos*, berry, + *L. caedere*, to kill]. Destructive to or an agent which kills gonococci.

gonococcus (gon-o-kok'us) [" + *kokkos*, berry]. The organism causing gonorrhea. *Neisseria gonorrhoeae*.

It is an intracellular biscuit-shaped diplococcus and tends to occur in pairs. It is classified as a Gram negative bacterium and may be found in or on the genitalia, in the blood, the eye, urine, feces, and in boils.

gon'ocyte [G. *gonos*, seed, + *kytos*, cell]. The primitive reproductive cell.

gonohemia (go-no-he'mi-ā) [G. *gonē*, semen, + *aima*, blood]. General gonorrhea infection. Syn *gonococcemia*.

gonophage (gon'o-fāj) [" + *phagein*, to eat]. The bacteriophage produced by the gonococcus.

gon'ophore [" + *phorein*, to carry]. Any body that stores up or activates sex cells, as the spermatic duct, seminal vesicle, oviduct, or uterus.

gonorrhea (gon-o-re'ā) [" + *rota*, flow]. A specific, contagious, catarrhal inflammation of the genital mucous membrane of either sex.

Error. Infection by the gonococcus, *Neisseria gonorrhoeae*.

The disease also may affect other structures of the body, such as the conjunctiva, the oral mucosa, the rectum, or the joints. In the female the parts involved may be the urethra, vulva, vulvovaginal glands, vagina, endocervix, Skene's glands, Bartholin's glands, or fallopian tubes.

Sym **Male** Yellow mucopurulent discharge from the penis. Inception in the urethra. May become deep-seated and affect the prostate. Slow, difficult and painful urination, and sometimes rigidity of the penis with great pain.

Female The labia may become red, hot, tender, and inflamed. A sticky, serous exudate may cover the surfaces. Labia may become so swollen as to prevent inspection. Two strawberry points may show just beneath the external meatus, the latter being red and tender. The urethral canal is inflamed, painful micturition and frequency of urination may occur. Thick, creamy or greenish mucopurulent discharge develops shortly after invasion. Later it subsides and if the cervix is involved, becomes mucopurulent, and in final stages, whitish. The positive diagnosis is made by finding the organism on smear. Very commonly the disease is subacute or chronic from its inception, in the female.

Proc It may clear up without serious results, or become chronic (involving deeper tissues and producing urethral stricture), or produce complications (prostatitis, epididymitis, orchitis, cystitis, etc., arthritis and endocarditis). No case of acute gonorrhea should be considered as cured until 3 successive negative smears from the cervix, Bartholin's and Skene's glands are obtained, at least 2 of which should be examined immediately after a menstrual period. Even then the case must be regarded with suspicion.

NP Every precaution for self-protection. Always wash hands after tending patient. Rubber gloves and a gown should be worn. The latter should not be worn in caring for another patient, and gloves should be sterilized after treatment. All linens should be sterilized after using and dressings immediately disposed of. The danger of an infected eye on part of the nurse is very considerable.

PROPHYLAXIS Modern methods include the oral administration of either a single tablet of crystalline penicillin G (250,000 units) or 4 Gm. of sulfadiazine within 6 hours of exposure.

TREATMENT Local measures, including urethral instillations, have largely given way to penicillin therapy. Penicillin is specific, and is regarded as superior to sulfadiazine and other sulfonamides. In the absence of response to adequate administration of penicillin, many venereologists assume that the condition is not gonorrhea but a persistent nonspecific urethritis, requiring local procedures (bladder irrigation, urethral instillation, etc.). Local ther-

apy may be required for eradication of foci of infection in the female, involving such structures as Skene's duct, Bartholin's glands, and the cervix.

Dosage. Penicillin is given in one intramuscular injection of 300,000 units. Another injection may be needed a day later. In therapeutic resistance, streptomycin may be injected in one dose of 0.3 Gm.

RS antibleenorrhagic, arthritis, blennorrhous, clap, gleet, gonococcus, gonotoxemia, rheumatism.

gonorrhe'al [G *gonē*, seed, + *roia*, flow].

Of the nature of or pert to gonorrhea.
g. arthritis, g. rheumatism. Arthritis, or rheumatism resulting from gonorrheal infection.

gonybatia (gōn-i-bā'shī-ā) Walking on the knees, a symptom of certain pathologic conditions.

gonycamp'sis [G *gonu*, knee, + *kampsis*, bending] Abnormal curvature of the knee or ankylosis.

gonycrote'sis [' + *krotēsis*, knocking]. Knock-knee.

gonyectyposis (gon'I-ek-ti-po'sis) [' + *ektypōsis*, displacement]. Bowlegs. **Syn** genu varum.

gonycele (gon'e-o-sēl) [' + *kēlē*, swelling]. Tuberculous synovitis of the knee. **Syn** white swelling.

gonyoncus (gon'I-on'kus) [' + *ogkos*, tumor]. Tumor of the knee. **Syn** white swelling.

gooseberries. A fruit. **Comp** Contain 93% water, also citric acid. Only contain 4% of sugar. **Av. Serving** 100 Gm. **Pro.** 0.8, **Fat** 0.4, **Carbo** 10.1, **Ca** 0.035, **Mg** 0.014, **K** 0.197, **Na** 0.038, **P** 0.031, **S** 0.011, **Fe** 0.005. **Vit B+** to ++, **C+**.

Action. The abundance of seeds and skin may cause irritation of the stomach and intestines. **Ind.** Diabetics may use as there is little sugar. **Ser** fruit.

goose flesh. **Syn** *cutis anserina*. A skin reaction caused by erection of skin papillae from cold or shock due to contraction of the arrector pili muscles.

Gordon's reflex (gord'ōn). Extension of great toe when sudden pressure is made on deep flexor muscles of calf of leg.

gorget (gor'jet) [Fr. *gorge*, throat, because of shape of instrument]. A grooved instrument to protect soft tissues from injury from point of knife.

gouge (gowj). Instrument for cutting away hard tissue of bone.

Goulard's extract (goo'lars). **USP.** An aqueous solution of lead subacetate, containing 18% lead.

Action and Uses. Diluted from 15 to 39 volumes of distilled water, as an astringent in inflammatory conditions of skin, for sprains and bruises.

Incompatibilities. Exposure to air, acacia, albumen.

gout (gowt) [L. *gutta*, drop]. Paroxysmal metabolic disease marked by acute arthritis and inflammation of the great toe and of the joints.

Etiol. Excessive uric acid in blood and deposits of urates of sodium in and around joints.

Sym. Nocturnally painful with swelling and pain around joints.

NP. The painful joints may be wrapped in cotton. They should be elevated and supported on a pillow. The weight of the bedclothes should be carried on a cradle. Hot fomentations may afford some relief. Massage and radiant energy may be employed. Watch for vomiting and purgation resulting from the

use of colchicum. Plentiful liquids should be given and the bowels kept open.

Dierz Milk, diluted fruit juices, and farinaceous foods may be given. The diet, however, should be a light one. Meat should not be given more than once a day. Rich game, kidneys, liver, sweetbreads, and duck are prohibited.

g., abarlicular. G. which involves structures other than the joints.

g., chronic. Persistent form of g.

g., latent, g., masked. Lithemia without regular symptoms of gout.

g., misplaced, g., retrocedent. Subsidence of joint symptoms followed by severe constitutional upsets.

g., poor man's. G. due to exposure and privation.

g., topaceous. G. marked by the development of tophi (deposits of sodium urate) in the joints, the external ear, and about the fingernails.

gout'y [L. *gutta*, drop]. Of the nature of, or rel to, gout.

g. diathesis. Predisposition to gout.

Gowers' tract (gow'erz) One formed of fibers from post. roots of lateral tract of the spinal cord reaching the cerebellum by way of the sup peduncle. The anterior spinocerebellar tract, q.v.

gr. Abbr. for *gram*.

graffian follicle. BNA. A mature, vesicular follicle of the ovary.

Beginning with puberty and continuing until the menopause, except during pregnancy a graffian follicle develops each four weeks. Each follicle contains a nearly mature ovum (an oocyte which upon rupture of the follicle, is discharged from the ovary, a process called ovulation). Ovulation occurs usually about the 13th day of the menstrual cycle, dated from the first day of the preceding menstrual period. Within the ruptured graffian follicle, the corpus luteum develops. Both the follicle and the corpus luteum are glands of internal secretion, the former secreting estrogens, the latter, progesterone.

gracile (gras'il) [L. *gracilis*, delicate] Slender; slight.

g. nucleus. Mass of medullary gray matter terminating the funiculus gracilis.

gracilus. A long slender muscle on the medial aspect of the thigh.

grada'tim [L.]. Gradually or by degrees.

Gradenigo's syndrome (grah-den-e'goz). Suppurative otitis media with abducens paralysis and pain in temporal region.

grad'ient. A slope or grade, an increase or decrease of varying degrees; or the curve which represents such.

g. axial. A gradient of physiological or metabolic activity exhibited by embryos and many adult animals, the principal one of which follows the main axis of the body, being highest at the anterior end and lowest at the posterior end.

graduate (grad'u-āt) [L. *gradus*, a step].

1. A vessel marked by lines for measuring liquids. 2. One who has been awarded an academic or professional degree from a college or university.

grad'uated. Marked by a series of lines indicating degrees of measurement, weight, or volume.

g. tenotomy. Partial surgical division of tendon of an eye muscle.

Graefe's, von, sign (graff'es). Failure of the upper lid to follow a downward movement of the eyeball when the patient changes his vision from upward, downward. Seen in Graves' disease.

graft [L. *graphium*, grafting knife] Skin or other living substance inserted into

Gram Conversion Into Ounces

a similar substance to supply an absence or defect by attachment and growth into an integral part of the original substances.

RS. autograft, skin grafting, transplantation, zoografting.

g., autoplasmic. One taken from another part of the patient.

g., bone. A piece of bone generally taken from the tibia and inserted elsewhere in the body to replace another osseous structure.

Bones for grafting can be kept in ice-box until needed. [other person]

g., heteroplastic. One taken from another person.

g., ovarian. Implantation of a section of an ovary into the muscles of the abdominal wall.

g., skin. Removal of small sections of skin to a raw, clean surface such as a large superficial burn.

g., sponge. Small piece of sponge placed over an ulcerating part to stimulate epidermal growth.

g., Thiersch's. One in which only epidermis and small amt of dermis are used.

g., Wolfe's. One in which the whole thickness of the skin is used. [animal.]

g., zooplastic. One taken from an animal. [*L. granum*].

grain. [*L. granum*]. 1. The seed or seed-like fruit of many members of the grass family, esp. corn, wheat, oats, and other cereals. 2. A weight, 0.065 of a gram. 3. Direction of fibers or layers.

g. poisoning. Poisoning due to a fungus which develops on grain, as ergot. **Gangrenous.** Tingling, pain, spasmodic muscular contractions, blood stasis and gangrene, fingers, toes, nose or ears.

Convulsive. May be similar to gangrenous form followed by nervous disturbance. Headache, slight fever, spasm and cramps of muscles, delirium, epilepsy, dementia.

Treatment: Provoke vomiting; wash out stomach; give a purgative; give an enema; give powdered charcoal freely; give peroxide of hydrogen. Collapse should be fought with external heat; whiskey, strychnine, atropine, etc.

gram. Abbr Gm, gm, g. A unit of weight (mass) of the metric system. It equals approximately the weight of a cubic centimeter or cubic milliliter of water. It is equal to 15.437 grain (Troy).

gramicidin (grām-i-sid'in). An antibiotic obtained from a spore-forming soil bacillus, *B. brevis*. One which is effective against Gram-positive bacteria. It is toxic to animals inducing hemolysis of the blood, consequently its clinical use is restricted principally to topical application.

gramicidin S. An antibiotic related to gramicidin and more effective than gramicidin against *Staph. aureus* and certain species of Gram-negative bacteria.

gram-meter. A unit of work energy equivalent to that expended in raising a weight of 1 gram vertically a height of 1 meter.

gram molecule. The grams of a substance which equal its molecular weight.

Gram-negative organisms will lose the stain and take the color of the counterstain.

Gram-positive organisms will retain the color of the gentian violet stain.

Gram's method. A method for staining bacteria of importance in the identification of bacteria. 1. Prepare a film on a slide, dry and fix with heat. 2. Stain with aniline gentian violet or ammonium oxalate crystal violet. 1 min. 3. Rinse in water, then immerse in Gram's iodine solution for 1 min. 4. Rinse off iodine solution then decolorize in 95% ethyl alcohol or acetone. 5. Counterstain with dilute carbol-fuchsin or safranin, 30 sec. 6. Rinse with water, blot dry, and examine.

Grancher's disease. Massive pneumonia. Syn: *splenopneumonia*.

G.'s sign. Raised pitch of expiratory murmur in pulmonary consolidation.

grand mal (grahn mal) [Fr. great evil]. The typical epileptic attack with or without coma.

gran'ular [*L. granulum*, little grain]. Of the nature of granules. Roughened by prominences like those of seeds.

g. cast. Coarse or fine granule, short and plump, sometimes yellowish, similar to hyaline cast.

Soluble in acetic acid. Seen in inflammatory and degenerative nephropathies. See: *cast*.

granulation [L. *granulum*, little grain]. 1. Formation of granules, or state or condition of being granular. 2. Fleishy projections formed on the surface of a gaping wound that is not healing by first intention* or indirect union.

Each granulation represents the outgrowth of new capillaries by budding from the existing capillaries and then joining up into capillary loops supported by cells which will later become fibrous scar tissue. Granulations bring a rich blood supply to the healing surface.

Os When the umbilical cord separates by wet gangrene there is left a raw area and granulation tissue is formed to heal it. If these granulations are left unchecked they will grow beyond the edge of the navel and form an umbilical polypus which is really an exuberant mass of granulation tissue.

g. arachnoidal. Syn: *Pachionian bodies, arachnoid villi*. Villus-like projections of the subarachnoid layer of the meninges which project into the superior sagittal sinus and other venous sinuses of the brain. Through them cerebrospinal fluid reenters the blood stream.

g. exuberant. An excessive mass of granulation-tissue formed in the healing of a wound or ulcer, proud flesh.

granule [L. *granulum*, little grain]. 1. A small, granlike body. 2. In histology (a) A minute mass in a cell, which has an outline, but no apparent structure; (b) any minute mass; (c) the crossing points of an intracellular reticulum endwise. 3. In pharmacy, a small globule of sugar and gum tragacanth, combined with a medicinal substance. See: *chondroconia, chromomere*.

g., acidophil. One which stains with an acid stain such as eosin. Found in eosinophils of the blood and alpha cells of ant. lobe of hypophysis.

g., agminated. Small round or angular particle of disintegrated red blood corpuscle in the blood.

g., albuminous. Cytoplasmic granule in many normal cells, not affected by ether or chloroform, but disappears from view when acetic acid is added.

g., aleuronoid. Pigment cell g., colorless, myeloid, and colloidal.

g., alpha. Albuminous g. in leukocytes. Coarse, eosinophil, and highly refractive. Syn: *eosinophil g., oxyphil g.*

g., Altmann's. Mitochondria, q.v.

g., amphophil. One which stains with both acid and basic dyes; beta granule q.v.

g., azurophil. One which takes a stain with azure dyes easily. Found in lymphocytes; and monocytes, small and red or reddish-purple in color; they are inconstant in number being present in about 30% of the cells.

g., basal. Syn: *blepharoplast, q.v.* A small deeply staining granule found in certain protozoa from which the flagellum arises.

g., beta. An azurophil granule found in beta cells of the hypophysis or Islets of Langerhans of the pancreas.

g., chromophil. A granule of chromophil substance present in the cytoplasm of neurons; Nissel granules.

g., chromatin. Small masses of deeply staining substance suspended within the

meshes of the linin network of the nucleus of a cell.

q's cone. The nuclei of the cones, sensory cells of the retina. They form the outer zone of the outer nuclear layer of the retina.

g., delta. Small granules in the delta cells of the pancreas.

g., eosinophil. Acidophil granules, q.v. alpha granules.

g., glycogen. Minute particles of glycogen seen in liver cells following fixation.

g., Grawitz's. Found in lead poisoning basophilia, in the red blood corpuscles.

g., iodophil. Found in polymorphonuclear leukocytes and staining easily with iodine. Seen in various acute infectious diseases.

g., Kölliker's interstitial. Appears in various sizes in muscle fiber sarcoplasm.

g., metachromatic. Found in protoplasm of numerous bacteria. Stains deeply, irregular in size. Syn: *Babes-Ernst body, metachromatic body*.

g., Much's. Rod found in sputum of tuberculosis which stains with Gram stain, considered to be a modified tubercle bacillus.

g., neutrophil. Granules such as those found in neutrophil leukocytes which stain with both basic and acid dyes, assuming a neutral tint.

g., Nissel. Chromophil granules found in the cell bodies of neurons, Nissel bodies.

g., oxyphil. See: *alpha g.*

g., pigment. Particle of coloring matter seen esp. in pigment cells.

g., Plehn's. Basophilic and seen in conjugating form of *Plasmodium vivax*.

g., protein. Anabolic and catabolic particles of minute size in various proteins.

g., rod. Nucleus of the rod visual cell found in the external nuclear layer of the retina, connected with the rods.

g., Schüffner's. Polychrome methylene blue-staining g. found in parasitized erythrocytes of tertian malaria; coarse and red.

g., secretory. Zymogen granules, q.v.

g., seminal. Minute particles in semen, supposed to derive from disintegrated nuclei in nutritive cells from seminiferous tubules.

g., vitelline. See: *yolk g.*

g., yolk. Minute particles of fatty and albuminous nutritive substances present in the yolk (deutoplasm) of ova.

g., zymogen. Granules present in gland cells esp. secretory cells of pancreas, chief cells of the gastric glands, and serous cells of the salivary glands. They are the precursors of the enzymes secreted.

granulitis (gran-u-lit'is) [L. *granulum*, little grain, + G. -itis, inflammation]. Acute miliary tuberculosis.

granuloblast [L. *granulum*, + G. *blastos*, germ]. Mother cell of a granulocyte.

A myeloblast, found in bone marrow.

granulocyte (gran-u-lō-sit) [L. *granulum*, little grain, G. *kytos*, cell]. A granular leukocyte. A polymorphonuclear leukocyte (neutrophil, eosinophil, or basophil).

granulocytopenia (gran'u-lo-sit'to-pe-ni-ā) [" + " + *penia*, poverty]. Abnormal reduction of granulocytes in the blood. Syn: *granulopenia*.

granulocytopenia (gran'u-lo-sit'to-poi-e-sis) [" + " + *poien*, to form]. The formation of granulocytes.

granulo'ma [L. *granulum*, + G. *oma*, tumor]. A granular tumor or growth, usually of lymphoid and epithelioid cells. They occur in various diseases such as leprosy, cutaneous leishmaniasis, yaws, and syphilis.

g., apical. Dental granuloma, *q.v.*

g., annulare. A condition of the skin characterized by development of reddish nodules arranged in the form of a circle.

g., coccidioidal. A chronic, generalized granulomatous disease caused by *Coccidioides immitis*. See *Coccidioidomycosis*.

g., dental. G. developing at the root of a tooth. May contain epithelial rests or colonies of bacteria.

g., eosinophilic. G. containing eosinophils and usually accompanied by eosinophilia.

g., fungoides. *Mycosis fungoides, q.v.*

Spirochaetes—All Species

Genus	Species	Colloquial or Old Names	Disease Caused in Man
<i>Pfeifferella</i>	<i>Pf. mallei.</i>	Bacillus mallei, or the glanders bacillus	Glanders
<i>Pseudomonas</i>	<i>Ps. pyocyanea.</i>	Bacillus pyocyaneus.	Suppuration ("blue pus").
<i>Vibrio</i>	<i>Vib. cholerae.</i>	Comma bacillus	Cholera.
<i>Neisseria</i>	<i>N. meningitidis.</i>	Meningococcus.	Cerebrospinal meningitis.
	<i>N. gonorrhoeae.</i>	Gonococcus.	Gonorrhea.
	<i>N. catarrhalis.</i>	Micrococcus catarrhalis.	Nasopharyngeal catarrh.
<i>Proteus</i>	<i>Pr. vulgaris.</i>	Bact. proteus vulgaris	Suppuration.
<i>Escherichia</i>	<i>E. coli</i>	Bacillus coli.	Occasionally suppuration, cystitis and pyelitis
<i>Klebsiella</i>	<i>K. pneumoniae</i>	Pneumobacillus or bacillus mucosus capsulatus	Occasionally pneumonia.
<i>Eberthella</i>	<i>E. typhosa</i>	Typhoid bacillus.	°Rhinoscleroma. Typhoid fever.
<i>Salmonella</i>	<i>S. paratyphosum (A&B)</i>	Bacillus paratyphosus, etc (Salmonella group)	Paratyphoid fever, gastroenteritis (food poisoning).
<i>Salmonella</i>	<i>S. enteritidis</i>		
<i>Salmonella</i>	<i>S. aertrycke</i>		
<i>Shigella</i>	<i>S. dysenteriae</i>	The dysentery bacilli.	Bacillary dysentery.
<i>Pasteurella</i>	<i>Past. pestis.</i>	Bacillus pestis	Plague
<i>Haemophilus</i>	<i>H. influenzae.</i>	Pfeiffer's bacillus	Catarrhal inflammation (°Influenza).
	<i>H. pertussis.</i>	Bordet-Gengou bacillus.	Whooping cough.
<i>Brucella</i>	<i>Br. melitensis.</i>	Micrococcus melitensis	Mediterranean fever.
<i>Spirochaete</i>	<i>Br. abortus.</i>	Bacillus abortus of Bang.	Undulant fever.
<i>Spirochaetes</i>	All species.		Syphilis, ictero-hemorrhagic jaundice, etc.

The Chief Gram-positive Bacteria

Genus	Species	Colloquial or Old Names	Disease Caused in Man
<i>Actinomyces</i>	<i>Actino. bovis.</i>	Streptothrix actinomyces, ray-fungus.	Actinomycosis.
<i>Mycobacterium</i>	<i>Myco. tuberculosis.</i>	Tubercle bacillus.	Tuberculosis.
	<i>Myco. leprae.</i>	Leprosy bacillus.	Leprosy
<i>Corynebacterium</i>	<i>C. diphtheriae.</i>	Diphtheria bacillus.	Diphtheria
	<i>C. hojmannii, C. xerosis, etc.</i>	Diphtheroid bacilli	Nonpathogenic.
<i>Streptococcus</i>	<i>Str. pneumoniae.</i>	Pneumococcus	Lobar pneumonia, peritonitis, etc
	<i>Str. pyogenes.</i>		Suppuration, scarlet fever, septicemia.
	<i>Str. viridans.</i>		Endocarditis.
<i>Staphylococcus</i>	<i>Staph. aureus, albus, etc.</i>		Suppuration, pyemia, osteomyelitis.
<i>Micrococcus</i>	<i>M. tetragenus.</i>		Rarely suppuration.
<i>Sarcina</i>	<i>Sarcina lutea.</i>		Rarely suppuration.
<i>Bacillus</i>	<i>B. anthracis</i>	Anthrax bacillus.	Anthrax.
	<i>B. subtilis.</i>	Hay bacillus.	Nonpathogenic.
	<i>Cl. tetani.</i>	Tetanus bacillus	Tetanus.
<i>Clostridium</i>	<i>Cl. botulinum.</i>	Bacillus botulinus.	Botulism.
	<i>Cl. welchii.</i>	Bact. aerogenes capsulatus.	Gas gangrene.

g., infectious. Any infectious disease in which granulomas are formed, such as tuberculosis or syphilis. Granulomas are also formed in mycoses, protozoan infections, and in certain metazoal diseases.

g., inguinale. A granulomatous disease common in the tropics caused by Donovan bodies (*Leishmania donovani*). Characterized by purulent lesions of the skin in region of the groin and often involving external genitalia.

g., iridis. G. which develops on the iris.

g., malignant. Lymphogranulomatosis; Hodgkin's disease.

g., pyogenicum. G. containing pyogenic organisms, which develop at the site of a wound. They may also occur at the tip of the fingers along the sides of the nails or beneath the free edge of the nail. They bleed easily and are usually painful to touch. Also called *septic granuloma*.

g., venereal. Lymphogranuloma venereum, *q.v.*

granulomato'sis [L. *granulum*, little grain, + G. *ōma*, tumor, + *-ōsis*]. The development of multiple granulomas.

g. siderot'ica. Brownish (Gamna) nodules in the enlarged spleen.

granulope'nia [' + G. *penia*, poverty]. Abnormal decrease of granulocytes in the blood. SYN *granulocytopenia*.

granuloplastic (gran'u-lo-plas'tik) [' + G. *plassein*, to form]. Developing granules.

granulopoiesis (gran'u-lo-poi-e'sis) [' + G. *poiein*, to make]. The formation of granulocytes.

granulopo'tent [' + *potentia*, power]. Potentially capable of forming granules.

granulosa. The membrana granulosa, *q.v.*

gran'ulose [' + G. *ōsis*]. The soluble portion of starch.

It is converted into sugar by hydrolysis.

gran'ulosis [' + G. *ōsis*]. A mass of minute granules.

g. ru'bia na'si. Disease of the skin of the nose.

ERROS. Inflammatory infiltration about nose with slightly elevated papules, and dilated sweat glands.

SYM. Moist erythematous patch on numerous macules.

grape'fruit. A citrus fruit. AV. SERVING 100 Gm. Pro 0.5, Fat 0.2, Carbo. 10.0. MINERALS Ca 0.021, Mg 0.009, K 0.161, Na 0.004, P 0.020, Cl 0.005, S 0.010, Fe 0.0003. Vit. A+, B++, C+ + +, G+ + +.

g. juice. AV. SERVING 120 Gm. Pro. 0.6, Fat 0.2, Carbo. 15.2. MINERALS Ca 0.011, Mg 0.009, K 0.106, Na 0.005, P 0.011, Cl 0.002, S 0.009, Fe 0.0003. Vit. A+, B+ +, C+ +, G+. SEE *fruit*.

grapes [Fr. *grappe*, a cluster]. COMP: Contain acid potassium tartrate. Acidity decreases with the age of the grape and sugar increases. The sugar is nearly all glucose and is more abundant than in any other fruit. Mannite, dulcitol, and saccharose also represented. Raisins contain more sugar and less water.

AV. SERVING (Concord): 100 Gm. Pro. 1.4, Fat 1.4, Carbo. 14.9. MINERALS Ca 0.019, Mg 0.010, K 0.197, Na 0.015, P 0.031, Cl 0.005, S 0.024, Fe 0.0003. Vit. A+, B+ to + +, C+ to + +, G+.

grape sugar. Dextrose.

-graph [G.]. Suffix: Pert. to a writing or treatise.

graph [G.]. A presentation of statistical, clinical, or experimental data by dots and lines.

graphes'the'sia. The sense by which outlines, numbers, words, or symbols traced or written upon the skin are recognized.

graphite (graf'it) [G. *graphein*, to write]. A soft form of carbon. SYN: *plumbago*.

grapho- [G.]. Prefix: To write.

graphology (graf-o'l'o-jī) [G. *graphein*, to write, + *logos*, study]. Examination of handwriting in diseases of the nerves as a means of diagnosis.

graphomotor. Pertaining to movements involved in writing.

graphophobia. Abnormal fear of writing.

graphorrhea (graf-o-re'hā) [' + *roia*, flow]. Writing of many meaningless words and phrases, manifested in dementia praecox.

graphospasm (graf'o-spazm) [' + *spasmos*, spasm]. Writer's cramp.

grat'tage (grat-ahzh') [Fr. a scraping]. Removal of morbid growths by rubbing with a brush or harsh sponge.

grave [L. *gravis*, heavy]. Serious, dangerous; severe.

g. wax. Waxlike matter on flesh caused by exposure to moisture with exclusion of air, as a body in the water or underground. SYN *adipocere*.

gravel [Fr. *gravelle*, coarse sand]. Crystalline dust, or concretions of crystals from the kidneys, distinguished from true calculi by the absence of definite structural arrangement.

Generally made up of phosphates, calcium, oxalate, and uric acid.

gravolent (grav'e-o-lent) [L. *gravis*, heavy, + *clere*, to smell]. Fetid, having an unpleasant, strong odor.

Graves' disease. Exophthalmic goiter. SEE *Mobius' sign*.

gravid (grav'id) [L. *gravidā*, pregnant]. Pregnant; heavy with child.

gravidā (grav'id-ā) [L.]. A pregnant woman.

grav'idin [L. *gravidā*, pregnant]. A substance on surface of standing urine, once considered a sign of pregnancy in women. SYN *kyestein*.

grav'idism [' + G. *ismos*, state of]. State of being pregnant.

grav'idity [L. *gravidā*, pregnant]. Pregnancy.

gravidocardiac (grav'id-o-kar'di-ak) [' + G. *kardia*, heart]. Pert. to cardiac disorders resulting from pregnancy.

gravimetric [L. *gravis*, weight, + G. *metron*, measure]. Determined by weight.

g. method. Examination of blood by weighing.

gravistatic (grav-is-tat'ik) [' + G. *statikos*, standing]. Resulting from gravitation, as in a form of congestion.

gravita'tion [L. *gravis*, weight]. Force and movement tending to draw every particle of matter together.

grav'ity [L. *gravitas*, weight]. Property of possessing weight.

g., specific. Weight of a substance compared with that of water, air, or hydrogen.

gravocaine (grav'o-kān). Spinal anesthetic mixture used in obstetrics.

gray [A.S. *græy*]. Black or brown mixed with white.

g. matter. Nervous tissue of a grayish color, in which myelinated nerve fibers do not predominate. It contains large numbers of cell-bodies of neurons, also called *substantia grisea*.

The term is generally applied to gray portions of the central nervous system, which include the cerebral cortex, basal ganglia, and nuclei of the brain and the gray columns of the spinal cord which form an H-shaped region surrounded

by white matter. Sympathetic ganglia and nerves may also be gray.

gray powder. USP. Mercury with chalk, containing about 36% mercury.

Usage. Most frequently as a cathartic for children, sometimes as an alternative.

green. A color intermediate bet blue and yellow, afforded by rays of wave length bet. 0 000491 and 0 000535 mm. SEE "chloro-" words.

g. blindness. *Glauropsia*, a type of color-blindness in which green colors cannot be distinguished

g. sickness. A form of anemia in adolescent girls, perhaps due to faulty diet during puberty. SYN *chlorosis*.

g. soap. A solution of soft soap in alcohol, molded and dried

g. softening. Cranial abscess with pus of a greenish hue.

g. vitriol. Ferrous sulfate. SYN: *copperas*.

greenstick fracture. One involving only part of the thickness of a bone. SEE: *incomplete fracture*.

greffotome (grêf-o-tôm) [Fr *greffe*, graft, + *G tomé*, incision]. Instrument for making tissue grafts.

grenz rays. Roentgen rays with an average wave length of 2 angstroms. SEE: *ray*.

griffe des orteils (grêf daz or-ta') [Fr.]. Muscular atrophy of foot with contraction SYN. *clawfoot*.

grinder (grin'der) (A.S. *grindan*, to gnash). A molar tooth. SYN: *dens molaris*.

grinders' disease. An asthma due to dust inhalation. SYN *siderosis*.

grip, gripe (grip) [Fr. *gripper*, to seize]. Acute, infectious disease marked by fever, prostration, pains in head and back, and by catarrh of respiratory tract. SYN: *influenza*, *q.v.*

gripes (grips) (A.S. *gripan*, to grasp). Intermittent severe pains in bowels. SYN: *colic*, *tormenta*, *q.v.*

grippotoxin (grip-po-tox'in) [Fr. *gripper*, to seize, + *G toxikon*, poison]. The toxin of the influenza bacillus

griseofulvin. An antifungal antibiotic for oral administration

gris'tle (A.S.). Cartilage.

gro'cers' itch. Eczema or psoriasis of the hands due to irritation from handling flour, sugar, etc.

Groff electrosurgical knife. Device for use of cutting current.

groin (A.S. *grynde*, abyss) The depression between the thigh and trunk. The inguinal region. SEE *bubonalgia*, *venereal bubo*.

groove (Danish *groeve*, to dig). A furrow or elongated channel. SYN *sulcus*.

g., bicipital. SYN: *intertubercular groove* Depression for long tendon of the triceps located on ant. surface of humerus.

g., branchial. In the embryo, a groove lined with ectoderm which lies between two branchial arches SEE *branchial groove* and *branchial arches*.

g., carotid. SYN: *cavernous g.* A broad groove on the inner surface of the sphenoid bone lateral to the body. It lodges the carotid artery and the cavernous sinus

g., costal. SYN *subcostal groove*. A groove in the lower internal border of a rib. It lodges the intercostal vessels and nerve

g., costovertebral. SYN: *vertebral g.* A broad groove extending along each side of the vertebrae. It lodges the sacrospinalis muscle and its subdivisions.

g., infraorbital. A groove on the orbital surface of the maxilla which transmits the infraorbital vessels and nerve.

g., intertubercular. The bicipital groove. *q.v.*

g., labial. A groove which develops in each of the primitive jaws. It gives rise to the vestibule separating the lips from the gums

g., lacrimal. 1 A groove on post surface of frontal process of the maxilla 2 A groove on ant. surface of the post lacrimal crest of the lacrimal bone The two grooves serve to lodge the lacrimal sac

g., laryngo-tracheal. A groove along the ventral surface of the ant. portion of the embryonic gut which gives rise to the respiratory organs

g., malleolar. G. on ant. surface of distal end of tibia which lodges tendons of the tibialis posterior and flexor digitorum longus muscles

g., medullary. Neural groove. *q.v.*

g., musculospiral. The radial groove, *q.v.*

g., mylohyoid. G. on inner surface of the mandible which runs obliquely forward and downward lodging the mylohyoid nerve and artery In the embryo it lodges Meckel's cartilage

g., nasolacrimal. In the embryo, a g. extending from inner angle of the eye to the primitive olfactory sac It separates the maxillary and lateral nasal processes and its epithelial lining gives rise to the nasolacrimal duct

g., nasopalatine. G. on vomer lodging nasopalatine nerve and vessels

g., neural. A longitudinal g. on dorsal surface of the embryo lying between the neural folds Upon closure of the folds to form the neural tube, the groove becoming the cavity of the neural tube eventually giving rise to the ventricles of the brain and the central canal of the spinal cord.

g., obturator. A g. at the sup and post. angle of the obturator foramen through which pass the obturator vessels and nerve

g., olfactory. A shallow g. on sup. surface of cribriform plate of the ethmoid on each side of the crista galli. It lodges the olfactory bulb.

g., palatine. One of a number of grooves on the inferior surface of the palatine process of the maxilla They lodge the palatine vessels and nerves

g., peroneal. 1 A shallow groove on lateral aspect of the calcaneus 2 A deep groove on inferior surface of the cuboid bone. Each transmits the tendon of the peroneus longus muscle.

g., pharyngeal. A branchial groove, *q.v.*

g., primitive. In the embryo, a shallow groove in the primitive streak of the blastoderm and bordered by the primitive folds

g., pterygopalatine. The pterygopalatine sulcus. A groove on the maxillary surface of the perpendicular portion of the palatine bone which, with corresponding grooves on the maxilla and pterygoid process of the sphenoid, transmits the palatine nerve and descending palatine artery.

g., radial. The musculospiral groove; a broad shallow groove running in a spiral direction on post. surface of the humerus. It transmits radial nerve and the profunda brachii artery.

g., rhombic. One of seven transverse grooves in the floor of the developing rhombencephalon. They separate the neuromeres.

g., sagittal. The sagittal sulcus; a shallow groove on inner surface of the parietal bones which lodges the sup. sagittal sinus.

g., sigmoid. G. on inner surface of the mastoid portion of temporal bone. It transmits the transverse sinus.

g., subcostal. SEE: *costal groove*.

g., tympanic. A g. at the bottom of the ext. auditory meatus which receives the inferior portion of the tympanic membrane.

g., urethral. A g. on caudal surface of the genital tubercle or phallus bordered by the urethral folds. The latter close transforming the groove into the cavernous urethra.

g., vertebral. SEE: *costovertebral groove*.

g., visceral. A branchial groove, *q.v.* **gross** [*L. grossus*, thick]. Not minute, in mass.

g., anatomy. That of organs and parts seen without the aid of a microscope.

g., lesion. One visible to the eye without the aid of a microscope.

Grothuss, law of. Light is absorbed when its wave length is in resonance with the atoms on which it falls.

ground. Basic substance or foundation; reduced to a powder, pulverized.

g. bundle. Fasciculus proprius, a bundle of nerve fibers which immediately surrounds the gray matter of the spinal cord. It is divided into three regions, the anterior, lateral, and posterior bundles which lie in the corresponding funiculi. These consist principally of short descending fibers.

g. itch. Ancylostomiasis cutis. Inflammation of the skin resulting from the invasion of the larvae of hookworms (*Ancylostoma* or *Necator*).

g. substance. SYN: *matrix, interstitial substance*. The material, fluid, semifluid, or solid which occupies the intercellular spaces in fibrous connective tissue, cartilage, or bone.

group'ing [*It. gruppo*, bunch]. Classification.

g., blood. Classifying blood of different individuals according to agglutinating and hemolyzing qualities before making a blood transfusion.

Human blood has been divided into 4 groups, and the blood of a patient must be compatible with that of the donor. The blood of one belonging to *Group I* may not be given to any patient not belonging to that group, although a donor belonging to *Group II* may give blood to one belonging to *Groups I* or *II*. One belonging to *Group III* may give to *Group II* or *III*, and one belonging to *Group IV* may give to those belonging to any of the 4 groups. SEE: *blood, transfusion*.

g. serum. A serum used for determining the blood group to which unknown cells belong. The grouping sera commonly used are human sera secured from donors and rabbit anti-sera prepared commercially.

growing pains. Pains in the limbs of young persons, probably rheumatic.

growth [*A.S. grōwan*, to grow]. The development or increase in size of a living thing, as cyst, excrescence, tumor, benign or malignant.

Methods of growth. 1. By the synthesis of new protoplasm and multiplication of cells. 2. By the intake of water. 3. By the manufacture and deposition of nonliving substances either within or outside of cells.

There are 4 main types of growth:

1. Organs of the *lymphoid* type, such as the thymus and the lymph nodes, grow fastest early in life, reach their peak of development at the age of about 12, and then regress.

2. The *neural* type of organ, such as the brain, cord, eye, and meninges, grows definitely in childhood, but is close to its adult size by the age of 8 years. This size is maintained without regression.

3. The *general* type of growth is seen in the weight of the body, the height of the body, and lengths of various bones, the total weight of the muscles, and various internal organs. It is a slower and steadier growth than the first two, but has a marked acceleration at the time of puberty.

4. The *genital* type of growth is seen in the testes, ovaries, and other genitourinary structures. Their growth is the slowest of these 4 types in infancy, but at puberty they grow faster than the others and cause the striking changes in appearance noted in the reproductive organs.

Not all of the organs of the body are included in the above 4 types. Some structures, such as the mammary glands, have several cycles of growth and regression in a lifetime, and many other peculiarities of particular organs might be mentioned.

gru'el [*L. grutum*, meal]. Any cereal boiled in water.

gru'mose, gru'mous [*L. grumus*, heap]. 1. BACT. Made up of coarse granular bodies in the center. 2. Lumpy, clotted.

Grunfelder's reflex (*grün'feld-ër*). Fanlike spreading of toes with upward flexion of great toe resulting from pressure over post fontanel.

grutum (*gru'tum*) [*L. meal*]. 1 Small pink and white patches most frequently on skin of face and scrotum caused by inspissated sebum beneath the horny epidermis. SYN: *nitum*. 2 Oaten grits.

gtt. Abbr. of *guttae*, drops.

gualacol (*gwí'ak-ol*). USP. A phenol obtained from wood creosote.

ACTION AND USES. Antiseptic and germicide, intestinal antiseptic and expectorant.

DOSEAGE: 8 m (0.5 cc).

g. carbonate. USP. A white crystalline powder used internally as a tasteless, nonpoisonous substitute for *gualacol*.

DOSEAGE: 15 gr. (1 Gm.).

INCOMPATIBILITIES. Alkali hydroxides, chloral hydrate.

guanase (*gwan'ás*). An enzyme in a number of glands; it converts guanine into xanthine.

guanidine (*gwan'id-in*). A crystalline organic compound, $\text{NH}_2\text{C}(\text{NH}_2)_2$, found among the decomposition products of proteins.

guanidinemia (*gwan'id-ën-e'mí-ä*) [*guanidine* + *G. aima*, blood]. Guanidine in the blood.

guanine (*gwah'nín*). An organic compound, $\text{C}_4\text{H}_5\text{N}_3\text{O}_2$, which can be extracted from guano and is related to guanidine and xanthine. It is also found in the liver, pancreas, and muscle.

gua'va. Fruit of the guava tree. Av. SERVING: 15 Gm. Pro. 0.2. Fat 0.1. Carbo. 26. MINERALS: Ca 0.014, Mg 0.008, K 0.384, P 0.030, Cl 0.045. No sodium, sulfur, or iron.

gubernaculum (*gu-ber-nak'u-lum*) [*L. helm*]. A structure which guides; a cordlike structure uniting two structures.

g., dentis. A connective tissue band which connects the tooth sac of an unerupted tooth with the overlying gum.

g., testis. A fibrous cord in the fetus which extends from the caudal end of the testis through the inguinal canal to the scrotal swelling. It plays a role in the descent of the testis into the scrotum.

Gubler's line (goo'b'lerz). The level of superficial origin of the trigeminus or 5th nerve.

G.'s paralysis. Hemiplegia affecting parts on opposite sides of the body. **SYN.** *alternate or crossed hemiplegia.*

G.'s tumor. A fusiform swelling on wrist in lead palsy.

Gudden's inferior commissure (good'enz in-fe'ri-or com'mis-sure). Fibers of optic tract. **SYN.** *arcuate c.*

G.'s law. Lesions of the cerebral cortex are not responsible for lesions of peripheral nerves.

guillotine (gil'o-tén) [Fr. instrument for beheading]. Instrument for excising tonsils and laryngeal growths.

Guinea worm. *Dracunculus medinensis*, *q. v.*

gul'let [L. *gula*, throat]. The esophagus, *q. v.*

Gull's disease. Atrophy of the thyroid gland and resulting myxedema.

gum (L. *gummi*). 1 The fleshy substance or tissue covering the alveolar processes of the jaws. 2 **SYN.** *gingiva.* A substance which is given out or extracted from certain plants which is sticky when moist but hardens upon drying. Roughly any resinlike substance given out by plants.

DIAG. *Bleeding Easily* Indicates scurvy, excess of salt in the diet, and lack of vegetable acids, or inflammation, as in trench mouth or pyorrhea, etc.

Bluish Red Indicates mercurial stomatitis or lead poisoning, if bluish line is at edge of teeth.

Greenish Line At edge of teeth, may indicate copper poisoning.

Purplish Line or Color Scurvy.

Red Line In youth, indicates gingivitis, pyorrhea, scurvy.

Spongy g., and Ulceration Gingivitis, scurvy, stomatitis, leukemia, tuberculous, diabetes, and digestive disturbances. **RS.** *diagnosis, gingiva, otorrhagia, uatropia, uatrorrhagia, uleic, ulitis, uloglossitis, uloncus, ulorrhoea.*

gumboll (gum'boyl) Gum abscess.

Ernot. Subperiosteal infection associated with a carious tooth, irritation or injury by a denture.

SYM. Gum is red, swollen, tender, and very painful. A fluctuating swelling may appear containing pus. It may point and break or require incision.

TREATMENT. Hot mouthwashes and applications over gum or externally. Warn patient not to swallow pus. Frequent mouthwashes after being evacuated. **SEE.** *gum.*

gumma (gum'mä) [L. *gummi*, gum]. A soft tumor of the tissues characteristic of the tertiary stage of syphilis. It is a granuloma varying in size from a millimeter to a centimeter or more in diameter. They may be single or multiple, and tend to be encapsulated. Each consists of a central necrotic mass surrounded by an inflammatory zone and fibrosis. The necrotic portion may be firm or elastic, gelatinous or hyalinized. Infectious organisms may be present. They occur most frequently in the liver but may occur in other organs such as the brain, testis, heart, bone, and skin.

SYM. Depend upon location. Bursting of a gumma leads to a gummatous ulcer, painless, but slow to heal. The base is formed by a "wash-leather"

slough but surrounding tissues are healthy. **SEE.** *syphilis.*

gummoses (gum'ös). A sugar from animal gum. $C_{12}H_{22}O_{11}$.

gum'my [L. *gummi*, gum]. Sticky, swollen, puffy.

gun'shot wound. Penetrating or perforating wound which may contain a foreign body, as a bullet. **SEE.** *wound.*

gun'stock deform'ity. Deformity in which the long axis of the extended forearm turns outwardly from the arm, caused by fracture at the elbow.

gustation (gus-ta'shun) [L. *gustare*, to taste]. Sense of taste.

gustatory (gus'tat-o-ri) [L. *gustare*, to taste]. Pert to sense of taste.

gustom'etry [' + G. *metron*, measure]. Measurement of the degree of the sense of taste.

gut (A.S.). 1. The bowel or intestine. 2. The primitive gut or embryonic digestive tube which includes the fore-gut, mid-gut, and hind-gut. 3. Short term for catgut.

g., blind. Cecum.

gut'ta [L. a drop]. A drop. The amount in a drop varies with the nature of the liquid, being about a minim of water.

g. rosacea. Chronic inflammation of skin of face and nose. **SYN.** *acne rosacea.*

g. serena. Blindness. **SEE.** *amaurosis.*

guttadiaphot test (gut-ä-dí-ä-föt) [L. a drop]. A test for detecting pathological conditions of the blood. Consists of examining by transmitted light strips of red, green, and blue absorbent paper upon which two drops of blood have been placed.

gut'tate [L. *gutta*, drop]. Resembling a drop, said of certain cutaneous lesions.

gut'ta'tim [L.]. Drop by drop.

gut'tur [L.]. The throat.

guttural (gut'u-ral) [L. *guttur*, throat]. Pert. to the throat.

gutturotet'any [' + G. *tetanos*, tension]. Laryngeal spasm of throat with temporary stutter.

Guyon's sign (gwy-onz'). Ballottement of kidney.

Gwath'mey's method or technic. Adm of rectal anesthetic of ether and olive oil solution in labor. **SEE.** *anesthesia.*

gymnas'tics [G. *gymnastikos*, pert. to nakedness]. Systematic bodily exercise, esp. in a gymnasium.

g., ocular. Systematic exercise of the eye muscles to improve muscular coordination and efficiency.

g., Swedish. A system of movements made by a patient against a resistance provided by the attendant.

gymnophobia (jim-no-fö-bl-ä) [' + *phobos*, fear]. Abnormal aversion to viewing a naked body.

gynander (jin-an'der) [G. *gynē*, woman, — *andr.* andr- man]. A gynandromorph, *q. v.* A pseudohermaphrodite, an individual possessing both male and female characteristics.

gynandroid (ji-nan'droyd) [' + *andros*, form]. A female having sufficient hermaphrodite sexual characteristics to be mistaken for a man.

gynandromorph. **SYN.** *gynander.* An individual in which certain parts of the organism are male and certain parts female, if bilateral, one half of the body shows male characteristics and the other half female. Occurs commonly in insects but is sometimes seen in vertebrates.

gynandromorphous (jin-an-dro-mor'fus) [' + *andros*, form]. Having the characteristics of both the male and female.

gynandry (jī-nan'drī) [G *gynē*, woman, + *andr*, andr- man]. Condition of pseudohermaphroditism.

gynatresia (jīn-a-tre'zī-ā) [" + *a-*, priv + *trēsīs*, perforation] Atresia* of the vagina.

gynecic (jīn-e'sik) [G *gynē*, woman]. Pert. to women.

gyneco-, gyno- [G.] Prefix meaning woman, female.

gynecologic, gynecological (jīn-e-ko-lo'jīk, -jī-kal, jīn-e-) [G *gynē*, woman, + *logos*, study] Pert. to gynecology, or study of women's diseases.

gynecologist (jīn-e-ko-lo'jīst, jīn-e-ko-lo'jīst) [" + *logos*, study] Physician who specializes in the diseases of women.

gynecology (jīn-e-ko-lo'jī, jīn-e-ko-lo'jī) [" + *logos*, study] The study of the diseases of the female, particularly of the genital, urinary or rectal organs.

NP *Procræpative* Empty bladder. Local preparation from nipple to anus. *Postoperative* Count and chart pulse every 15 minutes for first few hours. Report immediately any change in rate or volume. Watch for shock or internal hemorrhage. Keep warm and quiet, no visitors. Fluids when tolerated, tap water being best. Hypodermoclysis or infusions in excessive vomiting instead of fluids by mouth. Harris drip for distention and inability to void.

Patient catheterized every 12 hours after operation, then every 8 hours until able to void. Catheterization after voiding to prevent retention, until less than ½ oz urine is thus obtained after 2 successive voidings. An 80% solution silver nitrate instilled after each catheterization. Thrombophlebitis with embolism is a dreaded complication.

gynecomania (jīn-e-ko-ma'nī-ā, jīn-e-) [" + *mania*, madness] Abnormal sex desire in the male. SYN *satyriasis*, *g.v.*

gynecomastia, gynecomasty, gynecomazia (jī-ne-ko-mas'tī-ā, -tī, -ma'zī-ā) [" + *mastos*, *mazos*, breast]. Abnormally large mammary glands in the male, sometimes may secrete milk.

gynecopathy (jī-ne-kop'ā-thī) [G. *gynē*, woman, + *pathos*, disease] Diseases peculiar to women.

gynecophonus (jīn-e-ko'f-on-us) [" + *phōnē*, voice] Having an effeminate voice.

gynophobia (jīn-e-to'fī-ā) [" + *phobos*, fear]. Abnormal aversion to the company of women, or fear of them.

gynergen (ī'ner-jēn) [" + *ergon*, work]. Known as *ergotamine tartrate*, is a salt of one of the alkaloids of ergot.

Uses* As a uterine stimulant and in migraine.

Dosage* For oral use, 1/60 gr. (0.001 Gm.). Hypodermically, 1/240 gr. (0.00025 Gm.) with the same caution as with ergot.

gynesis (jī-ne'sik) [G. *gynē*, woman]. Pert. to the diseases of women.

gyniatrics (jīn-ī-at'riks) [" + *iatriā*, treatment]. Treatment of diseases of women.

gynopathic [" + *pathos*, disease] Pert. to disease of women.

gynoplastic [G. *gynē*, woman, + *plassein*, to form]. Pertaining to gynoplastic.

gynoplastics (jīn-o-plas'tiks) [" + *plassein*, to form] Reparative surgery of female genitalia.

gynoplastic (jīn'o-plas'tī) [" + *plassein*, to form]. Plastic surgery of the female reproductive organs.

gyrate (jī'rāt) [G. *gyros*, circle]. 1. Ring-shaped, convoluted. 2. To revolve.

gyration (jī-ra'shun) [G. *gyros*, circle]. A rotary movement.

gyre (jīr) [G. *gyros*, circle]. Convolution. SYN *gyrus*.

gyrencephalic (jī-ren-sef-al'ik) [" + *egkephalē*, head] Having a brain marked by numerous convolutions.

gyri (jī'rī) (sing *gyrus*) [G. *gyros*, circle] Convolutions of the brain.

gyro- [G.] Combining form meaning a circle, spiral, ring.

gyrochrome (jī-ro-krām) [G. *gyros*, circle, + *chrōma*, color] A nerve cell in which the stainable substance occurs in rings.

gyroma (jī-ro'mā) [" + *ōma*, tumor] Ovarian tumor consisting of a convoluted mass.

gyromele (jī-ro-mēl) [" + *mēlē*, a probe]. Revolving sound for massage and cleansing of stomach, determining its location, size and condition.

gyrometer (jī-rom'et-er) [" + *metron*, measure] A device for measuring the cerebral gyri.

gyrosa (jī-o'sā) [" + *ōsis*]. Gastric vertigo causing one to close one's eyes to prevent falling, as everything turns round when standing.

gyrose (jī'rōs) [" + *ōsis*]. Bacī Marked by wavy lines or circles applied to bacterial colonies.

gyrospasm (jī-ro-spasm) [" + *spasmos*, spasm]. Spasmodic rotary head movement.

gyrotrope (jī-ro-trōp) [" + *trōpē*, a turning] Cord connecting an electrode with source of an electric current. SYN *rheotrope*.

gyrous (jī'rus) [G. *gyros*, circle] Marked by circular lines. SYN *gyrose*.

gyrus (jī'rus) (pl gyri) [G. *gyros*, circle] A convolution of the cerebral hemisphere of the brain. They are separated by shallow grooves (sulci) or deeper grooves (fissures).

g., angular. G of the parietal lobe embracing post and of the superior temporal sulcus.

g., annectant. Any of many short folds of gray matter which are formed as a result of short branches or twigs of sulci extending into adjacent gyri. They are inconstant.

g., ant. central. G of the frontal lobe extending vertically between precentral and central sulci.

gyri breves insulae. Preinsular g.

g., Broca's. Inf frontal g.

g., callosal. A large g on medial surface of cerebral hemisphere which lies directly above the corpus callosum, and arches over its anterior end.

g., cerebelli. Layer of the cerebellum.

g., dentate. A g marked by indentations which lie on the upper surface of the hippocampal gyrus.

g., fornicatus. G on medial surface of cerebrum which includes the g cinguli, the isthmus, the hippocampus, hippocampal gyrus and uncus.

g., frontal, inferior. Convolution on external surface of frontal lobe of cerebrum located bet. the sylvian fissure and the inferior frontal sulcus.

g., frontal, middle. G. bet. the superior and inferior frontal sulci.

g., frontal, superior. Convolution of cerebral frontal lobe situated above the superfrontal fissure.

g., fusiform. G. beneath the collateral fissure joining the occipital and temporal lobes.

g., Heschl's. Transverse temporal g.

g., hippocampal. G. situated bet. the hippocampal and collateral fissures.

g., lingual. G. bet. the calcarine and collateral fissures.

g. longus insulae. Lengthy g. composing the postinsula

g., marginal. SEE *frontal superior g.*

g., mediotemporal. G. located bet the mediotemporal and supertemporal fissures.

g., middle temporal. G located between middle temporal sulcus and superior temporal sulcus

g., occipital. Any of the gyri on the lateral surface of the occipital lobe. They are inconstant but grouped roughly into two groups, the *inferior* or *lateral occipital gyri* and the *superior occipital gyri*

g., occipitotemporal. SEE *fusiform g*

g., orbital. One of four g. (ant., post., lat., and med.), forming inf. surface of the frontal lobe

g., paracentral. Area on mesial aspect of the cerebrum, the paracentral lobule. Lies above cingulate sulcus

g., parietal. G on lateral aspect of parietal lobe. Include post central gyrus, sup and inf parietal gyri

g., postcentral. G situated bet. the central and postcentral fissures.

g., primary. Fetal cerebral regions marked by the primary fissures

g. profundus cerebri. Very deep gyri of the cerebrum.

g., rectus. G on the orbital aspect of the frontal lobe, located bet the mesial margin and the olfactory sulcus

g., Retzius, g., sagittal. The supra- and subcallosal gyri

g., subcallosal. A narrow band of gray matter on median surface of hemisphere below the rostrum of the corpus callosum

g., subcollateral. SEE *fusiform g*

g., supracallosal. A rudimentary gyrus on the upper surface of the corpus callosum

g., supracallosus. Gray matter layer covering the corpus callosum

g., supramarginal. G in the inferior parietal lobule twisting about the upper terminus of the sylvian fissure

g., temporal. Three gyri (sup middle, inf) on lateral surface of temporal lobe

g. transilivus. SEE *annectent g.*

g., uncinata. Ant hooked portion of the hippocampal g.

H

H. or **h.** Abbr. for *haustus* (a draught), *height*, *henry*, *Holzknicht unit*, *hora* or *hour*, *horizontal*, *hypermetropia* Symb. for *hydrogen*.

H. Symb for *protium*

H². Symb for *deuterium*, an isotope of hydrogen.

H & E. Hematoxylin and eosin, a staining method much used in histology.

Haab's reflex. Contraction of pupils without alteration of accommodation or convergence when gazing at a bright object. A sign of a cortical lesion

habena (ha-be'nā) [L. rein]. 1. A frenum 2. Bandage for a wound 3. Pineal gland peduncle SYN *habenula*, 2.

haben'al, haben'ar [L. *habena*, rein]. Pert. to the habena or habenula

habenula (hab-en'u-lā) [L. strap]. 1. A frenum 2. A peduncle of the pineal gland BNA. 3. A narrow bandlike structure

h. urethra'lis. One of 2 whitish bands between the clitoris and *mcatus urethra*.

habenul'ar. Pertaining to the habenula, esp. the stalk of the pineal body

h. trigone. A depressed triangular area located on the lateral aspect of the post portion of the third ventricle. Each contains a *medial* and *lateral habenacular nucleus*, also called *habenacular area*

h. commissure. A band of transverse fibers connecting the two habenacular areas

habit [L. *habitus*, *habēre*, to hold] SYN *habitus*, *qv* 1. A motor pattern executed with facility following constant or frequent repetition; an act at first performed in a typical voluntary manner but which after sufficient repetition is performed as a reflex action Habits result from the passing of impulses through a particular set of neurons and synapses many times 2. A particular type of dress or garb. 3. Mental or moral constitution or disposition 4. Bodily appearance or constitution, esp. as related to a disease or predisposition to a disease, as the *apoplectic habit* 5. Addiction to the use of drug or beverage as the *opium habit*, *alcoholic habit*

h. chorea. SEE *h. spasm*.

h., full. Full bloodedness, as in a disease.

h. spasm. A spasmodic voluntary movement that has become involuntary Often due to something irritating, sometimes from mimicry. SYN *tic*.*

h. training. Schedule for 24 hr. adapted and rigidly enforced to train mental cases in habits of cleanliness and to stimulate mental activity

habit, words pert. to: *acolasia*, *addict*, *addiction* state, *alcoholomania*, *cacoethes*, *chloroformism*, *neuron*, *perversion*, *synapse*, *tic*.

habituat'ion [L. *habitus*, *habit*]. Act of becoming accustomed to anything from frequent use.

hab'itus [L. *habit*]. Indications in appearance of tendency to disease or abnormal conditions

h. apoplecticus. Full bloodedness, as in a disease

h. enteropticus. Physical state marking enteroptosis.

h. phthisicus. Predisposition to pulmonary tuberculosis characterized by poor bone development, pallor, etc.

habromania (hab-ro-ma'ni-ā) [G. *abros*, cheerful, + *mania*, madness]. A psychosis accompanied by pleasant delusions.

hachement (hash-mon') [Fr. *chopping*]. Strokes with edge of hand in massage SYN *hacking*.

hack'ing [A.S. *haccian*, to chop]. Strokes with edge of hand in massage. SYN *hachement*.

h. cough. A frequent, short cough.

Haemadipsa (hē'mā-dip'sā). A genus of terrestrial leeches found in Asia which attacks man and animals

H. zeylanica and **H. japonica** are species found in Ceylon and Japan, respectively

Haemagogus (hē'mā-gōg'ūs). A genus of mosquitoes. Includes the species *H. capricorni* which serves as a vector of yellow fever

Haemophilus (hem-of'il-us) [G. *aima*, blood, + *philein*, to love]. A genus of Bacteriaceae growing best in hemoglobin

H. conjunctiviti'dis. The cause of "pink eye" SYN *h. of Koch-Weeks*.

H. ducrey'i. The probable pathogenic agent of chancroid SYN *Ducrey's bacillus* and *Bacillus ulcers mollis*.

H. haemolyt'icus. A nonpathogenic agent in the respiratory tract

H. influen'zae. Influenza bacillus or Pfeiffer's b. found in respiratory tract during influenza and other diseases

h. of Koch-Weeks. Same as *H. conjunctiviti'dis*.

H. lacuna'tus. The cause of mild conjunctivitis

H. melaninogen'icus. A Gram-negative organism found on the genitalia and in oral cavities

H. pertus'sis. The possible cause of whooping cough. SYN *Bordet-Gengou bacillus*.

Haemosporidia (hē'mō-spō-rid'ē-ā). An order of Sporozoa which live in the blood cells of vertebrates and reproduce sexually in invertebrates, includes four important families, *Babesidae*, *Theileridae*, *Haemoproteidae*, and *Plasmodiidae*, the last including the genus *Plasmodium*, four species of which cause malaria in man

Haemophysalis (hē'mā-fī'sā-lis). A genus of ticks belonging to the family Ixodidae. Includes the dog tick and rabbit tick.

H. leporis-palustris. A species of ticks infesting rabbits. Serves as a vector of tularemia and Rocky Mountain spotted fever.

haf'nium. A rare chemical element of at. wt. 178.6 SYMB: Hf.

Hagedorn needle (hā'ge-dorn). A curved surgical needle with flattened sides.

Haines formula. The number of grains of solid in a fluidounce of urine determined by multiplying the last 2 figures of the sp. gr of a specimen by 1.1.

hair [A.S. *haer*]. 1. A keratinized, threadlike outgrowth from the skin of mammals 2. Collectively, the threadlike

outgrowths which form the fur of animals, or which grow on the human head.

A hair is a thin flexible shaft of cornified cells which develops from a cylindrical invagination of the epidermis, the *hair follicle*. Each consists of a free portion or *shaft* (*scapus pili*) and a *root* (*radix pili*) imbedded within the follicle. The shaft consists of three

HAIR

Root of hair, longitudinal section. A Hair B Cuticle of hair C Internal root sheath C Cuticle of root sheath D Huxley's layer of internal root sheath E External root sheath F Hair papilla

layers of cells: the *cuticle* or outermost layer, the *cortex*, forming the main horny portion of the hair, and the *medulla*, the central axis. Hair color is due to pigment in the cortex.

Hairs in each part of the body have a definite period of growth after which they are shed. In man there is a constant gradual loss and replacement of hairs. Hairs of the eyebrows last only three to five months, those of the scalp two to five years. Baldness or *alopecia* results when replacement fails to keep up with hair loss. It may be due to hereditary factors or pathological conditions such as infections or injury from irradiation.

h. bulb (*bulbus pili*). Lower expanded portion of a hair root. Growth of a hair results from the proliferation of cells of the hair bulb.

h. cell. An epithelial cell possessing fine nonmotile cilia found in the maculae and the organ of Corti of the membranous labyrinth of the inner ear. They are receptors for the senses of position and hearing.

h. dye. May contain silver nitrate or aniline dyes which are often irritating to skin or eyes, causing severe dermatitis or conjunctivitis. Occasionally results in blindness.

TREATMENT Wash with sterile salt solution, followed by soap and water, followed by sponging with alcohol, cover with bland ointment, as cold cream or lanolin. The eye should be washed with normal saline and then instil paraffin oil, sweet oil or other bland oil.

h. follicle. An invagination of the epidermis which forms a cylindrical depression, penetrating the *corium* into the connective tissue which holds the hair root.

Sebaceous glands which secrete an oily fluid, and flay muscles which cause the hair to stand (*arrectores pili*), are attached to these follicles.

h. gustatory. A taste-hair. One of several fine hairlike process extending from the ends of gustatory cells in a taste bud. They project through the inner pore of a taste bud.

h. papilla. A projection of the corium which extends into the hair bulb at the bottom of a hair follicle. It contains capillaries through which a hair receives nourishment.

h. pubic. That over the pubes. It assumes the form of a triangle in the female. *SYN* *escutcheon*. *SEE*: *pubic*.

hair'y heart. A heart covered with a rough exudation.

h. tongue. One covered with hairlike papillae.

halation [*G. alōs*, a halo]. Blurring of vision due to light from a wrong direction.

half-life. The time required for a radioactive substance to lose one half of its energy.

half-value layer. *SEE* half-value thickness.

h.-v. thickness. The thickness of a substance which, when placed in the path of a given beam of rays, will lower its intensity to 1/2 of the initial value.

h. ce'ra. Waxy softening of the bones.

halistere'tic [*" + sterēsis*, privation] *Rel.* to or affected with halisteresis, *q.v.*

halitosis (*hal-i-tos'is*) [*L. halitus*, breath, + *G. -ōsis*]. Offensive breath.

halituous (*hal-it'u-us*) [*L. halitus*, breath]. Covered with moisture. *SYN* *vaporous*.

hal'itus [*L. breath*]. 1. The breath. 2. Warm vapor.

haliver (*hal'i-ver*) [*ME halibut*, holy flounder, halibut, + *A.S. liver*, liver]. Oil from the halibut's liver. Rich in vitamins A and D.

h. oil. The expressed oil from fresh halibut livers, standardized to contain approximately 100 times the amount of vitamin A, and 10 to 30 times the amount of vitamin D as standard cod liver oil.

Uses In all conditions where cod liver oil is indicated.

Dosage Adults, 10 to 20 *m* daily, children, 10 drops.

h. o. with viosterol. Haliver oil to which has been added sufficient viosterol to assure a potency of not less than 10,000 vitamin D units per Gm.

Uses Same as for cod liver oil.

Dosage For infants, 8 to 10 drops daily, older children and adults, proportionately increased.

Adm With a special dropper designed to deliver a certain number of drops to the minin. (teries in the eye).

Hal'ler's circles. Circles of veins and arteriallex (*pl. hal'lices*) [*L.*]. The great toe. *SYN* *hallus*, *hallux*.

hallucination [*L. alucinari*, to wander in mind] *PSY*: False perception having no relation to reality and not accounted for by any ext. stimuli. May be *visual*, *auditory*, *olfactory*, etc.

Commonly, the patient is unable to consider it as not constituting reality, but judgment may at times recognize discrepancies, and even at times deny the hallucination entirely. Usually, then, the patient reacts emotionally and be-

haves as one would to a real situation. An indifferent attitude strongly suggests deterioration. Any sense may be involved, or elaborate combinations may occur. As in dreams, here the patient might be terrified at seeing an approaching assaulter, hear his threats, and feel his blows, and struggle in desperate defense. Emotional tone, delusions, and hallucinations tend to harmonize and this may be ascribed to the last, reflecting rather than determining the others.

Structural disease of the sensory organ and conducting mechanism may favor the formation of hallucinations, e.g., the deafness of an old otitis media often is associated with tinnitus, and at times the paresthesia is associated with phonemes. An irritative lesion of the visual cortex may produce more directly the hallucination, but even here an intact mind probably quickly would recognize the perception as unreal.

Hallucinations must then be considered the product of mental distortion, and the recognition of cause must be based on associated symptoms. It follows that hallucinations with few exceptions are presumptive evidence of a psychosis (insanity). Hypnagogic* hallucinations are notable exceptions.

RS. *acousma*, *acute hallucinosis*, *delusion*, *hallucinosis*, *illusion*.

h., extracampine. H of hearing words spoken at a great distance.

h., haptic. One pert to touching the skin, or to sensations of temperature or pain.

h., hypnagogic. Pre-sleep phenomena having the same practical significance as a dream but experienced while consciousness persists. Includes sense of falling, sinking, or of the ceiling moving.

h., kinetic. Sensation of flying or moving the body or a part of it.

h., microptic. One in which things seem reduced in size.

h., motor. Imaginary perceptions of movement.

h., somatic. Sensation of pain attributed to visceral injury.

h., teleologic. One which advises or guides the subject, such as those of Jeanne d'Arc.

hallucinosis (hāl-lū'sīn-ō'sis) [' + G. *ōsis*]. The state of having hallucinations more or less persistently. See: *hallucination*.

h., acute. Psy: Alcoholic psychosis. SYN: Fear or anxiety and auditory hallucinations.

hal-lus, **hal'lux** (pl. *hal'luces*) [L.]. The great toe.

h. doloro'sus. Pain in the metatarsophalangeal joint of the great toe due to flat foot.

h. flexus. Hammer toe.

h. valgus. Displacement of great toe toward other toes.

h. varus. Displacement of great toe away from other toes.

halmatogenesis (hāl'mā-to-jen'e-sis) [G. *alma*, jump + *genesis*, development]. A sudden deviation of type from one generation to the other one.

ha'lo [G. *alōs*, a halo]. 1. The areola, esp. of the nipple. 2. A ring surrounding the macula lutea in ophthalmoscopic images. 3. A circle of light surrounding a shining body.

h. glaumato'sus. A whitish ring surrounding the optic disk; seen in glaucoma.

h. symptom. Colored circle around lights in glaucoma.

hal'ogen [G. *als*, salt, + *gennan*, to form]. A salt former, one of a group of elements (chlorine, Cl.; bromine, Br.; iodine, I., and fluorine, F.), having very similar properties.

They combine with hydrogen to form acids and with metal to form salts.

haloid (hal'oid) [' + *eidos*, form]. Resembling salt.

h. salt. A salt made up of a base and a halogen, resembling common salt.

halometer (ha-lom'ē-ter) [G. *alōs*, a halo, + *metron*, measure] 1. Device for measuring diffraction halo of a red blood cell. 2. Device for measuring the halo around optic disk.

halosteresis (ha-lo-ster-e'sis) [G. *als*, salt, + *sterēsis*, privation] Deficiency of lime salts in the bones. SYN: *halisteresis*.

Hal'sted's operation. Operation for inguinal hernia and one for amputation of breast with carcinoma.

H.'s suture. An interrupted one for intestinal wounds.

Hal'stern's disease. Endemic syphilis.

ham [AS *haum*, haunch] 1. The popliteal space or region behind the knee.

2. Common name for the thigh, hip, and buttock. 3. The thigh of an animal, esp., the hog, prepared for food.

hamartia (ham-ar'shl-ā) [G. *amartia*, defect] Error in development due to imperfect tissue combination.

hamartoma (ham-ar-to'mā) [' + *ōma*, tumor]. 1. A tumor due to new growth of blood vessels, opp. to dilatation of preexisting vessels. 2. A tumor due to failure of development.

hamartomatosis (ham-ar-to-mā-to'sis) [' + *ōma*, tumor + *-ōsis*] Existence of multiple hamartomas.

hama'tum [L. *hamatus*, hooked] The unciform bone, *os hamatum*.

hammer. 1. An instrument with a head attached crosswise to the handle for striking blows. 2. Common name for the malleus, the middle ear bone.

h. percussion. A h. with a rubber head used for tapping surfaces of the body in order to produce sounds for diagnostic purposes. See: *plexor*.

h. reflex. A h. used for tapping part of the body such as a muscle, tendon, or nerve in order to initiate certain reflexes.

ham'mer toe. A toe with dorsal flexion of 1st phalanx and plantar flexion of 2nd and 3rd phalanges.

Hamp'son unit. X-ray unit of measurement.

It is one-fourth of the erythema dose. **hamster.** A rodent *Cricetus cricetus* resembling a rat belonging to the family Cricetidae, common in Europe and W. Asia. It is extensively used as a laboratory animal.

ham'string [AS *s. haum*, haunch]. One of the tendons which form the medial and lateral boundaries of the popliteal space.

h.'s inner. Tendons of the semimembranosus, semitendinosus, and gracilis muscles.

h.'s outer. The tendon of the biceps femoris.

hamstrings. Three muscles on the posterior aspect of the thigh, the semitendinosus, semimembranosus, and biceps femoris. They flex the leg and adduct and extend the thigh.

ham'ular [L. *hamulus*, a small hook]. Unciform; hook-shaped.

hamulus [L. a small hook] 1. Any hook-shaped structure. 2. Hooklike process on the hamate bone.

h. cochleae. A hooklike process at the tip of the osseous spiral lamina of the cochlea.

h. lacrimalis. Hooklike process on the lacrimal bone.

h. pterygoideus. Hooklike process at tip of medial pterygoid process of the sphenoid bone.

BONES OF THE HAND AND WRIST

1 Hamate 2 Pisiform 3 Triquetrum 4 Lunate 5 Capitate 6 Navicular. 7. Lesser multangular 8 Greater multangular 9 First metacarpal 10 Fourth metacarpal 11 Third metacarpal 12 Second metacarpal 13 First or proximal row of phalanges 14 Second row of phalanges 15 Second row of phalanges 16 Third or distal row of phalanges

hand [AS hand] That part of the body attached to the forearm at the wrist.

It includes the wrist (*ossa carpi*) with its 8 bones, the metacarpus, or body of the hand (*ossa metacarpalia*) having 5 bones, and the phalanges (fingers) with their 14 bones.

h., ape. Deformity of hand in which thumb is permanently extended.

h., claw. See *clawhand*.

h., cleft. Deformity of hand in which the division between the fingers, particularly between the third and fourth, extends into the carpus.

h., opera-glass. Deformity of hand due to chronic absorptive arthritis. The phalanges appear to be telescoped into one another like an opera glass.

hand, words pert. to: "chir-" words, dysgraphia, lumbricalis, macrochira, manus, metacarpal, metacarpus, palmar, skeleton, thenar, trapezium.

hands and skin. Disinfection of hands commonly consists of thorough scrubbing with a bristle brush in hot water and soap for 5 minutes. Mechanical cleansing alone removes a major part of the organisms. The hands may be immersed in a germicidal solution such as 70% alcohol for 1 minute. After drying with sterile towel, sterile rubber gloves are worn.

hand'edness. The tendency to use one hand in preference to the other.

h., left. Sinistrality; preferential use of the left hand.

h., right. Dextrality preferential use of the right hand.

hanging drop culture. A method of culturing microorganisms by placing a drop of the culture medium containing organisms on a coverslip, then inverting the coverslip over a concavity of a hanging drop slide.

hang'nail [AS *hangian* to hang, + *nagel*, nail]. SYN *agnail* Partly detached piece of skin at root of a finger-nail.

Hano's disease (han'os). Hypertrophic cirrhosis of liver with jaundice.

Hansen, Gerhard Henrik Armauer. Norwegian physician, 1841-1912.

H's bacillus. *Mycobacterium leprae*, which he discovered in 1871.

H's disease. Leprosy.

Han'son unit. One one-hundredth of the quantity of parathyroid extract solution necessary to elevate by 1 mg the concentration of calcium in blood serum of a parathyroidectomized dog whose weight is 15 Kg.

hapalonychia (hap-al-o-nik'i-ä) [G. *apalos*, soft, + *onyx*, *onych-*, nail]. Lack of rigidity of the nails. SYN *onychomalacia*.

haphalgnesia (haf-al-ge'zi-ä) [G. *aphe*, touch, + *algnesia*, pain] A sensation of pain upon touching the skin with an object which is not an irritant.

haphophobia (haf-e-fö'bi-ä) [" + *phobos*, fear]. Aversion to being touched by another person.

haplodermatitis (hap'lo-der-mä-ti'tis) [G. *aploos*, simple, + *derma*, skin, + *-itis*, inflammation] Simple inflammation of the skin. SYN *haplodermitis*.

hap'lodermitis [" + " + *-itis*, inflammation] Uncomplicated inflammation of the skin.

hap'loid. Possessing half the diploid or normal number of chromosomes found in somatic or body cells. Such is the case of the germ cells, ova or sperms, following the reduction divisions in gametogenesis, the haploid number being 24 in man.

haplo'pia. Single vision, condition in which an object viewed by two eyes appears as a single object in contrast to *diplopia*, in which it appears as two objects.

hap'ten [G. *aptein*, to seize] The portion of an antigen containing the grouping on which the specificity depends.

haptic (hap'tik) [G. *aptein*, to touch]. Pert to touch. SYN *tactile*.

hap'tics [G. *aptein*, to touch]. The science of the touch sense.

hap'tin (hap'tin) [G. *aptein*, to seize]. A cast off receptor.

There are 3 orders of haptin: (a) Antiferment or antitoxin; (b) agglutinin, coagulin, precipitin. (a) and (b) are *unicaptors*.* (c) Bacteriolysin, cytolyisin, hemolysin. These are *amboceptors*.*

haptophil(e) (hap-to-fil, -fil) [" + *philein* to love]. That portion of a receptor that unites with the haptophore group of a toxin.

haptophore (hap-to-för) [" + *pherein*, to bring]. The atom group of an antigen causing a combination with its corresponding antibody. SEE *Ehrlich's side-chain theory*.

haptophor'ic, haptoph'orous [" + *pherein*, to bring]. Pert. to the action of a haptophore.

hard'ening [A.S. *heardian*, to harden] 1. Rendering a pathological or histological specimen firm or compact for making thin sections for microscopic study

2 Increased resistance to changes in temperature of the atmosphere

If the body is exposed to low temperatures, a contraction of skin vessels takes place, with a corresponding dilatation of the capillaries of the mucous membranes

Hardening is induced by bathing to cause a prompt skin vascular reaction.

hard'ness [A.S. *heardness*] 1. Quality of water containing certain substances, esp. soluble salts of calcium and magnesium. These react with soaps forming insoluble compounds which are precipitated out of solution, thus interfering with their cleansing action 2 That quality of x-rays determining their penetrating power. Hardness lessens as wave lengths become longer

h. of a gas tube. A term used to qualify the condition of a tube according to the degree of rarefaction of the residual gas

The higher the vacuum, the harder the tube and the rays emitted, the higher the voltage required to cause a discharge with a cold cathode, and hence the shorter the wave length of the resulting roentgen rays. SEE *hardness of roentgen, ray*.

hare'lip [A.S. *hara*, hare, + *lippa*, lip]

SYN *cheiloschisis*. A vertical cleft or clefts in the upper lip. It is congenital resulting from the faulty fusion of the median nasal process and the lateral maxillary processes. It is usually unilateral and on the left side although it may be bilateral. It may involve the lip or the upper jaw alone or both together, and often occurs with cleft palate.

h. suture. A twisted figure-of-eight suture.

harlequin fetus (har'lē-kwīn). A newly-born infant with *ichthyosis congenita*.

SYN *hyperkeratosis congenitalis*.

Har'ison's groove. Depression on lower edge of the thorax caused by tug of the diaphragm, seen in adenoids and rickets

Has'ner's valve or fold. SYN *plica lacrimalis*. A fold of the mucous membrane at the opening of the nasolacrimal duct in the inf. meatus of the nasal cavity

Has'sall's corpuscles or bodies. SYN *thymic corpuscle*. Spherical or oval bodies present in the medulla of the thymus. Each consists of central area of degenerated cells surrounded by concentrically arranged flattened or polygonal cells. They are characteristic of the thymus

Hath'cock's sign. Tenderness just beyond the angle of the jaws when the finger follows on the under surface of the mandible towards the angle. Found in mumps before any swelling can be detected

haunch (haw'nsh) [Fr. *hanche*]. The hips and buttocks.

h. bone. The ilium. SYN *os coxae*.

Haus'man's stagnation test meal. Four tablespoonfuls of boiled rice and a glass of water are given at 9 o'clock at night (a little sugar and milk can be taken on the rice).

If, after fasting until 9 o'clock in the morning, rice residue is not shown microscopically or macroscopically, there is no stagnation (a drop of Lugol's solution stains any starch granules blue so that they are easily seen).

haustra (haws'tra) (sing *haustrum*) [L. *haurire*, to draw, drink]. The sacculated elevations of the colon.

h. coli. Sacculations of the colon resembling tufts, caused by the fact that the gut is longer than the longitudinal bands or taeniae

haustral (haw'stral) [L. *haurire*, to draw, drink]. Pert to the colonic hausta

h. churning. Agitation of the intestinal contents

haustrum (haw'strum) (pl *haus'tra*) [L. *haurire*, to draw, drink] One of the sacculations of the colon caused by longitudinal bands shorter than the gut which causes formation of pouches in the colon SYN *haustra coli*.

haus'tus [L. a drink] A draught of medicine.

haut-mal (o'mah) [Fr. high evil] Grand mal when at its height

HAVERSIAN SYSTEM OF BONE, MAGNIFIED

Cross section femur, dog. A Haversian canal. B Lacunae and canaliculi.

haver'sian canal. Minute vascular canal found in osseous tissue

h. canaliculi. Delicate canals extending from the lacunae into the matrix of bone. They anastomose with canaliculi of adjacent lacunae forming a network of fine channels which communicate with Haversian and Volkmann's canals. They transmit nutrient materials

h. gland. A mass of fatty tissue lodged in the acetabular fossa of the innominate bone. Also called *synovial gland*

h. system. Architectural unit of bone, consisting of a central tube (*h. canal*) with alternate layers of intercellular material (*matrix*) surrounding it in concentric cylinders. Alternating layers of matrix and cells are called *haversian lamellae*. SEE *bone*.

hay fever. SYN *allergic coryza*, *rose cold*, *vasomotor rhinitis pollinosis*. An allergic disease of mucous passages of nose and upper air passages induced by external irritants

SYM. Inflammation, catarrh, watery discharges from the eyes, cold in the head, coryza, headache, asthmatic symptoms

ETIOI. Air-borne pollens. *Spring type* due to pollens of trees such as oak, elm, hickory, ash; *Summer type* due to pollens of plants such as grasses, plantain, and sorrel; *Fall type* due principally to the pollen of ragweeds. Non-seasonal hay fever may result from (a) inhalation of irritating substances such as the danders of animals, or dust such as hay, straw, or house dust. (b) In-

gestion of substances such as drugs or foods to which the subject is allergic.

TREATMENT 1 Change of climate, sea voyage. 2 Filtration of air by air conditioning, masks, and nasal filters. 3 Drug therapy in which epinephrine, antihistamines, or other drugs are given orally or used as nose drops, or nasal sprays. 4 Prophylactic treatment consisting of injection of pollen extracts made from pollen to which the subject is sensitive.

Haygarth's deformities, nodes or nodosities. Exostoses or bony tumors on joints in arthritis deformans.

ha'zelnut [A.S. *hæsel*, hazel, + *hnutu*, nut] ASH CONST. Ca 0.287, Mg 0.140, K 0.618, Na 0.019, P 0.354, Cl 0.067, S 0.198, Fe 0.0041.

hb. Abbr. for hemoglobin.

h.d. Abbr. for *hora decubitus* (the hour of going to bed).

He. Symb. for helium.

H. D. Abbr. for hearing distance.

head [A.S. *heafod*]. 1. Caput. That part of the animal body containing the brain and organs of the sight, hearing, smell, and taste. It includes the facial bones. 2 The proximal end of a bone. 3 The larger extremity of any structure or body.

h., abnormal fixity of. May be caused by postpharyngeal abscess, occipitocervical myelalgia, arthritis deformans, swollen cervical glands, rheumatism, traumatism of neck, sprains of cervical muscles, congenital spasmodic torticollis, caries of a molar tooth, cicatrices of burns.

h., abnormal movement of. Habit spasms, such as noddings.

h., afferent. The head of a fetus in a breech presentation.

h., black. A comedo, q.v.

h., fold. A fold of the blastoderm of a chick which grows caudad under the ant. portion of the neural plate. It brings about the establishment of the head and the foregut.

h., gut. Part of embryo which develops into stomach, duodenum, and esophagus.

h., histamine. H. resulting from injection of histamine or excessive histamine in circulating blood. Due to dilatation of branches of the carotid artery.

h., inability to move the. May be due to caries of cervical vertebrae and diseases of articulation bet. occiput and atlas, or paralysis of neck muscles.

h., kidney. Embryonic kidney.

h., lock. Interlocking of chins in twin birth.

h., process. A strand of cells in the embryo extending forward from the primitive knot. Also called *notochordal plate*.

h., retracted. Seen in acute meningitis, cerebral abscess, tumor, thrombosis of sup. longitudinal sinus, acute encephalitis, laryngeal obstruction, tetanus, hydrophobia, epilepsy, spasmodic torticollis, strychnine poisoning, hysteria, and rachitic conditions. Also in painful neck lesions at the back.

h., rhythmic nodding of. Seen in arterial regurgitation, chorea, torticollis, q.v.

h., scald. Affection of scalp accompanied by crusts or scales.

head, words pert. to: acromegalia, acromegaly, capitate, caput, "ceph-" words, coryza, face, gyrospasm, macrocephalous, nutation, occipital, sinciput, skeleton, temple, vertex.

headache [A.S. *heafod* + *acan*, to ache].

A diffuse pain in different portions of

the head and not confined to any nerve distribution area.

It may be *frontal*, *temporal* or *occipital*, confined to 1 side of head or to region immediately over 1 eye. The character of pain may vary; may be dull ache, acute, almost unbearable pain; intermittent, intense pain; throbbing pain; pressure pain when head feels as if it will burst, or penetrating pain driving through head.

ETIOLOGY. (a) Associated with disorders of alimentary tract, probably due to absorption of toxins, as in indigestion or constipation. (b) Due to toxemia. A constant symptom in nephritis and jaundice, also occurs in septic absorption from foci present in body, as in septic teeth, septic tonsils, infected cranial sinuses. (c) Frequently a symptom at onset of febrile diseases, esp. pneumonia, typhoid fever, scarlet fever, smallpox, erysipelas, tetanus, and influenza. (d) Defective sight and, less commonly, defective hearing are causes. With defective sight, pain may occur over eyes, also at occiput owing to fatigue of visual area, situated in the occipital lobe of the brain. (e) Mental strain, worry, and anxiety will cause headache, this may be associated with eyestrain or be independent of it. (f) Abnormalities in blood pressure give rise to headache. In some cases due to low blood pressure, in which anemia of brain occurs, in other cases blood pressure is high. Sudden changes in blood pressure also cause headache. (g) Changes in intracranial pressure give rise to headache. The acutely painful headache following intrathecal anesthesia is an example, as is the headache associated with meningitis. (h) Diseases of central nervous system are characterized by headache. (i) Any injury resulting in concussion or compression of brain or cord.

Summary

1 TOXIC FACTORS—

(a) *Of exogenous origin*—Foul air, from poor ventilation, etc.; poisonous gases, including fumes from furnaces or gas fires, drugs (quinine, morphine, etc.), alcohol, tobacco, etc.

(b) *Of endogenous origin* (any absorption of the toxins of bacterial infection or perverted metabolism will cause headache).

Chronic focal infections—Nose and sinuses, teeth, middle ear, pharynx, tonsils, appendix, gallbladder, pelvic viscera.

Fever in general

Bacteremias—Typhoid fever, malaria, smallpox, tuberculosis, gripe and influenza, puerperal fever, etc.

Systemic diseases—Nephritis with uremia, biliary tract disease (including acute yellow atrophy of the liver), rheumatism, diabetes, anemia, polycythemia, eclampsia, syphilis.

2 GASTROINTESTINAL DISTURBANCES—Dyspepsia, gastric hyper- and hypoacidity, intestinal stasis and constipation.

3. PHYSICO-CHEMICAL DISTURBANCES—Acidosis, alkalosis.

4. CARDIOVASCULAR DISTURBANCES—High blood pressure, low blood pressure, myocardial and valvular insufficiency causing either congestion or anemia.

5. ENDOCRINE DISORDERS—Pituitary, thyroid, suprarenals, ovaries.

6. GYNECOLOGICAL FACTORS (due to functional disturbances of one or more of the above glands)—Puberty, menstruation, pregnancy, menopause.

7. **NEUROLOGICAL FACTORS**—Nervous shock; nervous exhaustion, worry, excitement, anger, or nervous tension; migraine; hysteria; epilepsy; psychoneuroses; headache which may be psychic with reflex symptoms to various regions or which may be, itself, a reflex pain secondary to organic disease.

8. **DISEASES OF SPECIAL SENSE ORGANS**—Iritis, glaucoma, etc.; adenoids, deviated septum, etc.; middle ear affections.

9. **ORGANIC DISEASE OF BRAIN**—Causing pressure. Tumor, abscess, gumma, cyst, hydrocephaly, intracranial hemorrhage. Intracranial vascular disease; arteriosclerosis, embolism, thrombosis or aneurism; encephalitis.

10. **VARIOUS FORMS OF MENINGITIS**, including meningismus.

11. **FUNCTIONAL CAUSES** (almost any disturbance of body function may cause headache)—External pressure and constriction of head, trauma to head, sunstroke, persistent noises, persistent motion (seasickness, train sickness, etc.), irritation of mucous membrane of nose and sinuses by dust, pollen, etc., fatigue (physical mental), insomnia, eyestrain, uncorrected defects, overwork, spinal puncture usually followed by headache.

TREATMENT Depends entirely on cause, and there is great danger of headache, which is probably only a symptom, being treated without regard to cause. Provided that due consideration has been given to this, the following points may receive general attention: (a) The diet; (b) adequate rest, (c) the state of the bowels, (d) the amount of urine being passed. Applications of cold to head may relieve, esp. if evaporating lotion is used. A hot bath may help, by stimulating circulation generally. Heat applied to back of neck may relieve by reflex effect. A saline aperient may relieve by producing dehydration, esp. in cases in which blood pressure is high. A stimulant, such as tea, coffee, or sal volatile, may relieve, when headache is due to fatigue or overstrain. Drugs for the relief of headache should be given with care. **Syn:** *cephalgia*.

h., sick. A nervous headache occurring periodically, usually on 1 side of the head, accompanied by nausea and vomiting.

SEE *migrain, migraine*.

heal (*hél*) [*AS hael, whole*]. To cure; to make whole or healthy.

healing [*AS. hael, whole*] The restoration to a normal condition, esp. of an inflammation or a wound.

HEALING BY FIRST INTENTION. This process closes the edge of a wound with little or no inflammatory reaction, and in such a manner that no scar is left to reveal the site of the injury. The free bleeding of the cut edges and the intact living cells not affected by the injury make this possible. New cells are formed to take the place of dead ones, and the capillary walls stretch across the wound to join themselves to each other in a smooth surface. New connective tissue may form an almost imperceptible scar which proves temporary.

HEALING BY SECOND INTENTION. This is healing by granulation or indirect union. Granulation tissue is formed to fill the gap between the edges of the wound with a thin layer of fibrinous exudate. It bars out bacteria and aids in checking bleeding by the coagulation of the blood. Connective tissue cells support the new capillaries. This form of heal-

ing is slower than that by first intention and its grayish-red surface may become pale and flabby if the healing is too long delayed. If the granulations show above the surface they may have to be removed with caustics. If the granulations first form at the top instead of the bottom of the wound, it may have to be kept open by drainage.

HEALING BY THIRD INTENTION. Of an ulcer, wound, or cavity by filling with granulations. It generally results in the formation of a scar.

COMPLICATIONS IN HEALING. These may result from (a) The formation of a scar interfering with functioning of the part, and possible deformity, (b) the formation of a *keloid*,* the result of overgrowth of connective tissue forming a tumor in the surface of a scar. (c) necrosis of the skin and mucous membrane producing a raw surface that results in an ulcer, (d) a sinus or fistula which may be due to bacteria, or some foreign substance remaining in the wound, (e) proud flesh. This represents excessive granulations, the result of a fungous growth.

health (*hælt*) [*AS hælt*, wholeness].

A condition in which all functions of body and mind are normally active.

h., bill of. Public health certificate certifying that passengers on a public conveyance or ship are free of infectious disease.

H., Board of. A public body in charge of the health of a community.

h. certificate. An official statement signed by a physician which attests to the state of health of a particular individual.

H., Department of. Branch of a government (city, county, or nation) for regulation and protection of the people's health.

h., industrial. The health of employees of industrial firms.

h., public. The state of health of the population of a particular community such as a city, county, state, or nation, as opposed to individual or personal health, community health.

h. nurse, public. One employed by a Board or Dept. of Health to serve the public.

H. Service, Public. A Bureau of the U S Treasury Dept.

health'y [*AS hælt*, wholeness] Being in a state of health or enjoying it.

h. pus. Pus of a form without odor, which is less dangerous than the other types.

h. ulcer. Ulcer which heals easily.

hearing [*AS hēran, to hear*]. The act or power of perceiving sound.

h., after. Perception of sound after the stimulus producing it has ceased to act.

h. aid. An apparatus used by those with impaired hearing for amplifying sound waves.

h. distance. That at which a given sound can be heard. On the prairies a voice may be heard for 2 miles or more.

h., functional tests for. Determination of hearing acuity can be determined by: (1) Determining the distance at which a person can hear a certain sound, such as a watch tick. (2) By the use of *audiometers*, in which electrically produced sounds are conveyed by wires to a receiver applied to the subject's ear. Intensity and pitch of sound can be altered and is indicated on dials. Results are plotted on a graph known as an *audiogram*. (3) By bone conduc-

tion tests in which a device such as tuning fork or an apparatus which converts an electrical current into mechanical vibrations is applied to the skull. Such is of value in distinguishing between perceptive and transmission deafness.

h. hallucinations. Subjective sensations of sound such as "hearing voices" when none actually exists.

heart (hart) [AS *heorte*] A hollow, muscular, contractile organ, the center of the circulatory system. Its wall possesses three layers, the outer *epicardium*, a serous layer, the middle

ventricles being known as *ventriculus dexter* (right) and *v. sinister* (left).

Contraction of the heart chambers is called *systole*, relaxation with accompanying dilation, *diastole*. The complete series of events which occurs in a single heart beat is known as the *cardiac cycle*. In a normal beating heart, each cycle lasts about 0.85 sec. The heart is divided perpendicularly from base to apex by the *interauricular* and *interventricular septa*, the right side having no communication with the left. The right side receives *deoxygenated* blood from the tissues and pumps it to the lungs, the left side receives *oxy-*

RIGHT AURICLE AND VENTRICLE
OF HEART

Both chambers laid open, the anterior wall of each having been removed. The arrows indicate the course of the blood. 1, Apex of heart, 2, *columnae carneae*; 3, papillary muscles, 4, *chordae tendinae*, 5, right coronary artery, 6, tricuspid valve, 7, opening of inferior vena cava, 8, *eustachian valve*, 9, *annulus ovalis*, 10, *fossa ovalis*, 11, *auriculoventricular orifice*; 12, *foramina thebesii*; 13, right auricle, 14, atrium; 15, opening of superior vena cava 16, superior vena cava; 17, aorta; 18, right branch of pulmonary artery, 19, left branch of pulmonary artery; 20, pulmonary artery, 21, *pectinate muscles*; 22, *auricular appendix*, 23, posterior flap of pulmonary valve; 24, *infundibulum*, 25, papillary muscles, 26, papillary muscles of posterior flap, 27, *chordae tendinae*; 28, papillary muscles; 29, *moderator band*; 30, muscular wall.

myocardium, composed of cardiac muscle, and the inner *endocardium*, a layer which lines the chambers of the heart and covers the valves. The heart is enclosed in a fibroserous sac, the *pericardium*, the space between the *pericardium* and the *epicardium* forming the *pericardial cavity*.

CHAMBERS. Each lower cavity is the *ventricle*, or *ventricle*; each upper one the *atrium*, or *auricle*. The right auricle is called the *atrium dexter*, and the left one the *atrium sinister*, the 2

LEFT AURICLE AND VENTRICLE
OF HEART

The arrows indicate the course of the blood. 1, *Columnae carneae*; 2, papillary muscles, 3, *chordae tendinae*, 4, orifice of aorta, 5, anterior flap of mitral valve, 6, anterior cardiac vein; 7, *pectinate muscles*, 8, *auricular appendix*, 9, *auriculoventricular orifice*; 10, aorta; 11, cavity of the left auricle; 12, right pulmonary veins; 13, pulmonary artery, 14, left pulmonary veins, 15, vena cava inferior; 16, coronary sinus, 17, transverse branch of the right coronary artery; 18, papillary muscles of the posterior flap; 19, *chordae tendinae*, 20, papillary muscles; 21, muscular wall; 22, apex.

genated blood from the lungs and pumps it to the tissues.

The atria, serving as receiving chambers, are thin walled; the ventricles, serving as pumping chambers, are thick walled.

Accelerator impulses are conveyed over nerves and ganglia of the sympathetic division. Preganglionic neurons which lie in the thoracic portion of the spinal cord synapse with postganglionic neurons located in the cervical ganglia of sympathetic trunk whose axons pass to the heart. Impulses over these nerves known as *augmentor nerves* increase rate and force of heart beat. Impulses regulating the heart arise in the cardiac center in the medulla oblongata.

Afferent fibers these pass through the vagus trunks to the medulla. Some

are *depressor* fibers originating in receptors in the base of the aorta. Impulses over these fibers reflexly slow the heart rate. Others are *pressor* fibers originating in receptors in the vena cavae and rt atrium. These reflexly increase heart beat. Fibers conveying pain impulses are also present.

Valves The auriculoventricular orifice bet. each auricle and ventricle. 1. *Valvula tricuspidalis* (tricuspid) guards the opening bet. the atrium dexter and the ventriculus dexter. 2 *Valvula bicuspidalis* (bicuspid or mitral valve), bet. the atrium sinistrum (left auricle)

STERNOCOSTAL SURFACE OF
HEART

1. Apex 2. Anterior descending branch of left coronary artery. 3. Right ventricle. 4. Aorta 5. Pulmonary artery. 6. Left atrium 7. Left auricle 8. Left ventricle

and the *ventriculus sinister* (left ventricle). 3. *Valvulae semilunares* (semilunar valves) guard the orifice bet. the *ventriculus dexter* and the pulmonary artery. 4. *Valvulae semilunares aortae* (aortic valves) guard the orifice bet. the *ventriculus sinister* and the aorta.

Nerve Supply: *Inhibitory:* Vagus or pneumogastric accelerator. By way of the sympathetic ganglia of the autonomic system and phrenic nerve. *Afferent* A depressor nerve running from the heart to a cardio-inhibitory center in the medulla, through the sheath of the vagi nerves, causing reflex inhibition of the heart. *Efferent fibers:* *Inhibitory impulses* are conveyed by preganglionic fibers of the vagus nerve, which synapse with post-ganglionic neurons located in terminal ganglia in the wall of the heart. They are distributed to the S-A node and other conductile tissue of the heart.

WORK OF HEART. Two to 3 oz of blood are driven into the arteries by each heartbeat. The power exerted by the heart is said to equal that necessary to lift 80 lb. 1 ft each minute. The human heart beats 72 times per minute, 104,000

times a day, 38,000,000 times during a year. At every stroke 5 cu in of blood are forced out into the body, or 500,000 cu. in. a day. In terms of work this is the equivalent of raising 1 ton to a height of 41 ft every 24 hr.

h. armored. Condition characterized by deposit of calcareous matter in the pericardium

h., athletic. Hypertrophy of the heart as a result of strenuous physical activity. Of little or no significance in the absence of diseased valves

h., auscultation of. Shows intensity, quality, and rhythm of heart sounds and detects the presence of any adventitious sounds, as murmurs. The 2 sounds over the heart have been represented by the syllables "lubb," "dupp." The first sound (systolic) results from the contraction of the ventricle, tension of the auriculo-ventricular valves, and the impact of the heart against the chest wall, and is

CIRCULATION OF THE BLOOD
THROUGH THE HEART

A Superior vena cava B Inferior vena cava C Right atrium D Right ventricle E Pulmonary artery. F. Pulmonary veins G Left atrium. H. Left ventricle. I Aorta

synchronous with the apex beat and carotid pulse. This sound is prolonged and dull, after the first sound is a short pause, then the second sound (diastolic), which results from the closure of the aortic and pulmonary valves. This sound is short and high pitched. After the second sound a longer pause follows before the first is heard again.

INTENSITY Both sounds are accentuated in: (1) Excitement of heart from any cause, (2) anemia; (3) cardiac hypertrophy; (4) subjects with thin chest walls; (5) consolidation of the lung, as in phthisis and pneumonia. *Accentuation of the aortic second sound results from:* (a) Hypertrophy of the left ventricle; (b) high arterial tension, as in arteriosclerosis and Bright's disease, (c) aortic aneurysm. *Accentuation of the pulmonary second sound results from.* (a) Pulmonary obstruction, as in emphysema, pneumonia and the congestion of the lungs following mitral disease; (b) hypertrophy of the right ventricle. *Weakness of both sounds is noted in:* (a) General obesity; (b) general debility; (c) degeneration or dilatation of

the heart; (d) pericardial or pleural effusion; (e) emphysema

REDUPLICATION — **HEART SOUNDS**: Probably due to a lack of synchronous action in the valves of the 2 sides of the heart, and results from many conditions, but notably from increased resistance in the systemic or the pulmonary circulation, as in arteriosclerosis of chronic nephritis and in emphysema. Frequently noted in mitral stenosis and pericarditis.

ADVENTITIOUS SOUNDS: **Murmurs**: A murmur is an abnormal sound heard over the heart or blood vessels and may result from (1) Obstruction or regurgitation at the valves following endocarditis, (2) dilatation of the ventricle or relaxation of its walls rendering the valves relatively insufficient, (3) aneurysm, (4) a change in the blood constituents, as in anemia; (5) roughening of the pericardial surfaces, as in pericarditis, (6) irregular action of the heart.

Murmurs produced within the heart are termed **endocardial**, those outside **exocardial**, those produced in aneurysms, bruits, those produced by anemia, hemic murmurs.

Hemic murmurs: They are soft and blowing in character, usually systolic in time, heard best over pulmonary valves. Associated with symptoms of anemia, and disappear with the latter.

Aneurysmal murmur or bruit. Usually loud, booming in character, systolic in time, heard best over the aorta or base of heart and is often associated with an abnormal area of dullness and pulsation, and with symptoms resulting from pressure on neighboring structures.

Pericardial friction sounds. Pericardial murmurs or friction sounds are superficial, rough, and creaking in quality, to and fro in time, not transmitted beyond the precordium and may be modified by pressure of the stethoscope.

PROCEDURE Patient should be recumbent when beginning examination, then, having elicited all the signs possible, repeat with patient sitting or standing and note any variations from change of position. First listen while patient is breathing naturally, then while holding breath, and finally have patient take 3 or 4 forced inspirations. Explore whole thoracic cavity and endeavor to localize the points at which heart sounds, both normal and abnormal, are heard with the greatest distinctness. Proceed from below upward, from left to right.

VALVES **Location for auscultation**: **Aortic**. 3rd intercostal space, close to left side of sternum. **Pulmonary**, in front of aorta, behind junction of 3rd costal cartilage with sternum, left side. **Tricuspid**, behind middle of sternum about level of 4th of costal cartilage. **Mitral**, behind 3rd intercostal space about 1 in. to the left of sternum.

h. block. Condition in which the conductile tissue of the heart (S-A node and the bundle of His its branches) fails to conduct impulses normally from the auricle to the ventricles. Such results in altered rhythm of heart beat with loss of every other, or of every 3rd beat, the auricular systole not always being followed by the ventricular systole, the bundle of His failing to transmit the regular systolic impulse. The ventricle contracts regularly at a much slower rate than the auricle. The contractions begin at the sino-auricular node, or normal point, but

they are interrupted before they reach their destination. The pulse is very slow, usually under 30.

Etiol. (a) Structural changes as from tumor or degeneration or embryonic maldevelopment. (b) Toxic effects of drugs or the toxins of infections. (c) Nutritional or functional factors.

h. block, abortive. B in which there is interference in terminal fibers of the Purkinje system.

h. block, atrioventricular. B. in which impulses are impeded at the A-V node.

h. block, bundle-branch. B in which impulses are blocked in one of the branches of the bundle of His, resulting in ventricles beating independently of each other.

h. block, complete. Condition in which there is a complete dissociation between auricular and ventricular systoles. Ventricles may beat at a rate of 30 to 40 per min while auricles are beating the normal 70 beats per min.

h. block, congenital. H. b. present at birth due to improper development of the impulse-conducting system.

h. block, incomplete. H. b. in which conduction time of impulses is prolonged, usually recognized only by electrocardiograph, partial h. b.

h. block, interventricular. Bundle-branch block, q r.

h. block, partial. One of 2 or 3 impulses passes to ventricle, pulse is thus 40-50.

h. block, sinoatrial. H. b. in which there is interference in the passage of impulses from the S-A node. May be partial or complete.

h. boatshaped. H. in which 1. ventricle is dilated and hypertrophied as a result of aortic regurgitation.

h. dilatation of. Enlargement of heart due to stretching of its walls. **VARIETIES**: 1. Dilatation with thickening of walls 2. Dilatation with thinning of walls. **Sym**: So long as the associated hypertrophy keeps pace with the dilatation no symptoms result, but otherwise dyspnea, cough, dyspepsia, scanty urine, dropsy, feeble pulse. **Treatment**: Rest, light, nutritious diet—improve general condition.

h. disease. Any pathological disorder of the heart.

Intravenous injections of epsom salt are being tried to detect the early stages.

h. failure. 1 Cessation of the beat of the heart. 2 A syndrome or clinical condition resulting from failure of the heart to maintain adequate circulation of blood. May result from failure of the right or left ventricle or both.

Etiol. Hypertension, infections, valvular insufficiency, coronary disease, congenital malformations, arteriosclerosis, atherosclerosis.

Sym: Dyspnea, cardiac asthma, stasis in systemic or portal circulation, edema, cyanosis, hypertrophy of heart. Symptoms vary depending on which side of the heart is affected.

h. f., backward. H. f. in which venous return to the heart is reduced with resulting venous stasis and congestion. Due principally to failure of the right ventricle.

h. f., congestive. Condition characterized by weakness, breathlessness, abdominal discomfort, edema in lower portions of body resulting from venous stasis and reduced outflow of blood. Also called **myocardial insufficiency**, **cardiac decompensation**.

h. f., forward. H. f. in which forward flow of blood to the tissues is inadequate due to failure of the left ventricle.

h., fatty degeneration of. Cardiac muscle becomes metamorphosed into fat. **SYM:** All signs of heart failure, viz.: dyspnea; asthma; cough; weak, irregular pulse; poor digestion; attacks of syncope. **PROG:** Unfavorable. Death may occur on slight exertion. **TREATMENT:** Rest of body and mind—light, nutritious diet—medication called for by individual condition.

h., fatty infiltration of. Abnormal amount of fat deposited in and upon heart. **SYM:** Shortness of breath, increased by exertion. Weak but regular pulse, precordial distress, tendency to pulmonary congestion, with resulting bronchitis and sluggish digestion. **PROG:** Favorable. **TREATMENT:** Regulated diet, fats, sugars and starches restricted, exercise, Turkish baths.

h., fibroid. **SYM:** Same as fatty degeneration, condition dependent upon atheroma or sclerosis of coronary arteries. **TREATMENT:** Same as in fatty heart.

h., hairy. **H.** in which pericardium possesses a hairy appearance resulting from deposit of an exudate or shreds of fibrin. Occurs in pericarditis.

Also called *cor villosum*, *shaggy heart*.

h., hypertrophy of. Enlargement due to overgrowth of its muscle. **VARIETIES:** 1. *Simple h.* Thickened muscle and cavities normal size. 2. *Excentric h.* Thickened muscle and cavities dilated. 3. *Concentric h.* Thickened muscle and cavities diminished in size. Always congenital. **SYM:** Unless advanced, no symptoms. Extreme hypertrophy, has precordial distress, palpitation. Strong pulse. Sometimes flushed face, ringing in ears, flashes of light, headache, and disturbed sleep. **TREATMENT:** Graduated exercise, light diet, sedatives.

h., irritable. Neurocirculatory asthenia, or effort syndrome. Syndrome characterized by breathlessness, palpitation, weakness and exhaustion. Also called *soldiers heart*.

h., palpitation of. Not only determines position, force, extent, and rhythm of apex beat, but also detects existence of any fremitus or thrill. A thrill is a vibratory sensation likened to that received when the hand is placed on the back of a purring cat. Thrills at base of heart may result from valvular lesions, atheroma of aorta, aneurysm, and from roughened pericardial surfaces, as in pericarditis. A presystolic thrill at apex is almost pathognomonic of mitral stenosis.

h., palpitation of. May result from dyspepsia; excitement, mental or physical; organic heart disease, exophthalmic goiter; overwork, as the "irritable heart" of untrained recruits; anemia; hysteria; or an independent neurosis. Also, *endocarditis*, *myocarditis*, *pericarditis* due to infection, to trauma, circulatory disturbances, disorders of metabolism, nutrition, and growth.

h., percussion of. Determines shape and extent of cardiac dullness. The normal area of superficial or absolute percussion—dullness (part uncovered by lung) is detected by light percussion and extends from the 4th left costosternal junction to the apex beat; from the apex beat to the junction of the xiphoid cartilage with the sternum, and thence up left border of the sternum. The normal area of deep percussion dullness (the heart projected on the chest

wall) is detected by firm percussion and extends from 3rd left costosternal articulation to the apex beat; from apex beat to junction of the xiphoid cartilage with the sternum; and hence up right border of sternum to the 3rd rib. The lower level of the cardiac dullness fuses with the liver dullness and can rarely be determined. The area of cardiac dullness is increased in: (1) Hypertrophy and dilation of the heart; (2) pericardial effusion. It is apparently increased in shrinking of the lungs, as in phthisis. The area of cardiac dullness is diminished in: (1) Emphysema. (2) pneumothorax, (3) pneumocardium (rare); (4) gaseous distention of stomach.

h. reflex. A cardiac reflex; any reflex in which the stimulation of a sensory nerve brings about an increase or decrease in heart rate. **EX:** Bainbridge's reflex in which stimulation of sensory receptors in rt. atrium by increased venous return results in increase of heart rate.

h. sounds. **SRR:** *h., auscultation of h. test.* Master has determined the efficiency of the heart by the number of steps a normal individual can ascend in a given time without increasing the heart rate more than 10 beats per minute and without increasing the blood pressure. The following rates were established:

	Age	Weight	Ascent or Steps
Man	20-24	130-139 lbs.	25
"	45-	150-159	21
"	45-	190-	19
Woman	40-	120-	20
"	53-	156	17

heartburn. Acid liquid raised from the stomach, causing sensation of burning in the esophagus. **SYN:** *pyrosis*. **SEE:** *ardor ventriculi*.

heat [*G heito*, fever]. 1. Condition of being hot; warmth. 2. High temperature. 3. A form of energy manifested to the senses, as in the effects of fire, sun's rays, etc. 4. Sexual excitement in lower mammals; period of such excitement. **SYN:** *estrus*. 5. To make hot. 6. To become warm.

Heat is constantly being produced within the body as a result of exothermic chemical processes occurring in metabolic activities. Ultimately all heat produced in the body results from oxidative processes. Body temperature (normally 98.6° F. or 37° C.) is the result of a balance between heat produced (*thermogenesis*) and heat loss (*thermolysis*).

The temperature of the body is not uniform. Oral temperatures range from 96.6° F. to 100° F. (ave 98.6° F.). Axillary temperature averages 0.5° F. lower; rectal temperature averages 0.6° higher.

Reducing the temperature of the skin reflexly brings about a constriction of the blood vessels, thus reducing heat loss and conserving heat within the body. The application of heat reflexly induces the dilation of blood vessels thus increasing blood flow to the skin with consequent increase in heat loss.

The application of heat to the skin reflexly produces effects in the deeper portions of the body. In general, internal organs are reflexly related to the region of the skin lying directly over them, and the effects are the same as those produced in the cutaneous area stimulated. Heat application induces muscle relaxation, increased blood sup-

The mode of elimination of body heat and the per cent of heat lost through each of the following is:

Radiation	55%	94%
Convection and Conduction	15%	
Evaporation through skin and lungs	24%	
Warming inspired air	2%	6%
Elimination of CO ₂ from lungs	3%	
Warming ingested food and water and loss through feces and urine	1%	

Figures are approximate and vary with physiological activity of the body

ply and stimulates metabolic activity. Physiological effects resulting are hyperemia, sedation of sensory or motor activity, and attenuation of bacteria. Application of cold tends to produce the opposite effects. Heat, by stimulating circulation and dilating blood vessels, has a tendency to spread infection, and for this reason is no longer used in suspected appendicitis.

Relaxation of muscular tissue results in relief of pain, which may be due to rigidity and tension in tissues. Local hot applications may have some reflex effect on deep organs, as in cases of lobar pneumonia, when the lung is known to be in a state of congestion, local heat is applied in order to relieve, probably, the congestion of the lung by inducing a superficial hyperemia.

H., APPLICATION OF, GENERAL. May be dry, as in the form of electric and radiant heat and hot air baths, or moist, when water or water vapor is used. The effect is first to produce a slight contraction of vessels in skin, thus increasing blood pressure and driving blood into the internal organs, this makes patient feel that his head is full and bursting. This effect is, however, only of very short duration, and discomfort can be avoided by application of cold compress or ice bag to head.

The true effect follows immediately, when blood vessels in skin are dilated, due to relaxation of involuntary muscle contained in their walls, the skin is reddened, increased blood supply to the sweat glands causes them to act freely, and waste products are better eliminated and heat is lost to the body. For this reason applications of heat are most often used to increase sweating and so relieve work of kidneys in cases of renal disease.

During a general application of heat it is necessary to watch the patient carefully, noting any apparent discomfort caused, also state of pulse and respiration and color.

H., APPLICATION OF, LOCAL. May be dry or moist. Dry applications include hot absorbent wool, rubber hot-water bottles, bags of hot salt or bran previously heated in an oven, radiant heat, electric pads, and diathermy.

H., APPLICATION OF, MOIST. Considered more penetrating than dry heat, thus more readily relaxing muscular spasm and relieving pain due to this. Hot compresses of hypertonic saline will relieve edema and tension in tissues which may be causing great pain.

Ex. Fomentations or stupes, either simple or medicated; poultices such as bread, linseed, linseed and mustard, linseed and charcoal, and antiphlogistine. A starch poultice may also be applied hot.

h., atomic. That amount which will raise an atom from 0° to 1° C.

h., body, loss of. The skin is supposed to lose 87.5 cal., the lungs 10.7 cal., and through excreta, 1.8 cal. In a healthy adult man weighing 154.28 lb., loss in elimination has been estimated in the table above.

h., conductive. A term applied to heat transferred by conduction from poultices, bags, etc.

h., convective. That supplied from heated particles of gases or liquids, such as superheated air, melted paraffin, incandescent light apparatus, or the whirlpool bath.

h., converse. A term used to designate heat generated in the tissues by a current of electricity or by some form of radiant energy.

h., cramps. Severe, intermittent, spasmodic cramping of muscles in abdomen and extremities.

Etiol. Profuse sweating due to deficiency of salt in the tissues. Often found in individuals who have been drinking large volumes of water and perspire profusely for long period of time, not fatal.

Sym. Hypochloremia. In addition to free sweating, cramps are felt in the legs and in other regions accompanied by fever, rapid pulse, pains, increased blood pressure, and loss of weight.

F. A TREATMENT. Adm. $\frac{1}{4}$ teaspoonful of ordinary table salt (sodium chloride) in glass of water. Repeat at 5- to 30-minute intervals until cramping ceases. May be prevented by adding salt to drinking water on hot days, particularly to hard working individuals.

As a preventive, 100-300 gr. of salt per day is necessary to compensate for each 2 quarts of sweat excreted. The salt aids in holding the water in the tissues.

If the supply of salt is lowered, thirst calls for more water, but the intake of water is dependent upon the increase of the salt. Local applications of heat to reduce pain and salt solution by mouth or injection. See cramps, salt.

h., diathermy. Electrical energy is converted into heat by the use of diathermy and short wave.

h., dry. May be adm. in form of hot, dry pack; hot water bottle, electric light bath, heliotherapy; hot bricks; resistance coil; electric pad or blanket; hot air bath, or therapeutic lamp.

h., exhaustion. Must not be mistaken for heatstroke, q.v. Usually affects adults, esp. the debilitated and fatigued.

Sym: Dizziness, nausea, faintness, weakness. Unconsciousness often follows. Skin pale, cool, moist; pulse rapid; respiration shallow and hurried.

PROG: Favorable under proper treatment.

F. A. TREATMENT: Lower head and shoulders; elevate lower extremities. Stimulate with aromatic spirits of ammonia to nostrils. Hot, black coffee or tea. External heat and massage. No cold drinks.

h., initial. Muscular heat produced (a) during contraction when tension is increasing, (b) during maintenance of tension, and (c) during relaxation when tension is diminishing.

h., latent. The heat which is required to convert a solid into a liquid or a liquid into a gas at the same temperature.

h., latent, of fusion. That which is required to convert 1 Gm. of a solid into liquid at the same temperature, e.g., when 1 Gm. of ice at 0° C is converted into water at 0° C; this process requires 80 calories, and until it is completed there will be no rise of temperature.

h., latent, of vaporization. That required to change 1 Gm. of a liquid at its boiling point to vapor at the same temperature. The latent heat of steam is 540 calories, therefore, when steam cools to liquid, each Gm. gives out 540 calories. This explains why it is that a scald from steam is much more severe than one caused by boiling water.

h., luminous. That derived from light. This may be borne better than other forms of radiation. Light may be converted into heat. Short infrared rays penetrate subcutaneous tissues to a greater extent than long, invisible rays.

h., mechanical equivalent of. The value of heat units in terms of work units. One calorie equals 426.5 gram-meters or 3.085 foot-pounds.

h., moist. May be applied as hot bath pack, hot wet pack, hot foot bath, fomentations, poultices or vapor bath.

WARNINGS: Watch for chill, fainting, dizziness, headache, collapse, faintness, increased pulse, weakness. Cold applications to head should be used during and after treatment. Opinion regarding therapeutic use of heat or cold differs.

h., molecular. Result of multiplying a substance's molecular weight by its specific heat.

h., prickly. Vesicles due to obstruction or acute inflammation of sweat glands. **SYN:** *millaria*.

h., radiant. Heat given off from a heated body and which passes through the air in form of waves.

h. rays. Visible rays from 4000-7000 A. U. and infrared rays from 6000-14,000 A. U.

h. recovery. Muscular heat produced after relaxation is complete.

h., sensible. Heat producing a temperature rise when absorbed by a body.

h., specific. The heat or number of calories needed to raise the temperature of 1 gram of a substance 1° C.

h. therapy. Use of heat in treatment of the body.

h. therapy, wet. Application of heat by hot water, steam and mud baths, and the hot pack, etc.

h. unit. A calorie, *q.v.*

heatstroke. Result of direct exposure to high temperatures or to sun, usually in adults, esp those who have been taking alcoholic beverages or who are debilitated or fatigued.

SYM: Early symptoms are dizziness, weakness, nausea, spots before the eyes and ringing in the ears. Bright red, dry skin; rapid, strong pulse, later becoming weak. Unconsciousness usually follows. Temperature may reach 108°; occasionally 112°. Latter patients usually do not recover.

F. A. TREATMENT: Patient should be cooled off in any conceivable manner. Remove clothing. Apply cold cloths, or pour cold water over person. Gently massage to help circulate blood. Cold water irrigations of the bowel are of value. Do not give stimulants of any sort. Heatstroke is a grave emergency, and must be treated promptly.

hebeosteotomy (hē'be-os-te-ō'tō-mī) [*G* *ēbē*, pubes, + *osteon*, bone, + *tomē*, incision] Section of the pubic bone in order to enlarge the pelvic opening for facilitation of delivery. **SYN:** *pubiotomy*.

hebeephrenia (hē-bē-frē'nī-ā) [*G* *ēbē*, puberty, + *phren*, mind] A type of schizophrenic reaction characterized by infantile behavior, regression and deterioration. Shallow emotional responses, illogical and senseless thought processes and actions, delusions, and hallucinations. Patient may laugh often without cause, talk incoherently and excessively, undergo rapid mood change. Occurs often at age of or following puberty.

Heatstroke versus Heat Exhaustion

Heat or Sunstroke. Definition: A condition or derangement of the heat-control centers due to exposure to the rays of the sun or very high temperatures.

History: Exposure to sun's rays

Differential Symptoms:

Face: Red, dry, and hot

Skin: Hot, dry, and no diaphoresis

Temperature: High, 108° to 110° F.

Pulse: Full, strong, bounding

Respirations: Dyspneic and sonorous

Muscles: Tense and possible convulsions

Eyes: Pupils are dilated but equal

Treatment: Absolute rest with head elevated. Cold packs to prolong radiation of body heat

Drugs: Allow no stimulants; give infusions of normal saline (to force fluids)

Heat Exhaustion. Definition: A state of very definite weakness produced by the loss of the normal fluids and sodium chloride of the body.

History: Exposure to heat, usually indoors

Differential Symptoms:

Face: Pale, cool, and moist

Skin: Cool, clammy, with profuse diaphoresis

Temperature: Slight elevation to sub-normal

Pulse: Weak, thready, and rapid

Respirations: Shallow and quiet

Muscles: Tense and contracted

Eyes: Pupils are normal

Treatment: Keep patient quiet; head should be lowered. Keep body warm to prevent shock symptoms

Drugs: Aromatic spirits of ammonia. Salt tablets and fruit juices in abundant amounts

hebephrenic (he-be-fren'ik) [+ *phrén*, mind]. Pert. to hebephrenia.

Heberden's asthma. Paroxysms of severe pain about heart and down left arm, with sense of oppression. SYN *angina pectoris, q.v.*

H.'s disease. Arthritis deformans.

H.'s nodes. Hard nodules or enlargements of tubercles of last phalanges of fingers, seen in osteoarthritis.

hebetific (he-bet'ik) [G. *ebē*, puberty]. Pert. to or occurring at the time of puberty.

hebetomy [G. *ēbē*, pubes, + *tomē*, incision]. Section through pelvis to aid obstructed delivery. SYN *pubiotomy*.

hebétude (heb'e-tud) [L *hebetudo*, *hebere*, to be dull]. Mental dullness, as seen in exhaustive conditions.

There may be latent conditions suddenly manifesting themselves during the course of a disease not concerned with such a condition but aggravated by the sickness, such as a sudden appearance of hysteria, or the development of a phobia, hallucinations, or delusions.

hebestotomy (he-bos-te-o'-o-mi) [G *ēbē*, pubes, + *osteon*, bone, + *tomē*, incision]. Enlargement of pelvic diameter by section of the pelvis to aid delivery. SYN *hebotomy, pubiotomy*.

hebotomy [+ *tome*, incision]. Section through the pubis to facilitate labor. SYN *hebestotomy, pubiotomy*.

hecatomeritic (hek-a'ter-om-cr'ik) [G. *ekateros*, each of two, + *meros*, part]. Having processes on a spinal neuron, one supplying each side of the spinal cord.

hecatomeritic (hek-at-o-mer'ik) [G *ekateros*, each of two, + *meros*, part]. Having a process which divides into two parts, as that of a spinal sensory neuron, one passing to each side of the spinal cord.

hectic (hek'tik) [G *ektikos*, habitual]. Habitual or constitutional.

h. fever. A form of fever that occurs in connection with some organic disease, that is attended by some continuous and exhausting drain upon the system, as in pulmonary consumption or abscess of liver or kidney.

h. flush. The bright pink-red spot that appears on the cheek during a paroxysm of hectic fever.

hec'togram [G. *ekaton*, hundred, + *gramma*, weight]. One hundred grams, or 1543 7 grains.

hec'toliter [+ *litra*, a pound]. One hundred liters.

hec'tometer [+ *metron*, measure]. One hundred meters.

hedgehog crys'tals. Globular crystals of ammonium urate with spines found in urine.

hedonia. Excessive cheerfulness; amenomania.

hedonism (he'don-izm) [G. *ēdonē*, pleasure, + *ismos*, state]. A theory or standard of conduct in which the principal object of life is pleasure.

hemocoele (hed-ro-sēl) [G. *ēdra*, anus, + *kēlē*, hernia]. Hernia; prolapse through the anus. SYN: *proctocoele*.

heel [A.S. *hæla*, heel]. Post. extremity of foot. SYN: *calc.*

h. bone. Bone at back of tarsus. SYN: *os calcis, calcaneum, calcaneus*.

RS: *calcaneum, calcaneodynia, calcigrade, calx, os calcis*.

Hegar's sign (hay'garz). Sign present during 2nd and 3rd month of pregnancy, due to: (1) Softening of lower segments of uterus; (2) at this stage, the ovum does not fill the uterine cavity, so there

is an empty space in its lower part. On bimanual examination the lower part of uterus is easily compressed bet. fingers in the vagina and those of the other hand.

Heldenhain's demilunes (hî'den-hinz) Crescent-shaped groups of serous cells at the base of or along the sides of the mucous alveoli of the salivary glands, esp. sublingual and submaxillary, also called *crenscents* of Gianuzzi.

height (hit) [A.S. *hiehtu*]. Distance to which anything rises above that surface on which it rests.

Heine-Medin disease (hî'ne-ma'din) Acute infectious disease accompanied by motor paralysis and muscular atrophy, frequently with permanent deformity. SYN. *acute anterior poliomyelitis*.

Heister, spiral valve of. A spiral fold of the mucous membrane lining the cystic duct. It serves to keep the lumen open.

helcoid (hel'koid) [G *elkos*, ulcer, + *eidos*, form]. Resembling an ulcer.

helcology (hel-kol'o'-ji) [+ *logos*, study]. The study of ulcers.

helcoplasty (hel-ko-plas-ti) [+ *plastēin*, to form]. Grafting healthy skin on ulcers. SEE *dermatoplasty*.

helco'sis [+ *ōsis*]. The development of an ulcer. SYN *ulceration*.

helicine (hel'is-in) [G *eliz*, coil]. Pert to a helix or coil; spiral.

h. arteries. Term applied to tortuous arteries in cavernous tissue of the penis and clitoris, and in the uterus.

helcoid (hel'koyd) [+ *eidos*, resemblance]. Resembling a helix or spiral.

helicopodia (hel'li-ko-po'di-ā) [G *eliz*, coil, + *pous*, pod-, foot]. A peculiar movement in which the foot, when brought forward, drags and describes a partial arc. Results in a gait such as seen in spastic hemiplegia.

helicotrema (hel'li-ko-tre-mā) [G *eliz*, coil, + *trema*, a hole]. The opening at the tip of the cochlear canal where the scala tympani and scala vestibuli unite.

heliencephalitis (he'll-en-sef-al'i'tis) [G. *elios*, sun, + *egkephalos*, brain, + *-itis*, inflammation]. Inflammation of the brain as the result of sunstroke.

heliopho'bia [+ *phobos*, fear]. Abnormal fear of the sun's rays esp by one who has suffered a sunstroke.

helio'sis [+ *-ōsis*]. Sunstroke.

heliotherapy (he-li-o-ther'a-pi) [+ *therapeia*, treatment]. The therapeutic application of radiation from the sun which includes infrared, ultraviolet and visible radiation. SEE *solarium*.

heliotropism (he-li-o-trō-pizm) [+ *trepon*, to turn, + *ismos*, state of]. Chemotropism induced by the action of sunlight, the tendency of an organism to turn toward or grow toward sunlight.

he'llum [G *elios* sun]. A gaseous element (He). It is given off by radium and other radioactive elements as charged helium ions known as alpha rays.

Because of its low density, it being next to the lightest element known, it is mixed with air or oxygen and used in the treatment of various respiratory disorders. Because of its low solubility, it is mixed with air supplied to workers laboring under high atmospheric pressure, as in caissons. It reduces time required in adjustment to increasing or decreasing air pressure and reduces the danger of "bends".

he'lix [G *eliz*, coil]. Margin of the external ear.

Heller's test. A test for the presence of albumin in urine.

Pour ½ in. of pure nitric acid into a clean test tube, and carefully overlay it with an equal quantity of urine. The

Height and Weight Table

presence of albumin is indicated by the appearance of an opaque ring at the junction of the fluids, also known as the "cold" test. RS: *albumin, urine*.

Hel'in's law. Occurrence of twins once in 80 pregnancies, triplets once in 6400 pregnancies, quadruplets once in 512,000 pregnancies.

hel'minth [G *elmins, elminth-*, worm] 1 A worm-like animal. 2 More specifically any animal, either free-living or parasitic, belonging to the phyla Platyhelminthes (flat-worms), Acanthocephala (spiney-headed worms), nemathelminthes (thread or round worms) or Annelida (segmented worms).

helminthogogue (hel-minth'ag-og) [" + *agōgos*, leading]. A remedy that expels worms. SYN: *vermifuge*.

helminthemesis (hel-min-them e-sis) [" + *emesis* vomiting]. The vomiting of intestinal worms.

helminthiasis (hel-min-thi'a-sis) [G. *elmins, elminth-*, worm]. Having intestinal parasites or worms.

helmin'thic [G. *elmins, elminth-*, worm]. 1. Pertaining to worms. 2. Pert. to that which expels worms. SYN: *anthelminthic; vermifugal*.

helminthicide (hél-mín'thí-síd) [" + *L. caedere*, to kill]. A worm-expelling drug. SYN: *vermicide*.

helminthoid. Wormlike or resembling a worm.

helminthol'ogy [" + *logos*, study]. The study of intestinal vermiform parasites.

helmintho'ma [" + *ōma*, tumor]. A parasitic worm tumor.

helminthophobia (hel-min-tho-fó-bí-ā) [" + *phobos*, fear]. Morbid dread of worms or delusion of being infested by them.

helmitol (hel'mi-tol) A methenamine compound, claimed to be well tolerated, and suitable for prolonged use.

USES In cystitis, and other conditions where methenamine is indicated.

DOSAGE From 10-15 gr. (0.6-10 Gm) dissolved in water.

heloma (he-lo'má) [G *ēlos*, nail, + *ōma*, tumor] A callosity or corn SYN: *clavus*.

helosis (he-lo'sis) [" + *-ōsis*]. The state of having corns.

helotomeia (he-lo-to-mí'ā) [" + *tomē*, incision] Corn surgery.

helot'omon [" + *tomē*, incision]. Surgical knife for cutting corns.

helotomy (he-lo'to-mí) [" + *tomē*, incision] Surgical treatment of corns.

Helweg's bundle. SYN *Helweg's tract*, *Bechterew's bundle*. A tract in cervical region of spinal cord. Fibers arise from cell bodies in olive of the medulla and upper region of cord.

hemabarometer (hem'ab-ar-om'et-er) [G. *ama*, blood, + *baros*, weight, + *metron*, measure]. Device for determining sp. gr. of blood.

hemachrome (hem'a-krōm) [" + *chrōma*, color]. The red coloring substance of blood SEE *hemoglobin*.

hemachro'sis [" + *chrōsis*, coloring]. Abnormal redness of blood.

hemacytom'eter [" + *kytos*, cell, + *metron*, measure]. Apparatus for counting blood corpuscles.

hemacytozoön (hem-a-si-to-zo'on) [" + *zōon*, animal]. A protozoan parasite infesting red blood corpuscles.

hemad (he'mad) [A.S. *hem*, border, + *L. ad*, toward]. Toward the ventral or hemal aspect of the body. Opp. to neural or dorsal.

hemadostenosis (hem'a-do-sten-o'sis) [G. *aimas*, aimed-, blood stream, + *stenosis*, narrowing]. Contraction of blood vessels.

hemadromometer [G. *aima*, blood, + *dromos*, course, + *metron*, measure]. Device for recording rapidity of flow of blood. SYN: *hemodromometer*.

hemadynamometer (hem'a-di'na-mom'e-ter) [" + *dynamis*, power, + *metron*, measure]. Device for determining blood pressure.

hemadynamometry (hem'a-di-nā-mom'e-tri) [" + " + *metron*, measure]. Measurement of blood pressure.

hemafacient [" + *L. facere*, to make]. A blood producing agent. SYN: *hematopoietic*, *sanguifacient*.

hemafecia (hem-ā-fe'si-ā) [" + *L. faec*, *faec*-, dregs]. Feces containing blood.

hemagglutination (hem'ag-glu-tin-a'shun) [" + *L. agglutināre*, to paste to]. The clumping of red blood corpuscles.

hem'agglutinin [" + *L. agglutināre*, to paste to]. An antibody that induces clumping of red blood corpuscles.

hemagogue (hem'ag-og) [" + *agōgos*, leading]. An agent that favors the flow of blood or of the menses. SYN: *emmenagogue*.

he'mal [G. *aima*, blood]. 1. Pert to the blood or blood vessels. 2. Pert. to side of the body in which the heart is located.

h. arch. The ribs, breastbone, and that part of the vertebrae, which together enclose the heart and viscera.

h. gland. A hemal or hemolymph node

h. node. SYN: *hemal gland*, *hemolymph gland* or *node*. A body resembling a lymph node in structure but associated with blood vessels instead of lymph vessels. Present in certain ungulates

hemanal'ysis [" + *analysis*, a dissolving]. A blood analysis. SEE *blood*.

hemangiectasis (hem'an-jī-ek'ta-sis) [" + *aggein*, vessel, + *ektasis*, dilatation]. Dilatation of blood vessels

hemangioblastoma (hem'an-jī-o-blas-to'mā) [" + " + *blastos*, germ, + *ōma*, tumor]. Hemangioma of the brain of a capillary nature

hemangioendothelioma (hem'an-jī-o-en'-do-the-lī-o'ma) [" + " + *endon*, within, + *thēlē*, nipple, + *ōma*, tumor]. An overgrowth of the endothelium of the minute capillary vessels frequently on the cerebral meninges.

hemangioma (hem'an-jī-o'ma) (pl. *hemangiomata*) [" + " + *ōma*, tumor]. An angioma consisting of blood vessels.

hemangiomatosis (hem'an-jī-o-ma-to'sis) [" + " + " + *-ōsis*]. Multiple angioma of blood vessels

hemangiosarcoma (hem'an-jī-o-sar-ko'mā) [" + " + *sarx*, flesh, + *ōma*, tumor]. A mixed sarcoma and hemangioma. SYN: *angiosarcoma*.

hemaphem (hem-af-e'in) [G. *aima*, blood, + *phalos*, tawny]. Brown coloring matter in the blood; a decomposition product of hematin.

hemapoiesis (hem-ap-oī-e'sis) [" + *poiein*, to form]. Blood formation. SYN: *hematopoiesis*.

hemapoletic (hem-ap-oī-et'ik) [" + *poiein*, to form]. Pert. to hemapoiesis. SYN: *hematogenic*, *hematoplastic*.

hemapophysis (hēm-ā-pof'is-is) [G. *aima*, blood, + *apo*, from, —*physis*, growth]. Portion of a developing vertebra which forms a rib and costal cartilage.

hemarthros (hem-ar'thros) [" + *arthron*, joint]. Bloody effusion into cavity of a joint. SYN: *hemarthrosis*.

hemarthrosis (hem-ar-thro'sis) [" + " + *-ōsis*]. Effusion of blood in a joint cavity.

hematachometer (hem-at-ak-om'e-ter) [" + *tachos*, swift, + *metron*, measure]. Device for determining rapidity of the circulation.

hemataerometer [" + *aēr*, air, + *metron*, measure]. Device for measuring gases in the blood.

hematalloscopy (hem-at-al-os'ko-pi) [" + *allos*, other, + *skopein*, to examine]. Examination to distinguish one kind of blood from another

hematapostema (hem'at-ap-os-te'mā) (pl. *hematapostemata*) [" + *apostēma*, abscess]. Abscess containing extravasated blood.

hemateikon (hem-āt-ī'kon) [G. *aima*, blood, + *eikon*, image]. A microscopic picture of the blood

hematemesis (hem-at-em'e-sis) [" + *emesis*, vomiting]. Vomiting of blood.

SYN: Blood often clotted and mixed with food, acid in reaction. Subsequent stools may be tarry, associated symptoms point to stomach. If of gastric origin, the blood is generally dark and acid. If of pharyngeal origin, it is bright red and alkaline in reaction. In pulmonary tuberculosis, loss of blood may be from a teaspoonful to 2 quarts. It occurs in 60% of patients. Coldness, or followed by a rise in temperature, shock, collapse.

TREATMENT: Absolute rest, nothing by mouth, nourishment through rectal enemas. No stimulants. May take broth. Have patient lie down, cold applications—ice bag to abdominal region. Keep quiet. Surgery may be necessary. SEE: *hemoptysis*, *hemorrhage*.

hematencephalon (hem-at-en-sef'a-lōn) [" + *egkephalos*, brain]. Cerebral hemorrhage

hematherapy (hem-a-ther'ā-pl) [" + *therapeia*, treatment]. Adm. of fresh blood in treatment of disease.

hemathermal [G. *aima*, blood, + *thermē*, heat]. SYN: *homothermal*. Warm blooded, applied to animals whose blood remains at a fairly constant temperature

hemather'mous [" + *thermē*, heat]. Warm blooded. SYN: *hemathermal*, *hemothermal*.

hemathidrosis, **hematidrosis** (he-mat-hi-dro'sis) [" + *idros*, sweat, + *-ōsis*]. Condition of sweating blood.

hematic (he-mat'ik) [G. *aima*, blood]. 1. Rel. to the blood. 2. A remedy for anemia

hematim'eter [" + *metron*, measure]. Apparatus for counting blood corpuscles in a cu.mm. of blood. SYN: *hematometer*, *hemocytometer*.

hem'atin [G. *aima*, blood]. An acid radicle or brown amorphous substance that unites with globin in the formation of hemoglobin

It can be prepared from hemoglobin by the action of acids, alkalis, or enzymes. It is the iron-containing pigment of hemoglobin.

h. hydrochloride. The hydrochloric acid ester of hematin, crystalline in form.

Crystals dark brown and often seen in groups. SYN: *Teichmann's crystals*.

hematinemia (hem-ā-tin-e'mī-ā) [hematin + G. *aima*, blood]. Hematin in the circulating blood.

hematinic (hem-a-tin'ik) [G. *aima*, blood].

SYN: *hematic* 1. Pert. to blood 2. An agent which increases the amount of hemoglobin in the blood.

hematimeter (hem-a-l-in-om'et-er) [" + *metron*, measure] Device for determining quantity of hemoglobin in blood.

hematuria [" + *ouron*, urine]. Hematin in the urine. SYN *hemoglobinuria*.

hematichesis (hem-a-tis'ke-sis) [" + *schesis*, checking]. Arrest of bleeding or hemorrhage.

hemato'bium [" + *bios*, life]. A parasite that lives in the blood. SYN *hematozoon*.

hematoblast [G. *aima*, blood + *blastos*, germ] 1. A hemocytoblast, *q.v.* 2. Old term for blood platelet.

hematocele (hem-at-o-sēl) [" + *kēlē*, hernia] 1. A blood cyst 2. Effusion of blood into a cavity 3. Swelling due to effusion of blood into the *tunica vaginalis testis*.

h., parametric, pelvic, retrouterine. Tumor formed by blood effusion in the *cul-de-sac* of Douglas walled off by adhesions.

Error. Usually leakage from a fallopian tube, the seat of ectopic gestation.

TREATMENT. Rest, applications of cold and pressure to limit increase of size. Aspiration may be needed or incision if there are clots.

h., pudendal. A bloody tumor of the labium.

hematocelia (hem'ā-to-se'll-ā) [" + *kōlia*, cavity]. Hemorrhage into the peritoneal cavity.

hematoceph'alus [G. *aima*, blood, + *kephalē*, head]. Fetus born with infusion of blood in the head.

hematochezia (hem'ā-to-ke'zī-ā) [" + *chēzein*, to go to stool]. Passage of stools containing blood.

hematochromato'sis [" + *chrōma*, color, + *-ōsis*]. A condition showing staining of tissues with blood pigment. SYN *hemochromatosis*.

hematochyluria (hem'ā-to-ki-lū'rī-ā) [" + *chylōs*, juice, + *ouron*, urine]. Blood and chyle in the urine in *Filaria* infections.

hematocolpometra (hem'at-o-kol'po-me'tra) [" + *kolpos*, vagina, + *mētra*, uterus]. Retention of menstrual blood in the vagina and uterus.

hematocolpos (hem-at-o-kol'pos) [" + *kolpos*, vagina]. Retained menstrual blood in the vagina from an imperforate hymen.

hematocrit (hem'ā-to-krit) [" + *krinein*, to separate] 1. Centrifuge for separating solids from plasma in the blood 2. The volume of erythrocytes packed by centrifugation in a given volume of blood. The hematocrit is expressed as the percentage of total blood volume which consists of erythrocytes or as the volume in cubic centimeters of erythrocytes packed by centrifugation in 100 cc. of blood. Normal values—45 for males, 41 for females.

hematocryal (hem-at-o-kri'al) [" + *kryos*, cold]. Possessing cold blood.

hematocrystallin (hem-at-o-kris'tal-in) [" + *krystallos*, crystal]. The coloring matter of the blood. SYN *hemaglobin*.

hematocyst (hem-at-o-sist) [" + *kystis*, a bladder]. A blood cyst.

hematocyte (hem-at-o-sit) [G. *aima*, blood, + *kytos*, cell]. A blood corpuscle.

hematocytoblast (hem'ā-to-si'to-blast) [" + *blastos*, germ]. A cell in bone marrow.

Granular leukocytes of myeloid origin

are assumed to be derived from it. SYN: *leukoblast*, *lymphoidocyte*, *myeloblast*.

hematocytolysis (hem'ā-to-si-to-lis-is) [" + *lysis*, dissolution]. Dissolution of blood corpuscles freeing hemoglobin. SYN *hemolysis*.

hematocytometer (hem-at-o-si-tom'et-er) [" + *metron*, measure]. Device for determining number of corpuscles in given quantity of blood.

hematocytozoon (hem'ā-to-si-to-zo'on) [" + *zōon*, animal]. A parasite which lives in red blood corpuscles.

hematocyturia (hem'ā-to-si-tū'rī-ā) [" + *ouron*, urine]. Red blood corpuscles in urine, *hematuria** as differentiated from *hemoglobinuria*.

hematodyscrasia. A pathological condition of the blood.

hematodystrophy (hem'ā-to-dis'tro-fi) [" + *dys*, bad, + *trophē*, nutrition]. Any disorder of blood, such as anemia.

hematogenesis (hem'ā-to-jen'es-is) [" + *genesis*, formation]. The development of blood corpuscles. SYN *hematopoiesis*.

hematogenic, hematogenous (hem-a-to-jen'ik, -ā-to-jen-us) [" + *gennan*, to produce]. Pert. to formation of blood. SYN *hematopoietic*.

hematoglob'ulin [" + *L globus*, globe]. Coloring matter of blood. SYN *hemoglobin*, *oxyhemoglobin*.

hematohidrosis (hem'ā-to-hi-dro'sis) [" + *idros*, sweat, + *-ōsis*]. Excretion of bloody sweat. SYN *hematohidrosis*.

hematohistioblast (hem'a-to-his'ti-o-blast) [" + *histos*, tissue, + *blastos*, germ]. A polymorphous white blood cell of large size forming connective tissue.

hematoid (he-mā-to'id) [G. *aima*, blood, + *eidos*, resemblance]. Resembling blood.

hematoidin (hem-ā-toy'din) [" + *eidos*, resemblance]. An iron-free principle in remains of old blood clots.

hematokolpos (hem-at-o-kol'pos) [" + *kolpos*, vagina]. Collection of blood in the vagina. SYN *hematocolpos*.

hematokrit (hem'at-o-krit) [" + *krinein*, to separate]. Device for determining number of corpuscles in the blood. SYN *hematocrit*.

hematolith [" + *lithos*, stone]. Concretion in a blood vessel wall. SYN *hemolith*.

hematologist. One who specializes in the study of the blood.

hematology (hem-at-o-lō-gi) [" + *logos*, science]. The science of the blood.

hematolymphangioma (hem'ā-to-limf-an'-ji-o-mā) [" + *L lymphā*, lymph, + *G. aggeion*, vessel, + *ōma*, tumor]. A tumor consisting of dilated blood vessels and lymphatics.

hematolysis (hem-at-o-lis-is) [" + *lysis*, dissolution]. A term applied to (a) diminished coagulability, or (b) to the destruction or disorganization of the blood and its corpuscles. SEE *hemolysis*.

hematolytic (hem-ā-to-lit'ik) [" + *lysis*, dissolution]. Pert. to hematolysis. SYN *hemolytic*.

hematoma (hem-ā-to-mā) [G. *aima*, blood, + *ōma*, tumor]. A blood tumor.

h., auris. One beneath perichondrium of ear cartilage.

h., pelvic. One affecting cellular tissue of pelvis. **TREATMENT:** Cold applications, rest, compression, massage.

h., subdural. H. located beneath the dura, usually the result of head injuries.

h., vulvar. H. occurring on the vulva. **SYM.** Distention and purplish swelling. **TREATMENT:** Surgical; light pack which is removed in 24 hours at latest.

hematomedialastinum (hem"ă-to-me"di-ă-siŭ-nŭm) {" + L *mediastinus*, in the middle]. Blood effusion into the mediastinum

hematometer (he-mă-tom'et-er) {" + *metron*, measure]. Device for determining the properties of blood

hematometra (he-mă-to-me'tră) {" + *mētra*, uterus]. 1 Hemorrhage in the uterus 2 Accumulation of menstrual blood in the womb SEE *hematocolpos*, *hydrometra*, *pyometra*.

hematometry {" + *metron*, measure]. Determination of varieties and number of blood cells and percentage of hemoglobin in the blood

hematomphalocele (hem"at-om-fal'o-sēl) {" + *omphalos*, navel, + *kēlē*, hernia]. Effusion of blood into an umbilical hernia

hematomphelia (he-mă-to-mī-e'lī-ă) {" + *myelos*, marrow]. Hemorrhage of blood into the spinal cord

hematomphilitis (hem"ă-to-mī-el-i'tis) {" + " + *-itis*, inflammation]. Inflammation of spinal cord with bloody effusion

hematomyelopenia (hem-at-o-mī-el-o-pē-ri) {" + " + *poros*, opening]. Porous condition of the spinal cord resulting from hemorrhages

hematonephrosis (hem-ă-to-nē-fro'sis) {" + *nephros*, kidney, + *ōsis*] Blood distending the pelvis of the kidney

hematon'ic {" + *tonos*, tone]. A blood tonic given to raise the percentage of hemoglobin

hematopathology {" + *pathos*, disease, + *logos*, study]. The study of morbid conditions of the blood

hematopericardium {" + *peri*, around, + *kardia*, heart]. Bloody effusion into the pericardial sac

hematoperitoneum {" + *peritoneum* peritoneum]. Bloody effusion into the peritoneal cavity SYN *hemoperitoneum*.

hematopexin {" + *pēxis*, fixation]. That which coagulates blood SYN *hemopexin*.

hematopexis {" + *pēxis*, fixation]. Coagulation of the blood SYN *hemopexia*

hematophage {" + *phagein*, to eat]. A phagocytic cell which destroys red blood corpuscles

hematophagia (hem-at-o-fa'jī-ă) {" + *phagein*, to eat]. 1 Subsistence on blood. 2 Adm. of blood as a treatment

hematophagous (hem-ă-tof'ag-us) {" + *phagein*, to eat]. Living on blood

hematophilla (hem-at-o-flī-ă) [G *aima*, blood, + *philein*, to love]. Congenital condition characterized by defective blood coagulation causing copious hemorrhages SYN *hemophilia*.

hematophobia (hem"ăt-ô-fô'bī-ă) [G *aima*, *aima*-, blood, + *phobos*, fear]. Abnormal aversion to the sight of blood.

hematophthalmia (he-ma-tof-thal'mī-ă) {" + *ophthalmos*, eye]. Blood in the vitreous humor

hematophyte (hem-ă-to-fit) {" + *phyton*, plant]. Plant organism or bacteria in the blood.

hematoplasia {" + *planē*, wandering]. Condition of vicarious menstruation.

hematoplastic {" + *plassein*, to form]. Pert to formation of blood SYN: *hematopoietic*.

hematopneic (hem-ă-to-pne'ik) {" + *pnein*, to breathe]. Rel. to oxygenation of the blood

hematopoesis (he-mă-to-poi-e'sis) {" + *poiein*, to form]. The formation of red blood corpuscles.

Tissues which can produce red corpuscles are said to be *hematopoietic*, as, for instance, the red bone marrow.

hematopoietic (hem"ă-to-poi-e'tik) {" + *poiein*, to make]. Rel. to blood-making processes SYN *hematogenic*, *hematoplastic*.

hematoporphyrin (hem"ă-to-por'fir-in) {" + *porphyrin*, purple]. Iron-free hematin, a decomposition product of hemoglobin in the urine in certain conditions

hematoporphyrinuria (hem"ă-to-por'fir-in-u'ri-ă) {" + " + *ouron*, urine]. Hematoporphyrin in urine

hematopsia (hem"ă-to-po'sī-ă) {" + *opsis*, a draught]. Drinking of blood SEE *hematophagia*.

hematorrhachis (he-mă-tor'ră-kis) {" + *rachis*, spine]. Hemorrhage into the spinal cord

hematorrhea (he-mă-tor-rē-ă) {" + *roia*, flow]. Profuse hemorrhage

hematosalpinx (he-mă-to-sal'pinks) {" + *salpinx*, tube]. Retained menstrual fluid in the fallopian tube

hematoschecele (hem-ă-tos'te-o-sēl) {" + *oscheon*, scrotum, + *kēlē*, hernia]. Blood accumulated in the scrotum

hematoscope (he-mat-o-skōp) {" + *skopein*, to examine]. Device for examining the blood

hematocopy (hem-at-os'ko-pl) {" + *skopein*, to examine]. Examination of the blood

hematose (hem'at-ōs) {" + *-ōsis*]. Full of blood

hematosepsis (hem-at-o-sep'sis) {" + *sēpsis*, putrefaction]. Blood toxemia. SYN *septicemia*

hematosin (hem-at-o'sin) [G *aima*, blood]. Decomposition product of hemoglobin SYN *hematin*.

hematosis (he-ma-to'sis) {" + *-ōsis*]. 1 The formation of blood and the development of the red blood corpuscles. 2. The oxygenation of blood in the lungs

hematospectroscope {" + L *spectrum*, image, + G *skopein*, to examine]. Spectroscope for inspecting the blood

hematospectroscopy {" + " + G *skopein* to examine]. Examination of the blood with the hematospectroscope

hematospermatocoele (hem"ă-to-sper-mat'o-sēl) {" + *sperma*, seed, + *kēlē*, tumor]. A blood-filled spermatocoele

hematospermia (he-mă-to-sper'mī-ă) {" + *sperma*, seed]. Bloody semen.

h. spuria. When coming from the prostatic urethra

h. vera. When coming from the seminal vessels

hematostatic (he-mat-o-stat'ik) [G *aima*, blood, + *stasis*, a standing]. SYN *hemostatic* 1 Retaining blood in a part. 2 Pertaining to the arrest of blood flow in a hemorrhage

hematosteon (hem-ă-tos'te-on) {" + *osteon*, bone]. Bleeding into the medullary cavity of a bone

hemathermal {" + *thermē*, heat]. Warm blooded SYN *hemathermal*; *hemathermous*.

hemathorax (hem-at-o-tho'raks) {" + *thōrax*, chest]. Blood in the chest. SYN: *hemothorax*

hematotoxic {" + *toxikon*, poison]. Pert. to toxemia

hematotrachelos (he-mat-o-trak'e-los) {" + *trachelos*, neck]. Retained menstrual blood in cervix uteri causing distention

hematotympanum (hem-at-o-tim'pan-um) {" + *tympanon*, drum]. Blood in the middle ear

hematoxylin. A colorless crystalline compound, C₁₅H₁₀O₆, obtained by extraction

with ether from logwood. Upon oxidation it is converted into hematein, which stains certain structures a deep blue color. It is an excellent nuclear stain, and widely used in histological work.

hematozoon (he-mat-o-zo'on) [" + *zōon*, animal]. Any living organism in the blood.

hematozoyosis (hem-at-o-zī-mō'sis) [" + *zymōsis*, fermentation]. Blood fermentation.

hematuria (he-ma-tu'ri-a) [G. *aima*, blood, + *ouron*, urine]. Blood in the urine + *Syn*. Urine may be slightly smoky, reddish, or very red.

Error. Lesion of urinary tract, or blood dyscrasia, contamination during menstruation or puerperium, prostatic disease, tumors, poisoning, esp. carbolic acid and cantharides, malaria and toxemias and calculus.

Diag. If well mixed with urine, probably from kidneys. If clotted in tubular casts of ureters, from kidneys or ureters. If passed at beginning of urination, from the urethra, if at the end, from bladder.

h., renal. Urine smoky, sometimes bright red.

h., urethral. Always bright red. Precedes urination.

h., vesical. Urine bright red, not uniform.

hemaurochrome (hem"ā-u'ro-krōm) [" + *ouron*, urine, + *chrōma*, color]. A hematin derivative found in the urine in sarcoma and carcinoma, malaria, anemias and other disorders. Supposed to result from dissolution of red blood corpuscles.

heme. $\text{C}_{54}\text{H}_{32}\text{O}_2\text{N}_4\text{FeOH}$. An iron-containing protoporphyrin derived from hemin when hemin is treated with sodium hydroxide. Heme can combine with a large number of organic nitrogenous substances to form *hemochromogens*. Formerly called *hematin*.

hemeralopia (hem-er-al-o'pī-ā) [G. *ēmera*, day, + *alaos*, blind, + *ōps*, eye]. Day blindness or night blindness, found particularly in macular lesions. Term formerly erroneously applied to night-blindness or *nyctalopia* (inability to see in dim light).

The latter, *nyctalopia*, indicates inability to see in dim light though otherwise vision is normal.

In day blindness, the sight is poor in sunlight and in good illumination, it is good at dusk, at twilight, and in poor illumination. This is noted in albinism, retinitis with central scotoma, toxic amblyopia, coloboma of the iris and choroid, opacity of the crystalline lens or cornea, and in conjunctivitis with photophobia.

hemi- [G.]. Prefix meaning *half*.

hemicephalus. A monster with a markedly defective head. See *anencephalus*.

hemichromatopsia (he-mī-ak-ro-mat-op'-sī-ā) [G. *ēmi*, half, + *a-*, priv. + *chrōma*, color, + *opsis*, vision]. Color blindness in one-half, or in corresponding halves, of the visual field.

hemialbumin (hem-i-al-bū'min) [" + *L. albumen*, white of egg]. A product resulting from the digestion of albumin. **Syn:** *antialbumin*.

hemialbumose (hem-i-al-bū-mōs) [" + *L. albumen*, white of egg]. An albumoid product from the digestion of certain proteins. It occurs in bone marrow.

hemialbumosuria (" + *G. ouron*, urine]. Hemialbumose in the urine.

hemialgia (hem-i-al'jī-ā) [" + *algos*, pain]. Pain in one-half of the body.

hemiamaurosis (hem"i-am-aw-ro'sis) [" + *amaurosis*, darkness]. Blindness in one-half the visual field. **Syn:** *hemianopia*.

hemiambyopia (hem"i-am-bli-o'pī-ā) [" + *amblyos*, dim, + *ōps*, sight]. Blindness in half the visual field. **Syn:** *hemianopsia*.

hemiamyosthenia (hem"i-am'i-os-the'nī-ā) [" + *a-*, priv. + *mys*, *myo-*, muscle, + *sthenos*, strength]. Absence of normal muscular power on 1 side of the body. **Syn:** *hemiparesis*.

hemianacusia (hem"i-an-a-kū'sī-ā) [G. *ēmi*, half, + *an-*, priv. + *akousis*, hearing]. Deafness in 1 ear.

hemianalgesia (hem"i-an-al-ge'sī-ā) [" + *a-*, priv. + *algos*, pain]. Lack of sensibility to pain (analgesia) on 1 side of the body.

hemianesthesia (hem"i-an-es-the'zī-ā) [" + *a-*, priv. + *aisthesis*, sensation]. Anesthesia of one-half of the body.

hemianopia, hemianopsia (hem-i-an-op'i-ā, sī-ā) [" + *a-*, priv. + *ōps*, eye]. Blindness for one-half field of vision in 1 or both eyes. **h., altitudinal.** Blindness in upper or lower half in each eye.

h., binasal. Affection of nasal half of visual field in each eye.

h., biftemporal. Affection of temporal half of visual field in each eye.

h., complete. H. of half of each eye.

h., crossed. Bitemporal or binasal hemianopsia.

h., heteronymous. See *crossed h.*

h., homonymous. Blindness of nasal half of 1 eye and temporal half of the other or right-sided or left-sided h. of corresponding sides in both eyes.

h., incomplete. H. of less than half of each eye.

h., quadrant. Affection of symmetrical quadrant of the field in each eye.

h., unilateral, uncircular. Hemianopsia affecting only 1 eye.

hemianosmia (hem"i-an-os'mī-ā) [G. *ēmi*, half, + *an-*, priv. + *osmē*, smell]. Loss of smell in 1 nostril.

hemipraxis (hem"i-ā-prak'sī-ā) [" + *a-*, priv. + *praxis*, to do]. Incapacity to exercise purposeful movements on 1 side of the body.

hemiarthrosis (hem-i-ar-thro'sis) [" + *arthron*, joint, + *ōsis*]. A false articulation bet. 2 bones. **Syn:** *synchondrosis*.

hemiasynergia (hem"i-as-in-er'jī-ā) [" + *a-*, priv. + *syn*, with, + *ergon*, work]. Lack of coordination of parts affecting 1 side of the body.

hemiataxia (hem"i-ā-taks'jī-ā) [" + *ataxia*, lack of order]. Impaired muscular coordination causing awkward movements of the affected side of the body.

hemiatheosis (hem"i-ath-et-o'sis) [" + *athetos*, without fixed position, + *-ōsis*]. Slow change of position, athetosis of 1 side of the body.

hemiatrophy (hem-i-at'ro-fī) [" + *atrophia*, atrophy]. Impaired nutrition resulting in atrophy of 1 side of the face or other part, marked by white or yellow macules on affected side.

hemiballism (hem-i-bal'izm) [" + *balismos*, jumping]. Jerking and twitching movements of 1 side of the body. **Syn:** *hemichorea*.

hemic [G. *aima*, blood]. Pert. to blood. **Syn:** *hrenal*.

hemicanities (hem"i-kan-ish'i-ēz) [G. *ēmi*, half, + *L. canities*, gray hair]. Grayness (canities) of hair on 1 side only.

hemicardia (hem-i-kar'dī-ā) [" + *kardia*, heart]. Half of a 4-chambered heart.

hemicellulose (hem-i-sel'lu-lōs) [G *aima*, blood, + L. *cellula*, little cell] One of a group of polysaccharides which differ from cellulose in that they may be hydrolyzed by dilute mineral acids and from other polysaccharides in that they are not readily digested by amylases. Includes pentosans, galactosans (agar agar), and pectins.

hemicentrum (hem-i-sen'trum) [" + *ken-tro-n*, center]. Either lateral half of the centrum of a vertebra.

hemichorea (hem-i-ko-re'ā) [" + *choreia*, a dancing]. Convulsive movements (*chorea*) of but 1 side of the body.

hemichromatopsia (hem-'i-kro-mat-op'si-ā) [" + *chroma*, color, + *opsis*, vision]. Blindness to color in one-half of the visual field. SYN *hemichromatopia*.

hemichrania (hem-i-kra-ni-ā) [" + *kranion*, skull]. 1. Unilateral head pain, usually migraine. 2. Monstrosity having only one-half of the skull developed.

hemicianectomy (hem-'i-kra-ni-ek'to-mī) [" + " + *ektomē*, excision]. Surgical division of cranial vault from before, backward, exposing half of the brain.

hemicaniosis (hem-'i-kra-ni-o'sis) [" + " + *ōsis*]. Enlargement of half of cranium or face.

hemidiaphoresis (hem-'i-di-āf-or-e'sis) [" + *dia*, through, + *pherein*, to carry]. Sweating on 1 side of the body.

hemidiaphragm [" + " + *phragma*, wall]. Paralysis affecting only one-half of the diaphragm.

hemidrosis [" + *idrosis*, sweat]. Bloody sweating. SYN *hemathidrosis*.

hemidysergia [" + *dy*, bad, + *ergon*, work]. Lack of coordination of muscles (*dysergia*) on 1 side of the body.

hemidysesthesia (hem-'i-dis-es-the'si-ā) [" + " + *aisthēsis*, sensation]. Impaired sensation (*dysesthesia*) of one-half of the body.

hemidystrophy (hem-'i-dis'tro-fi) [" + " + *trophē*, nourishment]. Inequality in development of the 2 sides of the body.

hemiep'ilepsy [" + *epilepsia*, seizure]. Epilepsy with convulsions confined to 1 lateral half of the body.

hemifacial [G *ēmi*, half, + L. *faciēs*, face]. Pert to 1 side of the face.

hemigastrectomy (hem-'i-gas-trek'to-mī) [" + *gaster*, belly, + *ektomē*, excision]. Excision of pyloric end of the stomach for hourglass contraction.

hemigeusia (hem-i-gu'si-ā) [" + *geusis*, taste]. Loss of sense of taste on 1 side of the tongue.

hemiglossitis [" + *glōssa*, tongue, + *-itis*, inflammation]. Vesicular eruption on one-half of the tongue and inner surface of cheek. Herpetic in character.

hemihidrosis [" + *idrosis*, perspiration]. Sweating on only 1 side of the body. SYN: *hemidiaphoresis*.

hemihyperesthesia (hem-'i-hi-per-es-the'si-ā) [" + *yper*, over, + *aisthēsis*, sensation]. Abnormal tactile and painful sensibility of 1 side of the body.

hemihyperidrosis (hem-'i-hi-per-i-dro'sis) [" + " + *idrosis*, sweating]. Excessive perspiration confined to 1 side of the body.

hemihypertonia [" + " + *tonos*, tone]. Exaggerated tonicity of muscles on 1 lateral half of the body.

hemihyper'trophy [" + " + *trophē*, nourishment]. Muscular overgrowth (*hypertrophy*) of one-half of the body or face.

hemihypesthesia (hem-'i-hi-pes-the'si-ā) [" + *ypo*, under, + *aisthēsis*, sensation]. Diminished sensibility on 1 side of the body.

hemihypotonia (hem-'i-hi-po-to-ni-ā) [" + " + *tonos*, tone]. Partial loss of tonicity of muscles on 1 side of the body.

hemilateral [" + L. *latus*, side]. Rel. to 1 side only.

hemin (he'min) [G *aima*, blood]. SYN: *heme hydrochloride*. A brownish red crystalline salt of heme formed when hemoglobin is heated with glacial acetic acid and sodium chloride. Used as a test to reveal the presence of blood.

h. crystals. Teichmann's crystals. formed when the above test is made.

heminephrectomy. Excision or removal of a portion of a kidney.

hemineurasthenia (hem-'i-nū-rās-the-ni-ā) [G *ēmi*, half, + *neuron*, nerve, + *asthēncia*, weakness]. Neurasthenia affecting 1 side of the body only.

hemio'pia (hem-i-o'pi-ā) [" + *ōps*, eye]. Blindness in half of the visual field. SYN *hemianopia*.

hemio'pic (hem-i-op'ik) [" + *ōps*, eye]. Pert to hemio'pia.

hemiparalysis [" + *paralyein*, to loosen from the sides]. Paralysis of 1 side of the body only.

hemiparasthenia (hem-'i-par-an-es-the'si-ā) [" + *para*, beyond, + *an-*, priv. + *aisthēsis*, sensation]. Anesthesia of 1 lower extremity or lower half of 1 side.

hemiparaplegia (hem-'i-par-ā-ple'ji-ā) [" + " + *plegē*, stroke]. Paralysis of the lower half of 1 side or of 1 leg.

hemipar'esis [" + *paresis*, paralysis]. Slight paralysis of 1 side of the body.

hem'iparesthesia [" + *para*, beyond, + *aisthēsis*, sensation]. Numbness of 1 side of body.

hemipeptone (hem-i-pep'tōn) [" + *peptēn*, to digest]. One of the 2 compounds of peptone in pepsin digestion which later forms leucin, tyrosin, and amino acids.

hemiplegia (hem-i-ple'ji-ā) [" + *plēgē*, a stroke]. Paralysis of only one-half of the body.

Etiol. A brain lesion involving upper motor neurons and resulting in paralysis of the opposite side of the body. May result from cerebral apoplexy, softening or tumors of the cerebrum.

NP. Elevate head and shoulders. Apply cold to head, hot water bottle to feet. See that tongue does not obstruct breathing. Avoid stimulants. Do not move patient until arrival of doctor.

Take a 4-hr. chair for day or two. Turn patient frequently to avoid hypostatic pneumonia. Watch for bedsores, retention of urine, which should be measured and tested for albumin and sugar. Avoid burning with hot water bottles. Do not discuss patient when apparently unconscious.

See: *Benedict's syndrome*, *paralysis*, *thalamic syndrome*.

h., alternate. Affecting 1 side of face and trunk and opposite of extremities.

h., capsular. H. resulting from a lesion of the internal capsule.

h., cerebral. Due to brain lesion.

h., crossed. Alternate h.; cruceate h. q.v.

h. cruciata. Medulla lesion involving the crossed arm and uncrossed leg fibers of the pyramids paralyzing 1 arm and the opposite leg.

h. facial. Paralysis of muscles of one side of face.

h., spastic. H. accompanied by spasms, usually occurring in infants.

h., spinal. H. resulting from a lesion of the spinal cord. **See:** *Brown-Sequard's paralysis*.

hemiplegic (hem-i-plej'jik) [G. *ēmi*, half, + *plégē*, stroke]. Pert. to hemiplegia.

Hemiptera. The true bugs; an order of insects characterized by piercing and sucking mouth parts; 1st pr. of wings leathery at base and membranous at tip, 2nd pair of wings membranous, incomplete metamorphosis. Includes bedbugs, kissing bugs, and several other species which are pests or transmitters of pathogenic organisms.

hemirachischism (hēm-i-rā-kis'si-s) [Rachischism in which protrusion of the spinal meninges does not occur, *spina bifida occulta*, q.v.]

hemisection [G. *ēmi*, half, + L. *sectio*, a cutting] SYN *bisection*. The act of dividing a part or an organ into two halves, *bisection*.

hemispasm (hem-i-spazm) [" + *spasmos*, spasm]. Spasm of only 1 side of the body or face.

hemisphere (hem'is-fēr) [" + *sphaira*, sphere]. Either half of the cerebrum or cerebellum.

hemispheric. *dominant*. The cerebral hemisphere in which the higher cortical functions, esp. those relating to speech and certain motor activities, are associated; the left one in right-handed individuals. Results in phenomenon known as "cerebral dominance."

Hemispora stellata. A variety of fungus causing mycosis.

hemisporium (hem-i-spōr) [G. *ēmi*, half, + *sporos*, seed]. A spore which reproduces by division of terminal part of a hyphus.

hemisporosis (hem-i-spo-ro'sis) [" + *sporos*, seed, + *ōsis*]. Infection with a fungus (*Hemispora stellata*) resulting in swellings of bone and other tissue of a gummatous nature. They may later ulcerate.

hemistrulectomy (hem'i-strū-mek'to-mī) [" + L. *struma*, goiter, + G. *ektomē*, excision]. Excision of about one-half of a goiter.

hemisyndrome (hem-i-sin'drōm) [" + *syndromē*, a running with] One indicating a unilateral lesion of the spinal cord.

hemistystole (hēm-i-sis'tō-le) [G. *ēmi*, half, + *stystole*, a contracting] One pulse beat to every two heart beats. Results from failure of the ventricle to contract every other time.

hem'iterat'a. Individuals possessing congenital malformations but not to such a degree as to be designated a monster.

hemiteric, **hemiteratic** (hem-i-ter'ik, -ter-at'ik) [" + *teras*, monster]. Congenitally deformed, but not marked as monstrous.

hem'teck [A.S. *hēmléac*]. 1. A species of fir tree. 2. Volatile oil extracted from hemlock tree.

POISONING. SYM: Nausea, vomiting, diarrhea, salivation, pupils dilated.

TREATMENT. Empty stomach by means of a stomach pump or an emetic. Give a teaspoonful of tannic acid in glass of water. Stimulate.

he'mo. Prefix meaning pertaining to the blood. See also *haemo-*, *haem-*, *hem-*, and *hemato*.

hem'oagglutina'tion [G. *aima*, blood, + L. *agglutināre*, to paste to]. The clumping of red blood corpuscles.

hem'oagglu'tinin [" + L. *agglutināre*, to paste to]. An agglutinin which clumps the red blood corpuscles.

hem'oalkalimeter [" + Arab. *alkali*, the kali plant, + G. *metron*, measure]. A device for estimating degree of alkalinity of blood.

hemobilia (hem'o-bīl-in-ū'ri-ā) [" + L. *bilis*, bile, + G. *ouron*, urine]. Urobilin in the blood and urine.

hem'oblast [" + *blastos*, germ]. Immature red blood corpuscles; a blood platelet. SYN *hematoblast*. A *hematocytoblast*.

hemoblastosis (hem'o-blas-to'sis) [" + " + *-ōsis*]. Changes occurring in or increase in amount of the blood forming tissues.

hemocatharesis (hem'o-kath-er-c'sis) [" + *kathairesis*, destruction]. Dissolution of red blood corpuscles as in the spleen.

hemocathartic (hem'o-kath-er-et'ik) [" + *kathairetikos*, destructive] Destructive to blood corpuscles.

hemochorial (hēm-o-kor'i-al) Pertaining to the relationship between blood of the mother and the chorionic ectoderm. SEE *placenta hemochorial*.

hemochromatosis (hem'o-kro-mat-ō'sis) [" + *chrōma*, color, + *-ōsis*]. A disease of pigmentation of the skin and viscera, sometimes associated with diabetes and has been called *bronzed diabetes*.

hem'ochrome [" + *chrōma*, color] The red pigment of the blood.

he'mo-chro'mogen [G. *aima*, blood, + *gennan*, to produce] General term applied to compounds of heme with nitrogen-containing substances such as a protein.

hemochromometer (hem-o-kro-mom'et-er) [G. *aima*, blood, + *chrōma*, color, + *metron* measure] A colorimeter used for estimating the amount of hemoglobin in the blood.

hemocla'sia, **hemoc'lasia** [" + *klasis*, destruction] Disintegration of red blood corpuscles. SYN *hemolysis*.

hemoclas'tic [" + *klasis*, destruction]. Destructive of erythrocytes. SYN *hemolytic*.

he'moconcentra'tion. SYN *anhydremia*. An increase in the number of red blood cells resulting from a decrease in the volume of plasma.

hemoco'nia [G. *aima*, blood, + *konis*, dust] SYN *hemokoma*. Minute colorless bodies in blood thought to be the products of disintegration of red blood cells. Also called *blood dust*.

hemoco'no'is [" + " + *-ōsis*]. Having an abnormal amt. of hemokonia in the blood. SYN *hemokoniosis*.

hem'oculture [" + L. *cultura*, development] A bacteriological blood culture.

hemocyte (hem'q-sit) [" + *kytos*, cell]. Blood corpuscle.

he'mocy'toblast [G. *aima*, blood, + L. *cultura*, + *blastos*, germ]. The common lymphoid stem cell found in bone marrow from which all blood cells are thought to arise.

hemocy'toblastoma (hem'o-si'to-blas-to'mā) [" + " + " + *ōma*, tumor] A tumor containing embryonic blood cells.

hemocy'tocatharesis (hem'o-si'to-kath-er-c'sis) [" + " + *kathairesis*, destruction]. The dissolution of blood corpuscles.

hem'ocy'togen'esis (hem'o-si'to-jen'e-sis) [G. *aima*, blood + *kytos*, cell, + *genesis*, development] SYN *hematopoiesis*. The formation of blood cells.

hemocytology (hem'o-si'tol'o-jī) [" + " + *logos*, study]. The science of blood cells.

hemocytolysis (hem'o-si'tol'is-is) [" + " + *lysis*, dissolution]. Dissolution of the blood corpuscles. SYN: *hematocytolysis*, *hemolysis*.

hemocytometer (hem'o-si'tom'et-er) [" + " + *metron*, measure]. Device for de-

termining relative number of corpuscles in the blood.

hemocytopenia (hem'-o-si'-to-poy-e'-sis) [" + " + *poien*, to form] The development of blood cells

hemocytotripsis (hem'-o-si'-to-trip'-sis) [" + " + *tripsis*, a crushing] Fragmentation of the red blood corpuscles

hemocytozoön (hem'-o-si'-to-zo'-on) [" + " + *zoön*, animal] An animal micro-parasite of the blood cells SYN *hematobium*.

hemodia. Extreme sensitivity of the teeth
hemodiagnosis (*aima*, blood, + *dia*, through, + *gnosis*, knowledge) Examination of the blood for diagnostic purpose.

hemodialyase [" + *diastasis*, separation] An amylolytic ferment in the blood

hemodilution. An increase in the volume of blood plasma resulting in reduced concentration of red blood cells

hemodromometer (hem'-o-dro-mom'-et-er) [" + *dromos*, course, + *metron*, measure] Device for determining the blood's velocity

hemodynam'ics [" + *dynamis*, power] The study of circulation of the blood

hemodynamiometer (hem'-o-di-na-mom'-et-er) [" + " + *metron*, measure] Device for measuring blood pressure

hemodystrophy (hem'-o-dis'-tro-fi) [" + *dys*, bad, + *trophē*, nutrition] Imperfect nutrition of the blood SYN *hematodystrophy*.

hem'o-en'dothe'lial. Pertaining to the relationship between blood of the mother and the endothelium of chorionic vessels SEE *placenta*, *hemendothelial*

hemoferrum (hem-o-fer'-um) [" + *L fer-rum*, iron] The iron element of hemoglobin. SYN *oxyhemoglobin*.

he'moflag'ellate. Any flagellate protozoan parasite of the blood includes trypanosomes and leishmanias
hemofuscin (hem'-o-fus'-in) [" + *L fuscus*, brown] Brown coloring material derived from hemoglobin

hemogenesis (hem-o-jen'-es-is) [" + *genesis*, formation] Blood formation SYN *hematogenesis*.

hemogen'ia [" + *gennan*, to produce]. A hemorrhagic condition of the blood forming apparatus

hemogen'ic [" + *gennan*, to produce] Rel to the production of blood

hemoglobin (hem-o-glo'-bin) [G *aima*, blood, + *L globus*, globe] A chromoprotein of red color, the coloring substance of the red blood corpuscles

The amount of hemoglobin in the blood averages 14 to 16 grams per 100 cc One gram of hemoglobin can combine with 134 cc of oxygen, the resulting compound being oxyhemoglobin

Hemoglobin is a crystallizable, conjugated protein consisting of an iron-containing pigment called *heme* or *hematin*, and a simple protein, *globin* In the lungs it combines readily with oxygen to form a loose, unstable compound called *oxyhemoglobin*, a process called *oxygenation* In the tissues where oxygen tension is low, oxyhemoglobin decomposes and oxygen is liberated The resulting compound is *reduced hemoglobin* Hemoglobin is a weak acid and in the red corpuscles is combined with potassium, an alkali, to form potassium hemoglobinate (an alkali), which acts to buffer carbonic acid formed from carbon dioxide entering the blood from the tissues The buffering action is accomplished by a mechanism known as the *chloride shift*

Hemoglobin liberated from disintegrating red blood cells is removed from circulation by the cells of the reticulo-endothelial system, esp., those of the liver and spleen The globin in converted to amino acids and reutilized Iron from the iron-containing portion is stored in the liver and spleen and reutilized, the noniron containing pigment is converted to *bilirubin* which is excreted as one of the bile pigments

hemoglobinemia (hem'-o-glob-in-e'-mi-ä) [" + " + *G aima*, blood] Presence of hemoglobin in the blood plasma.

hemoglobinocholia (hem'-o-glob'-in-o-ko'-li-ä) [" + " + *G cholē*, bile] Hemoglobin in the bile

hemoglobinolysis (hem'-o-glo-bin-o'-ly'-sis) [" + " + *G lysis*, dissolution] Dissolution of hemoglobin

hemoglobinometer (hem'-o-glo-bin-om'-et-er) [" + " + *G metron*, measure] Device for determining the hemoglobin in the blood

hemoglobinopexia (hem'-o-glob'-in-o-pep'-si-ä) [" + " + *G pepsis*, digestion] Destruction of hemoglobin SYN *hemoglobinolysis*.

hemoglobiophilic (hem'-o-glo-bin-o-fl'i'k) [G *aima*, blood, + *L globus*, globe, + *G philein*, to love] Pert to organisms which grow better in presence of hemoglobin

hemoglo'binous [" + *L globus*, globe] Pert to or containing hemoglobin

hemoglobinuria (hem'-o-glo-bin-u'-ri-ä) [G *aima*, blood, + *L globus*, globe, + *G ouron*, urine] The presence of hemoglobin in the urine, but free from red blood corpuscles

Occurs when hemoglobin from disintegrating red blood cells or from rapid hemolysis of red cells exceeds renal threshold

Etiol. Scurvy, purpura, or certain drugs, such as arsenic, phosphorus, or typhus fever, or pyemia

SEE *Buhl's disease*, *Winckel's disease*.
h., epidemic. H of the newborn characterized by jaundice, cyanosis, and fatty degeneration of heart and liver Winckel's disease

h., march. H occurring esp in young soldiers following strenuous exercise

h., paroxysmal. Intermittent, recurring attacks of h following exposure to cold or strenuous exercise Results from increased fragility of red blood cells, or presence of a thermolabile autohemolysin

h., fœtic. H resulting from toxic substances such as muscarine, or snake venom, toxic products of infectious diseases, such as yellow fever, typhoid fever, syphilis and certain forms of hemolytic jaundice, organisms such as *Plasmodium* which destroy red blood cells, foreign proteins in blood as may follow blood transfusion or serum therapy

hem'oglobinur'ic [" + " + *G ouron*, urine]. Rel. to or marked by hemoglobinuria

h. fever. Malarial hemoglobinuria.
hem'ogram [" + *gramma*, a writing]. A graph of the differential blood count. SEE *Schilling's h.*

hemohistioblast (hem'-o-his'ti'-o-bläst) [G *aima*, blood, + *istos*, tissue, + *blastos*, germ] SYN *hematohistioblast* Free macrophages which sometimes appear in the blood in certain diseases, esp. those of a septic nature

he'moid [" + *eidos*, resemblance]. Having the appearance of blood.

hemokonia (pl. *hemokoniae*) [" + *kōnis*, dust]. Minute, highly refractive body in the blood, said to be disintegrated par-

tile of blood corpuscle. SYN: *blood dust*, *blood mote*.

hemokoniosis (hem-'o-ko-ni-'o-sis) [' + -osis]. Abnormal amount of hemokoniae in the blood.

hem'olith [' + lithos, stone]. A calculus in the wall of a blood vessel.

hem'olymph [' + L. *lymphā*, lymph]. Blood and lymph.

hem'olysin [' + *lysis*, dissolution]. An agent in a serum destructive of erythrocytes.

hemolysis (hēm-ō'lī-'sis) [G *aima*, blood, + *lysis*, dissolution]. The destruction of red blood cells with the liberation of hemoglobin which diffuses into the fluid surrounding them. Also called "leaking" of the blood. May occur as a result of the effects of bacterial toxins, snake venoms, immune bodies (hemolysins), and hypotonic saline solutions.

Their stroma is ruptured or dissolved, and the hemoglobin is liberated into the plasma. As a result, the blood, examined grossly, appears to be more transparent and to have a richer, red color, under the microscope the dissolution of the red corpuscles can be observed.

When the hemolysis occurs within the blood vessels, the body is unable to retain the hemoglobin, which is lost through the kidneys and imparts a red color to the urine. A condition called *hemoglobinuria*, *q.v.*

Injection of a hypotonic saline solution or distilled water into the blood stream induces hemolysis and may result in death. The red blood cells swell, and become globular, their membranes stretch and hemoglobin is liberated. All solutions injected intravenously must be isotonic to the blood. Hemolysis may result from infection by certain disease organisms, e.g. certain streptococci, staphylococci, the tetanus bacillus, and the scarlet fever organism. Hemolysis also occurs in smallpox, diphtheria, and following severe burns. See *fragility test*, *laked*.

hemolytic (hem-o-lī-'ik) [G *aima*, blood, + *lysis*, dissolution]. Pert. to the breaking down of red blood corpuscles.

h. unit. The amount of inactivated immune serum which causes complete hemolysis of 1 cc of a 5% emulsion of washed red blood corpuscles, in the presence of complement.

hemolytotoxigenic (hem-ol-i-'tō-'o-poi-et-'ik) [' + -toxin, to form]. Rel. to processes of production and destruction of blood cells.

hem'olyze. To produce hemolysis.

hemomediastinum (hem-'o-me-di-as-ti-'num) [' + L. *mediastinus*, in the middle]. Effusion of blood into mediastinal spaces. SYN: *hematomediastinum*.

hemometra (he-mo-me'trā) [' + *mētra*, uterus]. Retention of blood within the uterus. SYN: *hematometra*.

hemonephrosis [' + *nephros*, kidney, + *ōsis*]. Blood in pelvis of the kidney. SYN: *hematonephrosis*.

hemopathic [' + *pathos*, blood]. Rel. or due to disease of the blood.

hemopathology [' + -logy, study]. The science of blood disorders.

hemopathy [' + *pathos*, disease]. A disease of the blood.

hemoperitoneum [' + *peritonāion*, peritoneum]. Effusion of blood into the peritoneal cavity.

hemopexin [' + *pēxis*, fixation]. Enzyme which coagulates the blood.

hemopexis [' + *pēxis*, fixation]. Blood coagulation.

hem'ophage [' + *phagēin*, to eat]. A cell destroying red blood corpuscles by phagocytosis.

hemophagocyte (hem-o-fag-'o-sīt) [' + - + *kytos*, cell]. A white blood corpuscle which ingests other blood corpuscles, esp. red.

RS *anemia*, blood, *leukocyte*.

hemophilia (hem-o-fī-lī-'ā) [G *aima*, blood, + *philēin*, to love]. An hereditary blood disease characterized by greatly prolonged coagulation time. The blood fails to clot and abnormal bleeding occurs. It is a sex-linked hereditary trait, being transmitted by normal heterozygous females who carry the recessive gene. It occurs almost exclusively in males.

Etiol. Failure of the blood to form thrombin. This may be due to failure of platelets to release thromboplastin, failure of prothrombin to react normally to thromboplastin, the presence of a factor inhibiting the formation of thrombin, or absence of a substance present in normal blood plasma which shortens coagulation time.

SYM: Abnormal tendency to bleed. May cause swelling of the joints.

PROG: Unfavorable, one-half of those afflicted die before the 8th year.

TREATMENT: In an emergency, blood transfusions, followed by admin of ferrous sulfate, 3 gr. (0.2 Gm.), 4 times daily. Adequate fluids and full nourishing diet. Aspirin, codeine or morphine for pain. Injection of placental extracts sometimes reduces clotting time of blood.

Subject should carry notice on person that he or she is a *hemophilic* so that in case of accident requiring an operation the surgeon may be forewarned and take necessary precautions. SEE *angiotaxis*, *blood*.

hemophilic (hem-o-fī-lī-'ak) [' + *philēin*, to love]. One afflicted with hemophilia.

he'mophilic. 1. Fond of blood said of bacteria which grow well in culture media containing hemoglobin. 2. Pertaining to hemophilia or hemophilic.

Hemophilus (hē-mōfī-'us) [G *aima*, blood, - *philēin*, to love]. A genus of bacteria belonging to the family *Parvobacteriaceae*. Small, pleomorphic, non-motile, gram-negative, rod-shaped hemophilic organisms.

H. ducreyi. Ducrey's bacillus, the causative organism of chancroid or soft chancre.

H. duplex. Morax-Axenfeld bacillus, the causative organism of angular conjunctivitis.

H. influenzae. Pfeiffer's bacillus, Koch-Weeks' bacillus. An organism found in respiratory infections and formerly thought to be the cause of influenza, but now considered to be a secondary invader. It is the causative organism of influenza meningitis.

H. pertussis. Bordet-Gengou bacillus, the causative organism of whooping cough.

H. suis. Species which, in conjunction with a filtrable virus, causes swine influenza.

hemophobia (he-mo-fō-bī-'ā) [' + *phobos*, fear]. Aversion to seeing blood or to bleeding.

hemophoric [' + *pherein*, to carry]. Conveying blood.

hemophthalmia, **hemophthalmus** [' + *ophthalmos*, eye]. Effusion of blood into eyeball.

hemoplastic [' + *plasmein*, to form]. Blood-forming. SYN: *hematoplastic*, *hematopoietic*.

hemopneumothorax (hem"o-nu-mo-tho'-raks) [*" + pneuma*, air, + *thōraz*, chest]. Blood and air in the pleural cavity.

hemopoie'sis [*" + poiein*, to make]. Formation of red blood corpuscles **Syn:** *hematopoiesis*.

hemoptysis (hēm-ōp'tis-is) [*G aima*, blood, + *ptyein*, to spit]. Expectoration of blood arising from hemorrhage of the larynx, trachea, bronchi, or lungs.

SYM Attack sudden. Salty taste. Blood frothy, bright red.

TREATMENT. Cold applications over chest.

NP Patient must be kept perfectly quiet in bed in a semirecumbent posi-

irregular; face pale; skin cold, moist and flabby

F. A. TREATMENT Depends upon location. Remove all dirt with absorbent cotton, using moisture of the blood, not water; apply sterilized sponge; bandage firmly, elevate limb. Patient should recline. Very cold or very hot water contracts vessels. Warm water increases bleeding. Do not use alum, iron solutions, etc., if avoidable. Make pressure on arteries leading to heart. Elevate the part. Tourniquet. A handkerchief or strap tied loosely around the limb, with stick against knot, turning it until part is compressed, will answer all purposes. If an open wound, apply anti-

Hemoptysis

- 1 Probable previous history of tuberculosis
- 2 Blood is coughed up
- 3 Blood is frothy, bright red, and alkaline in reaction.
- 4 Blood may be mixed with sputum
- 5 There is some dyspnea, pain, and a tickling sensation in the chest

Hematemesis

1. Probable previous history of gastric or duodenal trouble.
- 2 Blood is vomited
- 3 Blood is usually (not always) dark, usually not frothy, and acid in reaction. Often clotted.
- 4 Blood may be mixed with food
- 5 There is often nausea and pain referred to stomach

tion with bed slightly elevated. No movement or excitement permitted and no visitors. No talking by patient, who should be reassured. No hot drinks. Light diet.

In tuberculosis, in absence of doctor in case of hemorrhage, follow these rules:

1 Support the patient with pillows in a semirecumbent position, if the bleeding side is known, incline him towards that side, and, if any feeling of suffocation, loosen clothing about throat and chest.

2 If there be thirst, give iced water in sips.

3 Open the window.

Keep patient warm. He will probably complain of cold. In that case apply hot water bottle to feet.

4. Keep patient calm and comforted

5 Do not adm any drugs until doctor comes, and on no account give stimulants. An injection of morphia may probably be prescribed. Should patient faint hemorrhage will, in all probability, cease. This is often Nature's means of cure.

SEE *bleeding, hemorrhage, hematemesis*

The table (p H-22) gives the more important distinguishing features between hemoptysis and hematemesis, *q.v.*

h., endemic. Paragonimiasis **SEE** *h. parasitic*

h., parasitic. Spitting of blood resulting from infection of the lungs by *Paragonimus westermani*, *q.v.* A parasitic fluke

hemorrhage (hem"o-raj) [*G aima*, blood, + *rhēgnai*, to burst forth]. Abnormal discharge of blood, either external or internal, venous, arterial, or capillary from blood vessels into tissues, into or from the body.

Venous blood is dark red; flow is continuous. Arterial blood is bright red, flows in jets. Capillary blood is of a reddish color; exudes from tissue.

SYM When visible, diagnosis is obvious. When internal, diagnosis may be made from the general condition. Patient is in shock; pulse weak, rapid and

septic dressing and a firm bandage. Loosen tourniquet every 12 to 20 minutes. Re-tighten if bleeding has not stopped

h., accidental. OB. AND GYN. H. caused by premature rupture of the placenta **SEE** *ablatio placentae*.

h., antepartum. Hemorrhage appearing before the onset of labor

h., armpit. Place sterile gauze sponge into wound, apply pressure over pad and bandage over shoulder and under armpit. Also bandage under opposite armpit over shoulder already banded.

h., armpit and elbow (between). Insert sterile gauze sponge into wound and apply pressure over pad, or tourniquet

h., arterial. In arterial bleeding (red) the blood ordinarily comes through in waves or spurts; unless the torn artery is deep or buried, when the flow may be steady.

F. A. TREATMENT It is usually necessary (1) To make pressure along the course of artery, somewhere between heart and bleeding point, by means of fingers (digital pressure) on the pressure points. (2) Then by a tourniquet above the point of injury. (3) Elevate the part. (4) Apply an antiseptic. (5) A sterile dressing. (6) A firm bandage. (7) Gradually release tourniquet after 12 to 15 minutes, if bleeding, retighten. Do not give stimulants until bleeding is controlled

h., capillary. Bleeding from minute blood vessels, present in all bleeding, when large vessels are not injured they may be controlled by simple elevation and pressure as with sterile compress.

TREATMENT. Astringents, styptic. Best is simply dry compress applied with pressure.

h., carotid artery. Usually accompanied by bleeding from the jugular veins and may be fatal in a short time.

F. A. TREATMENT: Compression with the thumbs transversely across the neck, both above and below the wound, the fingers directed around the back of the neck to aid in compression. It may be more desirable to pack the wound with sterile gauze and compress it with the

ARREST OF HEMORRHAGE

Temporary and permanent, diagrammatic. A, Normal small artery: a, outer coat, adventitia, b, middle coat, muscular, c, inner coat, intima. B, Artery torn across. Retraction of middle and inner coats; contraction of muscular coat. C, Clotting of blood outside and inside the vessel, temporary arrest. D, Obliteration of the lumen of the vessel with fibrous tissue, permanent arrest.

closed fist. Wounds of the jugular vein are sometimes the cause of air embolism.

h., cerebral. Escape of blood into tissues of brain.

Etiol. hypertension, arteriosclerosis, or atherosclerosis, infections.

Sym. Unconsciousness, slow pulse, stertorous breathing, hemiplegia, death. May be speech disturbance, incontinence of bladder and rectum, or constipation according to location of damaged brain tissue.

Treatment. Ice bag over head and heat at feet.

h., consecutive. Some time after an injury, 20 to 24 hours after an operation.

Treatment. Compress applied to main artery and wound. Elevate parts. Reopen and tie bleeding vessels.

h., contact. Hemorrhage from the cervix uteri coming on as a result of exertion, or contact during coitus, douching, or instrumentation.

h., elbow and hand (bet.). Put pad in elbow, apply bandage over it as a tourniquet.

h. of foot. Apply pad and pressure and bandage.

h. of hand. Fill hand with sterile gauze sponge, clasp fingers around it and bandage; apply bandage just above elbow.

h. of knee. At the knee, or below, apply pad as stated with pressure, or put a pad under knee and bandage leg at that place.

h., lung. Blood bright red and frothy, frequently coughed up.

Treatment. Rest in cool bed, shoulders and head raised. Small pieces of ice to swallow.

h., pancreas. H. of dark blood in vomitus with slimy mucus, coming from pancreas, usually occurring in inflammation of pancreas. SEE. hemorrhagic pancreatitis.

h., petifical. H. in form of small rounded spots of petecia occurring in the skin or mucous membranes.

h., postmenopausal. Bleeding from the vagina after the menopause has been established.

h., postpartum. SEE. uterine h.

h., primary. Immediately following any trauma.

h., secondary. H. occurring some time after primary h. It may occur after twenty-four hrs. or at time of separation of ligature, usually between 7th and 10th day. Due to sepsis.

h., stomach. Blood dark, perhaps clotted or mixed with stomach contents, usually vomited.

Treatment. Ice to swallow, and ice

cracked and placed in towel over pit of stomach

h., thigh. Upper part near groin. Insert pad of iodoform gauze into wound and apply pressure or press thumb in center of fold of groin against bone until bleeding stops below groin. Pad as above or tourniquet with pad under.

h., typhoid. It occurs in about 7% of cases. Loss may be 1 quart. It may occur singly or in succession, the latter being more serious than large hemorrhages. They take place at the end of the 2nd week and during the 3rd week of the disease

h., unavoidable. Ceaseless, painless bleeding. See *placenta previa*.

h., uterine. One into cavity of uterus. ETIOLOGY. Common causes are (1) trauma, (2) congenital abnormalities, (3) pathological processes, such as tumors, (4) infections, esp. of alimentary, respiratory, and genitourinary tracts, (5) generalized vascular disorders such as various purpuras and (6) coagulation defects

TREATMENT. A wet, sterile packing is used by some but condemned by others. A retained placenta, when present and causing hemorrhage, should be removed with uterine forceps. A relaxed uterus may need a hypodermic injection of pituitrin. The patient may probably need transfusion

There are 3 varieties:

Essential uterine h. H occurring in connection with pelvic, uterine, or cervical diseases. SYN *metropathia haemorrhagica*. SEE *fibrosis uteri*.

Intrapartum h. Hemorrhage coming on during labor

Postpartum h. Occurring after 3rd stage of labor. Due to inversion, rupture, lacerations, relaxation of the uterus and hematoma. Mortality in cases due to rupture, 60% to 85%.

TREATMENT. Lower head, elevate hips, grasp uterus with hand and make firm compression, follow this with copious injections of hot water (110° to 120° F.)

h., venous. Characterized by steady, profuse bleeding of rather dark blood.

F. A. TREATMENT. Elevate the part, apply an antiseptic about injury, a sterile dressing and make pressure. Elevation and pressure control most venous bleeding. Tourniquets rarely essential. If the bleeding is very severe, may be necessary to compress arteries supplying the part.

GENERAL TREATMENT. Depends upon part affected.

1. Lower blood pressure by keeping patient quiet. Avoid worry and stimulants. Small drinks of cold water if bleeding is not internal

2. Elevate bleeding part if possible.

3. Apply cold to contract blood vessels

4. If external, apply pressure in arterial bleeding bet wound and heart (above bleeding point); in venous bleeding, pressure over wound in slight cases; below it in more serious ones, and farthest from heart. In capillary bleeding, pressure over part

5. Have hypodermic of morphia ready for doctor in severe internal bleeding.

6. Watch for shock

Subsequent treatment designed to maintain low blood pressure.

h., vicarious. H. from a part due to suppression in another part. SEE *vicarious menstruation*.

hemorrhage, words pert. to: arterioversion, angiotrophy, anthemorrhagic, atopo-

menorrhea, autotransfusion, bleeding, bloody weeping, cephalin, chemise, clotting, coagulation, -time, enterorrhagia, hematorrhagia, hemophilia, oxalic acid, rhinorrhagia, unavodable h., Werlhoff's disease, wound.

hemorrhagic (hem-o-ră-jen'ik) [G. *aima*, blood, + *regnumai*, to burst forth, + *gennan*, to form]. Producing hemorrhage

hemorrhagic (hem-or-aj'ik) [“ + *regnumai*, to burst forth]. Pert. to or marked by hemorrhage.

h. disease of the newborn. Due to inadequate supply of prothrombin received from mother or delay in establishment of bacterial flora of intestine which produces vitamin K. Adm. of vit K corrects the condition.

h. fever. Condition peculiar of NE Asia which occurred among United Nations forces from 1951 on. Characterized by prostration, anorexia, vomiting, and peteal hemorrhages. Etiology unknown.

hemorrhagin [G. *aima*, blood, + *regnumai*, to burst forth]. SYN. *endothelolysin*. A cytolytic present in venom of snakes and other toxins responsible for hemorrhages and effusion of blood by effecting solvent action upon capillary endothelium

h. unit. Quantity of venom needed to produce vascular hemorrhage in 3-day-old chick embryos.

hemorrhagiparous (hem-o-ră-jip'ă-rus) [“ + “ + *L parere*, to produce] Producing hemorrhage. SYN. *hemorrhagic*.

hemorrhea (hem-or-e'ă) [“ + *roia*, flow]. Hemorrhage

hemorrhoid (hem-o-roid) [G. *aimorros*, vein liable to discha ge blood]. A tumor in form of dilated blood vessels in the anal region. SEE *hemorrhoidectomy*, *piles*.

h., external. Cutaneous and thrombotic, outside the sphincter.

TREATMENT. Sitz baths; hot or cold applications; petrolatum; or surgical treatment

h., internal. Venous, arterial and capillary, within the sphincter but beneath the mucous membrane.

TREATMENT. Local applications of heat or cold. Laxatives. Rest in bed. Operation, ligature, injection, ointment, excision, crushing, clamp, and cautery.

hemorrhoidal (hem-o-roy'dal) [G. *aimorros*, veins liable to discharge blood]. 1. Rel. to hemorrhoids. 2. Pert. to certain anal arteries, *arteria hemorrhoidalis*.

hemorrhoidectomy (hem-o-roi-dek'to-mi) [“ + *ektomē*, excision]. Surgical excision of hemorrhoids.

DRESSING, etc.: Petrolatum, gauze, sponges, gauze strips 3 and 8 in. wide, cotton and T bandages, 6 towels, leg holders, Thiersch's solution for irrigation, gynecologic suit, Dudley or Kelly's pad.

NP. **Preoperative:** The patient is placed in lithotomy position. A towel, wet with antiseptic solution, is placed over external genitalia. The operating field is thoroughly scrubbed with soap and water and flushed with an iodine solution of 3% strength. The patient is draped with leggings; lithotomy sheet.

Postoperative: Knees tied together until anesthetic is worn off. Head and shoulders elevated on pillows. Keep weight off buttocks. Retard bowel action 3-5 days. Cool fluids, avoid foods stimulating peristalsis. Swab margin of anus with 2% cocaine before stool. Bathe

after with an antiseptic and renew dressing. After a week give daily bath. Inspect dressing carefully. Repack as necessary. Re-dress 2nd day with petrolatum gauze or dry dressing. Watch for retention of urine and possibility of hemorrhage.

hemosalpinx [G. *aima*, blood, + *salpīx*, tube]. Blood accumulated in an oviduct. SYN: *hematosalpinx*.

hem'osld'erin. An iron-containing pigment derived from hemoglobin from disintegration of red blood cells.

he'mosldere'sis. Condition characterized by the deposition, esp in liver and spleen, of hemosiderin. Occurs in diseases in which there is marked red cell destruction such as hemolytic anemia and malaria. Hemosiderin may be deposited in pulmonary lymphatics in congenital and rheumatic heart disease.

hemosezic (hem-o-so'zīk) [' + *sozem*, to save]. 1. Protective of blood corpuscles. 2. Rel. to an antiserum (*antihemolysin*) that prevents hemolysis.

hemospasia (hem-os-pa'zī-ā) [' + *spasin*, to draw]. Withdrawal of blood by cupping or leeching.

hemospermia [' + *sperma*, seed]. Bloody semen. SYN *hematospermia*.

hemosta'sia, **hemos'tasis** [' + *stasis*, a stopping]. 1. Arrest of bleeding or of circulation. 2. Stagnation of blood.

hem'ostat [' + *statikos*, standing]. 1. Device or medicine which arrests the flow of blood. 2. Compressor for controlling hemorrhage of the tonsils.

hemostatic (hem-o-stat'ik) [' + *statikos*, standing]. 1. Checking hemorrhage. 2. Any substance which checks bleeding without being directly applied to the bleeding areas. EX: *calcium lactate*, *ergot*, *whole blood*.

hemostyp'tic [' + *styptikos*, astringent]. An astringent that stops bleeding, chemically hemostatic.

hemotachometer (hem-o-tak-om'et-er) [' + *tachos*, swiftness, + *metron*, measure]. Device for measuring velocity of the blood.

hemotherapeu'tics [' + *therapeutikē*, medical practice]. The use of blood, by transfusion or otherwise, in treatment of disease.

hemother'apy [' + *therapeia*, treatment]. Blood transfusion or drinking as a therapeutic measure. SYN *hemotherapeu'tics*.

hemothorax (hem-o-tho'raks) [' + *thōraz*, chest]. Bloody fluid in the pleural cavity caused by rupture of small blood vessels, due to inflammation of the lungs in pneumonia, or to pulmonary tuberculosis, or to a malignant growth.

hemothy'mia [' + *thymos*, anger]. An irresistible impulse to murder.

hemotonia [' + *tonos*, tension]. The tension of the solid elements of the blood.

hemotoxin [' + *toxikon*, poison]. A toxin destructive of red blood cells. SYN: *hemolysin*.

hemotrip'sia [' + *tripsis*, a rubbing]. Hemorrhage in 1 part that induces hemorrhage in another part.

hemotrophic (hēm-ō-trof'ik). Pertaining to nutrient substances carried in the blood.

h. nutritiou. Nutrition of the fetus by substances in the maternal blood which pass to the blood of the fetus through vessels within the villi.

hemotropic (hē-mō-trof'ik). Attracted to or having an affinity for blood or blood cells.

hemotym'panum [' + *tympanon*, drum]. Blood in the middle ear.

hem'ozin. A dark pigment found within malarial organisms (plasmodia). It is derived from the disintegration of hemoglobin.

hem'oozon. A hematozoon, *q.v.*

henbane (hen'bān). SYN: *Hyoscyamus*, *q.v.*

Henle's ampul'la. A vas deferens dilatation just above the ejaculatory duct.

H.'s layer. Outer layer of cells of inner root sheath of hair follicle.

H.'s loop. A U-shaped portion of a renal tubule lying between the proximal and distal convoluted portions. Consists of a thin descending limb and a thicker ascending limb.

H.'s membrane. Bruch's layer forming inner boundary of the choroid.

H.'s sheath. SYN *endoneurium*. Connective tissue support of individual nerve fibers in a funiculus.

He'noch's angina. Form of angina with gangrenous patches found in mucosa of air passages in scarlet fever and diphtheria. SYN *necrotic angina*.

H.'s purpura. Purpura with intestinal disturbances. Infectious disease of children.

SYN Erythema, urticaria, purpura, gastroenteric disorders, and perhaps arthritis. [Inducance]

henry (hēn'rē). Unit designating electrical Hensen's cells. Tall columnar cells which form the outer border cells of the organ of Corti of the cochlea.

H.'s disk. Band in center of the A disk of a sarcomere of striated muscle. During contraction it appears lighter than the remaining portion and in its center, a dark stripe, the M stripe, is seen.

H.'s stripe. A dark band on the under surface of the tectorial membrane.

he'par [G. *ēpar*, liver]. The liver, *q.v.*

heparin (hēp-ā-rin) [G. *ēpar*, liver]. A mucolysin polysulfuric acid which has been isolated from the liver, lung, and other tissues. It is produced by the mast cells of the liver and by basophil leukocytes. It inhibits coagulation by preventing conversion of prothrombin to thrombin by forming an antithrombin, and by preventing liberation of thromboplastin from blood platelets. The action of heparin requires the presence of a co-factor found in serum albumin of the plasma.

Uses In prevention and treatment of thrombosis and embolism. Sometimes employed concurrently with dicumarol, *q.v.*

RS dicumarol, menadione sodium bisulfite, vitamin K.

heparinize [G. *ēpar*, liver]. To inhibit coagulation of blood with heparin.

hepatalgia (hep-at-al'jī-ā) [G. *ēpar*, liver, + *algos*, pain]. Pain in the liver. SYN: *hepatodynia*.

hepat'al'gic [' + *algos*, pain]. Pert. to hepatalgia.

hepatat'rophy (he-pat-ā-trof'fī-ā) [' + *atrophia*, atrophy]. Atrophied condition of the liver.

hepatauxe (hep'at-awk'se) [' + *auxē*, increase]. Enlargement or hypertrophy of the liver.

hepatectomy (hep-ā-tek'to-mī) [' + *ektomē*, excision]. Excision of part or all of liver.

hepat'ic [G. *ēpar*, *ēpat-*, liver]. Pertaining to the liver.

h. amebiasis. Infection of the liver by *Entameba histolytica* resulting in hepatitis and abscess formation. Usually a sequel to amebic dysentery.

- h. duct.** The canal that receives bile from the liver. It unites with cystic duct to form the common bile duct.
- h. flexure.** The right bend of colon under the liver. The junction of the ascending and transverse colon
- h. lobes.** Divisions of the liver.
- h. veins.** The 3 vessels returning blood from the liver and discharging into the inferior vena cava
- h. zones.** Venous, arterial, and portal hepatic regions.
- hepaticoduodenostomy** (he-pat'i-ko-du-o-de-nos'to-mī) [**+** *L. duodenum*, duodenum, **+** *G. stoma*, opening]. Making an artificial opening bet hepatic duct and duodenum
- hepaticointerostomy** (he-pat'i-ko-en-ter-os'to-mī) [**+** *enteron*, intestine, **+** *stoma*, opening]. Operation for artificial opening bet. hepatic duct and intestine
- hepaticogastrostomy** (he-pat'i-ko-gas-tros'to-mī) [**+** *+* *gaster*, stomach, **+** *stoma*, opening]. The operation for a passage bet. the hepatic duct and the stomach
- hepaticolithripsy** (he-pat-i-ko-lith'o-trīp-sī) [**+** *lithos*, stone, **+ *tripsis*, a crushing]. The crushing of a biliary calculus in the hepatic duct**
- hepaticostomy** [**+** *stoma*, opening]. Establishment of permanent fistula into hepatic duct
- hepaticotomy** [**+** *tomē*, incision]. Incision into the hepatic duct.
- hepatin** (hep-at-in) [*G. ēpar*, *ēpat-*, liver]. 1 Carbohydrate formed in the liver, which is changed to dextrose to meet body requirements. *SYN* glycogen. 2. A hepatic hormone supposed to be useful in reducing high blood pressure. *SYN* hephormone.
- hepatitis** (hep-ā-tī'tis) [*G. ēpar*, *ēpat*, liver, **+ *-itis*, inflammation]. Inflammation of the liver of infectious or toxic origin. It is manifest by jaundice and, in some instances, liver enlargement. Fever and other systemic disorders are usually present**
- h. A.** *SYN*. epidemic hepatitis, infectious hepatitis, catarrhal jaundice. Acute hepatitis due to filtrable virus. Occurs in epidemic or endemic form. Children and persons under 30 are more apt to have it. Onset sudden with fever, chills, malaise, anorexia, and nausea. After about 5 days, jaundice usually develops. The virus is found in blood and feces of its subjects. Incubation period 2 to 6 weeks
- h. acute parenchymatous.** Acute yellow atrophy of liver
- h. amebic.** Hepatic amebiasis, *q.v.*
- h. B.** *SYN* homologous serum jaundice, inoculation hepatitis, transfusion jaundice, viral hepatitis. Hepatitis resulting from blood transfusion, intravenous plasma therapy, or serum therapy, and due to inoculation with a virus similar to that causing hepatitis A. Incubation period 2 weeks to 4½ months. Onset gradual with little or no fever. However, later in the course of the infection the clinical picture is similar to that of hepatitis A, but the virus is found only in the blood stream. The mortality is higher than that of hepatitis A
- h. chronic interstitial.** Cirrhosis of liver.
- h. externa.** Perihepatitis.

- h. toxic.** H due to poisoning with a chemical through ingestion, inhalation, injection or skin absorption
- hepatization** [*G. ēpar*, *ēpat-*, liver]. The 2nd and 3rd stages in consolidation in lobar pneumonia the tissue changing into a liverlike substance
- hepato-** [*G.*] Prefix. The liver.
- hepatocoele** (he-pat'o-sēl) [*G. ēpar*, *ēpat-*, liver, **+ *kelē*, hernia]. Hernia of the liver**
- hepatocholangiocystoduodenostomy** (hep-at-o-ko-lan'ji-o-sis'to-du-o-de-nos'to-mī) [**+** *cholē*, bile, **+ *aggeion*, vessel, **+ *kystis*, bladder, **+ *L. duodenum*, **+ *G. stoma*, opening]. Establishment of drainage of bile ducts into the duodenum through the gallbladder********
- hepatocholangioduodenostomy** (hep-at-o-ko-lan'ji-o-du-o-de-nos'to-mī) [**+** *+* **+** *L. duodenum* **+ *G. stoma*, opening]. Establishment of drainage of bile ducts into the duodenum.**
- hepatocholangioenterostomy** (hep-at-o-ko-lan'ji-o-en-ter-os'to-mī) [**+** *+* *+* *enteron*, intestine, **+ *stoma*, opening]. Establishment of a passage bet the liver and intestine**
- hepatocholangiogastrostomy** (hep-at-o-ko-lan'ji-o-gas-tros'to-mī) [**+** *+* *+* *+* *gaster*, belly, **+ *stoma*, opening]. Establishment of drainage of bile ducts into the stomach.**
- hepatocholangiostomy** (hep-at-o-ko-lan'ji-os'to-mī) [**+** *+* *+* *+* *stoma*, opening]. Establishment of free drainage by opening into the gall duct
- hepatocirrhosis** (hep-ā-to-sī-ro'sis) [**+** *kirros*, tawny, **+ *ōsis*]. Cirrhosis of liver.**
- hepatocolic** [**+** *kōlon*, colon]. Rel. to both liver and colon
- hepatocystic** [**+** *kystis*, bladder]. Rel. to the liver and gallbladder, or the gallbladder
- hepatoduodenostomy** [**+** *L. duodenum* **+ *G. stoma*, opening]. Establishment of an opening from the liver into the duodenum. *SYN* hepatoduodenostomy.**
- hepatodynia** (hep-at-o-din'ā) [**+** *odynē*, pain]. Pain in the liver
- hepatodysentery** [**+** *dys*, painful, **+ *enteron*, intestine]. Inflammation of the liver causing dysentery**
- hepatoenteric** [**+** *enteron*, intestine]. Rel. to the liver and intestines
- hepatogastric** [**+** *gastēr*, belly]. Rel. to the liver and stomach
- hepatogenic** (hep-ā-to-jen'ik) [**+** *gennan*, to produce]. Having its origin in the liver.
- hepatogenous** (hep-a-to'jen-us) [**+** *gennan*, to produce]. Originating in the liver.
- hepatography** [*G. ēpar*, *ēpat-*, liver, **+ *graphein*, to write] 1 Treatise on human liver. 2 Roentgenography of the liver**
- hepatohemia** (hep-ā-to-he'mī-ā) [**+** *aima*, blood]. Liver congestion.
- hepatoid** [*G. ēpar*, *ēpat-*, liver, **+ *eidōs*, form]. Having the structural form of the liver.**
- hepatolenticular** [**+** *L. lenticula*, lentil, lens]. Rel. to lenticular nucleus and the liver.
- h. degeneration.** Progressive lenticular degeneration in cirrhosis of the liver. *SYN* Wilson's disease.
- hepatolith** (hep-at-o-lith) [**+** *lithos*, stone]. A biliary concretion in the liver.
- hepatolithiasis** (hep-a-to-lith-i'a-sis) [**+** *lithos*, stone]. Calculi or concretions in the liver
- hepatologist** [**+** *logos*, study]. A specialist in diseases of the liver.

hepatolysin (hep-ă-toŭl-i-sin) [⁺ + *lysis*, dissolution]. A cytolytic destructive to hepatic cells.

hepatolysis [⁺ + *lysis*, dissolution]. Liver cell destruction

hepatolytic [⁺ + *lysis*, dissolution]. Destructive to tissues of the liver.

hepatoma (hep-ă-to-mă) [⁺ + *ōma*, tumor]. A tumor of the liver

hepatomalacia (hep-ă-to-mal-ă-i-ă) [⁺ + *malakia*, softening]. Softening of the liver

hepatomegaly (hē-pă-to-meg-ă-ŭ) [⁺ + *megas*, large]. Enlargement of the liver

hepatomelanosis (hep-ă-to-mel-an-ō-sis) [⁺ + *melas*, black, + *-osis*]. Pigmented deposits or melanosis in the liver

hepatonephritis [⁺ + *nephros*, kidney, + *-itis*, inflammation]. Inflammation of both liver and kidneys

hepatonephromegaly (hep-ă-to-nef-ŕo-meg-ă-ŭ) [⁺ + " + *megas*, large]. Hypertrophy of both liver and kidney or kidneys.

h. glycogenica. Von Gierke's disease, characterized by hypertrophy of liver and excess accumulation of glycogen resulting from failure of glycogenolysis to occur

hepatopathy (hep-a-top-ă-thi) [⁺ + *pathos*, disease]. Disease of the liver

hepatoperitonitis (hep-ă-to-peŕ-i-to-ni-tis) [⁺ + *peritonaton*, peritoneum, + *-itis*, inflammation]. Inflammation of the peritoneal covering of the liver SYN *perihepatitis*.

hepatopexy [G. *ēpar*, *ēpat*-, liver, + *pēxis*, fixation]. Fixation of a movable liver to abdominal wall

hepatophag(e) (hep-ă-to-fă) [⁺ + *phagēin*, to eat]. A phagocyte that attacks liver cells

hepatoptosis, **hepatoptosis** [⁺ + *ptōsis*, a dropping]. Downward displacement of the liver

hepatopulmonary [⁺ + L *pulmō*, lung]. Rel. to both liver and lungs.

hepatorenal [⁺ + L *ren*, kidney]. Pert. to both liver and kidneys

hepatorrhaphy (hep-a-tor-ă-fi) [⁺ + *raphē*, suture]. The suturing of a wound of the liver.

hepatorrhea (hep-at-o-re-ă) [⁺ + *roia*, flow]. 1. Bilious diarrhea. 2. Morbid flow from the liver.

hepatorrhexis [⁺ + *rēxis*, rupture]. Rupture of the liver

hepatoscopy [⁺ + *skopein*, to examine]. Inspection of the liver.

heptose. Any sugar containing seven carbon atoms in its molecule

hepatosplenitis [⁺ + *spēn*, spleen, + *-itis*, inflammation]. Inflamed condition of both liver and spleen

hepatosplenomegaly (hep-ă-to-splē-no-meg-ă-ŭ) [⁺ + " + *megas*, large]. Enlargement of both liver and spleen

hepatostomy (hep-a-tos-to-mi) [⁺ + *stoma*, opening]. The making of an artificial fissure into the liver

hepatotherapy [⁺ + *therapeia*, treatment]. 1. Treatment of liver disease. 2. The use of liver or liver extract.

hepatotomy (hep-ă-to-tō-mi) [⁺ + *tomē*, incision]. Incision into the liver

hepatotoxemia (hep-ă-to-toks-e-mi-ă) [⁺ + *toxikon*, poison, + *aima*, blood]. Autointoxication due to malfunctioning of the liver.

hepatotoxin [⁺ + *toxikon*, poison]. A cytotoxin specific for liver cells.

hephestic (he-fes-tik). Pert. to a blacksmith.

h. hemiplegia, **h. spasm**. A hemiplegia and spasm of blacksmiths and of

others, marked by paresis of arm muscles

heptachromic (hep-ă-kro-mik) [G. *epta*, seven, + *chrōma*, color]. Possessing normal color vision

heptad [⁺ + L *ad*, to]. Any element with a valency of seven.

heptosuria [G *epta*, seven, " + " + G. *ouron*, urine]. Heptose in the urine

herb [L *herba*, grass]. A plant with a soft stem containing little wood

herbivorous [⁺ + *vorare*, to eat]. Vegetarian, living on grasses and herbs

herd [A S *heord*]. Any large aggregation of people or animals

h. instinct. The urge to remain one of the social group and to conform to social patterns and general opinions. An aversion to excessive individualism

hereditary [L *hereditarius*, an heir]. Transmitted from one's ancestry.

h. ataxia. Hereditary spinal ataxia • SYN *Friedreich's ataxia*.

heredity (hē-rēd-i-ti) [L *hereditas*, heir]. Inate capacity of an individual to develop traits and characteristics (body size and form, skin and hair color, intellectual capacity, tendency to certain diseases) possessed by its ancestors. Such is dependent upon the presence of genes (hereditary factors or determiners) in the chromosomes of the fertilized ovum from which the individual develops

RS *chromosome, gene, genetics, linkage, sex*

heredo- [L]. Prefix: heredity.

heredoataxia [L *heres*, *hered*-, heir, + G *ataxia*, lack of order]. Hereditary spinal ataxia. SYN *Friedreich's ataxia*.

Hering-Breuer reflex. Reflex inhibition of inspiration resulting from stimulation of pressoreceptors by inflation of the lungs

Hering's nerves. Afferent nerve fibers leading from carotid sinus via glossopharyngeal nerve to the brain. They are pressoreceptor nerves responding to changes in blood pressure which reflexly control heart rate. An increase in pressure diminishes heart rate

Hering's theory. A theory of color vision in which it is assumed that the retina possesses three photochemical substances, which depending on their decomposition or resynthesis, to produce different color sensations by their stimulation of different nerve endings.

heritage (her-it-aj) [L *heres*, heir]. All the characteristics transmitted by parents to their children

hermaphroditism (her-maf-ro-dizm). Hermaphroditism, q v

hermaphrodite (her-maf-ro-dit) [G *Hermaphroditos*, son of Hermes and Aphrodite, who was man and woman combined]. One possessing genital and sexual characteristics of both sexes. SYN: *androgynæ*.

The clitoris is usually enlarged, resembling the penis of the male.

RS *gynandroid, gynandromorphous, gynandry*.

hermaphroditism (G *Hermaphroditos*, son of Hermes and Aphrodite, who was man and woman combined, + *ismos*, state of) SYN: *hermaphroditism*. Condition in which both ovarian and testicular tissue exist in the same individual. Occurs rarely in humans

h., complex. Having internal and external organs of both sexes.

h., dimidiata. Lateral h q v.

h., false. Pseudohermaphroditism: possession of the sex glands of one sex (ovary or testis) but accompanied by secondary sexual characteristics and external genitalia of the opposite sex.

h., lateral. Possession of a testis on one side and an ovary on the other **h., spurious.** False hermaphroditism **h., transverse.** Having the outward organs indicating 1 sex, and the internal ones the other **h., true.** Double sex **h., unilateral.** H. in which an ovary and a testis or an ootestis are present on one side and either an ovary or testis present on the other side **hermetic** [G. *ermes*, Hermes]. Airtight. **hermetical** (her-met'ik-al) [G. *ermes*, Hermes] Airtight.

DIAGRAM OF HERNIA

a Skin and superficial fascia, b. muscular and aponeurotic layer, c. peritoneum, d. neck of the sac

hernia (hēr'nī-ā) [G. *ernos*, a young shoot] **SYN rupture.** The protrusion or projection of an organ or a part of an organ through the wall of the cavity which normally contain it.

ETIO. Failure of certain normal openings to close during development weakness resulting from debilitating illness, old age, or injury, prolonged distention as from tumors, pregnancy, or corpulence, increased intraabdominal pressure resulting from lifting heavy loads, or coughing.

TREATMENT 1. Surgery 2. Mechanical reduction, taxis 3. In very large hernias, mechanical devices or trusses may be used.

h., abdominal. H. through the abdominal wall

h., acquired. H. which develops any time after birth in contrast to one present at birth (congenital hernia) Usually the result of excessive strain on the muscular wall. Frequently occurs following injuries or operations.

h., bladder. Protrusion of the bladder or a part of bladder through normal or abnormal orifice.

h., cerebral. H. of the brain through the cranial wall

h., Cloquet's. A type of femoral hernia.

h., complete. H. in which sac and its contents have passed through the aperture.

h., concealed. H. that is imperceptible when palpated

h., congenital. H. existing from birth.

h., crural. **SEE:** femoral h.

h., cystic. Bladder hernia. **SYN:** cystocele.

h. of diaphragm. There are three groups. congenital, acquired or traumatic, and esophageal. In the latter, a portion of the diaphragm is pushed through the esophageal hiatus into the stomach; or h. protruding through the diaphragm.

h., direct. **SEE:** inguinal hernia

h., diverticular. Protrusion of intestinal congenital diverticulum.

h., encysted. Scrotal protrusion, which, enveloped in its own sac, passes into the tunica vaginalis.

h., epigastric. H. of the intestine through an opening in the midline above the umbilicus

h., fascial. Protrusion of muscular tissue through its fascial covering.

h., femoral. Descending of intestines besides femoral vessels and through femoral ring.

h., funicular. H. into the umbilical or spermatic cord.

h., hiatus. Protrusion of the stomach upward into the mediastinal cavity through the esophageal hiatus of the diaphragm

h., Hothouse's. **SEE** inguinocrural h.

h., incarcerated. H. completely obstructing the bowels

h., incomplete. H. which has not gone completely through the aperture

h., indirect. **SEE:** inguinal hernia

h., inguinal. Protrusion of the hernial sac containing the intestine at the inguinal opening. In **indirect lateral**, or **oblique inguinal hernia**, the sac protrudes through the internal inguinal ring into the inguinal canal often descending into the scrotum, in **direct medial inguinal hernia** the hernial sac protrudes through the abdominal wall in the region of Hesselbach's triangle, a region bounded by the rectus abdominis muscle, inguinal ligament, and inf epigastric vessels. Inguinal hernia accounts for about 80% of all hernias.

h., inguinocrural. H. which is femoral and inguinal

h., internal. H. which occurs within the abdominal cavity. May be intraperitoneal or retroperitoneal.

h., interstitial. **SYN intermuscular hernia.** Form of inguinal hernia in which the hernial sac lies between layers of the abdominal muscles.

h., irreducible. H. which cannot be returned to its original position out of its sac by manual methods

h., labial. Protrusion of a loop of bowel into the labium majus.

h., lateral. **SEE** inguinal hernia.

h., lumbar. In lumbar regions or loins

h., medial. **SEE** inguinal hernia.

h., mesocolic. H. bet. the layers of the mesocolon

h., nuckian. H. into canal of Nuck.

h., oblique. **SEE** inguinal hernia.

h., obturator. H. through the obturator foramen,

h., omental. H. containing a portion of the omentum

h., ovarian. Presence of an ovary in a hernial sac.

h., phrenic. Projecting through the diaphragm into 1 of the pleural cavities

h., posterior vaginal. H. of Douglas' sac downward bet rectum and post. vaginal wall. **SYN.** enterocele.

h., properitoneal. Protrusion through the peritoneum and into the abdominal wall.

h., reducible. H. which can be replaced by manipulation.

h., retroperitoneal. H. into peritoneal sac extending behind the peritoneum into the iliac fossa.

h., Richter's. H. in which only a portion of wall of intestine protrudes, the main portion of the intestine being excluded from the hernial sac and the lumen remaining open.

h., scrotal. One that descends into the scrotum.

h., strangulated. One so tightly constricted that gangrene results if operation does not relieve. Not reducible by ordinary means

h., umbilical. Occurring at the navel.

More frequent in women TREATMENT Surgical.

h., uterine. Presence of the uterus in the hernial sac

h., vaginal. Hernial protrusion of the vagina

h., vaginalabial. Hernia of a viscus into the posterior end of the labium majus

h., ventral. If stretching and thinning of an abdominal scar occur, pressure from the abdomen may cause protrusion of part of the gut. It is then protected only by a layer of thin scar tissue.

hernia, words pert. to: archocoele, Bassini's operation, Beclard's h., bubonocoele, cardioclasia, cayorrhesis, cephalocoele, ceratocoele, cercrioma, herniotomy, liparocoele, rupture, strangulated h.

hernial [G *ernos*, a young shoot]. Pert to a hernia.

h. sac. The pouch of peritoneum pushed before a hernia and into which it descends

herniated [G *ernos*, a young shoot] Having a hernia

herniation (her-ni-a'shun) [G *ernos*, a young shoot] Development of a hernia

hernioenterotomy [" + *enteron*, intestine, + *tomē*, incision] Herniotomy at same time as enterotomy

hernioid [" + *eidos*, resemblance] Resembling a hernia

herniolaparotomy (her'nī-o-lap-ā-rot'o-mī) [" + *lapara*, loin, + *tomē*, incision] Abdominal section for the cure of hernia.

herniology [" + *logos*, study]. The science of hernia.

hernioplasty [" + *plassein*, to form] Surgical operation for hernia

herniopuncture [" + *L. punctura*, puncture]. Puncture of a hernia with hollow needle for withdrawal of fluid or gas

herniorrhaphy (her-nī-or'ī-ā-flī) [" + *raphē*, for suture] Surgical operation for hernia.

herniotomy (hēr-nī-ōt'o-mī) [G *ernos*, a young shoot, + *tomē*, incision] Cutting for the relief of hernia, an operation for the correction of irreducible hernia, esp., strangulated hernia

NP: Paint area with iodine, 3½ or 7% as ordered. Place sterile towel over chest and abdomen, place lap ring (small sheet about a yard square, with opening in center) over area of incision. Place regular lap sheet on abdomen and open it. Place 4 towels around area of incision, 2 lengthwise and 2 crosswise.

When the operator is finished with an instrument, discard it into a basin of lysol solution (it may then be removed for resterilization and meanwhile has not contaminated anything). While the skin is being sutured prepare final dressing. The operating nurse washes off her gloves thoroughly before removing them. She then assists in replacing the dressing. In bilateral hernias, each side should be draped and treated as a separate operation.

DRESSING. Borosalicylic acid powder, 4.1, with collodion dressing, sheets, towels, gauze sponges, gauze compresses, safety pins, bandages, cotton, bichloride solution, alcohol, plenty of hot and cold normal saline solution for hands. One pillow under head until otherwise ordered, knee roll under knees, prevent strain on abdominal muscles—assist in turning, etc. The surgeon's requisites vary with the operator.

hero'ic [G. *ērōikos*, pert. to a hero, daring]. Pert to treatment which, if not successful, increases danger.

heroin (her'o-in) A narcotic derived from morphine, commonly used by addicts

POISONING. **SYM** Resemble those of morphine, but act more markedly on respiration, causing headache, restlessness, cramps, and cyanosis.

TREATMENT Resembles that of morphine poisoning

heroinism [heroin + G. *ismos*, condition] Addiction to habitual use of heroin

herpangina (her-pan'jī-nā) [G. *erpēs*, herpes, + *L. angina*, a choking] A disease of children marked by fever and small ulcers in the throat.

ETIOI. Thought to be caused by group A Coxsackie viruses

herpes (her'pez) [G *erpēs*, herpes] 1 A form of vesicles appearing in clusters on inflammatory base but with no tendency to rupture, in *herpes zoster* they are distributed along the nerve trunks. 2 Inflammatory skin disease characterized by formation of groups of vesicles. See *tetter*, *zona*.

h. circinnatus. Dermatitis herpetiformis, an inflammatory skin disease of a herpetic nature

h. desquamans. Tinea imbricata, *q*

h. facialis. A form of *h. simplex* which occurs on the face usually about the mouth; commonly called *cold sore*

h. febrilis. **SYM** *h. facialis* *q r* Fever sores or blisters on the lips

h. genitalis. Herpetic lesions on the male or female genitalia

h. iris. *Erythema iris*; a type of erythema multiforme in which the vesicles occur in concentric rings

h. labialis. **SYM** *h. facialis* *q r* Fever blister, cold sore, *h* of the face

h. menstrualis. Herpetic lesions seen on the lips at the time of the menstrual period

h. praeputialis. Herpes of the male *h. simplex*. So-called fever blisters

SYM Occurrence of clusters of vesicles on erythematous edematous base on face or genital regions marked by itching and localized hyperemia, the lesions drying up and shedding yellowish crusts in 10-14 days if unmoistened

ETIOI. A medium-sized virus which is found in early vesicles but usually absent in later pus-filled vesicles. Indigestion, febrile and toxic states, physical fatigue, and emotional disturbances are precipitating factors. The virus apparently lives within the body cells between recurrent manifestations

h. zoster. **SYM** *shingles*, *zona*. An acute, infectious, inflammatory disease of the skin

SYM Usually unilateral

ETIOI. A large filtrable virus related to that causing chicken pox. Usually, precipitating causes are systemic disease, trauma, exposure to wind or cold, or ingestion or injection of drugs, esp. arsenic.

PATH. The skin vesicles are usually confined to the epidermis accompanied by inflammation of the underlying corium. The nerve, its sensory ganglion and post horn of the gray matter may show inflammatory reaction.

PROG. Acute course conferring immunity. Hemorrhagic, gangrenous and supraorbital cases are serious.

TREATMENT: Avoidance of temperature changes. Phenacetin, aspirin, sodium salicylate. Antiseptic dusting powder covered with cotton. After crusting, lubricate. Mild galvanic current for neuralgia. Recent successful

method of treatment has been intramuscular injections of pluitrin Thiamin chloride (vitamin B₁) has aided materially in helping the lesions clear quickly

herpetic [G. *erpsēs*, herpes]. Pert to herpes.

h. neuralgia. Painful neurosis with **h. sore throat**. Herpetic tonsillitis.

herpetiform [' + L. *forma*, form]. Resembling herpes

herpetism [' + *ismos*, state of]. Predisposition to herpetic eruption.

hersage (ār-sazh') [Fr a harrowing]. Splitting of a nerve trunk into separate fibers.

Herter's infantilism. Celiac disease: a form of infantilism resulting from defective fat and calcium absorption. Resembles sprue in adults

hertzian waves. Electromagnetic vibrations that have wave lengths of a centimeter or longer

hesperidin. A derivative of a white glycoside found in ripe and unripe citrus fruits. Decreases capillary fragility and prevents localized hemorrhage.

Hesselbach's hernia (hes-el-bakhs'). A lobated hernia which passes through the cruriform fascia.

H's triangle. The triangular space bounded by Poupart's ligament below, ext. border of rectus muscle internally, and epigastric artery ext.

heteradenia (het-er-ad-e'nī-ā) [G. *eteros*, other, + *adēn*, gland]. 1. Glandular substance in a part not provided with glands. 2. Abnormal glandular tissue.

heteradenic (het-er-ad-e'nīk) [' + *adēn*, gland]. Pert to heteradenia.

heteradenoma (het'er-ad-en-o'mā) (pl *heteradenomata*) [' + + *ōma*, tumor]. A heteradenic tissue tumor, any hyaline cylindroma

heterecious (het-er-e'shus) [' + *oikos*, house]. Living upon different hosts at different stages of development

heterecism (hēt'er-ēs'izm) [' + *oikos*, house]. Development of different cycles of existence on different hosts, said of certain parasites

heteresthesia (het-er-es-the'zī-ā) [' + *anesthesia*, sensation]. Variation in degree (plus or minus) of sensory response to cutaneous stimuli

heteroagglutinin. An agglutinin formed as result of injection of an antigen from an animal of a different species; an agglutinin capable of agglutinating blood cells of other species of animals.

heteroalbumose [' + L. *albumen*, white of egg]. Albumose insoluble in water but soluble in saline solutions, in acid or alkaline solutions. **SYN** *hemialbumose*.

heteroautoplasty (het'er-o-aw-to-plas-tī) [' + *autos*, self, + *plassein*, to form]. Grafting skin from 1 person to another.

heteroblastic [' + *blastos*, germ]. Having origin in tissue of another kind. Opp. of homoblastic.

heterocellular. Composed of different kinds of cells.

heterochiral (hēt-er-ō-kī'rāl). Pertaining to the other hand

het'erochromatin. A type of chromatin that stains less distinctly than the *euchromatin*, forming clear discs interposed between dark bands on chromosomes. In interphasic nuclei it constitutes the chromocenters. It is thought that it controls certain metabolic activities of cells. **SEE** *euchromatin*.

heterochromatosis (het'er-o-kro-ma-to'sis) [' + *chrōma*, color, + *ōsis*]. 1. Pigmentation of skin from foreign substances. 2. Difference in color. **SYN**: *heterochromia*.

heterochromia (het-er-o-kro'mī-ā) [' + *chrōma*, color]. A difference in color.

h. iridis. Different color of iris in the 2 eyes; the lighter colored iris is atrophic due to previous iridocyclitis, congenital or otherwise.

het'erochromosome (hēt-er-ō-kro'mō-sōm) An allosome, a chromosome which differs from the ordinary chromosomes or autosomes, the X and Y or sex chromosomes. Also called *accessory chromosome*

heterochromous (het-er-ō-kro'mūs) [G. *eteros* other, + *chrōma*, color]. With abnormal difference in coloration.

heterochronia [' + *chronos*, time]. Denoting an abnormal time for the occurrence of a phenomenon or production of a structure

heterochronic [' + *chronos*, time]. Occurring at different or at abnormal times

heterochylia (het-er-o-kī'lī-ā) [' + *chylous*, juice]. A change in character of the gastric juice without apparent cause.

heterocinesia (het-er-o-sī-ne'sī-ā) [' + *kinēsis*, movement]. Movements the reverse of those the patient is instructed to make.

heterocladic. Pertaining to an anastomosis between branches of two different arteries, in contrast to *homocladic*. **q v**

heterocri'sis [' + *crisis*, division]. Irregular crisis with abnormal symptoms

heterocyclic (het-er-o-sī'klīk) [' + *kyklos*, circle]. Pert to ring compounds which contain other atoms in addition to carbon atoms as part of the ring

heteroder'mic [' + *derma*, skin]. Pert. to a method of skin grafting when grafts are taken from another person. **SEE** *dermatoheteroplasty*.

heterodont [' + *odous*, odont-, tooth]. Having teeth of various shapes

heteroecious (hēt'er-ēs'shus) [G. *eteros*, other, + *oikos*, house]. Existing upon different hosts during different phases of development

heteroecism (hēt'er-ēs'izm) [' + *oikos*, house]. Existence during different phases of development upon different hosts, said of certain parasites

heteroer'otism [' + *erōs*, love, + *ismos*, state of]. Sexual desire for another person.

het'eroqam'etic. Pertaining to the production of unlike gametes, applied esp. to a male which produces two types of sperm, one containing the X chromosome, the other the Y chromosome.

het'eroqam'y. The union of gametes which are dissimilar in size and structure. Occurs in higher plants and animals. **SEE** *isogamy*

heterogeneous (hēt-er-ō-jē'nē-ūs) [G. *eteros*, other, + *genos*, type]. Of unlike natures composed of unlike substances in contrast to homogeneous. **q v**

h. vaccine. That made from some source other than patient's own organism. Opp. of *autogenous*.

heterogen'esis [G. *eteros*, other, + *genesis*, production]. Alternation of generations; mode of reproduction in which an asexual generation alternates with a sexual generation, or a dioecious generation alternates with a parthenogenetic generation. Occurs in lower forms such as coelenterates and trematodes.

heterogenet'ic [' + *gennan*, to produce]. Rel. to heterogenesis.

het'eroqraft [' + L. *graphium*, grafting knife]. A graft taken from another individual or an animal of a different

species than the one for whom it is intended. SEE *autograft*, *isograft*.

heterography [' + *graphein*, to write]. Writing different words from those the writer intended.

heteroinfection [G *eteros*, other, + L *in*, in, + *facere*, to make] SYN *exogenous infection*. Infection by virus originating outside of the body.

heteroinoculation [' + + *oculus*, bud] Inoculation from other organisms.

heterologia [' + *latia*, babbling]. The use of meaningless words instead of those intended.

heterologous [' + *logos*, relation]. Made up of cell tissue not normal to the part, as certain new growths.

heterology [G *eteros*, other, + *logos*, relation] Difference from the normal in structure or method of growth.

heterolysin (het-er-ol'is-in) [' + *lysis*, solution] Lysins formed from an antigen from an animal of a different species. SEE *autolysin*, *hemolysin*.

heterolysis (het-er-ol'is-is) [' + *lysis* solution]. Hemolytic action of blood serum of an animal upon corpuscles of another species. SEE *isolysis*.

heteromeric (het-er-o-mer'iki) [' + *meros*, part] 1 Pert to spinal neurons with processes to opposite side of cord. 2 Possessing a different chemical composition.

heterometaplasia (het'er-o-met-ä-pla'zi-ä) [' + *meta*, beyond, + *plassein*, to form]. Transformation of tissue to a tissue foreign to the part where produced.

heteromorphous (het-er-o-mor'fus) [' + *morphē*, form]. Deviating from the normal type.

heteronomous (het-er-on'o-mus) [' + *nomos*, law]. Abnormal, differing from type.

heteronymous (het-er-on'i-mus) [' + *onyma*, name]. 1. Expressed in or having different names. 2. On opposite sides.

h. diplopia. Having a false image on same side as the sound eye.

heteroosteoplastic [' + *osteon*, bone, + *plassein*, to form]. Grafting of bone, esp. with a graft from an animal.

heteropathy (het-er-op'ä-thi) [' + *pathos*, disease]. 1. Abnormal reaction to irritation or to stimuli. 2. Creation of a morbid condition to neutralize another disorder.

heterophany (het-er-of'ä-ni) [' + *phainēin*, to appear] Having different expressions of the same disorder.

heterophasia (het-er-o-fä'zi-ä) [' + *phasis*, speech]. Expression of meaningless words instead of those intended. SYN *heterologia*, *heterophemy*.

heterophasia, heterophemy [' + *phēmē*, speech]. Expressing 1 thing when another is intended. SYN: *heterologia*, *heterophasia*.

heterophyllite (het'er-o-fil) [' + *philein*, to love]. 1. Pert. to an antibody reacting with other than the specific antigen. 2. Pert. to a tissue or microorganism that takes a stain other than the ordinary one.

heterophonia (het-e-ro-fō-ni-ä) [G *eteros*, other, + *phōnē*, voice]. Change of voice.

heterophoralgia (het-er-o-for-ä'l'i-ä) [' + *phoros*, bearing, + *algos*, pain] Deviation of 1 eye accompanied by pain.

heterophoria [G *eteros*, other, + *phoros*, bearing]. The tendency of the eyes to deviate from their normal position, esp. when one eye is covered, latent deviation or squint.

Etiol. Imbalance or insufficiency of ocular muscles.

heterophthalmos (het-er-of-thal'mus) [' + *ophthalmos*, eye]. Difference in appearance of the eyes due to the irides differing in color. SEE *heterochromia*.

Heterophyes (hët-ër-ö-fi-ës) A genus of flukes belonging to the family Heterophyidae, q v.

H. heterophyes. A species of intestinal fluke commonly infesting man. In heavy infestations may cause diarrhea, nausea, and abdominal discomfort.

heterophyiasis (hët-ër-ö-fi-äs'is) Infestation by any fluke belonging to the family *Heterophyidae*, q v.

Heterophyidae. A family of Trematoda (flukes) which infests the intestines of dogs, cats and other mammals including humans. Infestations are common in Egypt and in the Far East. Includes the genera *Heterophyes*, *Haplorchi*, *Diorchitrema* and *Metagonimus*. Intermediate hosts are snails, the cercaria encysting in fishes, esp. mullets, or frogs. The eggs of foreign species may cause serious damage to organs esp. the heart.

heteroplasia (het-er-o-pla'si-ä) [' + *plassein*, to mold] Production of a part where it does not belong.

heteroplastic (het-er-o-plas'tik) [' + *plassein*, to form] Rel to heteroplasia.

heteroplasty [' + *plassein*, to form] Grafting with tissue from another person or an animal.

heteroploid. Possessing a chromosome number that is a multiple of the haploid number common for the species.

heteroproteose. An intermediate product formed in the hydrolysis of proteins to peptones.

heteropsia (het-er-op'si-ä) [' + *opsis*, vision]. Inequality of vision in the 2 eyes.

heteroptics. Pervision of vision such as seeing objects that do not exist or misinterpreting what is seen.

heteropyknosis. The property whereby various parts of a chromosome stain with varying degrees of intensity, thought to be due to variations in concentration of nucleic acid.

heteroscopy [' + *skopein*, to examine] Finding range of vision in strabismus.

heteroserotherapy (het-er-o-se-ro-ther'ä-pi) [' + L *serum*, whey, + G *therapeia*, treatment] Treatment by serum from another person.

heterosexual [' + L *sexus*, sex] Having normal attraction for the opposite sex. SEE *homosexual*.

heterosexual'ity [' + L *sexus*, sex]. The normal state of love for one of the opposite sex.

heterosis. Hybrid vigor; condition in which the offspring of individuals belonging to different races or species possess greater vitality, sturdiness, and resistance to disease, or unfavorable environmental conditions.

heterotaxia [G *eteros*, other, + *taxis* arrangement]. Abnormal position of organs or parts. SEE *dextrocardia*, *situs inversus viscerum*.

heterotopia [' + *topos*, place]. Displacement of an organ or part.

heterotopic [' + *topos*, place]. Misplaced, pert to heterotopia.

heterotopous (het-er-ot'o-pus) [' + *topos*, place]. Pert. esp. to teratomata consisting of tissues out of normal placement.

heterotopy (het-er-ot'o-pi) [' + *topos*, place]. Displacement of an organ or a portion of the body.

heterotox'in [' + *toxikon*, poison]. A toxin introduced from without the patient's body.

heterotransplant [G. *eteros*, other, + L. *trans*, across, + *plantare*, to plant]. An organ tissue, or structure taken from an animal and grafted into, or on, another animal of a different species. Such transplants usually atrophy.

heterotrichosis (het'er-o-tri-ko'sis) [' + *trichōs*, growth of hair]. Growth of different kinds or color of hairs on the scalp, or body.

heterotroph (het'er-o-trōf). An organism which obtains its energy by the oxidation of organic compounds, such as *heterotrophic bacteria*. **See** *autotrophic*.

heterotropia [' + *tropos*, a turn]. Manifest deviation of the eyes due to absence of binocular equilibrium. **See** *strabismus*.

heterovaccine [' + L. *vaccinus*, pert to a cow]. A vaccine from a source other than that of the disease for which it is intended.

heteroxanthine (het'er-o-zan'thin) [' + *xanthos*, yellow]. Methyl xanthine found in the urine.

heterozygosis (hēt-ēr-ō-zō-gō'sis). Condition in which the two members of a pair of genes in the zygote differ from each other; the result of cross breeding. **See** *homozygosis*.

heterozygote. An individual in which the members of one or more pairs of genes are unlike.

heterozygous (hēt-ēr-ō-zō-gūs). Genetically impure, not breeding true. Having one or many pairs of genes in the phase of heterozygosis resulting from cross-breeding. Having unlike genes. **See** *homozygous*.

hettocytosis (het-o-sir-to'sis) [G. *ēttōn*, less, + *kyrtōsis*, curvature]. A slight curvature of the spine.

Heublein method (hoyb'lin). Low voltage doses of x-ray given over the entire body for cancer.

Heubner's disease (hoib'ners). Syphilitic endarteritis of the brain.

heurteloup (hert-loo'). An artificial leech, a cupping apparatus.

hexa- [G.]. Prefix **Six**.

hexabasic [G. *ex*, six, + *basis*, base]. Having 6 replaceable hydrogen atoms.

hexachlorophene (hēs-ā-klō-rō-fēn). A bactericidal and bacteriostatic compound, used in emulsions and soaps for preoperative cleansing of skin and mucous membranes and for hand scrubs. **See** *phisoheez*.

hexachromic [' + *chrōma*, color]. Not being able to distinguish more than 6 of the 7 colors of the spectrum or to distinguish violet from indigo.

hexad (hēs'ad) [G. *ex*, six]. The atom of an element having a valence of 6.

hexadactylism (hēs-ā-dāk'til-izm). Possession of six fingers or six toes.

Hexapoda (hek-ā-pod'ā). The insects or six-legged arthropods.

hexatomic (hēs-ā-tōm'ik) [G. *ex*, six, + *atomos*, indivisible]. Pertaining to a compound consisting of six atoms, or a compound having six replaceable hydrogen or univalent atoms.

hexavaccine [' + L. *vaccinus*, pert to a cow]. A vaccine made from 6 different microorganisms.

hexavalent (hēs-ā-vā'lent) [G. *ex*, six, + L. *valere*, to have power]. **Syn.** *sextivalent*. Having a valence of six.

hexokinase. An enzyme present in muscle tissue which catalyzes the phosphorylation of glucose. It has also been isolated from yeast.

hex'one, or **hex'one base** [G. *ex*, six]. One of the amino acids, as histidine, arginine and lysine, so called because they contain chains of 6 carbon atoms.

hexon'ic [G. *ex*, six]. Rel. to hexone bases. **hexosephosphate** (hex-ōs-rōs'fat) [G. *ex*, six, + *phosphas*, phosphate]. A phosphoric acid ester of glucose. One of several esters (Cori, Robison, *et al.*) formed in the muscles and other tissues in the metabolism of carbohydrates.

hex'oses [G. *ex*, six]. Monosaccharides of the general formula $C_6H_{12}O_6$, the group includes particularly dextrose and levulose, *q v*.

hexyl-chloro-m-cresol (hēs'Il-klō'rō-m-kres'ōl). New antiseptic effective against staphylococcus and *Streptococcus pyocyanus*.

Hex'yloresor'cinol solution. S.T. 37. **See** *caprokol*.

Hey's ligament. The semilunar lateral margin (falciiform margin) of the fossa ovalis which lies between iliac and pubic portions of the fascia lata.

Hg. **Symb** *mercury (hydrargyrum)*.

HgCl₂. Mercuric chloride, corrosive sublimate.

Hg₂Cl₂. Mercurous chloride; calomel.

HgI₂. Mercuric iodide.

HgO. Mercuric oxide.

HgS. Mercuric sulfide.

HgSO₄. Mercuric sulfate.

hia'tus [L. an opening]. 1. An opening, a foramen. 2. The vulva.

h. aorticus. Opening in diaphragm through which pass the aorta and the thoracic duct.

h. canalis facialis. Opening on superior (ant.) portion of petrous portion of temporal bone. It transmits the great superficial petrosal nerve and branch of facial and petrosal branch of middle meningeal artery.

h. esophagus. Opening in diaphragm through which passes the esophagus.

h. Fallopii. H. canalis facialis, *q v*.

h. maxillaris. Opening of maxillary sinus into the nasal cavity, located on nasal surface of maxillary bone.

h. semilunaris. The groove in the external wall of middle meatus of nasal fossa into which the antrum of Highmore, frontal series, and ant ethmoid cells open.

hiccough, **hiccup** (hik'up) [probably of imitative origin]. Spasmodic periodic closure of the glottis following spasmodic lowering of the diaphragm, causing a short, sharp, inspiratory cough. **Syn** *singultus*.

Etiol. It may be caused by indigestion, an overloaded stomach, irritation under surface of diaphragm, alcoholism, new growths of the pleura, or certain cerebral lesions, or a hysteria or an influenza. May be due to a disturbance of the phrenic nerve and diaphragm and if prolonged it has serious significance. The time of occurrence and whether accompanied by a burning sensation in the throat, or by an unpleasant sensation, should be noted.

Treatment. Warm applications to the diaphragm, protrusion of tongue, holding of breath, drink of water, cold to the spine, are remedies tried successfully in simple cases. Inhibition over the 3rd and 4th cervical vertebrae is sometimes successful. The A.M.A. has reported an almost instantaneous cure by an injection of chlorpromazine.

Hicks' (Braxton) sign. Uterine intermittent contractions at end of 3rd mo. of pregnancy, or in presence of tumor.

hidebound disease' [A.S. *hyd*, a skin, + *bindan*, to tie up]. Hardening and thickening of the skin with loss of elasticity. SYN: *scleroderma*.

hidradenitis (hi-drăd-en-î'tis) [G. *idrôs*, sweat, + *adên*, gland, + *-itis*, inflammation]. Inflammation of sweat glands by staphylococcus, usually in the axillae.

hidroadenoma (hi-drăd-ê-nô'mă) [G. *idrôs*, sweat, + *adên*, gland, + *oma*, tumor] SYN *syringocystadenoma*. Adenoma of the sweat glands.

hidroa (hi-drô'ă) [G. *idrôs*, sweat]. 1. Vesicles due to retention of sweat SYN *sudamina*. 2. Any bullous eruption. SYN *hydra*.

hidrocystoma (hi-drô-sis-to'mă) [' + *kystis*, cyst, + *ôma*, tumor]. A cystic tumor of a sweat gland.

hidropoiesis (hi-drô-poy-ê'sis) [G. *idrôs*, sweat, + *poiesis*, formation]. The formation of sweat.

hidropoietic [' + *poiesis*, formation]. Pert. to hydropoiesis. SYN: *sudorific*.

hidrorrhea (hi-drô-re'ă) [' + *roia*, flow]. Abnormal sweating.

hidrosadenitis (hi-drôs-ad-en-î'tis) [' + *adên*, gland, + *-itis*, inflammation]. Inflammation of sweat glands. SYN: *hidradenitis*.

hidroschesis (hi-drôs'kes-is) [' + *schesis*, a holding]. Retention of perspiration.

hidrosis (hi-drô'sis) [G. *idrôs*, sweat, + *ôsis*]. 1. Formation and excretion of sweat. 2. Excessive sweating.

hidrotic. SYN *diaphoretic*, *sudorific*. 1. Causing the secretion and excretion of sweat. 2. Any drug or medicine that induces sweating.

hieraigia (hi-er-al-jî'ă) [G. *ieron*, sacrum, + *algos*, pain]. Pain in the region of the sacrum.

hierophobia (hi'er-ô-fô-bî'ă) Abnormal fear of sacred things, or persons connected with religion.

high blood pressure. Abnormal pressure in arteries at height of pulse wave.

Diet: Moderate protein d. Fruits, vegetables. Protein allowance for adults, 55-60 Gm. per day. Milk, eggs, no alcohol. Restrict coffee, tea, and tobacco. **TREATMENT**: Many drugs and some surgical procedures are used to bring blood pressure to normal.

RS. blood, blood pressure, hypertension, hypotension, pulse pressure.

high Calory diet. One that provides maintenance and extra heat and energy. **Indicated** 1. To prevent loss of weight. 2. In wasting diseases. 3. In high basal metabolism. 4. After long illness. 5. In deficiency caused by anorexia, poverty, poor dietary habits. 6. During lactation when 1000 to 1200 extra Cal. are indicated.

Three meals plus lunch bet. Milk, eggs as under normal conditions, a slight excess of proteins and fats. Fermentable and bulky foods to be avoided.

Breakfast: Three oz. cream, extra butter. **Dinner**: Salad with mayonnaise, extra butter, 3 oz. cream. **Supper**: Same as for dinner. Each in addition to the general diet, with a 10 A.M. and 2-30 P.M. high caloric lunch, and a glass of milk at 8 P.M.

high cellulose diet. The general diet plus the following: **Breakfast**: Bran muffin or a tablespoon of bran added to a cereal, and extra large serving of fruit. 10 A.M.: Fruit juice. **Dinner**: Salad, extra serving of vegetables, fruit. **Supper**: Salad, extra serving of vegetables and fruits.

high frequency treatment. High frequency current passed through the body to

produce heat in the tissues. **RS**: circuit, current, diathermy.

Highmore, antrum of. The air sinus in the maxillary bone. **See**: *antracete*, *antrum*.

H's body. Fibrous tissue mass, a prolongation of albuginea testis, projecting forward along posterior border of testis SYN: *mediastinum testis*.

highmoritis. Inflammation of the maxillary sinus or antrum of Highmore. SYN: *antritis*, *sinusitis maxillaris*.

hillcock. A small eminence or projection.

h., anal. One of two small eminences which lie lateral and posterior to the cloacal membrane, and later, the anal fissure in the embryo.

h., axon. SYN *implantation cone*. A small conical elevation on the cell body of a neuron from which the axon arises. It is devoid of Nissl bodies.

h., seminal. The colliculus seminalis q v

Hilfon's law. The trunk of a nerve which sends branches to a particular muscle, also sends branches to the joint moved by that muscle and to the skin overlying the insertion of the muscle.

H's line. A white one at junction of skin of perineum and anal mucosa.

H's muscle. The compressor sacculi laryngis muscle.

H's sac. Pit along external portion of false vocal cords SYN *sacculus laryngis*.

hi'lum, hi'lus [L a trifle] 1. Depression or recess at exit or entrance of duct into a gland, or of nerves and vessels into an organ. 2. The root of the lungs at level of 4th and 5th dorsal vertebrae.

himantosis (hi-man-to'sis) [G *mantôsis*, a long strap]. Abnormal lengthening of the uvula.

hindbrain [A.S. *hindan*, behind, + *bragen*, brain]. The most caudal of the three divisions of the embryonic brain: the *rhombencephalon*. It differentiates into the *metencephalon* which gives rise to the cerebellum and pons and the *myelencephalon*, which gives rise to the medulla oblongata.

hind-gut. The caudal portion of the entodermal tube which develops into the alimentary canal. It gives rise to the ileum, colon, and rectum.

hind kidney. The metanephros, the most caudal of three embryonic kidneys. It persists and develops into the permanent kidney. **See** *metanephros*.

hinge joint. An articulation which permits flexion and extension about a single axis; *ginglymus*.

Hinton's test. Agglutination test for syphilis.

hip [A.S. *hype*]. 1. Upper part of thigh, formed by the femur and innominate bones. 2. The region on each side of the pelvis.

h. bone. *Os coxa* or *os innominatum*. Its 3 portions are: (a) The ilium (pl. *ili*); (b) ischium (pl. *ischia*), and (c) pubis (pl. *pubes*).

h., dislocation of. Dislocations of the hip are very often accompanied by a fracture and it is extremely difficult even for a well-trained surgeon to distinguish a pure dislocation from a fracture dislocation without an x-ray.

DIAG If person has great difficulty in straightening the hip following an accident. It is always accompanied by pain. The knee on the injured side resists points inwardly toward the other knee and it is difficult to straighten the leg.

SYM: Pain, rigidity, loss of function, and the dislocation may be obvious by

the abnormal position in which the leg is held, or by seeing or feeling the head of the femur in an abnormal position.

P A T R E A T M E N T Place the patient on a large splint as in a fractured back. In addition, place a large pad, such as a pillow, under the knee of the affected side. Treat for shock.

h., dislocation of, backward. Onto the dorsum ilii or sciatic notch. **SYM** 1. Inward rotation of thigh, with flexion, inversion, adduction, shortening. 2 Pain, tenderness. 3. Loss of function and immobility. **T R E A T M E N T** (a) Patient anesthetized. (b) Dorsal position, leg flexed on thigh, latter upon abdomen. (c) Adduct thigh, rotate outward, circumduct outward across abdomen, back to straight position. (d) Possibly traction, even incision and direct replacement.

h., dislocation of, downward. Rare. **T R E A T M E N T** (a) Traction in flexed position. (b) Outward rotation and extension.

h., dislocation of, forward. Through obturator foramen, on pubis, in perineum, or through fractured acetabulum. **SYM** 1 Pain, tenderness, and immobility. 2 In pubic and suprapubic forms, shortening, lengthening in obturator and perineal forms. **T R E A T M E N T** (a) Hyperextension and direct traction. (b) Flexion, abduction with inward rotations, adduction. **SEE** *os cotae*.

hip joint. Articulation bet femur and innominate bone. A ball and socket (enarthrosis) formed by the head of the femur fitting into a concavity, the acetabulum.

h. i., arthritis of. Usually occurring before age of 14 years. **V A R I E T I E S** Arthritic, acetabulum, femoral. **SYM** Divided into 3 stages, cardinal symptoms, wasting, spasm, lameness, pain, swelling, deformity. **P R O G** Influenced by circumstances. Tendency toward recovery. **T R E A T M E N T** Tonics, hygiene, mechanical and surgical treatment.

h. j. disease. May be 1 Tubercular. 2 Pustular (pyogenic). 3 Fracture. 4 Congenital deformities. 5 Dislocation of. 6 Dystrophies of (internal glandular). 7 Perthe-Legge's of. **SYM** *General* 1. Early—pain, limp, muscle spasm. 2 Later—muscle wasting, swelling, deformity. **T R E A T M E N T** *General* Build up patient's general health by 1 Diets. 2 Fresh air and sunshine. 3. Tonics. *Specific* Varies with disease. *General to all* Put on spica plaster cast, surgery or mechanical manipulation.

hip lift (artificial respiration). Following application of the prone-pressure, or Schafer, method, operator leans forward and inserts his clenched fist under one hip, elevating it about 2 inches, then with the other fist under the other hip, it is lifted 4 to 6 inches, producing a rotary motion on the stationary hip. This is alternated with the back-pressure method. This procedure provides more than twice the amount of air in respiration than the prone-pressure method.

hip lift-back pressure (artificial respiration). This method combines alternate lifting of the hips with pressure on the midback (just below the scapulas), with the fingers spread and the thumbs about an inch from the spine. As the operator lifts the hips, he rocks backward, and as he exerts back pressure, he rocks forward. In each phase, he keeps the arms straight, so that the work of lift-

ing and pressing is distributed over the shoulders and back, rather than being imposed primarily on the arms. Active inspiration results from lifting the hips and active expiration from pressure on the midback.

hip roll-back pressure (artificial respiration). This is a modification of the hip lift-back pressure method in which a roll is substituted for the lift in order to increase the ease of performance. The operator kneels astride the prone subject as described for the hip lift, instead of lifting both hips, he uses the knee on which he is kneeling as a fulcrum on which to roll the victim. The operator keeps his arm straight and rolls himself in the same direction in which he rolls the victim. Great care must be exercised to insure that the victim is rolled up onto the operator's knee or thigh so that both hips are raised from the ground.

hippocamp'al [G. *ippokampus*, seahorse] Pert to the hippocampus.

h. commissure. **SYN** *spalterium* or *lyra* A thin sheet of fibers passing transversely under post portion of the corpus callosum. They connect the medial margins of the crura of the fornix.

h. fissure. Fissure above the temporal lobe on mesial surface of cerebrum.

h. formation. Olfactory structures lying along the medial margin of the pallium. It includes the hippocampus, dentate gyrus, supracallosal gyrus, longitudinal striae, subcallosal gyrus, diagonal band of Broca, and hippocampal commissure.

hippocampus, major [G. *ippokampus*, seahorse] Elevation of floor of inf horn of lat ventricle of the brain, occupying nearly all of it.

h., digitations of. Three or four shallow grooves on ant. portion of hippocampus.

h. minor. **SYN** *calcaravis* A small elevation on mesial wall of lat. ventricle formed by end of the calcarine fissure.

Hippocrates (hi-pōk'rā-tēz) [B.C. 460-359 or 377]. Greek physician who is referred to as the "father of medicine."

hippocratic facies. The appearance of the face before impending death.

SYM Dark brown, livid, or lead colored skin, hollow appearance of eyes, collapse of temples, sharpness of nose, lobes of ears contracting and turning outward. **SEE** *facial*.

h. oath. Oath exacted of his students by Hippocrates in which they swore to reverse him as they would a parent, prescribe for the good of the patient, give no deadly drug, perform no abortions, cut no stones, leaving that work to the stone cutter, act only for the welfare of the patient and keep his secrets, and also to keep themselves from intentional illdoing and seduction.

In part, some of these points are still the accepted standard for the ethical physician today.

hip'pulin'e [G. *ippos*, horse]. An estrogenic substance, obtained from urine of pregnant mares.

hippur'ia [G. *ippos*, horse, + *ouron*, urine]. Large quantities of hippuric acid in the urine.

hippu'ric acid. An acid formed and excreted by the kidneys. It is formed in the human body from the combination of benzoic acid and glycine, the synthesis taking place in the liver and to a

limited extent by the kidney

Seven to 15 gr. (0.5 to 1.0 Gm.) is eliminated every 24 hr. It is increased by eating prunes, greengages, plums, cranberries, and some vegetables. They increase acidity of the urine, as the hippuric acid remains unburned.

hippuricase. *SYN* *hippurase, histozyme*

An enzyme found in the liver, kidney, and other tissues which catalyzes the synthesis of hippuric acid from benzoic acid and glycine

hippus (hip'us) [G *ippos*, horse] Rhythmic and rapid dilatation and contraction of the pupils Tremor of iris, spasmodic in character

h., respiratory. Dilatation during inspiration, and contraction of pupil during expiration

Hirschberg's reflex (hîrsh'bêrg). Adduction of foot when sole at base of great toe is irritated

Hirschsprung's disease (hîrsh'sprungs). Congenital hypertrophic dilatation of the colon {Hairv

hirsute (hîr-sût) [L. *hirsutus*, shaggy]

hirsuties (hur-su'shî-êz) [L. *hirsutus*, shaggy] Excessive growth of hair

hirsutism (hur'sût-izm) Condition characterized by the excessive growth of hair or the presence of hair in unusual places

hirudicide (hî-ru'dis-id) [L. *hirūdō*, a leech, + *caedere*, to kill] Any substance that destroys leeches

hirudin. A substance present in the secretion of the buccal glands of the leech which prevents coagulation of the blood It inactivates thrombin

Hirudinea. A class of annelids They are hermaphroditic, lack setae or appendages, and usually possess two suckers. Includes the blood-sucking leeches A number of species including *medicinalis* were formerly used extensively for blood-letting

hirudin'asis. Infestation by leeches In external *h.* leeches attach themselves to the skin and suck blood After the leeches drop off, bleeding may continue as a result of the action of hirudin Bites may become infected or ulcerate

h. internal. Results from accidental ingestion of leeches in drinking water, which may attach to wall of pharynx, nasal cavity, or larynx

Hirudo. A genus of leeches belonging to the family Gnathobdellidae

His. bundle of. The atrioventricular bundle, A-V bundle, a group of modified muscle fibers, Purkinje fibers, forming a part of the impulse conducting system of the heart It arises in the atrioventricular node and continues in the interventricular septum as a single bundle, the *crus commune* which divides into two trunks which pass respectively to the right and left ventricles, five branches passing to all parts of the ventricles It conducts impulses from the atria to the ventricles which initiate ventricular contraction

histamine (his'tâ-fên) [G. *istos*, tissue, + L. *affinis*, having affinity for] 1 Having affinity for tissues 2. A hypothetical substance in the blood serum assumed to fix certain constituents of food and esp. pathological tissues

histaminase (his-tâm'in-âs). An enzyme widely distributed in the body which inactivates histamine It is used in the treatment of certain allergies and other conditions resulting from release of excessive quantities of histamine

histamine (his'tâ-mên). 1 A substance in the body found wherever tissues are damaged. Red flush of a burn is due

to the local production of histamine; product of histidine catabolism.

2. An amine found in almost all animal tissues, and produced by the action of putrefactive bacteria

Injected under the skin, if the circulation is normal, it produces a wheal surrounded by a flare, suggesting a mosquito bite. Thought to be 1 cause of shock Given intravenously, causes gastric secretion, flushing of skin, lowered blood pressure, and headache.

h. cataphoresis. Method of treating rheumatic affections in which histamine solution is applied to the skin by the positive pole of the galvanic current.

h. phosphate. USP A chemically made product, which may be produced from citric acid by a lengthy process.

Uses Most frequently as a diagnostic agent in determining the acid secreting power of the stomach

histamine'mia (his'tâ-mî-ne + G. *aima*, blood) Histamine in the blood

histamin'ia. Shock induced by histamine in the body.

his'tase [G. *istos*, tissue, + *ase*, enzyme] An enzyme which digests tissue

histen'zyme [' + *en*, in, + *zyme*, leaven].

An enzyme in renal tissues which splits up hippuric acid into benzoic acid and glycolic acid *SYN* *histozyme*.

his'tidase. An enzyme present in the liver which acts on L-histidine It splits the imidazole ring with the resultant formation of glutamic and formic acids and ammonia

histidine (his'tîd-ên). An amino acid, C₆H₉N₃O₂, obtained by hydrolysis from tissue proteins and necessary for tissue repair and growth

histiocyte (his'tî-ô-sî) [G. *istos*, web, + *kytos* cell] *SYN* *macrophage, clasmatoocyte, purrhol cell, adventitial cell, resting wandering cells* A cell present in all loose connective tissues It may exhibit active amoeboid movement and show marked phagocytic activity These cells take up readily substances such as trypan blue, colloidal carbon, and other foreign substances of a particulate nature Histiocytes belong to the reticuloendothelial system

histiogenic (his-tî-ô-jen'îk) [' + *gennan*, to form] Formed by the tissues *SYN* *histogenous*.

his'tioid [' + *eidos*, form] Resembling or composed of 1 of the body tissues *SYN* *histoid*.

his'tiour'ritative [' + L. *irritâre*, to excite]. Irritative to connective tissue

histio'ma [' + *ôma*, tumor]. A tissue tumor

histo- [G.] Prefix *Relation to tissue.*

histoblast [G. *istos*, tissue, + *blastos*, germ]. A tissue cell.

histochromatosis (his'tô-kro-mâ-to'sis) [' + *chrôma*, color, + *ôsis*]. Name of disorders of reticuloendothelial system.

histoclas'tic [' + *klastos*, breaking]. Decomposing tissue.

histocyte (his'tô-sî) [' + *kytos*, cell]. A tissue cell. *SYN* *histoblast*.

histocytoma. A tumor containing histocytes

histocyto'sis [' + ' + *ôsis*, intensive]. Histocytes in the blood in unusual numbers.

h., lipoid. Niemann-Pick disease, *q.v.*

his'todiagno'sis [' + *diag*, through, + *gnôsis*, knowledge]. Diagnosis made from examination of the tissues.

histodial'ysis [' + *dialysis*, a loosening]. Disintegration of tissue. *SYN* *histolysis*.

histogenesis (his-to-jen'e-sis) [' + *genesis*, formation] Development into dif-

ferentiated tissues of the germ layer, origin and development of tissue.

histogenetic (his-to-jen-et'ik) [" + *genesis*, formation] Pert to histogenesis

histogenous (his-toj'en-us) [" + *gennan*, to form] Made by the tissues

histogram (his'to-gram) [" + *gramma*, a writing] A graph showing frequency distributions

histography [" + *graphein*, to write]. A written description of the tissues

histohematin [" + *ama*, blood] A hemoglobin pigment in various tissues

histohematogenous (his'to-hem-ä-toj'en-us) [" + *gennan*, to form] Arising from both the tissues and the blood.

histoid (his'toid) [" + *eidōs*, form] 1 Resembling one of the tissues 2 Developed from a single tissue, as *fibroma*.

histokinesis (his-to-kim-e'sis) [" + *kinesis*, movement] Movement through the tissues of the body.

histologic [" + *logos*, knowledge] Pert to microscopic tissue anatomy

histology [" + *logos*, study] Study of the microscopic structure of tissue

h., **normal**. Study of healthy tissue

h., **pathologic**. Study of diseased tissue.

histolysis (his-tol'is-is) [" + *lysis*, dissolution]. Disintegration of tissues

histolytic [" + *lysis*, dissolution] Pert to histolysis

histoma [" + *ōma*, tumor] A tumor composed of tissue. SYN *histioma*.

histone (G *istos*, web) A class of simple proteins derived from cell nuclei which interferes with coagulation, yielding certain amino acids (the histone or hexone bases) as a result of hydrolysis. The thymus histone and globin, or hemoglobin, are the only important ones in foods

histonec'tomy (G *istos*, tissue, + *ektomē*, excision) Periarterial excision of parts of the sympathetic nerve

histonomy [" + *nomos*, law] The law governing development and structure of tissues

histonuria [" + *ouros*, urine]. Excretion of histone in the urine seen in leukemia and certain fevers

histopathology [" + *pathos*, disease, + *logos*, study] Histology of diseased tissues

histophysiology [" + *physis*, nature, + *logos*, study] Study of functions of cells and tissues.

Histioplasma. A genus of parasitic fungi

H. capsulatum. The causative agent of histoplasmosis, *q.v.*

histoplasmin. An antigen prepared from cultures of *Histoplasma capsulatum* and used as a skin test for the diagnosis of histoplasmosis

histoplasmosis [" + *plasma*, plasma, + *ōsis*]. A disease due to infection by *Histoplasma capsulatum*.

Sym. Primary infections may be asymptomatic. The respiratory tract is often involved giving rise to pulmonary calcifications which are often mistaken for tubercular calcifications. In severe infections resulting from exposure to massive doses of the fungus such as occurs in closed areas the following symptoms may occur emaciation, irregular fever, leukopenia and splenomegaly.

historetention [" + *L. rē*, back, + *tenēre*, to hold]. Retention of substances in the tissues.

historrhhexis (his-tor-rek'sis) [" + *rēxis*, rupture]. Disintegration of tissue by a noninfectious agent.

histother'apy [" + *therapeia*, treatment]. Administration of animal tissues. SYN: *cytotherapy*, *organotherapy*.

histothrombin [" + *thrombos*, a clot]. A thrombin derived from connective tissue

histotome (his'to-tōm) [" + *tomē*, incision] Instrument for cutting tissue for study of its minute structure. SYN. *microtome*.

histotomy (his-tō'tō-mī) [G. *ismos*, web, + *tomē*, incision] SYN *microtomy* 1 Dissection of tissue 2 The cutting of thin sections of tissue for microscopic study

histotoxic. Pertaining to a poisonous condition within the cells

h. anoxia. Anoxia in which oxidative processes of tissues are depressed or abolished, in cyanide poisoning

histotribe [" + *tribein*, to crush] Instrument for crushing the tissues to stop bleeding

histotroph. Nutritive substances other than the mother's blood which the embryo utilizes in early development. These include endometrial tissues which have been destroyed during implantation, extravasated blood, and glandular secretions. SYN *embryotroph*

histotrophic (his-to-trof'ik) [" + *trophē*, nourishment] 1 Pertaining to or favoring the formation of tissue 2 Pertaining to histotroph, *q.v.*

h. nutrition. Nutrition of the embryo in which histotroph serves as a source of nourishment. Cf *hemotrophic nutrition*

histotropic [" + *tropē*, a turning] Having attraction for tissue cells, as certain parasites, sponges, or chemicals

histozoic. Living within or on tissues, said of certain protozoan parasites

histozyme (his'to-zim) [" + *zymē*, leaven] A renal enzyme which converts hippuric acid into benzoic acid and glycochol, causing fermentation

histrionic [L *histrio*, an actor] Theatrical, dramatic.

h. mania. Dramatic gestures, expressions and speech in certain psychiatric states

h. spasm. Facial spasm, tics

hives [of uncertain origin]. Eruption of very itchy wheals, caused by an allergic substance or food. SYN *nettle rash*, *urticaria*, *q.v.*

Sudden sharp changes in climate (allergy to heat and cold) may produce hives in some persons

H. Abbr for latent hyperopia.

Hm. Abbr. for manifest hyperopia.

HNO. Symb for nitrous acid.

HNO. Symb for nitric acid.

HO. Symb for holmium

H.O. Symb for water.

H.O. Symb for hydrogen peroxide.

hoarse'ness [AS *hās*, harsh] A rough quality of the voice

Etym. 1 Simple chronic inflammations, secondary to chronic nasopharyngitis (infected teeth, chemical irritants, tobacco, alcohol, etc.). 2 Specific chronic laryngitis, syphilis, tuberculosis, rhinoscleroma, leprosy, 3. Neoplasms, papilloma, angioma, fibroma, singer's nodes, carcinoma. 4. Paralysis 5. Pro-lapse of ventricle of larynx

hob'nail liver. One with irregular surface.

Etym. Cirrhosis from alcoholism.

Hochsinger's sign (hōk'zing-ers). 1. Indica-toria a sign of tuberculous in children. 2 Closure of fist in tetany caused by pressure on inner side of bi-ceps muscle.

Hodara's disease. Trichorrhexis nodosa, *q.v.*

hodgeletics (hod'ē-jet'iks) [G. *odēgētikos*, suitable for guiding]. Medical ethics and etiquette.

Hodgkin's disease (høj'kins). A chronic, infectious disease producing enlargement of lymphoid tissue, spleen, and liver, and sometimes kidneys.

Syn. Enlargement of lymph nodes beginning in the cervical region, then the axillary, inguinal, mediastinal and mesenteric. Heart is weak, pressure in various parts, lymphoid infiltration of blood vessels, secondary anemia, presence of eosinophiles, and fibrosis of glands. It may appear in several forms. Acute, localized, latent with relapsing pyrexia, splenomegalic form, lymphogranulomatosis, lymphadenia ossium.

hodonemomere (hod-o-nu'ro-mēr) [G. *odos*, path, + *neuron*, nerve, + *meros*, part]. Portion of the primitive trunk including neurons and processes.

Hofbauer cell. A large cell found in the connective tissue of chorionic villi. It is thought to be phagocytic.

Hoffman's atrophy. Spinal muscular atrophy, a familial condition which occurs in children.

holarthrititis (hol-ar-thri'tis) ["" + *arthron*, joint, + *-itis*, inflammation]. Inflammation of all or many joints. **Syn.** *polyarthrititis*.

Hol'den's line. A wrinkle or indistinct furrow in the groin.

holergasia (hōl'ēr-gās'ī-ā) [G. *alos*, whole, + *ergon*, work]. A major psychoses affecting the personality by great excitement, fits of depression, stupor and confusional states.

holergastic (hōl'ēr-gas'tik) [G. *alos*, whole, + *ergon*, work]. Pert to major psychoses affecting the personality by great excitement, fits of depression, stupor and confusional states.

hol'ism. **Syn.** *organicism*. Belief or doctrine that the whole is more than the sum of its parts. In biol the principle may apply to the entire organism, individual organs, or to cells.

holist'ic. Pertaining to holism.

hol'low-back. Ant post spinal curvature. **Syn.** *lordosis*.

Holm'gren's test. Matching colored skeins of yarn for testing color blindness.

holoblastic ova [G. *olos*, whole, + *blastos*, germ]. Cleavage with segmentation of the entire yolk. Complete division of the egg as opposed to partial or meroblastic cleavage.

holocrine (hōl'o-krin) [G. *olos*, whole, + *krinein*, to secrete]. Pert to a secretory gland or its secretions consisting of altered cells of the same gland. **Opp.** of merocrine, *q.v.*

holodiastolic ["" + *diastellein*, to expand]. Rel. to the entire diastole.

holomastigote (hō-lo-mas'tī-gōt) ["" + *mastix*, mastig-, lash]. Having flagella all over the surface.

holorrachischisis (hōl'o-rā-kis'ki-sis) ["" + *rachis*, spine, + *schisis*, fissure]. Complete spina bifida.

holosystolic ["" + *systellein*, to draw together]. Rel. to the entire systole.

holotetanus (hōl-o-tet-an-us) ["" + *tetanus*, tetanus]. General tetanus. **Syn.** *holotonia*, *q.v.*

holotonia ["" + *tonos*, tension]. Muscular spasm of the entire body. **Syn.** *holotetanus*.

holoton'ic ["" + *tonos*, tension]. Pert. to or affected by holotonia.

holotrichous (hōl-ōt'ri-kūs). Covered entirely with cilia, said of certain protozoa and bacteria.

holozo'ic. Resembling an animal as to its method of nutrition in which organic materials serve as a source of energy.

Holt's house's hernia. Inguinal hernia protruding along folds of the groin.

Holtz static machine. Machine for producing static electricity by induction.

Holzknecht unit (holts'knekt). **Abbr.** *H*. An x-ray unit of measurement; 1/5 the erythema dose.

homax'ial [G. *omos*, the same, + *axōn*, axis]. Having all axes alike, as a sphere.

homeo- [G.]. Prefix. Likeness or resemblance.

homeomorphous (hō-me-o-mor'fus) [G. *omoios*, like, + *morphē*, form]. Of like shape but not of same composition.

hom'eod'steoplastic ["" + *osteon*, bone, + *plassein*, to form]. Grafting of a piece of bone like the one upon which it is grafted.

homeopathic (hō-me-o-path'ik) ["" + *pathos*, disease]. Pert to homeopathy.

homeopathist (hō-me-op'ā-thist) ["" + *pathos*, disease]. One who practices homeopathy.

homeopathy (hō-me-op'ā-thī) ["" + *pathos*, disease]. School of medicine founded by Dr S C F Hahnemann which assumes that such agents cure disease, as in health produce similar symptoms and that the more finely a drug is divided the more potent it becomes.

homeoplasia (hō-me-o-pla'zī-ā) ["" + *plassein*, to form]. Formation of new tissue similar to that already existing in a part.

homeoplastic ["" + *plassein*, to form]. Rel. to or resembling the structure of adjacent parts.

homeostasis (hō-mē-ōs'tā-sis) [G. *omoios*, like, + *stasis*, a standing]. 1 State of equilibrium of the internal environment. 2 The state of relative constancy of the body fluids (blood, lymph, tissue fluid) as to their chemical and physical properties.

homeostatic ["" + *statikos*, standing]. Pert to homeostasis.

homeotherapy (hō'mē-o-ther'ā-pl) ["" + *therapeia*, treatment]. Treatment or prevention of disease with a substance similar but not identical with the active causative agent. **Ex.** *Jennerian vaccination*.

homeotransplant (hō'mē-o-trans'plant) ["" + *L trans*, across, + *plantāre*, to plant]. Tissue from one individual transplanted into another.

homeotransplantation (hō'mē-o-trans-plan-tā'shun) ["" + "" + *plantāre*, to plant]. Tissue transplantation from one to another of the same species.

homergy (hom'er-jī) [G. *omos*, same, + *ergon*, work]. Normal metabolism and its results.

homesickness [A.S. *hām*, home, + *seōc*, ill]. Abnormal desire to return home. **Syn.** *nostalgia*.

Home's lobe (hōm). Median lobe of prostate gland which frequently hypertrophies in older men.

homicide (hom'ī-sid) [L. *homō*, man, + *caedere*, to cut]. 1. Murder. 2 A murderer.

homiculture (hom'ī-kult-chur) ["" + *cultura*, cultivation]. Application of the laws of breeding to the human species. **Syn.** *eugenics*, *stirpiculture*.

homo- [G.]. Prefix. Likeness.

homocen'tric [G. *omos*, same, + *kentron*, center]. Having the same center.

h. rays. Light rays from the same center.

homeochronous (hō-mō-kron'ūs). Occurring at the same time, or at the same age in each generation.

homogamet'ic. Producing one kind of gamete as regards the sex chromosome. In humans, the XX female is the homogametic sex as all ova produced contain the X chromosome. *See. heterogametic*.

homogeneous (ho-mo-jē-ne-us) [' + *genos*, kind]. Uniform in structure, composition or nature.

homogenesis (ho-mo-jen'e-sis) [' + *genesis*, development]. Reproduction of offspring similar to the parents. *Opp. of heterogenesis*.

homogenize (hō-mōj'en-iz) To make homogeneous, to produce a uniform emulsion or suspension of two substances normally immiscible.

homogenit'ic acid. Alkaptonic; an acid in the urine due to incomplete oxidation of tyrosine.

homogeny (ho-moj'en-l) [G. *omos*, same, + *genos*, race]. Reproduction of offspring similar to parents.

homoglandular (ho-mo-glan'du-lar) [' + L. *glandula*, a little acorn]. Rel. to the same gland.

homolopodal (ho-mol-op'o-dal) [G. *omoiōs*, like, + *pous*, *pod-*, foot]. With only 1 kind of process, as nerve cells.

homolateral [G. *omos*, same, + L. *latus*, side]. Pert. to or on the same side. *SYN ipsilateral.**

homolog, **homologue** (ho'mo-log) [' + *logos*, relation]. 1. An organ or part common to a number of species. 2. One that corresponds to a part or organ in another structure.

homologous (hō-mōlō-gūs) [G. *omos*, same, + *logos*, relation]. Similar in fundamental structure and in origin but not necessarily in function. *e. g.* the arm of man, forelimb of a dog, and the wing of a bird are homologous structures.

h. organs. Structures which are morphological equivalents as the arm of man and forelimb of quadrupeds; penis of male and clitoris of female. Homologous organs indicate relationship, or descent from a common ancestor.

h. series. Compounds with a similar chemical structure and properties, arranged in order of their molecular complexity, such as *methane* and *ethane*.

h. tissues. Those identical in structure.

h. vaccine. One from the micro-organism infecting the patient. *SYN. autogenous vaccine*.

homology (hō-mōlō-jī) [G. *omos*, same, + *logos*, relation]. Similarity in structure and in origin.

h. serial. Anterior-posterior correspondence of parts of an organism which occur in a serial fashion, as the appendage of a crayfish, or the fore- and hind limbs of quadrupeds.

homolysin (hō-mōl'is-in) [G. *omos*, same, + *lysis*, solution]. *SYN. isolysin*. An agent in a serum destructive of erythrocytes.

homonomous (hō-mōn'ōm-ūs) [G. *omos*, same, + *nomos*, law]. Pertaining to parts arranged in a series which are similar in form and structure as metameres of a segmented animal or the fingers and toes.

homonymous (ho-mōn'im-us) [' + *onyma*, name]. Having the same name.

h. diplopia. D. in which the image seen by the right eye is on the right side and *vice versa*.

homophil (ho'mo-fil) [' + *philein*, to love]. Pert. to an antibody reacting only with a specific antigen.

homoplast'ic [' + *plassein*, to form]. Having similar form and structure.

homoplasty [' + *plassein*, to form]. Repair by tissue similar to the one replaced.

Homo sapiens. The species to which all races of modern man belong.

homosex'ual [' + L. *sexus*, sex]. 1. An invert, one sexually attracted to another of the same sex. 2. Pert. to attraction to another of same sex.

ho'mosexual'ity [' + L. *sexus*, sex]. A condition in which the libido is directed toward one of the same sex.

homostimulant [' + L. *stimulare*, to arouse]. Stimulating the organ that an extract is derived from.

homotherm'al [G. *omos*, same, + *therma*, heat] *SYN. warm-blooded*. Condition in which the body temperature is maintained at a fairly constant level regardless of the temperature of the environment.

homotonic (ho-mo-ton'ik) [' + *tonos*, tension]. Of uniform tension.

homotype (ho'mo-tip) [' + *typos*, type]. One organ or part similar in form and function to another, as 1 of 2 paired parts or organs.

homotypic (ho-mo-tip'ik) [' + *typos*, type]. Of the same form and type.

homozygote (hō-mō-zī'gōt) *homozygous* individual; an individual developing from like gametes and thus possessing like pairs of genes for any hereditary characteristic.

homozygous (hō-mō-zī'gūs). 1. Produced by similar gametes. 2. Pure bred. 3. Said of an organism when all germ cells transmit identical genes resulting from inbreeding.

homunculus (hō-mūn'kūl-ūs). A dwarf in which the parts of the body develop in their normal proportions.

hook [A.S. *hōk*, an angle]. A curved instrument.

h. blunt. One used in extraction of fetus or in embryotomy.

hook-up. Term used in speaking of the method of arranging circuits, appliances and electrodes in the giving of any particular treatment; as, for instance, the hook-up for direct sparks.

hook'worm. A parasitic nematode belonging to the superfamily Strongyloidea, esp. *Ancylostoma duodenale* and *Necator americanus*, *q.v.*

hook'worm disease. A condition brought about by the presence of the hookworm in the intestinal tract. *SYN: ankylostoma, uncinariasis*.

hordeolum (hor-de'o-lum) [L. barleycorn]. Inflammation of a sebaceous gland of the eyelid. *SYN: sty, q.v.*

h. internum. Suppuration of Zeiss or meibomian glands.

horismascope (hor-iz'mā-skōp) [G. *orizma*, a boundary, + *skopein*, to examine]. A U-shaped tube for an acid test for albumin in the urine.

horizocardia (ho-rī'zo-kar'di-ā) [G. *orizōn*, horizon, + *kardia*, heart]. Horizontal position of the heart on the diaphragm.

horizon'tal posi'tion [G. *orizōn*, horizon]. Lying supine with feet extended. Employed in palpation and auscultation of

HORIZONTAL POSITION.

fetal heart beat and in operative procedures.

h. p., abdominal. The patient lies flat on the abdomen with feet extended. Employed in examination of back and spinal column

hor'mion [G. *or'mion*, a little chain] Junction of post. border of the vomer with the sphenoid bone.

horm'one [G. *ormanein*, to excite]. 1. A chemical substance originating in an organ, gland, or part, which is conveyed through the blood to another part of the body, stimulating it to increased functional activity, and increased secretion.

Contains amino acids which may be the precursors of hormones

2 The secretion of the ductless glands, such as insulin, by the pancreas.

They are active in minute quantities and do not supply energy A hormone that induces an excitatory effect is called an *autocord*, an inhibitory effect, a *chalone*

h., adrenocortical. H. secreted by the cortex of the adrenal gland. SEE. the cortex, under *adrenal*

h., adrenocorticotrophic. SYN. *adrenotropin*, *corticotropin* ACTH A hormone secreted by the ant. lobe of the hypophysis which stimulates the adrenal cortex

h., androgenic. SYN. *male sex hormones* Includes *testosterone*, *androsterone*, and *dehydroandrosterone*. H. which regulates the development and maintenance of the male secondary sexual characteristics, an androgen, *q.v.* Androgens are secreted by the interstitial tissue of the testis and by the adrenal cortex of both sexes.

h., anterior pituitary. H. secreted by ant lobe of the hypophysis. Includes the somatotrophic (SH), thyrotropic (TH), gonadotropic, follicle-stimulating (FSH), interstitial-cell stimulating (ICSH), luteotropic (LH), lactogenic, and adrenocorticotrophic (ACTH) hormones

h., A.P.L. Anterior pituitary-like hormone A chorionic gonadotropin secreted by the placenta and found in the urine of pregnant women and serum of pregnant mares Used in pregnancy tests, *q.v.*

h., chromatophoretropic. Intermedin, *q.v.*

h., corpus luteum. Progesterin, *q.v.*

h., corticoadrenal. Adrenocortical hormones, *q.v.*

h., diabetogenic. H. antagonistic to insulin.

h., estrogenic. A hormone which stimulates the development and main-

tenance of female sexual characteristics As estrogen, *q.v.* Estrogens are secreted by the ovary, the placenta, and the adrenal cortex in both sexes. *Female hormones* Include estradiol, estrone, estriol

h., follicle, h., follicular. H. secreted by the ovarian follicles, an estrogen

h., follicle-stimulating (FSH) H. secreted by the ant. lobe of hypophysis which stimulates development of the ovarian follicles

h., gastric. Gastrin, *q.v.*

h., gonadotropic. Ant. pituitary h. affecting the gonads SEE *follicle-stimulating h.*, *interstitial cell-stimulating h.*, *lutemizing h.*, *luteotropic h.*

h., growth. Ant. pituitary h. promoting normal growth

h., interstitial cell-stimulating (ICSH). SEE. *lutemizing hormone*

h., intestinal. A hormone produced by the mucosa of the intestine. SEE *secretin*, *cholecystokinin*

h., lactogenic. SYN. *prolactin*, *luteotropin* Luteotropic hormone, *q.v.*

h., luteal. SYN. *progesterone*, *q.v.* H. produced by the corpus luteum.

h., lutemizing. SYN. *interstitial cell-stimulating hormone* (ICSH) (LH). H. produced by the ant lobe of hypophysis which induces ovulation and the formation of the corpus luteum Also stimulates development of interstitial cells of the testes

h., luteotropic. H. produced by ant lobe of hypophysis which stimulates the secretion of progesterone by the corpus luteum and secretion of milk by the mammary gland

h., ovarian. A h. produced by the ovary SEE *estradiol*, *estrone*, *estriol*, *progesterone*

h., pancreatic. H. produced by the islets of Langerhans of the pancreas SEE *insulin* and *ipocac.*

h., parathyroid. H. secreted by the parathyroid glands which regulates calcium and phosphorus metabolism Deficiency results in tetany. SEE. *parathyrim*, *parathormone*.

h., placental. H. secreted by the placenta Includes estrogens and chorionic gonadotropin.

h., post. pituitary. H. secreted by post lobe of hypophysis. Includes *pitressin*, which produces vasopressor and antidiuretic effects and *ditocin* (oxytocin) which causes contraction of smooth muscles of the uterus.

h.'s, sex, female. Estrogenic hormones, *q.v.*

h.'s, sex, male. Androgenic hormones, *q.v.*

h., testicular. H. produced by the interstitial tissue of the testis, *e. g.*

testosterone, androsterone, and dehydroandrosterone, *q v*

h., thyroid. H secreted by the thyroid gland Among them are three iodine-containing compounds *thyroglobulin*, *diiodotyrosine*, and *thyroxine*

h., thyrotropic. H. produced by ant lobe of hypophysis which regulates development and functioning of the thyroid gland.

h., wound. Traumatism

hormon'ic [G *ormanein*, to excite]. Rel. to or acting as a hormone SYN *hormonal*.

hormonogenesis (hor"mon-o-jen'e-sis) [" + *genesis*, production] Production of an internal secretion SYN *hormonopoeisis*.

hormonogenic (hor"mon-o-jen'ik) [" + *gennan*, to produce] Producing hormones SYN *hormonopoeitic*.

hormonol'ogy [" + *logos*, study]. The study of hormones

hormopoeisis (hor-mo-poi-e'sis) [" + *poeisis*, formation] The production of hormones SYN *hormonopoeisis*.

hormopoeitic (hor-mo-poi-e'tik) [" + *poeisis*, formation] Rel to hormones and their formation SYN *hormonopoeitic*.

horn. SYN *cornu* A cutaneous outgrowth composed chiefly of keratin A horn-like projection

h., dorsal. SYN *posterior column* Post projection of gray matter of the spinal cord

h., ventral. SYN *anterior column* Anterior projection of gray matter of the spinal cord

Horn'er's syndrome. Anidrosis, enophthalmos, miosis, and ptosis from paralysis of cervical sympathetic nerves

hor net sting. Sting by a hornet

A general urticaria may result from the sting of this insect

TREATMENT Remove the stinger, apply tincture of iodine and cold compresses Weak alkaline solutions are beneficial and subsequent soothing lotions such as zinc oxide or calamine lotion may be used.

hor'ny [AS *horn*]. Resembling or consisting of horn.

h. epithelium. The horny granulations in trachoma of the skin

h. layer. Horny layer of the skin. SYN: *stratum corneum*.

horopter (hor-op'ter) [G *oros*, limit, + *optēr*, observer] Sum of all points in the binocular vision

horripilation (hor-i-pi-la'shun) [L *hor-rēre*, to bristle, + *pilus*, hair]. Goose flesh SYN *cutis anserina*.

horse-shoe fis'tula. A fistulous tract in a semicircle in front or behind the anus.

h. kidney. A congenital abnormality. The 2 kidneys are united at their lower poles forming a horseshoe mass generally at a lower level than normal

hos'pital [L *hospitalis*, pert to a guest]. Institution for treatment of the sick and wounded

h., base. A hospital unit within the lines of an army for reception of wounded and patients from the front, as well as for cases within the line itself.

h., camp. An immobile military unit for care of sick and wounded in camp

h., cottage. A collection of detached cottages for care of the sick

h., evacuation. A mobile advance hospital unit to take the place of field hospitals and to supplement base hospitals.

h., field. A portable military hospital beyond the zone of conflict and beyond the dressing stations

hos'pitalism [L *hospitalis*, pert to a guest, + G *ismos*, state] 1 Morbid conditions due to lack of ventilation in a hospital 2 A neuroasthenic condition affecting nurses, doctors, and others who spend the greater part of their time in a hospital 3 Term applied to psychoneurotic condition in which one is a frequent patient of hospitals

hospitalization. Removal of a patient to and confinement in a hospital

host [L *hostis* a stranger] 1 The organism from which a parasite obtains its nourishment 2 In embryology, the larger and relatively normal of conjoined twins 3 In transplantation of tissue, the individual which receives the graft

h., accidental. A host other than the usual or normal host

h., alternate. Intermediate host, *q v*
h., definitive. The final host, or host in which the parasite reaches sexual maturity 2 The vertebrate, when the intermediate host is an invertebrate

h., final. The definitive host, *q v*

h., intermediate. H in which a parasite passes through its larval or asexual stages of development The invertebrate host, when final host is a vertebrate

h., primary. The final host, *q v*

h., reservoir. A host other than the usual or normal one in which a parasite is capable of living and serving as a source of infestation

h., secondary. The intermediate host, *q v*

hot. 1 Possessing a high temperature 2 Actively conducting a current 3 Contaminated with dangerous radioactive material

h. flashes. Crises of vasodilation in skin of head, neck, and chest accompanied by sensation of suffocation and sweating Occurs commonly during menopause

hot eye. Temporary eye congestion in gout.

Hot'tentot ap'ron. Excessive elongation of the labia minora seen in Hottentot women SYN *relaxatio vulvae*.

H. deformity. Abnormal fatness of the buttocks SYN *steatopygia*. [ing

hot'tentotism. Abnormal form of stut-
hot water bag. Rubber bag of various shapes and sizes for applying dry heat to circumscribed areas and for keeping moist applications warm.

hourglass contrac'tion. Excessive, irregular contraction of an organ at its center, as the pregnant uterus during 3rd stage of labor.

The placenta is held in upper part of uterus by a tightly constricting band bet. lower and upper uterine segments. SYN: *ectasia*. RS: *labor*, *stomach*.

h. stomach. Division of stomach (in form of an hourglass) by a muscular

constriction; often associated with gastric ulcer.

house fly. *Musca domestica*, a fly belonging to the order Diptera. Serves as a transmitter of organisms of many infectious diseases.

housemaid's knee. A traumatism resulting from kneeling which produces a swelling of the bursa, ant. to the patella.

house physician. The senior intern in a hospital responsible for the orders of the attending physician.

house staff. The interns and externs of a hospital acting under direction of the general staff.

house surgeon. The senior surgical member of the hospital staff who acts for the attending surgeon in his absence.

Houston's muscle (hūs'tonz). The ant. part of the *musculus bulbo-cavernosus*.

H.'s valves. The folds of mucous membrane or valves formed by them in rectum, supposed to keep feces from entering the anus too rapidly. Syn. *plica transversalis recti*.

Howard's method (artificial respiration) (Benjamin Douglas Howard, American physician, 1840-1900). The patient is placed on his back, with head lower than his abdomen with his hands under his head. Pressure is exerted upon the lower ribs rhythmically every few seconds.

Howell-Jolly bodies. Coarse granules seen in erythrocytes in slides of stained blood. They are thought to be nuclear particles.

Howship's lacunae. Small pits, grooves or depressions found where resorption of bone is occurring. They are usually occupied by osteoclasts, *q. v.*

H.'s symptom. Paresis, or pain in obturator hernia, on inner side of thigh.

HPO. Metaphosphoric acid.

H₂PO. Hypophosphorous acid.

H₃PO. Orthophosphorous acid.

H₂PO. Orthophosphoric acid.

H₂P₂O. Hypophosphoric acid.

Hr factors. Structures including *Hr agglutinogens* and *Hr antigens*, on surface of the red blood cells responsible for reactions with *Hr antisera*. A number of related factors of human blood, so named because of their reciprocal relationship to the Rh factors. The factors, Hr', Hr'', and Hr₀, have been identified. These blood factors are important because sensitization may give rise to dangerous blood transfusion reactions. The baby of a sensitized Rh-negative pregnant woman may develop the blood disease, erythroblastosis fetalis, just as with sensitized Rh-negative mothers.

h.s. Hora somni, bedtime.

H. S. Abbr. for *house surgeon*.

H₂S. Hydrogen sulfide.

H₂SO. Sulfurous acid.

H₂SO. Sulfuric acid.

H-substance. A substance similar to or identical with histamine, *q. v.*

Ht. Symb. for *total hyperopia*.

Hubbard tank. One used for underwater exercises.

Hughes reflex (ūs). Sudden downward movement of penis when the prepuce or gland of a completely relaxed penis is pulled upward. Syn. *virile reflex*.

Higuer's canal (u-ghe-a'). A canal through which the chorda tympani nerve exits from the cranium.

H.'s circle. Anastomosis around the isthmus of the uterus.

H.'s diseases. Lupus of vulva, and uterine fibroma.

H.'s glands. Two tiny vaginal glands.

Huhner test. One for sterility in the male.

SEE. *test*.

hum [of imitative origin]. A soft continuous sound.

h., venous. Sound from large veins in certain anemias. Syn. *bruit de diable*.

human [L. *humanus*, pert. to man]. Pert. to or characterizing man or mankind.

h. bite. Wound caused by human teeth.

SYM. Intense swelling, edema, and foul discharge may develop. The organisms most frequently found in wounds from such bites are a fusiform bacillus, and a spirillum of streptococcus.

TREATMENT. If lymphangitis, moderate fever, and leukocytosis occur, a wide incision may be necessary with hot wet pack applied to the whole arm or hand that has been injured. Smears should be taken from the drainage. Induration in the palm of the hand may occur. All such victims need the immediate attention of a physician.

humectant. A moistening or diluent agent.

humeral (hu'mer-əl) [L. *humerus*, shoulder]. Pert. to the humerus.

humeralradial (hū'mer-o-rad'i-āl) [' + *radius*, wheel spoke, ray]. Pert. to humerus and radius, esp. in comparison of their length.

humeralulnar (hū'mer-o-ul'nār) [' + *ulna*, forearm]. Pert. to the humerus and ulna, esp. in comparison of their length.

HUMERUS

Anterior view of left humerus. 1. Lateral epicondyle; 2. trochlea; 3. medial epicondyle; 4. coronoid fossa; 5. anatomical neck; 6. head; 7. anatomical neck; 8. greater tubercle; 9. lesser tubercle; 10. body.

hu'merus [L. shoulder]. Upper bone of arm from the elbow (articulating with

the ulna and radius) to the shoulder joint, where it articulates with the scapula.

h., fracture of. 1. If the fracture is of the upper end the arm is abducted on a wire splint for about 4 weeks. Movements of the elbow and wrist are started early and movements (active) of shoulder in about a fortnight, or 3 weeks.

2. Fracture of shaft and lower end. The limb is put in plaster in a position midway between pronation and supination with the humerus at right angles to the forearm. Movement of the shoulder, wrist, and finger is allowed at once.

RS *acromioclavicular, capitellum, cubitus, glenoid cavity.*

hu'mid [L *humidus*, moist]. Moist, damp

h. gangrene. G with serous exudation and rapid decomposition. SEE *gangrene*.

humidifier (hu-mid'-fī-er) [L *humidus*, moist] Apparatus to increase moisture content of the air in a room

humid'ity [L *humiditas*, moisture]. Moisture in the atmosphere.

If air was saturated at a temperature of 70° F, water would condense on all objects if the temperature fell to 68° F

THE SATURATION OF THE AIR OCCURS AT.

If It Contains

50° 4.2 grains of water per cu ft

60° 5.8 grains of water per cu ft

70° 7.9 grains of water per cu ft

90° 14.3 grains of water per cu ft

The air can contain at 90° almost twice as much as at 70° F. The relative humidity at 70° F would be 50% if the air held 3.88 grains of water per cu ft. A room with a humidity of from 40-50° F means the presence of 1½ gal of water every 24 hours if it represents a content of 10 cu ft. or 8 or more gal for a 6-room house. SEE: *relative humidity*.

humor [L *fluid*] 1 Any fluid or semi-fluid substance in the body. 2 In ancient medicine, the four "juices" or fluids (blood, phlegm, black bile, yellow bile) of which the body was thought to be composed.

h., aqueous. A watery fluid in the anterior and posterior chambers of the eye.

h., crystalline. The fluidlike substance of the crystalline lens of the eye.

h., vitreous. The vitreous body, q v. A semifluid, transparent substance occupying the space between the lens and retina of the eye.

humoral [L *humor*, fluid] Pertaining to body fluids or substances contained in them.

h. control or correlation. The control of various bodily activities by chemical substances, esp. hormones transported by the blood or lymph in contrast to *nervous control* brought about through nerve impulses.

humpback [origin uncertain]. Curvature of the spine. SYN: *kypshosis*.

hung'er [AS *hungar*] 1 A sensation resulting from lack of food, characterized by dull or acute pain referred to the epigastrium or lower part of chest. Usually accompanied by weakness and an overwhelming desire to eat. Hunger pains coincide with powerful contractions of the stomach. Distinguished from *appetite* in that the latter is a pleasant sensation based on previous experience which causes one to seek food for the purpose of tasting

and enjoying. 2 To have a strong desire.

RS: *addephagia, air h., appetite, bulimia, hormone, limosis.*

h., alr. Dyspnea, breathlessness.

h. contractions. Those observed, and often felt, in the normal empty stomach. They may be painful. A series of such contractions is followed by a period of rest, after which they may return with greater intensity unless food is taken. Digestion may be activated under such conditions.

h. cure. Restricted diet or fasting for cure of disease. SYN *nestiatria, nestitherapy*.

h. day. One on which a diabetic is restricted to broth only.

h., hormone. Deficiency of special hormone in an organ.

hungry. Craving food.

hunterian chancre. Indurated, syphilitic chancre. SEE *chancre*.

Hun'ter's canal. *Canalis adductorius*.

H.'s chancre. Hunterian chancre.

Huschke's canal (hoosh'kēz). One formed by juncture of the *annulus tympanicus* tubercles.

H.'s foramen. Perforation found in arrested development near inner extremity of tympanic plate.

H.'s teeth. Tiny, toothlike protuberances at edge of cochlear labium vestibulare.

H.'s valve. *Plica lacrimalis*.

Hutchinson's patch (hutsh'in-sōn). Salmon-colored area in the cornea seen in syphilitic keratitis. SYN *salmon patch*.

H.'s teeth. A congenital condition, pegged, lateral incisors and notched central incisors along the cutting edge.

A sign of congenital syphilis.

Huxley's layer. Inner layer of nucleated cells forming the inner root sheath of a hair follicle.

hyalin (hi'al-in) [G *yalos*, glass] 1. A substance obtainable from the products of amyloid, colloid, or hyaloid degeneration. 2. Basement substance of hyaline cartilage.

hyaline (hi'al-en, hi'al-in) [G *yalos*, glass] Crystalline, glassy, translucent. SEE *casts, degeneration*.

h. bodies. Homogeneous substance, the result of colloid degeneration and found in degenerated cells.

h. cartilage. The true cartilage. Smooth and pearly. It covers the articular surfaces of bones.

h. casts. The commonest form of cast. They are transparent, pale, and homogeneous with rounded ends, and they indicate nephropathy.

hyalino'sis [" + *ōsis*]. Waxy or hyaline degeneration.

hyalinuria [" + *ouron*, urine]. Hyalin present in the urine.

hyalitis (hi-al-'tis) [" + *-itis*, inflammation]. Inflammation of the vitreous humor. [vitreous.]

h., asteroid. Spherical bodies in the *h. punctata*. A form marked by minute opacities in the vitreous humor.

h. suppurativa. A purulent inflammation of the vitreous humor.

hyalo- [G]. Prefix: Transparent.

hyaloenchondroma (hi'a-lo-en-kon-dro-mā) [G. *yalos*, glass, + *en*, in, + *chondros*, cartilage, + *ōma*, tumor]. A chondroma composed of hyaline cartilage.

hyalogen (hi-al'o-jen) [" + *gennan*, to produce]. A protein substance in cartilage and the vitreous humor.

hyaloid (hi'al-oid) [' + *eidos*, form].

Hyaline, glassy

h. artery. Present in the fetus Supplies nutrition to lens Disappears in later months of gestation

h. canal. Lymph channel in vitreous extending from optic disc to post capsule of lens; contains hyaloid artery in fetus. [the vitreous humor

h. membrane. That which envelops

hyaloiditis (hi'al-oid-i'tis) [' + " + -itis, inflammation] Inflammation of the hyaloid membrane of the vitreous humor SYN *hyalitis*.

hyaloma (hi-äl-ö'mä) [G *yalos*, glass, + *ōma*, tumor] SYN *colloid milium*. A small yellow papule which develops in the corium of the skin as a result of colloid degeneration

hyalomere (hi'al-o-mēr) [' + *meros*, part] Homogeneous part of a blood platelet, pale in color, as contrasted with the chromomere

hyalomucoid [' + *L. mucus*, mucus, + *G. eidos*, form] Mucoid in vitreous body.

hyalonyxis (hi'al-o-niks'is) [' + *nyxis*, puncture] Puncture of vitreous body

hyalophagia (hi'al-o-fa'ji-ä) [' + *phagēin*, to eat] The eating of glass by the demented

hyalophagy (hi-al-of'aj-l) [' + *phagēin*, to eat] Eating of glass by the demented. SYN. *hyalophagia*.

hyalophobia [' + *phobos*, fear] Fear of touching glass

hyaloplasm (hi'äl-ö-pläzm) [G *yalos* glass, + *plasma*, a thing formed] SYN *hyalomitome* The fluid portion of protoplasm The basic ground substance, also called basic or fundamental protoplasm

h., nuclear. Clear substance filling the meshes of the nuclear reticulum SYN. *karyolymph*, *nuclear sap*.

hyaloserousitis (hi'al-o-se-ro-si'tis) [' + *L. serosus*, serous, + *G. -itis*, inflammation] Inflammation of a serous membrane with fibrinous exudate undergoing hyaline transformation

h., progressive multiple. "Phthisis of serous membranes"

hyalotome (hi-al-o-tōm) [G. *yalos*, glass] Fluid portion of protoplasm

hyaluron'ic acid. An acid mucopolysaccharide found in the ground substance of connective tissue which acts as a binding and protective agent Also found in the synovial fluid, vitreous and aqueous humors

hyaluronidase (hi'ä-lür-ön'i-däs) SYN *Duran-Reynolds spreading factor* An enzyme found in the testes and other tissues and present in semen It depolymerizes hyaluronic acid thus increasing the permeability of connective tissues by dissolving the substance that hold body cells together It acts to disperse the cells of the corona radiata about the newly ovulated ovum

hybrid. The offspring of unlike parents, a heterozygous individual

hybridization. The mating of individuals which differ in one or more pairs of genes; cross breeding

hydan'toin. A colorless base, glycolyl urea, C₂H₅N₃O₂, from urea or allantoin.

hydatid (hi'da-tid) [G *ydatis*, a drop of water] 1 A cyst formed in the tissues, esp. liver, resulting from the development of the larval stage of the dog tapeworm, *Echinococcus granulosus* The cysts develop slowly forming a hollow bladder from the inner surface of which hollow brood capsules are formed. These are attached by slender stalks or they may fall free into the fluid-filled cavity of the mother cyst. Scolices

form on the inner surface of the older brood capsules In older cysts there is a granular deposit of brood capsules and scoleces called *hydatid sand*. Hydatids may grow for years sometimes attaining an enormous size. SEE *Echinococcus granulosus* 2 A small cystic remnant of an embryonic structure

TREATMENT SURGICAL
h. fremi'tus. A tumulous sensation felt on palpating a hydatid tumor

h. mole. Degenerative process in chorionic villi, which gives rise to multiple cysts and rapid growth of uterus with hemorrhage DIAG. Indicated by the latter and expulsion of some of the cysts. **TREATMENT.** (a) Packing to con-

HYDATID MOLE

The entire placenta is transformed into a large number of edematous vesicles which resemble a bunch of grapes. Only a small part of the placenta is represented in this picture

trol bleeding, (b) curettage week or 2 after expulsion

h. of Morgagni. Cystlike remnant of the müllerian duct which is attached to the fallopian tube.

h., sessile. Morgagnian h connected with a testicle

h., stalked. Morgagnian hydatid connected with a fallopian tube

hydatidiform (hi-dat-id'if-orm) [' + *L. forma*, shape]. Having the form of a hydatid

hydatidocele (hi-dat-id'o-sēl) [' + *kēlē*, tumor] Hydatid cyst of scrotum or testicle

hydatido'ma [' + *ōma*, tumor]. A tumor consisting of hydatids.

hydatidosis (hi-dat-i-do'sis) [' + *ōsis*]. Condition caused by infestation with hydatids

hydatidostomy (hi-dat-id-os'to-mi) [' + *stoma*, opening]. Evacuation of a hydatid cyst.

hydat'iform [' + *L. forma*, form]. Having the form of a hydatid

hy'datism [' + *ismos*, state of] The sound produced by fluid in a cavity

hydradenitis (hi-dräd-en-i'tis) [G *idrōs*, sweat, + *adēn*, gland, + -itis, inflammation]. Inflammation of a sweat gland.

hydradeno'ma [' + " + *ōma*, tumor]. Tumor of a sweat gland

hydraeroperitoneum (hi-dra-er-o-per-it-o-ne'um) [G. *ydōr*, water, + *air*, + *peritonion*, peritoneum] Collection of fluid and gas in the peritoneal cavity

hydragogue (hy'dra-gog) [' + *agōgos*, leading]. Drug promoting watery evacuation of the bowels.

Ex: *magnesium sulfate, sodium phosphate, solution of magnesium citrate.*

hydramnion, hydramnios (hi-dram'n-l-on, -os) [" + *amnion*, a caul on a lamb]. An excess of liquor amnii which leads to overdistention of the uterus and the possibility of malpresentations.

The normal amount is about 1-2 pt. It may increase to 4-6 pt., and in rare cases to very much more.

Liquor amnii is secreted by the fetus, and abnormal amounts are probably due to some abnormality of the fetus. Nearly half the cases occur in twin pregnancies. Hydramnios begins about 5th month of pregnancy and the pressure of the enlarged uterus gives rise to breathlessness, edema, cyanosis, and varicose veins in the mother. The uterus is large for the date given and the fetus may be felt bobbing about in the liquor and the fetal heart is not easily heard.

hydragyrum (hi-drar'jir-um) [" + *argyros*, silver]. Mercury or quicksilver. SEE: *mercury*.

hydrarthrosis (hi-drar-thro'sis) [" + *arthron*, joint, + *osis*]. Serous effusion in a joint cavity; white swelling.

hydrase. An enzyme which catalyzes the addition of or the withdrawal of water from a compound without hydrolysis occurring.

hydrate (hi'drat) [G. *ydōr*, water]. A crystalline substance formed by water combining with various compounds.

hydrated (hi'dra-ted) [G. *ydōr*, water]. Combined chemically with water.

hydration. The chemical combination of a substance with water.

hydrazine (hi'draz-in) 1. A colorless gas, H_2N_2 , with peculiar odor; soluble in water. 2. One of a class derived from hydrazine.

hydremia [G. *ydōr*, water, + *aima*, blood]. Excess of watery fluid in the blood.

hydrocephalocoele (hi-dren-sef'al-o-sēl) [" + *egkephalos*, brain, + *kēlē*, tumor]. A hernia through a cranial defect of brain substance and meninges, in which fluid occupies the space between the two.

hydrocephalus (hi-dren-sef'al-us) [" + *egkephalos*, brain]. Accumulation of fluid in the cerebral ventricles or outside of the brain. SYN: *hydrocephalus*.

hydropigastrium (hi-drep-i-gas'tri-um) [" + *epi*, upon, + *gaster*, belly]. Accumulation of fluid bet the peritoneum and the abdominal muscles.

hydriatics (hi-dri-at'iks) [" + *iatrikos*, healing]. Application of water in treatment of disease. SYN: *hydrotherapeutics*.

hydriatric (hi-dri-at'rik) [" + *iatrikos*, healing]. Pert to treatment of disease with water, as hydriatric procedures or hydriatric institutions.

hydriatrist [" + *iatrikos*, healing]. One who practices hydrotherapy.

hydrid [G. *ydōr*, water]. Chemical compound containing hydrogen and an element or radical.

hydron. The hydrogen ion (H^+).

hydro [G.]. Prefix. Water, also hydrogen.

hydroa [G. *ydōr*, water]. Chronic inflammatory skin disease.

SYM: Bullae, erythema, itching, papules, pustules, and vesicles.

SYN: *dermatitis herpetiformis, pemphigus pruriginosus*.

hydroappen'dix [" + *L. appendere*, to hang]. Watery fluid distending the vermiform appendix.

hydrobilirubin (hi'dro-bil-l-ru'bin) [" + *L. bilis*, bile, + *ruber*, red]. A brownish

red bile pigment perhaps identical with stercobilin and urobilin.

hydrobromate (hi-dro-bro'māt) [" + *bromos*, stench]. A salt of hydrobromic acid.

hydrocarbon [G. *ydōr*, water, + *L. carbo*, carbon]. A compound made up only of hydrogen and carbon.

Hydrocarbons may exist as aliphatic chain compounds in which the carbon atoms are arranged in the form of a chain, or as aromatic or cyclic compounds in which the carbon atoms form one or more rings.

h., saturated. H in which the carbon atoms are linked by a single electron pair and in which all valences are satisfied.

h., unsaturated. H in which carbon atoms share two or three pairs of electrons.

hydrocele (hi'drō-sēl) [G. *ydōr*, water, + *kēlē*, hernia]. The accumulation of serous fluid in a saclike cavity, esp. the tunica vaginalis testis, serous tumors of the testes or associated parts.

h., acute. Most common, majority of cases bet 2nd and 5th years. H occurring suddenly, usually the result of inflammation of the epididymis or testis.

h., cervical. H in the neck resulting from accumulation of serous fluid in persistent cervical duct or cleft.

h., chronic. H usually seen in men of middle age. May result from flarialis.

h., congenital. That present at birth, resulting from failure of closure of the vaginal process.

h., encysted. H in the vaginal process in which openings to the scrotal and peritoneal cavities are closed.

h. feminae. H in labium majus or canal of Nuck.

h. hernialis. When hernia accompanies infantile or congenital h. and there is an accumulation of peritoneal fluid in a hernia sac.

h., infantile. Peritoneal fluid in the tunica vaginalis and vaginal process with the latter closed at the abdominal ring.

h. muliebris. H feminae, q.v.

h. spermatic. Spermatic fluid in the tunica vaginalis of the testes.

h. spinalis. Spina bifida.

hydrocenes (hi-dro-sen-o'sis) [" + *kenōsis*, an emptying]. Evacuation of a dropsical fluid by tapping or by a hydragogue. SYN: *paracentesis*.

hydroceph'alic [G. *ydōr*, water, + *kephalē*, head]. Pert to hydrocephalus.

hydrocephalocoele (hi-dro-sef'al-o-sēl) [" + " + *kēlē*, hernia]. Watery hernia of the brain. SYN: *hydrocephalocoele*.

hydroceph'aloid [" + " + *eidōs*, resemblance]. Resembling or pert to hydrocephalus.

h. disease. One of infants similar to hydrocephalus.

SYM: Depressed fontanels, pulse irregular, tendency to vomit.

hydrocephalus (hi-dro-sef'al-ūs) [G. *ydōr*, water, + *kephalē*, head]. The increased accumulation of cerebrospinal fluid within the ventricles of the brain. Results from interference with normal circulation and absorption of the fluid, esp. destruction of the foramina of Magendie and Lushka. This may result from developmental anomalies, infection, injury, or brain tumors.

In children the head is usually globular or pyramidal in shape. Face disproportionately small. Eyes hidden in sockets and turned upward. Sutures separated, with bulging fontanels and thin cranial bones.

In older individuals after skull has formed there are headache, vomiting, choked disks, atrophy of optic nerve, mental disturbances.

h., communicating. H in which normal communication between fourth ventricle and subarachnoid space is maintained.

h., congenital. Chronic type occurring in infancy. Also called *infantile h.*

h., external. Accumulation of fluid in subdural spaces.

h., internal. Accumulation of fluid within ventricles of the brain.

h., secondary. H following injury or infections such as meningitis or syphilis.

hydrochlorate (hi-dro-klo'rāt) [¹ + chlōros, green]. Any salt of hydrochloric acid.

HYDROCHLORIC ACID

The shaded part indicates the normal limits of Hydrochloric Acid.

(1) The upper line (of crosses) is Hyperchlorhydria.

(2) The middle (straight line) is Hypochlorhydria.

(3) The bottom (dotted line) indicates Achlorhydria.

hy'drochlo'ric acid (HCl) [G. *ydōr*, water, + *chlōros*, green]. An aqueous solution of hydrogen chloride, containing 35 to 38% (HCl). Crude commercial hydrochloric acid is known as *muratic acid*.

It is a normal constituent of gastric juice amounting to 0.4 to 0.5% and is produced by the parietal cells of gastric glands. It serves the following functions:

1. Converts pepsinogen into pepsin and produces an acid medium favorable for the activity of pepsin.
2. Dissolves and disintegrates nucleoproteins and collagen.
3. Hydrolyzes sucrose.
4. Precipitates caseinogen.
5. Inhibits multiplication of bacteria, esp. putrefactive lactic acid fermentation, and certain pathogenic forms.
6. Stimulates secretion of secretin by the duodenum. It inhibits the action of ptyalin and thus stops salivary digestion in the stomach.

Average amount found in the food content of stomach is about 0.2% due to dilution and neutralization by alkaline contents. In pernicious anemia there is an absence of this acid (achlorhydria).

SEE: *achlorhydria*, *hypochlorhydria*.

hyperchlorhydria, *parietal cells*.

h.a. dilute. Aqueous solution of 10% HCl.

hydrocholecystis (hi-dro-ko-le-sis'tis) [G. *ydōr*, water, + *cholē*, bile, + *kystis*, bladder]. Dropsy of gallbladder.

hydrocholeresis. Choleresis. Choleresis in which water content of the bile is increased resulting in production of bile with reduced specific gravity, viscosity, and total solid contents.

hydrocirsocele (hi-dō-sir'sō-sēl) [¹ + *kirso*, varix, + *kēlē*, tumor]. Hydrocele with varicose veins of spermatic cord.

hydrocollidine (hi-dro-kol'id-ēn) [¹ + *kolla*, glue]. A poisonous ptomaine from putrefying fish or animal flesh.

hydrocolpos (hi-dro-kol'pos) [¹ + *kolpos*, vaginal]. Retention cyst of the vagina containing watery, nonsanguineous fluid, or mucus.

hydroconia (hi-dro-ko'nī-on) [¹ + *konis*, dust]. An atomizer.

hydrocrania [¹ + *kranion*, skull]. Water on the brain. SYN *hydrocephalus*.

hy'drocyst [¹ + *kystis*, a bladder]. A cyst containing watery fluid.

hydrocystoma [¹ + *ōma*, tumor]. Disease marked by small hydrocysts. Sudamina on the face, esp. in women after middle age. SYN *hydrocystoma*.

hydrodiascope (hi-dro-di'ā-skōp) [¹ + *dia*, through, + *skopein*, to examine]. Device to correct astigmatism.

hydrodictiomy (hi'dro-dik-ti-ōt'ō-mī) [¹ + *dictyon*, retina, + *tomē*, incision]. Incision of retina for edema.

hydroelec'tric bath. Administration of an electrically charged bath.

hydroencephalocoele (hi'dro-en-sef'al-o-sēl) [G. *ydōr*, water, + *ekkephalos*, brain, + *kēlē*, hernia]. Brain substance expanded into a watery sac protruding through a cleft in the cranium. SYN *hydroencephalocoele*.

hy'drogel [¹ + L. *gelāre*, to congeal]. A colloid containing water that solidifies in gelatinous form.

hy'drogen (H) [G. *ydōr*, water, + *gennan*, to produce]. An element existing as a colorless, odorless, tasteless gas. It has an atomic weight of 1.008 and atomic number of 1. It possesses one valence electron. Three isotopes of hydrogen (*protium*, *deuterium*, and *tritium*) exist having atomic weight of 1, 2, and 3, respectively.

OCCURRENCE: It occurs in its free state in natural gases and volcanic eruptions only in minute quantities. It is present in the sun and stars and on the earth it comprises about 1% of all known terrestrial matter. It occurs principally as hydrogen oxide (water, H₂O) and is a constituent of all hydrocarbons. It is present in all acids and in ionic form is responsible for the properties characteristic of acids. It is present in nearly all organic compounds and is a component of all carbohydrates, proteins, and fats.

Uses: It is highly inflammable and used in the oxy-hydrogen flame in welding, in hydrogenation of oils for solidifying purposes, as a reducing agent, and in many syntheses.

h. acceptor. In oxidation-reduction reactions a substance which receives hydrogen atoms from another substance. SEE: *coenzyme*.

h. donor. In oxidation-reduction reactions a substance which gives up hydrogen atoms to another substance, the acceptor.

hy'drogenate [¹ + *gennan*, to produce]. To bring about a combination with hydrogen.

hydrogenation (hi-dro-jen-a'shun) [⁺ + *gennan*, to produce]. A process of changing an unsaturated fat to a solid, saturated fat by the addition of hydrogen in the presence of a catalyst, as olein and stearin.

hydrogen dioxide (di-oks'id) [⁺ + ⁺ + *di*, two, + *oxys*, acid]. Hydrogen peroxide (H_2O_2). *q.v.* Used in form of 3% aqueous solution. **ACTION AND USES** Antiseptic and cleansing agent.

hydrogen ion. A proton, the positively charged nucleus of a hydrogen atom.

h. ion concentration. The relative proportion of hydrogen ions in a solution, the factor responsible for the acidic properties of a solution.

h. ion or pH scale. A scale used to express the degree of acidity or alkalinity of a solution. It extends from 0.00 (total acidity) to 14 (total alkalinity), the numbers running in reverse order of H-ion concentration. The pH value is the negative logarithm of the H-ion concentration of a solution, expressed in gram ions (moles) per liter.

As the hydrogen ion concentration decreases, a change of 1 pH unit means a ten-fold increase in hydrogen-ion concentration or true acidity. Thus a solution with a pH of 1.0 is ten times more acid than one with a pH of 2.0 and 100 times more acid than one with a pH of 3.0. A pH of 7.0 indicates neutrality.

As the hydrogen-ion concentration varies in a definite reciprocal manner with the hydroxyl ion (OH^-) concentration, a pH reading above 7.0 indicates alkalinity. The blood and body fluids are slightly alkaline having a pH of about 7.4.

hydrogen peroxide [G. *ydōr*, water, + *gennan*, to form, + *L per*, through, + *G oxys*, acid]. H_2O_2 , a colorless, syrupy, liquid with an irritating odor and acid taste. It decomposes readily, liberating oxygen.

Uses As a commercial bleaching agent, as an oxidizing and reducing agent. In a 3% solution, as a mild antiseptic, germicide, and cleansing agent.

h. p. solution of. The action kills bacteria because of its oxidizing power. The most important use is as an antibacterial agent, although its germicidal activity is generally greatly overestimated. In the presence of organic matter (pus, blood, etc.) this compound is so rapidly broken down that it has little efficiency. In contact with tissues its germicidal power is very limited, owing to the fact that organic matter decomposes it. As long as there is effervescence caused by its application to a wound there is no great destruction of bacteria.

It is of value chiefly as a cleansing agent for suppurating wounds and inflamed mucous membranes. It is especially useful for this purpose because of the development of gas, which tends to loosen adherent deposits. Its value in cleansing infected wounds and freely suppurating ulcers is probably due more to removal of organic detritus* which forms a breeding place for the microorganisms rather than to its antibacterial action.

Its styptic action—probably due to activation of the fibrin ferment of the blood and consequent more rapid coagulation—as well as its harmless nature, make it a very popular antiseptic for household use. It is sometimes injected into deep cavities to determine the presence of pus, which will be indicated by

effervescence. Because of its lack of toxicity it is a favored disinfectant for application to various mucous membranes, esp. those of the nose and throat. Diluted with equal parts of water used as a gargle in pharyngitis, or mouthwash in stomatitis.

hydroglossa (hi-dro-glos'a) [⁺ + *glōssa*, tongue]. Cystic tumor beneath the tongue. **SYN** *ranula*.

hydrogymnasium [⁺ + *gymnasion*, exercising]. Pool for underwater exercises.

hydrogymnas'tics [⁺ + *gymnastikos*, pert. to nakedness]. Underwater exercises.

hydrohematonephrosis (hi'dro-hem'at-o-nef-ro'sis) [⁺ + *aima*, blood, + *nephros*, kidney, + *ōsis*]. Blood and urine in pelvis of the kidney.

hydrohepatosis (hi'dro-hep-at-o'sis) [⁺ + *ēpar*, *ēpat*-, liver, + *ōsis*]. Accumulation of fluid in the liver.

hydrohymenitis (hi'dro-hi-men-i'tis) [⁺ + *ymen*, membrane, + *-itis*, inflammation]. Any inflammation of a serous membrane.

hydrokinetics [G. *ydōr*, water, + *kinēsis*, motion]. Science of fluids in motion.

hydrolase (hi'dro-lās) [⁺ + *ase*, enzyme]. An enzyme that causes hydrolysis. **SYN**: *hydrolyst*.

hydrology (hi-drōl'ō-jī) [G. *ydōr*, water, + *logos*, science]. The science of water in all its aspects.

hydrolysis (hi-drōl'i-sis) [G. *ydōr*, water, + *lysis*, solution]. Any reaction in which water is one of the reactants, more specifically the combination of water with a salt to produce an acid and a base, one of which is more dissociated than the other. The reverse of neutralization. A chemical decomposition in which a substance is split into simpler compounds by the addition of and the taking up of the elements of water.

Reactions of this kind are extremely frequent in life processes. The conversion of starch to maltose, of fat to glycerol and fatty acid, and of protein to amino acids, are examples of hydrolysis, as are more of the other reactions involved in digestion. A simple example is the reaction in which the hydrolysis of ethyl acetate yields acetic acid and ethyl alcohol. $C_2H_5.C_2H_3O_2 + H_2O \rightarrow H_2C_2H_3O_2 + C_2H_5.OH$. Such reactions can be reversed, usually, the reversed reaction is called neutralization, esterification, or condensation. **SEE**: *assimilation*, *enzyme*.

hydrolyst (hi'drol-ist) [⁺ + *lysis*, solution]. A ferment that produces hydrolysis.

hydrolytic [⁺ + *lysis*, solution]. Rel. to hydrolysis.

hydrolyze. To cause to undergo hydrolysis.

hydroma (hi-dro'mā) [⁺ + *ōma*, tumor]. A collection of serous fluid in a cyst.

hydromel (hi'dro-mel) [⁺ + *mel*, honey]. Mixture of honey and water.

hydromeningitis (hi-dro-men-in-j'i'tis) [⁺ + *mēniz*, membrane, + *-itis*, inflammation]. 1. Inflammation of membranes of brain with serous effusion. 2. Inflammation of Descemet's membrane.

hydromeningocele (hi'dro-men-in-go-sēl) [⁺ + ⁺ + *kēlē*, hernia]. Protrusion of meninges or spinal cord in a sac of fluid.

hydrom'eter [⁺ + *metron*, measure]. An instrument which measures the density of a liquid by the depth to which a graduated scale sinks into the liquid.

hydrometra (hi-dro-me'trā) [⁺ + *mētra*, uterus]. Collection of watery fluid or mucus in the uterus.

hydromphalus (hi-drom'fal-us) [+ *omphalos*, navel]. Watery tumor at the umbilicus.

hydromyelia (hi'dro-mi-e'l-i-ä) [G. *ydör*, water, + *myelos*, marrow]. Increased fluid in central canal of spinal cord. **SYN** *hydromyelia*.

hydromyelocele (hi-dro-mi-el-o-sël) [+ *kêlê*, hernia]. Protrusion of sac with cerebrospinal fluid through a spina bifida.

hydromyoma (hi-dro-mi-o-mä) [+ *mys*, *myo-*, muscle, + *oma*, tumor]. Cystic fibroid, usually uterine, filled with fluid.

hydronephrosis (hi'dro-net-ro'sis) [+ *nephros*, kidney, + *ôsis*]. Collection of urine in the kidney pelvis owing to obstructed outflow, forming a cyst by production of distention and atrophy of organ.

DIAG Large, fluctuating, soft mass in region of kidney, appearing and disappearing as retained urine passes into the ureters and bladder.

TREATMENT Aspiration, nephrectomy, or nephrotomy.

hydroparasalpinx (hi'dro-par-ä-sal'pinks) [+ *para*, beside, + *salpiz*, tube]. Accumulation of serous fluid in the accessory tubes of the fallopian tube.

hydroparotitis [+ *para*, near, + *ous*, *ot-*, ear, + *itis*, inflammation]. Accumulation of fluid in the parotid gland.

hydropathic [+ *pathos*, disease]. Rel. to hydropathy.

hydropathy (hi-dro-pä-thi) [+ *pathos*, disease]. A term now used to denote the empirical application of water in the treatment of disease. **SEE** *hydrotherapy*.

hydropericarditis [+ *peri*, around, + *kardia*, heart, + *itis*, inflammation]. Serous effusion accompanying pericarditis.

hydropericardium (hi'dro-per-i-kar'di-um) [+ *peri*, around, + *kardia*, heart]. Pericardial dropsy. Accumulation of water in pericardial sac without inflammation.

SYM Distress in region of heart: dysphagia, disturbed cardiac action and dyspnea. [Cause of attack.]

TREATMENT Paracentesis. Governed by

hydroperinephrosis (hi'dro-per-i-ne-fro'sis) [+ *peri*, around, + *nephros*, kidney, + *ôsis*]. Accumulation of serum of connective tissue surrounding the kidney.

hydropion (hi-dro-per'i-on) [G. *ydör*, water, + *peri*, around, + *ôon*, egg]. Fluid supposedly present between decidua capsularis and decidua parietalis.

hydropertoneum [+ *peritoneum*, peritoneum]. Accumulation of fluid in peritoneal cavity. **SYN** *ascites*.

hydropilism. Tendency of tissues to attract and hold water.

hydropilous (hi-dro-pi-lüs) [+ *philein*, to love]. Taking up moisture. **SYN** *divuluous*.

hydrophobia (hi-drö-fö-bi-ä) [G. *ydör*, water, + *phobos*, fear]. **SYN** *lyssa*. 1 Morbid fear of water. 2 Common name for rabies. *q v*, resulting from bite of a rabid animal.

hydrophobophobia. Morbid fear of contracting hydrophobia, sometimes resulting in a hysterical condition resembling hydrophobia.

hydrophthalmos (hi-drof-thäl'mös) [G. *ydör*, water, + *ophthalmos*, eye]. **SYN** *buphthalmia*, *infantile glaucoma*. Distention of the eyeball due to accumulation of fluid within it.

hydrophysometra (hi'dro-fi-so-me'trä) [+ *physis*, gas, + *metra*, uterus]. Presence of water and gas in the uterus.

hydropic [G. *ydörpikos*, pert. to dropsy]. Dropsical or pert. to dropsy.

hydropigenous (hi-dro-pij'en-us) [C. *ydrops*, dropsy, + *gennan*, to produce]. Producing dropsy.

hydropneumatoxis (hi'dro-nu-mä-to'sis) [+ *pneuma*, air, + *ôsis*]. Liquid and gas in the tissues producing combine edema and emphysema.

hydropneumogony (hi-dro-nu-mog'o-ni) [+ *gonu*, kneel]. Diagnosis of joint effusion by injecting air in joint.

hydropneumopericardium (hi-dro-nu'm-per-i-kar'di-um) [+ *peri*, around, + *kardia*, heart]. Serous effusion with gas in the pericardium.

hydropneumoperitoneum (hi'dro-nu'm-per-i-to-ne-um) [+ *peritoneum*, peritoneum]. Gas and serous fluid in the peritoneal cavity.

hydropneumothorax (hi'dro-nu'mo-tho-raks) [+ *thöraz*, chest]. Gas and serous effusion in pleural cavity. **SYN** *pneumohydrothorax*.

hydrops, **hydropsy** [G. *ydrops*, dropsy]. Dropsy or edema.

h. abdominis. Dropsy of the abdominal cavity. **ASCITES**.

h. endolymphatic. H. labyrinthine.

h. fetalis. Erythroblastosis fetali.

h. folliculi. Accumulation of fluid in graafian follicle of ovary.

h. gravidarum. Edema accompanying pregnancy.

h. labyrinthine. Dilatation due to accumulation of fluid in the endolymphatic space of the ear. A characteristic of Meniere's disease. *q v*.

h. tubae. Collection of fluid in an oviduct. **Hydrosalpinx**.

h. t. profuens. A hydrops of the tube in which the distention becomes great that the tube is forced to empty itself by the pressure, the emptying taking place via the uterine cavity. **SYN** *intermittent hydrosalpinx*.

h. vesicae felleae. Fluid in the gall bladder causing distention.

hydropyonephrosis (hi'dro-pi'o-nef-ro'si) [G. *ydör*, water, + *pyon*, pus, + *nephros*, kidney, + *ôsis*]. Dilatation of kidney pelvis with pus and urine.

hydrothorax (hi-dro-tho-raks) [+ *thöraz*, chest, + *thöraz*, to place]. Thorax with water resistance.

hydropneumothorax (hi-dro-pä-kis) [+ *rachis*, spine]. Condition of increased cerebral spinal fluid bet. membranes and spinal cord or its central canal or cavities.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

hydropneumitis (hi-dro-pä-kis) [+ *itis*, inflammation]. Serous effusion from the spinal cord or its membrane with inflammation of the cord.

phase, are free to move about. SEE: *hydrogel*.

hydrosphygmograph (hi-dro-sfīg'mo-grāf) [" + *sphygmos*, pulse, + *graphein*, to write]. A sphygmograph with indicator consisting of a column of water.

hydrostatic [" + *statikos*, standing]. Pert. to the pressure of liquids in equilibrium and that exerted on liquids. *h. test.* Putting lungs of a dead infant in water. If they float, the infant was born alive.

hydrostatics [G *ydōr*, water, + *statikos*, standing]. Science of properties of fluids in equilibrium.

hydrosudotherapy (hi'dro-sū'do-ther'a-pl) [" + L *sudor*, sweat, + G. *therapeia*, treatment]. Treatment of disease by sweating and hydrotherapy.

hydrosyringomyelia (hi'dro-sir-in'go-mi-e'll-ā) [" + *syngis*, tube, + *myelos*, marrow] Distention of central canal of spinal cord with effusion of fluid and formation of cavities.

hydrotaxis. The response of an animal toward or away from moisture. SEE: *hydrotropism*.

hydrotherapeutics [" + *therapeutikē*, treatment]. Treatment of disease with water. SYN *hydrotherapy*.

hydrotherapist (hi-dro-ther'a-pist) [" + *therapeia*, treatment]. One who practices hydrotherapy.

hydrotherapy (hi-dro-ther'a-pl) [" + *therapeia*, treatment]. Scientific application of water in treatment of disease. RS *bath, cold, compress, douche, pack*.

The therapeutic effects of hydrotherapy are as follows

Brief Hot Tub and Shower Baths. Relieve fatigue but may cause cerebral congestion and wakefulness unless cold compresses are used on the head.

Cold Baths and Applications. Abstract heat and stimulate reaction, esp if followed by friction and percussion. They contract the small blood vessels when applied locally.

Cold and Hot Applications. One followed by the other causes *revulsion*, relieving congestion of internal organs.

Gradually Elevated Hot Tub and Vapor Baths. Relax all muscles of the body.

Hot Baths. Relax tissues including capillaries of skin, drawing blood from deeper tissues, also relieve pain.

Warm and Hot Baths and Applications. They soothe cutaneous nerves, and nerves of internal organs in reflex relation with skin areas to which heat is applied.

SEE *Kneipp cure*.

hydrothionammonemia (hi'dro-thi'on-am-o-ne'ml-ā) [" + *theion*, sulfur, + L. *ammonia*, ammonium, + G. *aima*, blood]. Ammonium sulfide in the blood.

hydrothionemia (hi'dro-thi-on-e'ml-ā) [" + " + *aima*, blood]. Condition caused by hydrogen sulfide in the blood.

hydrothionuria (hi-dro-thi-on-ū'rl-ā) [" + " + *ouron*, urine]. Condition caused by hydrogen sulfide in the urine

hydrothorax (hi-dro-tho'raks) [G *ydōr*, water, + *thōraz*, chest]. Dropsy of the chest, or effused fluid in pleural cavity.

SYM. Dyspnea, absence of vesicular breath sounds, murmur, flatness over location of fluid.

TREATMENT According to cause. Aspiration.

hydrotis [" + *ous*, ot-, ear]. Serous effusion in the internal ear tympanum.

hydrotomy (hi-dro'to-mī) [" + *tomē*, dissection]. Dissection of tissue by forcible injection of water into the vessels.

hydrotropism. Response of plants toward (positive h) or away (negative h) from moisture.

hydrotympānum [" + *tympanon*, drum]. Dropsy of the middle ear.

hydroure'ter [" + *ourēter*, ureter]. Dropsy of the ureter.

hydrovarium (hi-dro-va'ri-um) [" + L. *ovarium*, ovary]. Dropsy or cyst of the ovary.

hydroxide (hi-droks'id) [G. *ydōr*, water, + *oxys*, acid]. A compound which contains the hydroxyl (OH) group. Ex. NaOH (sodium hydroxide, or caustic soda).

hydroxy acids (hi-droks'ī). Acids containing 1 or more hydroxyl groups in addition to the carboxyl group, as *lactic acid*.

hydroxyethylapocupreine (hi-drok'sī-ēth'-ll-a'pō-ku'pre-in). Derivative of quinine effective in stopping growth of all types of pneumonia germs.

hydroxyl. The univalent radical OH which, when combined with a metallic ion or a radical which acts as a metal (e. g. NH₄), forms a hydroxide. Commonly called a base or alkali.

hydrozone (hi'dro-zōn) [G. *ydōr*, water, + *ozein*, to smell]. A bactericide of an aqueous solution of pure hydrogen dioxide.

hydruria (hi-dru'ri-ā) [" + *ouron*, urine]. Increase of watery constituents of the urine with diminished solids in proportion. SYN *polyuria*.

hygiene (hī'jēn) [G. *ygēinos*, healthful]. The study of health and observance of health rules.

h., community. That branch of hygiene which deals with the health of a large group of individuals such as a city, state, or nation, and esp the control of communicable diseases.

h., industrial. That branch of hygiene which deals primarily with health of industrial workers, esp. prevention of occupational diseases.

h., mental. Science of developing and maintaining mental health, preventing neurosis and mental unsoundness.

h., military. That branch of hygiene that deals with the health of men in military service.

h., oral. Scientific care of teeth and mouth.

h., social. The prevention and treatment of venereal disease.

hygienic (hi-jī-en'ik) [G. *ygēinos*, healthful]. 1. Pert. to health or its preservation. 2. In a healthy condition.

hygien'ics [G. *ygēinos*, healthful]. A system for promoting health.

hygienist (hī'jī-en-ist) [G. *ygēinos*, healthful]. A specialist in hygiene.

h., dental. One trained in dental prophylaxis to assist a dentist.

hygienization (hī'jēn-i-za'shun) [G. *ygēinos*, healthful]. The establishment of sanitary conditions and rules of hygiene.

hy'gric [G. *ygros*, moisture]. Pert. to moisture.

hygro- [G.] Prefix: Rel. to moisture.

hygroma (hi-gro'mā) (pl. *hygromata*) [" + *ōma*, tumor]. A sac or bursa containing fluid.

hygroscopic (hi-gro-skop'ik) [" + *skopein*, to examine]. 1. Pert. to hygros-copy. 2. Absorbing moisture readily. SYN *bibulous*, *hydropathous*.

hygros'copy [" + *skopein*, to examine]. Estimation of the quantity of moisture in the atmosphere.

hygrostomia (hi-gro-sto'ml-ā) [" + *stoma*,

mouth]. Excess flow of saliva. SYN: *ptyalism*, *salivation*.

hyla (hi'lā) [G. *ylē*, matter]. A lateral extension of the *aqueductus cerebri*. SYN *paraqueduct*.

hyla'ma [' + *ōma*, tumor] A tumor composed of or in the hylc tissues, such as *hypohyloma*, and *mesohyloma*.

hymen (hi'men) [G. *ymēn*, membrane]. A membranous fold wholly or partially occluding the vaginal orifice. Its rupture is no longer considered as a loss of virginity.

RS *carunculæ myrtiformes*, *deformation*, *hymenorraphy*, *hymenotomy*, *imperforate*.

h. annularis. Hymen with a ring-shaped opening in the center.

h. biforis. One with 2 parallel openings with a thick septum between

h. cribriformis. One with many small perforations

h. denticulatis. One with an opening with serrated edges

h. fenestrated. Same as cribriform.

h. imperforatus. A hymen with no opening in it

h. lunar. H. shaped like the moon

h. ruptured. Hymen that has been torn by coitus, injury or operation

h. septus or **h. septate**. Hymen in which the opening is separated by a thin septum

h. unruptured. The normal hymen.

hymenal (hi'mē-nal) [G. *ymēn*, membrane] Pert. to the hymen.

hymenectomy (hi-men-ek'tō-mī) [' + *ektomē*, excision] 1 Removal of a membrane 2. Removal of the hymen

hymenitis (hi-men-i'tis) [' + *-itis*, inflammation] Inflammation of the hymen or a membrane.

Hymenolepis (hi-men-ol'ep-is) [G. *ymēn*, membrane, + *lepis*, rind] A genus of tapeworm. Parasitic in birds and mammals

H. nana. The dwarf tapeworm, a parasite in the intestine of rats and mice and commonly found in man. It averages about 1 in. in length and differs from other tapeworms in that it is capable of completing its complete life cycle within a single host. It causes severe toxic symptoms, esp in children

hymenology (hi-men-ol'o-jī) [' + *logos*, science]. Science of the membranes and their diseases.

hymenorraphy (hi-men-or'af-i) [' + *raphē*, suture]. Plastic operation on the hymen, occluding the vagina.

hymenotome (hi-men'ō-tōm) [' + *tomē*, incision]. Knife used to divide membranes

hymenotomy (hi-men-ot'o-mī) [' + *tomē*, incision]. 1. Incision of the hymen 2. Dissection of a membrane

hypo [G.]. Prefix: Connection with hyoid bone

hyobasiglossus (hi'o-ba'si-o-glos'us) [G. *yoedēs*, shape like letter U, + *basis*, base, + *glōssa*, tongue]. The part of hyoglossal muscle attached to the hyoid bone. SYN *basiglossus*.

hyoepiglottic (hi'o-ep-i-glot'ik) [' + *epiglōttis*, epiglottis]. Rel. to hyoid bone and epiglottis.

hyoepiglottidean (hi'o-ep-i-glot-id'ē-an) [' + *epiglōttis*, epiglottis]. Rel. to hyoid bone and epiglottis. SYN *hyoepiglottic*.

hyoglossal [' + *glōssa*, tongue]. 1. Pert. to the hyoglossus. 2. Extending to the tongue from the hyoid bone.

hyoglossus. A muscle arising from body and greater cornu of hyoid bone and inserted into dorsum of tongue.

ACTION: Draws down sides and retracts tongue

hyoid [G. *yoedēs*, U-shaped]. Bone at ant. surface of neck at root of the tongue, suspended from styloid processes by the stylohyoid ligament.

It is shaped like the Greek letter U. **h. arch**. Second branchial arch.

HYOID BONE

A. Greater cornu B. Lesser cornu.
C. Body.

hyopharyngeus (hi-o-far-in'je-us) [' + *pharygz*, gullet]. Middle pharyngeal constrictor

hyoscine (hi'o-sin) Scopolamine.

Hyoscyamus (hi-o-si'am-us) [G. *vs*, a pig, + *kyamos*, bean]. USP. Dried leaves of the plant *Hyoscyamus niger*. SYN *henbane*.

ACTION and **USES**. Same as belladonna. **DOSAGE**. Tincture, 30 m (2 cc.), and of the extract, 3 gr. (0.2 Gm.)

POISONING. Related to atropine, *q.v.* SYN. *henbane*.

hypacusia, **hypacusis**, **hypacusis** (hip-ā-koo'si-ā, -kū'si-ā, -sis) [G. *ypo*, under, + *akousis*, hearing]. Impaired hearing.

hypalbuminosis (hip'al-bū-min-o'sis) [' + *L. albumen*, white of egg, + *G. ōsis*] Deficiency in proportion of albumin in blood.

hypalgesia (hi-pal-je'zī-ā) [' + *algēsis*, pain] Lessened sensitivity to pain. SEE *hyperalgesia*.

hypalgia (hi-pal'ji-ā) [' + *algos*, pain] Lessened sensitivity to pain. SYN. *hypalgesia*.

hypamnios (hi-pam'ni-os) [' + *amnion*, caul of a lamb]. Deficiency in amt. of amniotic fluid.

hypanakinesis (hi-pan-a-kin-e'sis) [' + *anankēsis*, exercise]. Lowered rate of movement of stomach or intestines.

hypaxial (hi-paks'i-al) [' + *axōn*, axis]. Situated beneath the body axis.

hyper [G.]. Prefix: Above, excessive, or beyond.

hyperacidaminuria (hi'per-as'id-am-in-ū-ri-ā) [G. *yper*, above, + *L. acidus*, sour, + *amine* + *G. ouron*, urine]. Presence of an excess of amino acids in the urine. SYN *acidaminuria*.

hyperacid'ity [' + *L. acidus*, sour]. 1. An excess of acid. 2. An excess of acid in the stomach. SEE *hyperchlorhydria*.

Diet: Three meals and 3 lunches per day. Provide protein to combine with the acid. Moderate amt. of fat to inhibit secretion of acid. Avoid bulky foods, condiments, and extremes of temperature in foods.

hyperacuity (hi-per-a-kū'ti-l) [' + *L. acutās*, sharpness]. Abnormal acuteness, as of vision.

hyperacusis (hi-per-a-ku'sis) [+ akou-sis, hearing]. Abnormal sensitivity to sound. Sometimes found in hysteria.

hyperadenosis (hi'per-ad-en-o'sis) [+ aden, gland, + ōsis]. Lymph gland enlargement. SEE *Hodgkin's disease*.

hyperadiposis, hyperadiposity (hi-per-ad-i-po'sis, -pos'i-ti) [+ L. *adeps, adip-, fat, + ōsis*]. Excessive fatness.

hyperadrenalemia (hi'per-ad-re'nal-e'e-mi-ā) [+ L. *ad, toward, + renalis, pert. to a kidney, + G. aima, blood*]. Excess of adrenal secretion in the blood.

hyperadrenalinism [+ " + " + G. *ismos, state of*]. Excess of adrenal secretion.

hyperadrenia [+ " + " + *rên, kidney*]. Condition caused by abnormal activity of adrenal glands.

hyperalbuminosis (hi'per-al-bu-min-o'sis) [+ L. *albumen, white of egg, + G. ōsis*]. Increased albumin in the blood.

hyperalgesia (hi-per-al-je'zi-ā) [+ al-gēsis, pain]. Excessive sensitivity to pain, opp of hypalgesia.

hyperalgia (hi-per-al'ji-ā) [+ *algos, pain*]. Excessive sensitivity to pain.

hyperanacinesia, hyperanacinesis (hi'per-an-ā-sin-e'si-ā, -sls) [+ *anakinēsis, exercise*]. Unusual movement, as of the intestines or stomach.

hyperanakinēsis [+ *anakinēsis, exercise*]. Unusual mechanical activity, as of the stomach or intestines.

hyperaphia (hi-per-a'fi-ā) [G. *yper, above, + aphē, touch*]. Excessive sensitiveness to touch.

hyperaphic (hi-per-af'ik) [+ *aphē, touch*]. Marked by extreme sensitiveness to touch.

hyperazoturia (hi-per-az-ot-u'ri-ā) [+ a-, priv. + *zōē, life, + ouron, urine*]. Excessive amt. of nitrogenous matter in the urine.

hyperbilirubinemia (hi'per-bil-i-rū-bin-e'e-mi-ā) [+ L. *bilis, bile, + ruber, red, + G. aima, blood*]. Excessive amt of bilirubin in the blood.

hyperbrachycephaly (hi'per-brak-i-sef-a-fi) [+ *brachys, short, + kephalē, head*]. Excessive degree of brachycephaly; having a cephalic index over 85.

hyperbulia [+ *boulē, will*]. Morbid wilfulness.

hypercalcemia (hi-per-kal-se'mi-ā) [+ L. *calx, lime, + G. aima, blood*]. An excessive amt of calcium in the blood.

hypercalciuria (hi'pēr-kāl-si-ū'ri-ā) [+ " + G. *ouron, urine*]. An excessive quantity of calcium in the urine.

hypercapnia [+ *kapnos, smoke*]. Undue amt of carbon dioxide in the blood.

hypercatharsis (hi-per-ka-thar'sis) [+ *katharsis, purge*]. Excessive bowel movement.

hypercementosis (hi'per-se-men-to'sis) [+ L. *cementum, cement, + G. ōsis*]. Overgrowth of tooth cement (cementum).

hypercenesesthesia (hi-per-sen-es-the'si-ā) [+ *kyōnes, common, + aisthēsis, sensation*]. Syn. *euphoria*. Exaggerated feeling of well-being.

hyperchloremia (hi-per-klor-e'mi-ā) [+ *chlōros, green, + aima, blood*]. Increase in chloride content of the blood.

hyperchlorhydria (hi-per-klor-hid'ri-ā) [+ " + *ydōr, water*]. An excess of hydrochloric acid in the gastric secretion. The amount secreted above what is needed to combine with albumoid and basic substances is known as free HCl.

The normal amount of free hydrochloric acid averages 0.4 to 0.5%. Total acidity is expressed in terms of "clinical units" or the number of c c of 0.1

N sodium hydroxide solution required to bring the stomach contents to end point of titration. If stomach contents give values above 60 and after the second hour instead of declining remain high or continue to rise, *hyperchlorhydria exists*. It is common occurring in about 5% of population. If values are below 20 after test meals, hypochlorhydria exists. Excess of HCl causes a burning sensation in the stomach in the absence of ingested food. It also gives rise to gas from this acid's decomposition, and this may cause gastric ulcer. It is more frequent in nervous types, ulcers and chronic gastritis. Two pathological conditions commonly accompanying hyperacidity are duodenal ulcer and pyloric obstruction. SEE: *hydrochloric acid*.

Diet Small, frequent meals to absorb the HCl. Bland foods and those which will not stimulate the secretion of this acid. Proteins, such as gelatin, eggs, and milk, but little meat or meat broths. Fats, such as cream and butter, permissible as they inhibit the secretion of gastric juice. No sweets, bulky foods, cabbage, onions, or condiments. Cereals, toast, custards, soft, strained, cooked fruits allowable. SYN: *gastrosuccorhea*. SEE: *gastritis, hypochlorhydria*.

hyperchloridation [G. *yper, above, + chlōros, green*]. A dosing with large amounts of sodium chloride.

hypercholestere'mia [+ *cholē, bile, + stereos, stiff, + aima, blood*]. Excess of cholesterol in the blood. SYN: *hypercholesterinemia*.

hypercholesterine'mia [+ " + *stereos, solid, + aima, blood*]. Excess of cholesterol in the blood.

hypercholesterolemia (hi'per-ko-les'ter-o'e-mi-ā) [+ " + " + *aima, blood*]. Excessive amt of cholesterol in the blood.

hypercholesterolia (hi'per-ko-les'ter-o'i-ā) [+ " + *stereos, stiff*]. Excessive cholesterol in the bile.

hypercholia (hi-per-ko'li-ā) [+ *cholē, bile*]. Abnormal secretion of bile.

hyperchromasia (hi'per-kro-ma'si-ā) [+ *chrōma, color*]. Excessive pigmentation. SYN: *hyperchromatism*.

hyperchromatic (hi'per-kro-mat'ik) [+ *chrōma, color*]. Overpigmented.

h. cell. A cell or a part of a cell which contains more than the normal number of chromosomes and hence stains more densely.

hyperchromatism [+ " + *ismos, state of*]. 1. Excessive pigmentation. 2. Increased staining capacity of any structure. SYN: *hyperchromatosis*.

hyperchromatopsia (hi'per-kro-ma-top-si-ā) [+ " + *opsis, vision*]. Defect of vision in which all objects appear colored.

hyperchromato'sis [G. *yper, above, + chrōma, color, + ōsis*]. Excessive pigmentation, esp. of the skin.

hyperchromemia (hi'per-kro-me'mi-ā) [+ " + *aima, blood*]. Condition of a high color index of the blood.

hyperchromia (hi-per-kro'mi-ā) [+ *chrōma, color*]. Excessive pigmentation. SYN: *hyperchromatism*.

hyperchromic (hi-pēr-krōm'ik) [+ *chrōma, color*]. Pert. to excessive pigmentation.

hyperchylia (hi-per-ki'li-ā) [+ *chylōs, juice*]. Abnormal secretion of gastric juice.

hypercinesia (hi-per-sin-e'si-ā) [+ *kinēsis, motion*]. Abnormal mobility.

h., professional. Occupational neurosis

hypercrinism [' + " + *ismos*, state of]. Condition due to excessive activity of any endocrine gland

hypercrystalgia (hi-per-kri-al-jē'si-ā) [G *yper*, above, + *kryos*, cold, + *algēsis*, pain]. **SYN** *hypercrystalgia*. Excessive sensitivity to cold

hypercrysthesia [' + " + *aisthēsis*, sensation] Excessive allergy to cold **SYN** *hypercrystalgia*

hypercyanosis (hi'per-si'an-o'sis) [' + *kyanos*, dark blue, + *ōsis*]. Extreme cyanosis

hypercyanotic (hi-per-si-an-o'tik) [' + *kyanos*, dark blue] Denoting extreme cyanosis

hypercyesis (hi-per-si-e'sis) [' + *kyōsis*, gestation] Presence of more than 1 fetus in a uterus because of fertilization of a second ovum within a short time, at different menstrual periods **SYN** *superfetation*

hypercythemia (hi-per-si-the'mi-ā) [' + *kytos*, cell, + *aima*, blood]. Condition of having an excessive number of red blood corpuscles

hypercytosis (hi-per-si-to'sis) [' + " + *ōsis*]. Abnormal increase in leukocytes in the blood **SYN** *hyperleukocytosis*

hyperdactylia [G *yper*, above, + *dactylos*, finger]. State of having supernumerary fingers or toes

hyperdiastole (hi'per-di-as'to-le) [' + *diastellein*, to draw apart]. Extreme cardiac diastole

hyperdicrotic [' + *dikrotos*, beating double]. Abnormally dicrotic

hyperdistention (hi'per-dis-ten'shun) [' + L *distendere*, to stretch out] Excessive inflation

hyperdiuresis [' + *dia*, through, + *ourēin*, to urinate] Excessive urination **SYN** *polyuria*

hyperdynamia [' + *dynamis*, force]. Muscular restlessness or extreme violence

h. uteri. Abnormal uterine contractions in labor

hypereccrisia, hypereccrisis (hi-per-ek-kris'i-ā, -ek'kris-is) [' + *ek*, out, + *krisis*, separation]. Abnormal amt of excretion

hyperecritic, hyperecritic (hi-per-ek-rit'ik) [' + *ekkritikos*, excreting]. Pert. to an abnormal amt of excretion or hypereccrisis

hyperemesis (hi-per-em'e-sis) [G *yper*, above, + *emesis*, vomiting]. Excessive vomiting

h. gravidarum. One of the toxemias of early pregnancy characterized by excessive vomiting

Etiol. Occurs most frequently in highly sensitive, neurotic individuals, and although it may begin on a neurotic basis the constant vomiting brings on the definite toxic changes. In the severe cases there is definite pathological evidence of the condition, the liver showing changes of a necrotic nature in the center of the lobules

SYM. The condition may start as a simple vomiting of early pregnancy, but with combined vomiting of first gastric contents, and later of bile, there is developed a chloride depletion, an acidosis, and, finally, with severe and continued vomiting the pathological changes in the liver take place.

The findings are those of a patient who is pregnant and who vomits constantly, loses weight rapidly, dehydrates, develops a rapid pulse, has rise

in temperature, and acetone in the urine. Liver function tests may reveal evidences of impaired function if the condition is allowed to progress.

TREATMENT. In early cases, rest in bed, restrictions of fluids taken by mouth, fluids given per rectum or by hypodermoclysis, saturation of the patient with soporifics. In the average case where nervous irritability is a factor the patient should be kept in a darkened, quiet room free from all visitors

Any malposition of the uterus, or any cervical pathology should be taken care of immediately. With rigid management of this type, and no relief from symptoms, and if the pulse and temperature rise and there is definite evidence of liver damage (jaundice), therapeutic abortion should be resorted to.

The necessity for emptying the uterus should occur only rarely if the patient is seen early, and the proper treatment instituted at once. When the patient improves and food is again taken by mouth, it should consist of thick gruels and dry toast with very little liquid nourishment

h. lactentium. Vomiting in nursing infants

hyperemia (hi-per-e'mi-ā) [' + *aima*, blood] 1 Congestion. An unusual amount of blood in a part. 2 A form of macula, red areas on skin which disappear on pressure. 3 PT Increase in the quantity of blood flowing through any part of the body, as undue redness of the skin, caused by the application of heat.

h., active, h., arterial. H caused by increased blood inflow

h., Bier's, h., constriction. Passive hyperemia* produced by application of an elastic bandage and by suction

h., leptomeningeal. Pia-arachnoid congestion

h., passive, h., venous. H caused by decreased blood outflow

hyperemization (hi'per-e-mi-zā'shun) [G. *yper*, above, + *aima*, blood] Hyperemia produced artificially for therapeutic purposes

hyperemotivity [' + L *ēmotum*, *ēmovēre*, to move out] Excessive emotivity or response to stimuli

hyperendocrinia [' + *endon*, within, + *krinein*, to separate]. Pert. to hyperendocrinism

hyperendocrinism (hi'per-en-dok'ri-nizm) [' + " + " + *ismos*, state of]. Abnormal increase of internal secretion

hyperendocrisia (hi'per-en-do-kris'i-ā) [' + " + *krisis*, a separation] Excessive increase of internal secretions **SYN** *hyperendocrinism*

hyper eosinophilia (hi'per-e'o-sin-o-fil'i-ā) [' + *ēos*, dawn (rose colored), + *philein*, to love] Excessive leukocytosis with increase of eosinophils

hyperhidrosis (hi'per-ef-i-dro'sis) [' + *epi*, upon, + *idrōs*, sweating] Abnormal sweating

hypernephria (hi'per-ep'i-nof'ri-ā) [' + " + *nephros*, kidney]. Excessive adrenal secretion with arterial tension

hyperpinephrine'mia [' + " + *nephros*, kidney, + *aima*, blood] Undue proportion of adrenalin in the blood **SYN** *hyperadrenalemia*

hyperequilibrium [' + L *aequus*, equal, + *libra*, balance]. A tendency to vertigo when turning.

hypererethism (hi-per-er'eth-izm) [" + *erethisma*, stimulation]. Excessive irritability.

hyperergasia (hi-per-er-ga'si-ä) [" + *ergasia*, work]. Unusual functional activity.

hyperergia (hi-per-er'i-ä) [" + *ergon*, work]. Excessive or increased functional activity *SYN* *hyperergasia*.

hy'perergy (hi'per-er-jī) [G *yper*, above, + *ergon*, energy]. Hypersensitivity or condition in which there is an exaggerated response.

hypererythrocythemia (hi'per-er-ith'ro-si-the'mi-ä) [" + *erythros*, red, + *kytos*, cell, + *aima*, blood]. Excess of red corpuscles in the blood.

hyperesophoria (hi'per-es-o-fō'ri-ä) [" + *esō*, inward, + *phorēin*, to bear]. A tending of visual lines upward and inward *SYN* *heterophoria*.

hyperesthesia (hi'per-es-the'zi-ä) [G *yper*, above, + *aisthēsis*, sensation]. Unusual sensibility to sensory stimuli, such as pain or touch *SYN* *algēsia*.

h., *acoustic*, *h.*, *auditory*. Abnormal sensitivity to sound.

h., *cerebral*. H caused by a cerebral lesion.

h., *gustatory*. Oversensitivity of taste.

h., *muscular*. Muscular sensitivity to pain and tiredness.

h., *optic*. Abnormal sensitivity to light.

h., *sexualis*. Abnormal increase in the sexual impulse.

h., *tactile*. Abnormal sensitivity of touch.

hyperesthetic [" + *aisthēsis*, sensation]. Pert to hyperesthesia.

hyperexophoria (hi'per-eks-o-fō'ri-ä) [" + *exō*, outward, + *phorēin*, to bear]. A tendency of visual lines upward and outward.

hyperextension (hi'per-eks-ten'shun) [" + *L* *extendere*, to stretch out]. Extreme or abnormal extension.

hyperfunction. Excessive activity.

hypergalactia (hi-per-gal-ak'shi-ä) [" + *gala*, milk]. Excessive milk secretion.

hypergenesis (hi-per-jen'es-is) [" + *genesis*, development]. Redundancy of organs or parts; overproduction. *SYN*: *hyperplasia*.

hy'pergen'italism (hi-per-jen'it-al-izm) [G *yper*, above, + *L* *genitalis*, genital, + G *ismos*, state of] *SYN* *Precocious puberty*. Excessive development of the genital organs.

ETIOL. Disturbances in endocrine secretions of the adrenal gland, or gonads, or hypothalamic disorders.

hypergeusethesia, hypergeusia (hi'per-ges-the'si-ä, -gu'si-ä) [" + *geusis*, taste]. Excessive acuteness of sense of taste.

hyperglan'dular [" + *L* *glandula*, a little acorn]. Having excessive glandular secretions.

hyperglobu'la [" + *L* *globulus*, globule]. Having an excessive number of red blood corpuscles. *SYN*: *hypercythemia*, *polycythemia*.

hyperglobulinemia (hi-per-glob-u-lin-e'mi-ä) [" + " + G *aima*, blood]. Excessive globulin in the blood.

hyperglycemia (hi-per-gli-se'mi-ä) [" + *glykus*, sweet, + *aima*, blood]. Increase of blood sugar from 0.15 to 0.2 or 0.3% or more, as in diabetes.

This condition increases susceptibility to infection and it often precedes diabetic coma. *SEE*: *hypoglycemia*.

hyperglycistia (hi-per-glis-is'ti-ä) [G.

yper, above, + *glykus*, sweet, + *istos*, tissue]. Excess of glucose in the tissues.

hyperglycogenolysis (hi-per-gli-ko-jen-of-is-is) [" + " + *gennan*, to form, + *lysis*, dissolution]. Excessive conversion of glycogen into glucose by hydrolysis.

hyperglycoplasma (hi'per-gli'ko-plas-mi-ä) [" + " + *plasma*, matter formed]. Excessive sugar in the plasma of the blood.

hyperglycorrhachia (hi'per-gli'ko-ra'kl-ä) [" + " + *rachis*, spine]. Excess of sugar in the cerebrospinal fluid.

hyperglycosemia (hi-per-gli-ko-se'mi-ä) [" + " + *aima*, blood]. Excessive sugar in the blood *SYN* *hyperglycemia*.

hyperglycosuria (hi-per-gli-ko-su'ri-ä) [" + " + *ouron*, urine]. Excessive sugar in the urine. *SEE* *glycosuria*.

hypergnosis (hi'per-no-sis) [" + *gnōsis*, knowledge]. All that is involved in projection of conflicts with the environment, evidenced in paranoia, *q v*.

hypergonadism (hi-per-gon'ad-izm) [" + *gonē*, semen, + *ismos*, state of]. Excessive internal secretion of the sexual glands.

hyperguanidinemia (hi'per-gwan-i-dēn-e'mi-ä) [" + *guanidine* + *aima*, blood]. Abnormal amt of guanidine in blood.

hyperhedonia, hyperhedonism (hi-per-he-do'ni-ä, -he'don-izm) [" + *ēdonē*, pleasure, + *ismos*, state of]. 1 Abnormal pleasure in anything 2 Abnormal sexual excitement.

hyperhepatia (hi'per-he-pa'shi-ä) [" + *epar*, *epātē*, liver]. Overfunctioning of the liver.

hyperhidrosis [G *yper*, above, + *idrōs*, sweat, + *ōsis*]. Excessive sweating.

ETIOL. Functional disorder of sweat glands, caused by debilitating disease, stimulants, neurasthenia. Increased in rheumatic, malarial, relapsing and septic fever. At night, in pulmonary tuberculosis, and at crisis in pneumonia. In Graves' disease, neuralgia, migraine and following certain drugs and hot drinks. Locally (hands and feet), in hysteria, fright, vagotonia, nervous irritability, and exophthalmic goiter. *SEE* *sweat*.

h. oleosa. Increased and altered sebaceous secretion. *SYN* *seborrhea*.

hyperhor'monism [" + *ormanein*, to arouse, + *ismos*, state of]. Excessive activity of the endocrine glands.

hyperhypocytosis (hi'per-hi'po-si-to'sis) [" + *ypo*, under, + *kytos*, cell, + *ōsis*]. Decrease of white corpuscles (leukopenia), esp. with relative increase of neutrophils.

hyperinose'mia [" + *is*, *in-*, fiber, + *aima*, blood]. Abnormal coagulability of the blood, excess of fibrinogen in the blood. *SYN* *hyperinosis*.

hyperino'sis [G. *yper*, above, + *is*, *in-*, fiber, + *ōsis*]. Excessive fibrinogen in the blood *SYN* *hyperinosemia*.

hyperinsulinism (hi-per-in'su-lin-izm) [" + *L* *insula*, island, + G. *ismos*, state of]. An excessive amount of insulin in the blood.

ETIOL. Tumor or islets of Langerhans, or excessive sensitivity of the islet tissue to an increase in blood-sugar level. May also occur following injection of an excess of insulin.

SYM. The hypoglycemic picture: hunger, weakness, sweating, staggering, diplopia—rarely convulsions—coma, and death. Occasionally spontaneous. Symptoms similar to but more chronic than in insulin shock. *SEE*: *insulin*, *insulin shock*, *shock*.

hyperinvolution (hi-per-in-vo-lu'shun) [" + L. *involvere*, to roll in]. 1. Reduction in size of uterus below normal after childbirth. 2. Reduction in size below normal of any organ following hypertrophy. SYN: *superinvolution*.

h. uteri. Extreme atrophy of the uterus seen following prolonged lactation or severe puerperal sepsis.

hyperisoton'ic [" + " + *tonos*, tension]. Noting 1 of 2 solutions having greater osmotic pressure. SYN: *hypertonic*.

hy'perkalem'ia. Excessive amount of potassium in blood plasma.

hyperkeratomycosis (hi'per-ker-at-o-mi-ko'sis) [" + *keras*, horn, + *mykēs*, fungus, + *ōsis*]. Hypertrophy of horny layer of the epidermis due to a parasitic fungus.

hyperkerato'sis [" + " + *ōsis*]. 1. Overgrowth of cornea. 2. Overgrowth of the horny layer of the epidermis. SYN: *keratodermia*, *keratosis*.

h. congenitalis. Hyperkeratosis in the harlequin fetus.

hy'perketonur'ia. Excessive quantity of ketones in urine.

hyperkine'sia, **hyperkine'sis** [" + *kinēsis*, motion]. Excessive amt of mobility. SYN: *hyperkinesia*.

hyperlacta'tion [" + L. *lactare*, to suckle]. Excessive milk secretion. SYN: *superlactation*.

hyperleukocyto'sis [" + *leukos*, white, + *kytos*, cell, + *ōsis*]. Excessive quantity of leukocytes. SYN: *leukocytosis*.

hy'perlip'e'mia (hi-per-lip-e'mi-ā) [G *yper*, above, + *lipos*, fat, + *aima*, blood]. Excessive quantity of fat in the blood.

hyperlip'o'sis [" + " + *ōsis*]. 1. Abnormal fat, adiposity. 2. Excessive fatty degeneration.

hyperlithuria (hi-per-lith-u'ri-ā) [" + *lithos*, stone, + *ouron*, urine]. Excessive excretion of lithic (uric) acid in the urine.

hypermas'tia [" + *mastos*, breast]. 1. Excessively large mammary gland. 2. Presence of abnormal number of mammary glands. SYN: *polymastia*, *polymazia*.

hypermat'ure (hi-per-mat-ur') [G *yper*, above, + L. *maturus*, ripe]. Overmature, past maturity.

hypermegasoma (hi'per-meg-ā-sō'mā) [" + *megas*, large, + *sōma*, body]. Excessive bodily development. SYN: *gigantism*.

hypermenor'rhca (hi-per-men-o-re-ā) [" + *mēn*, month, + *roia*, flow]. 1. Too frequent menstrual periods. 2. Abnormal menstrual flow.

hypermetaplasia (hi-per-met-ā-pla'si-ā) [" + *metaplasia*, transformation]. Overactivity in tissue replacement or transformation from one type of tissue to another, as cartilage to bone.

hyperme'tria [" + *metron* measure]. Unusual range of movement.

hypermetrope (hi-per-met-rōp) [" + " + *ōps*, eye]. One who is farsighted. SYN: *hyperope*.

hypermetro'pia [" + " + *ōps*, eye]. Farsightedness. Opp. of *myopia*. SYN: *hyperopia*.

hy'permetrop'ic [" + " + *ōps*, eye]. Pert. to farsightedness.

hypermesia (hi-perm-ne'zi-ā) [" + *mnēsis*, memory]. 1. Great ability to remember names, dates, and details. 2. An exaggeration of memory involving minute details of a past experience. It may occur in mentally unstable individuals after a shock.

hypermorph (hi'per-morf) [" + *morphē*, form]. One whose length of limb and consequent standing height is high in proportion to the sitting height. SEE: *hypomorph*, *mesomorph*.

hypermoti'lity [" + L. *motio*, motion]. Unusual motility. SYN: *hyperkinesia*.

hypermyat'rophy (hi'per-mi-at-rō-fi) [" + *mys*, *myo*, muscle, + *atrophia*, atrophy]. Unusual wasting of muscle.

hypermyesthesia (hi'per-mi-es-the'si-ā) [" + " + *aisthēsis*, sensation]. Muscular sensitivity.

hypermyotonia (hi-per-mi-o-to'nī-ā) [" + " + *tonos*, tone]. Excessive muscular tonus.

hypermyotrophy (hi-per-mi-ot-rō-fi) [" + " + *trophē*, nourishment]. Abnormal muscular development.

hyperneocytosis (hi'per-ne'o-si-to'sis) [" + *neos*, new, + *kytos*, cell, + *ōsis*]. Abnormal increase of leukocytes in the blood (*leukocytosis*) including immature forms. SYN: *hyperleukocytosis*.

hy'pernephr'o'ma [G *yper*, above, + *nephros*, kidney, + *oma*, tumor]. A tumor of the kidney or other organ which contains adrenal tissue. It can be identified by presence of chromaffin cells.

hyperneurotization (hi-per-nū-rot-i-za'shun) [" + *neuron*, nerve]. Grafting of a motor nerve into a muscle to increase its energy.

hypernitremia (hi-per-nī-tre'mī-ā) [" + *nitron*, niter, + *aima*, blood]. Excess of nitrogen in the blood.

hypernolia (hi-per-nov-ā) [" + *nous*, mind]. Excessive mental activity or imagination. SYN: *hyperpsychosis*.

hypernor'mal [G *yper*, above, + L. *norma*, rule]. Abnormal.

hypernormocytosis (hi'per-nor'mo-si-to'sis) [" + " + *kytos*, cell, + *ōsis*]. An increased proportion of neutrophils in the blood.

hypernutrit'ion [" + L. *nutrire*, to nourish]. Supernutrition, overfeeding.

hyperontomorph (hi-per-ōn-tō-mōr'ti) [G *yper*, above, + *ōn*, being, + *morphē* form]. 1. A person with a long thin body and short intestine. 2. One with a tendency to hyperthyrroidism.

hyperonychia (hi-per-o-nīk'i-ā) [" + *onyx*, nail]. Overgrowth (hypertrophy) of the nails.

hyperope (hi'per-ōp) [" + *ōps*, eye]. One who is farsighted. SYN: *hypermetrope*.

HYPEROPIA
Parallel light rays come to a focus behind the retina. SEE: *ametropia*, *myopia*.

hypero'pia [" + *ōps*, eye]. Farsightedness.

Parallel rays come to a focus behind the retina due to flattening of the globe

of the eye, or to error in refraction. SYN: *hypermetropia*.

h., absolute. H. in which the eye cannot accommodate.

h., axial. H. caused by shortness of the eye's anteroposterior axis.

h., facultative. H. which can be corrected by accommodation.

h., latent. H. in which the error of refraction is overcome and disguised by ciliary muscle action.

h., manifest. Total amount of h which can be measured by a convex lens.

h., relative. H. in which vision is clear only when excessive convergence is made.

h., total. Complete h combining both latent and manifest types

hyperorchidism (hi-per-or'kid-izm) [" + orchis, testicle, + ismos, state of] Abnormal activity of testicular secretion

hyperorexia (hi-per-o-rek'si-ā) [" + orexis, appetite]. Abnormal hunger

Usually satisfied by frequent small meals, as in gastric diseases, diabetes, hysteria, psychosis, hyperthyroidism and brain tumors

It is found in helminthiasis, diabetes, hysteria, convalescence from acute diseases, psychosis, hyperthyroidism, brain tumors, diseases of the stomach in which hypermotility and hypersecretion are present SYN *bulimia*.

hyperorthocytosis (hi-per-or'tho-si-to'sis) [" + orthos, straight, + kyto, cell, + ōsis]. Increased white blood cells with normal proportion of various forms and without immature forms

hyperosmia [G. *yper*, above, + *osmē*, smell] Abnormal sensitiveness to odors

hyperostosis [" + osteon, bone, + ōsis]. Abnormal growth of osseous tissue. SYN *exostosis*.

hyperovaria [" + I *ovarium*, ovary]. Precocity of libido in young girls due to excessive ovarian secretion as the result of unusual and premature development of the ovaries

hyperpancreatism (hi-per-pan'kre-ā-tizm) [" + *pagkreas*, pancreas, + ismos, state of] Abnormal activity of the pancreas with trypsin in excess of other ferments

hyperparasitism. Condition in which a parasite lives in or upon another parasite.

hyperparathyroidism (hi-per-par-a-thi-roi-dizm) [" + *para*, beside, + *thyreos*, shield, + *eidos*, form, + ismos, state of] Condition due to increase of the parathyroid secretions

hyperpepsia [" + *pepsis*, digestion] 1. Unusually rapid digestion 2. Indigestion with hyperchlorhydria.

hyperpepsinia (hi-per-pep-sin'i-ā) [" + *pepsis*, digestion] Excess of pepsin in the gastric secretion.

hyperperistalsis (hi-per-per-i-stal'sis) [" + *peri*, around, + *stalsis*, contraction]. Overactive peristalsis

hyperphalangism (hi-per-fal'an-jizm) [" + *phalang*, a line, + ismos, state of]. Having an extra phalanx on a finger or toe. SYN: *polyphalangism*.

hyperphasia (hi-per-fa'zi-ā) [" + *phasis*, speech]. Loss of control of the organs of speech.

hyperphonosis (hi-per-fō-ne'sis) [" + *phonē*, voice]. Increase in voice or percussion sound in auscultation.

hyperphonia (hi-per-fō'nī-ā) [" + *phonē*, voice]. Stuttering or stammering due to excessive innervation of vocal muscles.

hyperphoria (hi-per-fō'rī-ā) [" + *phorein*,

to bear]. Tendency of 1 eye to turn upward. SEE: *anophoria*.

hyperphosphatemia (hi-per-fos-fā-te'mī-ā) [" + L. *phosphās*, phosphate, + G. *aima*, blood]. Abnormal amt. of phosphorus in the blood. SYN: *hyperphospheremia*.

hyperphosphaturia (hi-per-fos-fā-tū'rī-ā) [" + " + G. *ouron*, urine]. Increased amt of phosphates in the urine.

hyperphospheremia (hi-per-fos-fer-e'mī-ā) [G *yper*, above, + L. *phosphās*, phosphate, + G. *aima*, blood]. Abnormal amt of phosphorus compounds in the blood. SYN *hyperphosphatemia*.

hyperphragia (hi-per-frāg'i-ā) Excessive mental activity occurring esp. in the manic phase of manic-depressive psychosis.

hyperphragic (hi-per-frāg'ic). Pertaining to hyperphragia, *q v*

hyperphrenia (hi-per-fre'nī-ā) [" + *phrēn*, mind] 1. Unusual intellectual activity 2. Genius

hyperpiesia, hyperpiesis (hi-per-pi-e'zī-ā, -sis) [" + *piesis*, pressure]. Abnormally high blood pressure.

hyperpletic (hi-per-pi-et'ik) [" + *piesis*, pressure]. Rel to extremely high blood pressure

hyperpituitarism (hi-per-pit-u'i-tar'izm) [G *yper*, above, + L *pituita*, mucus, + G ismos, state of]. Condition resulting from overactivity of the *hypophysis cerebri* or its ant. lobe. SEE *acromegaly, gigantism*

hyperplasia (hi-per-plā'zi-ā) [G. *yper*, above, + *plassein*, to form]. An increase in size of a tissue or organ resulting from proliferation of cells or the development of additional tissue of which the organ is composed but excluding tumor formation; excessive formation of tissue

h., fibrous. Connective tissue cell increase following any inflammation or in chronic visceral fibrosis.

h., lipoid. Increase in cells containing lipid.

hyperplasia [" + *plasma*, matter formed]. 1. Abnormal increase within certain organs of leukocytes which do not appear in the blood. SYN *leukemia*. 2. Increase in size of red blood cells through absorption of fluids.

hyperplastic (hi-per-plas'tik) [" + *plassein*, to form]. Rel. to hyperplasia

hyperpnea (hi-perp-ne'a) [" + *pnōē*, breath]. An increased respiratory rate or breathing which is deeper than that seen in resting subjects. A certain degree of hyperpnea is normal after exercise

ETOL. Pain, respiratory disease, febrile or cardiac disease, disease of diaphragm, of blood, of abdominal viscera, or due to certain drugs, hysteria, or atmospheric conditions.

hyperporosis [" + *pōros*, callus, + *ōsis*]. Excessive callous formation after a bone fracture.

hyperpragic (hi-per-pra'jik) [" + *praxis*, action] Denoting excessive activity.

hyperpraxia [G. *yper*, above, + *praxis*, action]. Excessive activity.

hyperprochorexis (hi-per-pro-ko-re'sis) [" + *pro*, forward, + *choreia*, dance]. Unusually rapid passage of food through the alimentary tract due to increased peristalsis. SYN: *hyperperistalsis, hyperanacnesia, forma nervosa*.

hyperprosexia (hi-per-pro-sek'si-ā) [" + *prosekein*, to heed]. PSY: Fixation of an idea to the exclusion of other ideas, as in compulsion states.

hyperproteinemia (hi'per-pro'te-in-e'-mi-ä) [" + *prōtos*, first, + *aima*, blood]. Excess of protein in the blood plasma.

hy'perpro'teinuria [" + " + *ouron*, urine]. Excess of protein in the urine.

hyperproteosis (hi'per-pro-te-o'sis) [" + " + *ōsis*]. A condition resulting from an excess of protein in the diet.

hyperpselaphesia (hi'perp-sel-af-e-zī-ä) [" + *pselaphēsia*, touch]. Morbid sensitivity to touch.

hyperpsycho'sis [" + *psychē*, mind, + *ōsis*]. Overfunctioning of the mind.

hyperpyre'mia [" + *pyreia*, fuel, + *aima*, blood]. Excess of heat and energy producing substances in the blood.

hyperpyretic (hi'per-pi-ret'ik) [" + *pyrexia*, fever]. Pert to high body temperature (hyperpyrexia).

hyperpyrexia (hi'per-pi-reks'ī-ä) [" + *pyrexia*, fever]. Elevation of systemic temperature, above 106° F.

Produced by following physical agents. Baths, diathermy, radiofrequency current, hot air, radiant heat, electric blankets.

hyperpyrex'ial [" + *pyrexia*, fever]. Denoting high body temperature.

hyperreflex'ia [" + *L. reflexus*, bent back]. Increased action of the reflexes.

hyperres'onance [" + *L. resonāre*, to resound]. Increased resonance caused by percussion.

hy'persaliva'tion. Excessive secretion of saliva.

hypersecretion (hi-per-se-kre'shun) [G. *yper*, above, + *L. secretare*, to secrete]. Abnormal amt. of secretion.

hy'persensibility [" + *L. sensibilitas*, sensibility]. Hypersensitivity of the body to a foreign protein or drug. SYN. *anaphylaxis*, *q v*.

hypersensitiveness (hi'per-sen'si-tiv-nēs) [" + *L. sensitivus*, sensitive]. Excessive and abnormal susceptibility to the action of a given agent, as pollen or foreign protein. See *allergy*, *anaphylaxis*, *hay fever*.

hy'persensitiv'ity. Abnormal sensitivity to a stimulus of any kind.

hypersensitiza'tion [" + *L. sensitivus*, sensitive]. An abnormally increased susceptibility to infection.

hyperskeocytosis (hi'per-ske'o-si-to'sis) [" + *skaios*, left, + *kytos*, cell, + *ōsis*]. Leukocytosis with many immature forms. SYN. *hyperneocytosis*.

hypersom'nia [" + *L. somnus*, sleep]. A toxic condition conducive to sleeping an excessively long time.

hypersphyxia (hi-per-sfik'sī-ä) [" + *sphixis*, pulse]. High blood pressure with increased activity of the circulation.

hypersthe'nia [" + *sthenos*, strength]. Abnormal strength or excessive tension, as in the insane.

hypersthen'ic [" + *sthenos*, strength]. Denoting excessive strength, or tension.

hypersthenuria (hi'per-sthen-u'ri-ä) [" + " + *ouron*, urine]. Dilute condition of the urine with elevation of the freezing point.

hy'persuscep'tibility [" + *L. suscipere*, to take, + *habilis*, apt]. Unusual susceptibility to a disease or to physical, esp. pathological, conditions. See *allergic*, *allergy*, *anaphylactia*, *anaphylactogenic*, *anaphylaxis*, *anatoxic*.

hypersystole (hi-per-sis'to-lē) [" + *systolē*, contraction]. Unusual force or duration of the systole.

hypersystolic [" + *systolē*, contraction].

1. Pert. to hypersystole. 2. Person with undue heart contractions.

hypertarachia (hi-per-tā-rak'ī-ä) [" + *tarache*, disorder]. Excessive irritability of the nervous system.

hypertelorism (hi-per-tel'or-izm) [" + *tēlē*, far, + *orizein*, to separate]. Abnormal width between 2 paired organs.

h. ocular. Abnormal width bet. the eyes.

hy'pertens'in. SYN. *angiotonin*. An active vasoconstrictor (pressor) agent formed in an ischemic kidney. It is a polypeptid formed from the action of renin, an enzyme produced by the renal cortex, on *hypertensinogen*.

hy'pertens'inase. SYN. *angiotonase*. An enzyme present in normal kidney tissue which inactivates *hypertensin*. It is also present in other organs and tissues.

hy'pertens'inogen. A pseudoglobulin present in blood plasma which is the precursor of *hypertensin*, *q v*.

hyperten'sion [G. *yper*, above, + *L. tensio*, tension]. 1. Tension or tonus above normal. 2. A condition in which patient has a higher blood pressure than normal for his age.

Etiol. The primary factor in hypertension is an increase in peripheral resistance resulting from vasoconstriction or narrowing of peripheral blood vessels.

One hundred and sixty millimeters systolic pressure constitutes the beginning of high blood pressure which may run well above 200 or even as high as 280. Persistent high blood pressure may eventuate in apoplexy or heart failure.

Recent research has attributed it, in part, to calcium formation on walls of blood vessels. It is treated by redissolving the calcium into the blood by means of electrolysis.

h., essential. SYN. *hyperplasia* H. which develops in the absence of kidney disease. Its cause is unknown. Also called primary or benign hypertension.

h., benign. H. of slow onset which is usually without symptoms.

h., Goldblatt. Hypertension which resembles renal hypertension produced in experimental animals.

h., malignant. Severe form of h. in which occlusion of peripheral vessels occurs resulting from hyperplasia and degenerative changes in intima.

h., renal. H. resulting from kidney disease. H. produced experimentally by constriction of renal arteries. It is due to a humoral substance *renin*, produced in an ischemic kidney.

RS blood pressure, diastolic p., hypotension, pulse, pulse pressure, systolic p. **hyperten'sive** [" + *L. tensio*, tension]. Marked by a rise in blood pressure.

h. diseases. Noninfectious ones with increased blood pressure.

hyperthē'lia [" + *thēlē*, nipple]. The presence of more than 2 nipples.

hyperthermalgia (hi'per-therm-al-je-zhi-ä) [" + *thermē*, heat, + *algēsia*, pain]. Unusual sensitiveness to heat.

hyperthermia (hi-per-ther'mī-ä) [G. *yper*, above, + *thermē*, heat.] SYN. *hyperpyrexia*. 1. Unusually high fever. 2. Treatment of disease by raising bodily temperature, accomplished by introduction of the malaria organism, injection of foreign proteins, or by physical means.

hyperthermoesthesia (hi-per-therm-o-es-thē-sī-ä) [" + " + *aisthēsis*, sensation]. Unusual sensitiveness to heat. SYN. *hyperthermalgia*.

hyperthrombinemia (hi'per-throm-bin-e-mī-ä) [" + *thrombos*, clot, + *aima*,

blood]. Excess of thrombin in the blood causing coagulation.

hyperthymergastic reaction (hi'per-thi-mer-gas'tik) [" + *thymos*, mind, + *ergasia*, work]. A syndrome of a psychic disorder in which circumscribed attacks exhibit elated excitement, delusions of self-exaltation, euphoria, and other symptoms, including inability to conform to environment, and rebellion against inhibitions

hyperthymia (hi-per-thi'mi-ä) [" + *thymos*, mind] 1. Morbid sensitiveness. 2 Cruelty or foolhardiness. 3 Moral insanity.

hyperthymism, hyperthymiza'tion [" + " + *thymos*, state]. Excess secretion of the thymus gland.

hyperthyrea (hi-per-thi're-ä) [" + *thyreos*, shield]. Excessive activity of the thyroid

hyperthyreosis (hi'per-thi-re-o'sis) [" + " + *osis*]. Overactivity of the thyroid

SYN *hyperthyrea, hyperthyroidation.*

hyperthyroidation (hi'per-thi-roy-da'-shun) [" + " + *eidos*, form]. Excessive action of thyroid gland SYN *hyperthyrea.*

hyperthyroidism (hi-per-thi'roid-izm) [" + " + " + *ismos*, state of]. A condition caused by excessive secretion of the thyroid glands which overstimulates the basal metabolism, causing an increased demand for food to prevent oxidization of body tissues

It may take 2 forms exophthalmic goiter* or Graves' disease and toxic adenoma

SYM Autonomic imbalance, exaggeration of all functions, rapid pulse, psychic disturbances, excitement, restlessness, tremors, diarrhea, loss of weight, increased metabolism

NP Mental and physical rest with freedom from worry and excitement imperative. A cool, bracing climate away from the seashore desirable Exercise during hot weather aggravates symptoms Winter months often bring improvement

In severe cases confinement in bed, perhaps for several weeks or months. Light, fresh air, and sunshine are needed and sometimes a change of room desirable. Visitors should not be permitted prior to operation or in severe cases, and the nurse should attempt to allay all nervousness on part of patient. Simple diversions help to allay restlessness. Bedclothes during hot weather reduced to a minimum Encourage patient to drink plenty of water. Bowels should be evacuated daily. Warm baths and frequent rubs are conducive to rest. Patient's position should be changed frequently Hydrotherapy may be prescribed, and cold applications used to allay palpitation. An accurate record of pulse should be kept and the weight recorded at regular intervals. Regular nursing procedures should be followed for daily care of patient

Diet The doctor and the dietitian may indicate the needed calories and prescribe the diet. Ordinarily, diet should be light and nourishing, with 2 or 3 pints of milk per day. No coffee or alcohol Fish, eggs, fat bacon, chicken, custard, bread, vegetables and fruit are permitted Red meats should be avoided.

RS Basedow's disease, cretinism, goiter, myxedema, thyroid.

hyperthyro'sis [" + " + *osis*]. Excess of thyroid secretion in the blood. SYN: *hyperthyroidation.*

hyperto'nia [G. *yper*, above, + *tonos*, tension] Abnormal tension of arteries or muscles.

hyperton'ic [" + *tonos*, tension]. 1. Having a higher osmotic pressure than blood. Pert. to a solution of higher osmotic pressure than another

2. Being in a state of greater than normal tension or of incomplete relaxation Said of muscles Opp. of *hypotonic*.

hypertonic'ity [" + *tonos*, tension]. Excess muscular tonus or intraocular pressure SYN *hypertonia.*

hypertonus (hi-per-to'nus) [" + *tonos*, tension] Increased tension, as muscular tension in spasm

hypertoxic'ity [" + *toxikon*, poison] The state of being excessively poisonous

hypertrichiasis (hi'per-tri-ki'a-sis) [" + *thrix*, *trich-*, hair] Abnormal growth of hair.

ETIOL Congenital or obscure causes May be due to adrenal or gonad disturbances Noted in Addison's disease and in patients bedridden with pulmonary tuberculosis SYN *hypertrichosis.*

hypertrichophobia (hi'per-trik-o-fobi-ä) [" + " + *phobos*, fear] Fear of hair on the body

hypertrichophrydia (hi'per-trik-of-rid'i-ä) [" + " + *ophrys*, eyebrow] Undue length of the eyebrows

hypertrichosis (hi'per-tri-ko'sis) [" + " + *osis*]. Abnormal growth of hair. SYN: *hypertrichiasis.*

hypertrophia (hi-per-tro'fi-ä) [" + *trophē*, nourishment] Increased size of an organ, or of the body, due to growth SYN *hypertrophy.*

hypertrophic (hi-per-trof'ik) [" + *trophē*, nourishment]. Pert to hypertrophy.

hypertrophy (hi'per-tro-fi) [G. *yper*, above, + *trophē*, nourishment] SYN: *hypertrophia* Increase in size of an organ or structure which does not involve tumor formation. Term is generally restricted to an increase in size or bulk not resulting from an increase in number of cells or tissue elements, as in the hypertrophy of a muscle. Term sometimes used to apply to any increase in size as a result of functional activity. SEE *hyperplasia*

h., adaptive. H in which an organ increases in size to meet increased functional demands, as h. of the heart which accompanies valvular disorders.

h., cardiac. H of the heart, increase in size of the heart resulting from hypertrophy of muscle tissue but without increase in size of cavities

h., compensatory. H resulting from increased function of an organ due to a defect, or due to impaired function of the opposite of a paired organ.

h., concentric. H in which the walls of an organ become thickened, with no enlargement, but with diminished capacity.

h., eccentric. Hypertrophy of an organ, with dilatation

h., false. H with degeneration of 1 constituent of an organ and its replacement by another.

h., Marie's. Chronic arthral enlargement subsequent to chronic periostitis.

h., numerical. H. caused by increase in structural elements

h., physiological. That due to natural rather than pathological factors

h., pseudomuscular. A disease usually of childhood, characterized by paralysis, depending upon degeneration of the muscles which, however, become en-

larged from a deposition of fat and connective tissue.

Syn. Weakness of muscles, child is awkward, stumbles and seeks support in walking. As paralysis increases, the muscles, particularly those of the calf, thigh, buttocks and back, enlarge. Upper extremities less frequently affected. In erect posture feet are wide apart, abdomen protrudes and spinal column shows a marked curvature with convexity forward. Patient rises from recumbent position by grasping the knees or by resting the hands on the floor in front of him, extending the legs and pushing the body backwards. Gait is waddling. In course of few years paralysis becomes so marked patient is unable to leave his bed, atrophy of muscles follows.

Prog. Utterly unfavorable.

Treatment. Constitutional, graduated exercises, massage, electricity.

h., simple. H due to increase in size of structural parts.

h., true. H caused by increase in size in all the different tissues composing a part.

h., vicarious. H of an organ when another organ of allied function is disabled or destroyed.

hypertr'opia [G *yper*, above, + *trōpē*, a turning]. Vertical strabismus, upward.

hyperuresis (hi-per-ū-re'sis) [' + *ourēsis*, urination]. Excess of urinary secretion. **Syn.** *enuresis*, *polyuria*.

hyperuricemia (hi-per-ū-ris-e-mi-ā) [' + *ouron*, urine, + *aima*, blood]. Abnormal amt. of uric acid in the blood.

hyperuric'ria [' + ' + *ouron*, urine]. Undue amt of uric acid in the urine.

hypervascular [' + *L vasculis*, vessel]. Excessively vascular.

hyperv'osity (hi-per-ve-nos'ti) [' + *L venōsus*, pert to a vein]. Excessive development of the venous system. **Syn.** *super'v'osity*.

hy'perventilation [G *yper* above, + *L ventilatio*, ventilation]. Hyperpnea as occurs in forced respiration, increased inspiration and expiration of air as a result of increase in rate or depth of respiration, or both. Results esp in carbon dioxide depletion (*acapnia*) with accompanying symptoms (fall in blood pressure, vasoconstriction, and sometimes syncope).

h. syndrome. A condition common during sleep. Faster and deeper breathing causes a loss of carbon dioxide from the lungs producing numbness of the hands, fingers and of other parts of the body, prickling of skin, trembling feeling, racing of heart, light-headedness, fainting, cramps of muscles, esp leg cramps, a spastic and painful condition resulting in tetany and possibly death.

hyperviscos'ity [' + *L viscosus*, gummy]. Excessive viscosity or exaggeration of adhesive properties. Seen in anemias and inflammatory diseases.

hypervitaminosis (hi-per-vi-tām-in-ō'sis) [' + *L vita*, life, + *amine* + *ōsis*]. A condition caused by an excessive amount of vitamin. Occurs only in cases of administration of massive doses of vitamins A & D.

hypervolemia (hi-per-vol-e'mi-ā) [' + *L volumen*, volume, + *G aima*, blood]. Plethora of blood.

hypesthesia (hi-pes-the'zi-ā) [G. *ypo*, under, + *aisthēsis*, sensation]. Lessened sensibility to touch.

hypha (hi-fa) [G. *phē*, web]. A filament of mold, or part of a mold mycelium.

hyp'hedonia (hip-he-dō-ni-ā) [G. *ypo* under, + *ēdonē*, pleasure]. Abnormal diminution in gratification of desires.

hyp'hemia (hi-fē-mi-ā) [' + *aima*, blood]. 1. Blood in the ant. chamber of the eye in front of iris. 2. *Oligemia*.

hyp'hex (hi-fēks) A name for both hexamethonium chloride, and 1-hydrazinophthalazine, effective in treatment of the hypertensions.

hyp'hidrosis (hip-hid-ro'sis) [' + *idrōs*, sweat]. Diminished secretion of sweat.

Hyphomycetes (hi-fō-mi-se'tēs) [G. *phē*, web, + *mykes*, fungus]. The *Fungi imperfecti*. Filamentous fungi with branched or unbranched threads. **Syn.** *molds*.

hyp'nosis (hip-in-ō'sis) [G. *ypo*, under, + *is*, in-, fiber, + *ōsis*]. Deficiency of fibrin in the blood.

hyp'nagogic (hip-nag-oj'ik) [G. *ypnos*, sleep, + *agōgos*, leading]. 1. Inducing sleep or induced by sleep. **Syn.** *hypnotic*. 2. *Psy* Pert to hallucinations or dreams just before loss of consciousness. **See** *hypnogenic zones*.

h. state. A transitional state bet sleeping and awaking and delusions which may result therefrom.

hyp'nalgia (hip-nal'ji-ā) [' + *algos*, pain]. False sense of pain experienced in a dream.

hyp'nic [G. *ypnos*, sleep]. Causing sleep. **Syn.** *somnificient*, *somniferous*.

hyp'nocyst [' + *kystis*, a cyst]. A quiescent cyst or 1 whose activity is in abeyance.

hyp'nogetic [' + *gennan*, to produce]. Producing sleep.

h. spots. Areas which, on being stimulated, produce sleep. **Syn.** *hypnogenic zones*.

hypnogenic zones (hip-no-jen'ik) [' + *gennan*, to produce]. Areas on the body which, when stimulated, produce sleep, esp a sleep resembling somnambulism. The area may be the elbow or the popliteal spaces. **See** *hypnagogic*.

hyp'noidal (hip-noi'dal) [' + *eidōs*, resemblance]. Pert to a condition between sleep and waking, resembling sleep.

hyp'noidiza'tion [' + *eidōs*, form]. Induction of hypnosis.

hyp'nolepsy (hip-no-lep-si) [' + *lēpsis*, seizure]. Irresistible sleepiness. **Syn.** *narcolepsy*.

hyp'nology (hip-no-lo'ji) [' + *logos*, study]. Scientific study of sleep.

hyp'nophob'ia. Morbid fear of falling asleep.

hypnopompic (hip-no-pom'pic) [' + *pompē*, procession]. Dreams persisting after return of consciousness.

hyp'nosis (hip-no'sis) [' + *ōsis*]. A subconscious condition in which the objective manifestations of mind are more or less inactive, accompanied by abnormal sensibility to impressions, the subject responding to these impressions, unrestrained by the reasoning faculties. **See** *autohypnosis*, *bradism*, *hypnotism*, *sleepwalking*, *somnology*.

hypnosophy (hip-nos-ō-fi) [' + *sophia*, wisdom]. The study of sleep.

hyp'nother'apy [' + *therapeia*, treatment]. Treatment by hypnotism, or by inducing prolonged sleep.

hypnotic [G. *ypnos*, sleep]. 1. Pert. to sleep or hypnosis. 2. An agent that induces sleep or which dulls the senses. **Ex:** *chloral hydrate*, *sulfonethylmethane*.

hypnotics [G. *ypnos*, sleep]. Drugs which cause insensibility to pain by inhibiting

afferent impulses, or the cortical centers of the brain receiving sensory impressions, and thus causing partial or complete unconsciousness. They include: *Sedatives, analgesics, anesthetics, and intoxicants, q.v.* They should yield not unpleasant after effects and result in natural sleep.

They are sometimes called *narcotics, somnifacients, and soporifics. q.v.*, when used to induce sleep.

NP They should not be administered without a physician's order.

Ex *Mild* Bromides, sodium bromide, dose 5-30 gr., potassium bromide, dose 5-30 gr., or ammonium bromide, dose 5-30 gr.

Aspirin, dose 5-15 gr., acts as a mild hypnotic.

Stronger Trional, 5-10 gr., veronal, 5-10 gr., sulfonal, 5-20 gr. —this should be given early in the evening, as it takes several hours to act.

Chloral, 5-20 gr., often used in conjunction with bromide to obtain a more powerful hypnotic effect. Chloral is a heat depressant.

Chloralamide, dose 10-30 gr., is a safer drug to use than chloral, as it is less depressing to the heart.

Narcotics Opium, morphia and its derivatives are narcotics.

hypnotism (hi'p'no-tiz'm) [+ *ismos*, state of.] An induced sleeplike state during which patient is peculiarly susceptible to the suggestions of the hypnotist.

hypnotist [G *ypnos*, sleep.] One who practices hypnotism.

hypnotize (hi'p'no-tiz) [G *ypnos*, sleep]. To put under hypnotism.

hy'po [G *ypo*, under] 1 A hypochondriac 2 Popular name for hypodermic injection.

hy-po [G.] Prefix Less than, below
hy'pocid'ity [G *ypo*, under, + L. *acidus*, sour] A condition caused by lowered hydrochloric secretion.

Secondary to other disorders, such as pernicious anemia.

TREATMENT Dilute HCl by mouth.

DIET Fruit juices and meat broths before meals. Nourishing diet.

hypoadre'nia [+ *adēn*, gland]. Defective activity of the glands.

hypoadrenalism, hypoadre'nia [+ L. *ad*, to, + *rēnalis*, pert to kidney, + G *ismos* state of.] Adrenal insufficiency.

hypoaimenta'tion [+ L. *alimentum*, nourishment] Insufficient nourishment. SYN *subalimentation*.

hypocalonemia (hi'p'o-al-o-ne'mī-ā) [+ *als*, salt, + *aima*, blood]. Lack of salts in the blood.

hypozoturia (hi'p'o-az-ot-ū'rī-ā) [+ *a-*, priv + *zōē*, life, + *ouron*, urine]. Diminished urea in the urine.

hypobaropathy (hi'p'o-bar-op'ā-thī) [+ *baros*, pressure, + *pathos*, disease]. Symptoms produced by diminished air pressure, mountain sickness, aviator's sickness.

hyp'oblast [G *ypo*, under, + *blastos*, germ] The inner cell layer or *endoderm* which develops during gastrulation. The external layer is called *epiblast*.

hypoblastic (hi-po-blas'tik) [+ *blastos*, germ] Pert. to the inner layer of the blastoderm.

hypobulia (hi-po-bu'li-ā) [+ *boulē*, will]. Lack of will power.

hypocalcemia (hi'p'o-kal-se'mī-ā) [+ L. *calx*, lime, + G *aima*, blood]. Abnormally low blood calcium.

hypocalcia (hi-po-kal'sī-ā) [+ L. *calx*, lime]. Lack of calcium in the system.

hypocap'nia [+ *kapos*, smoke]. Lack of carbon dioxide in the blood.

hypochloremia (hi'p'o-klo-re'mī-ā) [+ *chlōros*, green, + *aima*, blood]. Having deficiency of the chloride contents of the blood.

hypochlorhydria (hi-po-klor-hī'drī-ā) [+ " + *ydōr*, water]. Diminished secretion of hydrochloric acid.

Less than 25° throughout Ewald test. Small amount and low acid may be indicative of carcinoma or anemia. May be found in subacute and chronic gastritis, peptic ulcers, infections, advanced tuberculosis, early carcinoma, and neuroses. SEE *achlorhydria, hyperchlorhydria*.

hy'pochlorization [+ *chlōros*, green]. Reduction of sodium chloride in the diet in nephritis and epilepsy.

hypochloruria (hi-po-klo-ru'rī-ā) [G. *ypo*, under, + *chlōros*, green, + *ouron*, urine] Diminution of chlorides in the urine.

hypocholesteremia (hi'p'o-ko-les-ter-e'mī-ā) [+ *cholē*, bile + *stereos*, solid, + *aima*, blood] Lowered cholesterol in the blood.

hypochon'dria [+ *chondros*, cartilage]. Abnormal concern about health with false belief of suffering from some disease. SYN *hypochondriasis*.

hypochon'driac [+ *chondros*, cartilage]. 1. Pert to the region of the hypochondrium,* or upper lateral region on each side of the body and below the thorax, beneath the ribs.
2 One having a morbid fear of disease.

h. region. Part of abdomen beneath lower ribs on both sides of epigastrium. SYN *hypochondrium*.

hypochondriacal (hi'p'o-kon-dri-ā-kal) [+ *chondros*, cartilage] Affected with a morbid interest in health and disease.

hypochondrial reflex (hi-pō-kon'drī-āl) A sudden inspiratory act resulting from sudden pressure below costal border.

hypochondriasis (hi'p'o-kon-dri-ā-sis) [+ *chondros*, cartilage] Morbid anxiety about one's health, a frequent symptom of depressed states. SYN *hypochondria*.

hypochon'drium [+ *chondros*, cartilage] That part of the abdomen beneath the lower ribs on each side of the epigastrium.

hypochromasia (hi'p'o-kro-mā-sī-ā) [+ *chrōma*, color]. Lack of hemoglobin in the red blood cells.

hypochromatosis (hi'p'o-kro-mā-to'sis) [+ " + *ōsis*]. Disappearance of the chromatin or nucleus in a cell. SYN *chromatolysis*.

hy'pochromia [G *ypo*, under, + *chrōma*, color] Condition of the blood in which the red blood cells have a reduced hemoglobin content.

hypochromic (hi-pō-krōm'ik) [+ *chrōma*, color] Pert to hypochromia.

hypochro'sis [+ *chrōma*, coloring]. Lack of color in the blood because of low hemoglobin.

hypochylia (hi-po-ki'li-ā) [+ *chylos*, juice] Lack of normal secretion of gastric juice.

hypocinesia (hi-po-sin-e'sī-ā) [+ *kinēsis*, motion]. Diminished power of movement.

hypocolasia (hi-po-ko-la'sī-ā) [+ *kolasis*, hindering]. Functional weakness of the inhibiting mechanism.

hypocondylar (hi-po-kon'dī-lar) [+ *kondylos*, condyle]. Below a condyle.

hypocone. The distolingual cusp of an upper molar tooth.

hypoconid. The distobuccal cusp of a lower molar tooth.

hypocrinism (hi-po-kri'nizm) [' + *krinein*, to separate, + *ismos*, state of]. Deficient secretion of any gland, esp. an endocrine.

hypocyclosis (hi'po-si-klo'sis) [G. *ypo*, under, + *kyklos*, circle]. Deficient accommodation.

h., ciliary. Weakness of ciliary muscle.

h., lenticular. Lack of elasticity in crystalline lens.

Both forms interfere with accommodation.

hypocystotomy (hi-po-sis-to'to'o-mi) [' + *kystis*, a bladder, + *tome*, incision]. Perineal opening of the bladder.

hypocytosis (hi-po-si-to'sis) [' + *kytos*, cell, + *osis*]. Lack of normal number of blood corpuscles.

hypodermatomy (hi-po-der-mat'o-mi) [' + *derma*, skin, + *tome*, incision]. Subcutaneous incision or section, as of a muscle or tendon.

hypodermic [' + *derma*, skin]. Under, or inserted under the skin, as a hypodermic injection.

It may be given *subcutaneously*, *intracutaneously*, or into the skin, *intramuscularly*, or into a muscle, *intraspinally*, or into the spinal canal, or *intravenously*, into a vein.

It is given to secure prompt action of a drug, when the drug cannot be taken by mouth, when it may not be readily absorbed in the stomach or intestines, when it might be changed by action of the gastric secretions, or to act as an anesthetic about the site of injection.

h., antitoxin, serum, and vaccine. Subcutaneous in intrascapular region, infraclavicular region, or post portion of axilla. May also be adm intramuscularly or intravenously, all by a physician.

h., intracutaneous. Usually adm by a physician.

h., intramuscular. Given in gluteal or in lumbar region. Used when a drug is not easily absorbed or when it is irritating and when large quantity of liquid is to be used.

h., intravenous. Site Median basilic, or median cephalic vein. To be adm by a physician.

h., subcutaneous. Given in front of thighs, or outer surface of arms and forearm.

hypodermoclysis, hypodermatoclysis (hi-po-der-mok'lis-is, -mat-ok'lis-is) [' + *klysis*, injection]. The injection of fluids into the subcutaneous tissues to supply the body with liquids quickly, as after shock or hemorrhage, diarrhea, or when the blood coagulation time is too long, in fact, it may be given in any condition in which it is impossible to give sufficient water by mouth or by rectum.

When it is necessary to maintain a larger amount of water in the tissues in order to keep up proper metabolism, hypodermoclysis may be ordered. The purpose is about the same as that of intravenous infusions.

SOLUTIONS USUALLY USED. Physiological salt solution. Normal salt solution is generally used because it is one of the principal constituents of the blood.

The solution may be made with prepared tablets, as is done in many institutions, or 9/10 of 1% may be made very easily by taking 9/10 of 1% com-

mon table salt and adding it to each 100 parts of water until the required amount is prepared; this is then boiled. Usually not more than 2 parts are given, or 1 dram for each pound of body weight for each 15 minutes.

Care must be taken that it does not evaporate, as the content will be hypotonic solution if the steam is not contained.

There are other solutions given by this method as preferred by the attending physician. If the solution is not of the right percentage, hemolysis* may occur. Other solutions adm intravenously are not generally given by hypodermoclysis.

TEMPERATURE OF SOLUTION. It is very essential that solution be of the proper temperature, which should be from 108°-115° F., in the flask, as it cools rapidly while passing through the tubing. It is very necessary also that it be warm enough during the entire course of the flow.

SITE OF INJECTION. The thighs are not used by some authorities as the needles are not supposed to penetrate near the course of large blood vessels. Here the femoral vein is too close to the site of an injection. (a) In the loose tissues at the base of the breasts, (b) in the thighs or buttocks (care being taken to avoid the large blood vessels), (c) in the axillary line (even for men), (d) beneath the skin of the abdomen (half way between the navel and the ant sup spine), (e) and intraperitoneally in children.

hypodynamia (hi'po-di-na-mi-ā) [G. *ypo*, under, + *dynamis*, energy]. Vital debility, Syn. *adynamia*.

hypoeccrisis (hi-po-ek-kri'si-ā) [' + *ek*, out, + *krisis*, separation]. Imperfect excretion.

hypoeccritic (hi'po-ek-krit'ik) [' + *ek-kritikos*, secreting]. 1 Retarding normal excretion. 2 Pert to insufficient or defective excretion.

hypoendocrinism (hi'po-en-dok'ri-nizm) [' + *endon*, within, + *krinein*, to separate, + *ismos*, state of]. Insufficiency of internal secretion in 1 or more glands.

hypoendocrisia (hi'po-en-do-kri'zi-ā) [' + '' + *krisis*, separation]. Insufficiency of endocrine secretion. Syn. *hypoendocrism*.

hypoeosinophilia (hi'po-e-o-sin-o-fl'i-ā) [' + *eōs*, dawn (rose colored), + *philein*, to love]. Diminished quantity of eosinophil leukocytes of the blood.

hypopinephria (hi-po-ep-i-ne'fi-ā) [' + *epi*, upon, + *nephros*, kidney]. Insufficiency of the adrenal secretion.

hy'poer'gy. Hyposensitiveness, q r

hypoesophoria (hi'po-es-o-fo'ri-ā) [' + *esō*, inward, + *phorein*, to bear]. Downward and inward deviation of the eye.

hypoesthesia [' + *aisthēsis*, sensation]. Duller sensitivity to touch.

hypoesophoria (hi'po-es-o-fo'ri-ā) [' + *esō*, outward, + *phorein*, to bear]. Downward and outward deviation of the eye.

hypogas'tric [' + *gastēr*, belly]. Pert. to lower middle of the abdomen or hypogastrium.

h. artery. *Arteria iliaca interna*.

h. plexus. Sympathetic nerve plexus in the pelvis.

h. region. The hypogastrium. See: *abdominal region*.

hypogast'rium [' + *gastēr*, belly]. Region

below the umbilicus, or navel, between the right and left inguinal regions

hypogenesis [' + *genesis*, development]. Cessation of growth or development at an early stage, causing defective structure. SYN *atelosia*.

hypogenitalism (hi-pō-jên'ti-ăl-izm) [G *ypo*, under, + L *genitalis*, a genital + G *ismos*, state of]. Condition in which the genital organs are underdeveloped. Characterized by reduced size of genital organs, failure of testes to descend in some cases, and incomplete development of secondary sex characters. SEE *hypogonadism*.

Gonadotropic hormones from urine of pregnant mares aid in causing testicular descent and growth of the genitalia

hypogeusia (hi-po-gū'si-ă) [' + *geusia*, taste]. Blunting of sense of taste.

hypoglobulia [' + L *globulus*, globule]. Lack of cellular elements of the blood. SYN *cytopenia*, *hypocytosis*.

hypoglossal [' + *glossa*, tongue]. Situated under the tongue.

h. alternating hemiplegia. Medulla lesion paralyzing the tongue by involving the 12 fibers as they course through the uncrossed pyramid. The pathology may extend across the midline or dorsally, involving the medial fillet, causing contralateral anesthesia

h. nerve. A mixed nerve. It carries afferent proprioceptive impulses as well as efferent motor impulses

Orig. Medulla oblongata

Dist. Extrinsic and intrinsic muscles of tongue

hypoglossitis [' + *glossa*, tongue]. 1. Undersurface of tongue. 2. Cystic tumor of floor of mouth. SYN *ranula*.

hypoglycemia [' + *glykos*, sweet, + *aima*, blood]. Deficiency of sugar in the blood. A condition in which there is less than 80 mg of sugar per 100 cc of blood

ETIOI. Hypertunction of the islands of Langerhans may cause it or injection of excessive quantity of insulin. SEE *coma*, *hyperglycemia*, *hyperinsulinism*. SYN *acute fatigue*, *restlessness*, *malaise*, *marked irritability*, and *weakness*. In severe cases, mental disturbances, delirium, coma, and possibly death

hypoglycemic (hi-po-gli-se'mik) [' + " + *aima*, blood]. Pert. to or causing hypoglycemia

h. shock. Production of shock by artificial production of hypoglycemia by intramuscular adm of insulin in the treatment of schizophrenia. RS *insulin*, *schizophrenia*, *shock*.

hypoglycogenolysis (hi'po-gli-ko-jen-ol-'i-sis) [' + " + *gennan*, to produce, + *lysis*, solution]. Defective hydrolysis of glycogen (glycogenolysis)

hypognathous (hi-pog'na-thus) [G *ypo*, under, + *gnathos*, jaw]. Having a lower jaw longer than the upper one

hypogonadism (hi-po-go'nad-izm) [' + *gonē*, semen, + *ismos*, state of]. Defective internal secretion of the gonads.

hypohepatic (hi'po-he-pā'ti-ă) [' + *ēpar*, *ēpat*-, liver]. Deficient liver function

hypohidrosis (hi-po-hi-dro'sis) [' + *idrōs*, sweat, + *ōsis*]. Diminished perspiration. SYN *hyphidrosis*.

hy'polyhydrochloria diet [' + *ydōr*, water, + *chlōros*, green]. (a) Avoid excessive quantities of fats and salts. (b) Avoid overeating. (c) Avoid much liquid. 1. Potato. 2. Dextrinized cereals. 3. Nuts. 4. Egg yolk. 5. Fruits. 6. Jellies. (d) Small amts. of broth or meat stimulate activity of the stomach.

hypohyloma (hi'po-hi-lo'mă) [' + *ylē*, matter, + *ōma*, tumor]. A tumor formed by embryonic tissue. Derived from hypoblast tissue

hypohypophysis (hi'po-hi-pof'is-izm) [' + *ypo*, under, + *phyein*, to grow, + *ismos*, state of]. Diminished activity of ant. lobe of the hypophysis. SYN *hypopituitarism*.

hypoinosemia (hi-po-in-o-se'mi-ă) [' + *is*, *in*-, fiber, + *aima*, blood]. Decreased formation of fibrin in the blood

hypoin'sulinism [' + L *insula*, island, + G *ismos*, state of]. Insufficient secretion of insulin. SYN *diabetes mellitus*.

hyposotonic (hi'po-is-o-ton'ik) [' + *isos*, equal, + *tonos*, tension]. Denoting a solution having lesser osmotic pressure than another solution

hypokinesia (hi-po-kin-e'zi-ă) [' + *kinēsis*, motion]. Decreased motor reaction to stimulus

hypokinet'ic [' + *kinēsis*, motion]. Pert. to hypokinesia

hypokolasia (hi'po-kol-a'si-ă) [' + *kolasis*, hindrance]. Imperfect inhibitory power

hypoleim'nal. Situated below a sheath or membrane

hypolepidoma (hi-po-lep-id-o'mă) [' + *lepis*, *lepid*-, ind., + *ōma*, tumor]. A hypoblastic tissue tumor

hypoleukocytosis (hi'po-lū'kō-si-to'sis) [G *ypo*, under, — *leukos*, white, — *kutos*, cell, — *ōsis*]. SYN *leukocytopenia*. A lessening of leukocytes in blood

hypoliposis (hi-pō-lip-ō'sis) [G *ypo*, under, + *lipos*, fat, + *ōsis*]. Deficiency of fat in the tissues

hypologia (hi-po-loj'i-ă) [G *ypo*, under, + *logos*, word]. A cerebral symptom marked by inadequate speech

hypolymphemia (hi-po-lim-fe'mi-ă) [' + L *lymphā*, lymph, + G *aima*, blood]. Decreased lymphocytes in the blood with normal number of leukocytes.

hypomania (hi-po-ma'ni-ă) [' + *mania*, madness]. Mild mania without much change in behavior, but accompanied by sound association and distractibility.

hypomaniac [' + *mania*, madness]. Pert. to maniacal exaltation, or one so affected.

hypomastia, **hypomazia** (hi-po-mas'ti-ă, -ma'zi-ă) [' + *mastos*, *mazos*, breast]. Condition of having abnormally small breasts

hy'pomelancholia [' + *melas*, black, + *cholē*, bile]. Melancholia without delusions

hypomenorrhea (hi'po-men-or-re'ă) [' + *mēn*, month, + *roia*, flow]. Deficient menstrual flow

hypomere (hi-po-mēr) [' + *meros*, part]. That portion of the mesoderm that later forms the pleuroperitoneal walls

hypometabolism (hi'po-me-tab'o-lizm) [' + *metabolē*, change, + *ismos*, state of]. Lowered metabolism

hypometria (hi-po-met'ri-ă) [' + *metron*, measure]. Shortened range of movement

hypometropia (hi'pō-mē-trōp'i-ă) Myopia or shortsightedness

hypomicron (hi'pō-mi'krōn) A sub-micron, a particle invisible under an ordinary microscope but capable of being recognized under an ultramicroscope

hypomnesia, **hypomnesis** (hi-pom-ne'zi-ă, -nē'sis) [' + *mnēsis*, memory]. Impaired memory.

hypomorph (hi'po-morf) [' + *morphē*, form]. One with short limbs who is short when standing in proportion to

- when sitting. The opposite of *hypermorph*, *q.v.* See *mesomorph*.
- hypomotility** (hi-pō-mō-tīl'ī-tī). Hypokinesia, *q.v.*
- hypomyotonia** (hi'pō-mi-o-to-nī-ā) [' + *mys*, *myo*, muscle, + *tonos*, tension]. Lacking in muscular tonus
- hypomyxia** (hi-pō-miks'ī-ā) [' + *myxa*, mucus] Diminished secretion of mucus
- hyponanosoma** (hi-pō-nān-ō-sō'mā). Extreme dwarfishness
- hyponatremia** (hi-pō-nā-trē'mī-ā) Subnormal concentration of sodium in the blood
- hyponeucytosis** (hi'pō-ne'ō-si-to'sis) [' + *neos*, new, + *kytos*, cell, + *osis*]. Decreased number of leukocytes (leukopenia) with immature cells in the blood
- hyponeia** (hi-pō-noy'ā) [' + *nous*, mind]. Sluggish mental activity or imagination SYN *hypopsychosis*.
- hyponychium** (hi-pō-nik'ī-ūm) [G *ypo*, under, + *onyx*, *onych*, nail]. The nail bed SYN *matrix unguis*.
- hypopancratis** (hi'pō-pan'kre-ā-tizm) [' + *pankreas*, pancreas, + *ismos*, state of]. Diminished activity of the pancreas
- hypoparathyreosis** (hi'pō-par-ā-thi-rē-ō'sis) [' + *para*, beside, + *thyreos*, shield, + *osis*]. A condition due to lessened or absent secretion of the parathyroids SYN *hypoparathyroidism*.
- hypoparathyroidism** (hi'pō-pār-ā-thi'roidizm) [' + " + " + *idos*, form, + *ismos* state of] Insufficient secretion of the parathyroid glands
- hypopeps'ia** [' + *pepsis*, digestion] Impaired digestion due to lack of pepsin.
- hypopepsinia** (hi-pō-pep-sin'ī-ā) [' + *pepsis*, digestion]. Deficient pepsin in the gastric juice
- hypopharynx** [G *ypo*, under, + *pharynx*, pharynx] The laryngopharynx, the lowermost portion of the pharynx which leads to the larynx and esophagus
- hypophonesis** (hi-pō-fō-nē'sis) [' + *phōnē*, voice]. A diminished sound in auscultation or in percussion fainter than usual.
- hypophonia** (hi-pō-fō-nī-ā) [' + *phōnē*, voice] Abnormally weak voice due to incoordination of speech muscles
- hypophoria** (hi-pō-fō-rī-ā) [' + *phorein*, to bear] Tendency of one visual axis to fall below the other one
- hypophosphatemia** (hi'pō-fos-fā-te'mī-ā) [' + L *phosphas*, phosphate, + G *aima*, blood] Phosphates below normal in the blood
- hypophrenia** (hi-pō-fre-nī-ā) [G *ypo*, under, + *phrēn*, mind]. Subnormal mentality.
- hypophren'ic** [' + *phrēn*, mind]. 1. Pert to subnormal mentality 2. A feeble-minded person.
- hypophrenosis** (hi-pō-fre-no'sis) [' + " + *osis*]. Feeble-mindedness
- hypophyseal** (hi-pō-fiz'e-ai) [' + *physis*, growth]. Pert. to the hypophysis
- hypophysectomy** (hi'pō-fi-sek'tō-mī) [' + " + *ektomē*, excision]. Excision of the hypophysis cerebri.
- hypophysis** (hi-pōf'ī-sis) (pl. *hypophyses*) [' + *physis*, growth]. 1. Any undergrowth. 2. BNA. The pituitary body. *h. cerebri*. SYN *pituitary gland*, *q.v.* A gland of internal secretion lying in the sella turcica of the sphenoid bone. It consists of two portions, the *adenohypophysis* and the *neurohypophysis*. These are differentiated into the anterior and posterior lobes which are attached to the hypothalamus of the brain by the hypophyseal stalk
- hypophysitis** (hi-pōf-is'ītis) [' + " + *-itis*, inflammation]. Inflammation of the pituitary body
- hypopiesis** (hi-pō-pi-e'sis) [' + *piesis*, pressure] Subnormal arterial pressure
- hypopinealism** (hi-pō-pin'e-al-izm) [' + L *pineus*, pert to pine cone, + G *ismos*, state of]. Diminished secretion of the pineal body.
- hypopituitarism** (hi-pō-pit-u'ī-tā-rizm) [G *ypo*, under, + L *pituita*, mucus, + G *ismos*, state of] A condition resulting from diminished secretion of pituitary hormones, esp those of the anterior lobe
- hypoplasia** (hi-pō-plā'zī-ā) [' + *plasis*, formation] Defective development of tissue. RS *tissue*.
- hypoprosia** (hi'pō-pō-rō'sis) Deficient development of a callus at site of a bone fracture
- hypoproteinemia** (hi'pō-prō-tē-in-ē'mī-ā) [' + *protos*, first, + *aima*, blood] Decrease in the normal quantity of protein in the blood
- hypoproteino'sis**. Condition resulting from protein deficiency in diet
- hypoprote thrombinemia** (hi'pō-prō-thrōm'bi-nē-mī-ā) Deficiency of prothrombin in the blood
- hypopselaphesia** (hi-pōp-sel-af-e'zī-ā) [' + *pselaphesis*, touch] Blunted tactile sense
- hypopsychosis** (hi-pō-si-kō'sis) [G *ypo*, under, + *psychē*, mind, + *osis*] SYN *hyponoia* Weakness of the function of thought.
- hypoptyalism** (hi-pō-tī'al-izm) [' + *ptyalon*, saliva, + *ismos*, state of] Decreased salivary secretion
- hypopyon** (hi-pō-pi-on) [' + *pyon*, pus] Pus in ant chamber of the eye in front of iris but behind cornea, seen in corneal ulcer
- hyporeflex'ia** [' + L *reflexus*, bent back]. Diminished function of the reflexes
- hyposalemia** (hi-pō-sal-e'mī-ā) [' + L *sal*, salt, + G *aima*, blood]. Decreased amt of salts in the blood SYN *hypochloremia*.
- hyposaliva'tion**. Abnormal decrease in flow of saliva
- hyposar'ca** [' + *sarz*, flesh] Extreme dropsy (anasarca) of subcutaneous connective tissue
- hyposекре'tion** [' + L *secretus*, *secerere*, to separate]. Lowered amt of secretion.
- hyposen'sitive** [G *ypo*, under, + L *sentire*, to feel] Having reduced ability to respond to stimuli
- hy'posensitiza'tion** [' + L *sentire*, to feel]. Production of hyposensitiveness
- hyposialadenitis** (hi'pō-sī'al-ad-en'ītis) [' + *sialon*, saliva, + *adēn*, gland, + *-itis*, inflammation] Submaxillary salivary gland inflammation.
- hyposmia** (hi-pōz'mī-ā) [G *ypo*, under, + *osmē*, smell] Defect in sense of smell
- hypospadia**, **hypospadias** (hi-pō-spa'dī-ā, -as) [' + *span*, to draw]. Congenital opening of the male urethra upon the undersurface of the penis, also an urethral opening into vagina RS. *penis*, *urethra*.
- hyposphresia** (hi'pō-sfrē-sī-ā). Hyposmia, *q.v.*
- hyposphysis** (hi-pō-sfik'sī-ā) [' + *sphysis*, pulse]. Sluggish circulation due to abnormally low blood pressure.
- hypostasis** (hi-pōs'tas-is) [' + *stasis*, a halt]. Deposit; sediment. Opposite of *epistasis*.
- hypostatic** (hi-pō-stat'ik) [G. *ypo*, under, + *statikos* standing]. 1. Of or per-

taining to hypostasis. 2. In genetics, hidden or suppressed, said of a gene whose effect is suppressed by the presence of another gene

hyposteolysis (hi-po-ste-at-ol'is-is) [" + *steor*, fat, + *lysis*, loosening]. Diminished emulsification of fats during digestion.

hyposthenia (hi-po-sthe'nī-ā) [" + *sthenos*, strength]. Subnormal strength; an enfeebled state; weakness

hypostheniant (hi-pos-the'nī-ant) [" + *sthenos*, strength]. Reducing vital forces, debilitant

hyposthenic (hi-pos-then'ik) [" + *sthenos*, strength] Debilitant

hyposthenuria (hi-pos-then-u'ri-ā) [" + *ouron*, urine]. The secretion of urine of low specific gravity, chiefly in chronic nephritis

h., **tubular**. H. resulting from trauma of renal tubule epithelial cells

hypostypsis (hi-po-stip'sis) [" + *stypsis*, a contracting] State of being slightly astringent

hypostyptic (hi-po-stip'tik) [" + *stypsis*, a contracting] Slightly astringent

hyposuprarenalism [" + *L* *supra*, above, + *ren*, kidney, + *G* *ismos*, state of]. Suprarenal inactivity

hyposynergia (hi-po-sin-er'i-ā) [" + *syn*, with, + *ergon*, work] Poor coordination

hyposystole (hi-po-sis'to-le) [*G* *ypo*, under, + *systole*, contraction] A weak or lowered systolic contraction

hypotaxia (hi-po-taks'i-ā) [*G* *ypo*, under, + *taxis*, arrangement]. State of reduced control over voluntary actions such as occurs in early stages of hypnotism

hypotension [*G* *ypo*, under, + *L* *tensio*, tension] 1 Decrease of systolic and diastolic blood pressure below normal. 2. Deficiency in tonus or tension

Below 90 systolic and 50 diastolic is pathologic. If hypotension follows hypertension the condition is serious. If the diastolic blood pressure drops in proportion to the systolic pressure and the systolic pressure does not go below 80 points, the patient will respond to the administration of stimulants

Patients with a systolic pressure of 180 points or over should be kept in bed under observation and for treatment. A patient with a systolic pressure of 90 points or less should also remain in bed for treatment

It occurs in shock and collapse, in hemorrhages, infections, fevers, cancer, anemia, neurasthenia, Addison's disease and in other debilitating or wasting diseases, and approaching death.

Hypotension causes an accumulation of blood in the veins and slows down the arterial current. Capillary circulation is interfered with as are other functional processes of the body. Thyroid tablets are frequently used for this condition.

h., **orthostatic**. H. occurring when a person assumes an erect position

h., **postural**. H. occurring upon suddenly arising from a recumbent position or from standing still

hypotensive [" + *L* *tensio*, tension]. Denoting low blood pressure.

hypotensor (hi-po-ten'sor) [" + *L* *tensus*, *tendere*, to stretch]. Agent that lowers blood pressure.

hypothalamus (hi-po-thal'am-us) [*G* *ypo*, under, + *thalamos*, chamber]. The portion of the diencephalon comprising the ventral wall of the third ventricle below the hypothalamic sulcus and in-

cluding structures forming ventricular floor, including the optic chiasma, tuber cinereum, infundibulum, and mammillary bodies. It lies beneath the thalamus and laterally is continuous with the subthalamic regions. It contains a number of nuclei which are of importance in the control of visceral activities, such as maintenance of water balance, sugar and fat metabolism, regulation of body temperature and secretion of endocrine glands. It is the chief subcortical region for the integration of sympathetic and parasympathetic activities

hypothenar (hi-poth'en-ar) [" + *thenar*, palm] 1 Having a body prominence on inner side of the palm next to the little finger.

h. **eminence**. Prominence on palm below little finger.

hypothermal [" + *thermē*, heat]. 1 Tepid. 2 Subnormal temperature below 98.6° F

hypothermia [*G* *ypo*, under, + *thermē*, heat] 1 Having a body temperature below normal. 2 Frozen sleep. Refrigeration treatment for schizophrenia and cancer. 32° F externally and 75° F. internally for 24 to 72 hours

hypothesis (hi-pōth'ē-sis) [*G* *ypo*, under, + *thesis*, a placing] 1 An assumption not proved by experiment or observation. It is assumed for the sake of testing its soundness or to facilitate investigation of a class of phenomena. 2 A conclusion drawn before all the facts are established and tentatively accepted as a basis for further investigation

hypothrombinemia (hi'po-throm-bin-e'mī-ā) [" + *thrombos*, clot, + *aema*, blood]. Deficiency of thrombin in the blood, making hemophilia possible.

hypothymergasia (hi'po-thi'mer-ga'sī-ā) [" + *thymos*, mind, + *ergasia*, energy] A condition of physical and mental depression

hypothymergastic reaction (hi'po-thi'mer-gas'tik) [" + " + *ergasia*, energy] Psychic disorder producing a sense of lonesomeness, sadness, and depression. Opp of *hyperthymergastic reaction*, *q.v.*

hypothymia (hi-po-thi'mī-ā) [" + *thymos*, mind] Decreased emotional response to stimuli

hypothymism (hi-po-thi'mizm) [" + " + *ismos*, state of] Thymus inactivity

hypothyrea (hi-po-thi're-ā) [" + *thyreos*, shield]. Thyroid insufficiency. *Syn*: *hypothyreosis*.

hypothyreosis (hi'po-thi-re-o'sis) [" + " + *ōsis*]. 1. Thyroid insufficiency. 2. Condition resulting from lack of thyroid secretion. *Syn* *myxedema*.

hypothyroid (hi-po-thi'roid) [" + " + *eidos*, form]. Marked by insufficiency of thyroid secretion

hypothyroidia [" + " + *eidos*, form]. Condition causing insufficient thyroid secretion.

hypothyroidia (hi'po-thi-roi'de-ā) [" + " + *eidos*, form] Diminished thyroid secretion. *Syn*: *hypothyreosis*

hypothyroidism (hi-po-thi'roid-izm) [" + " + *ismos*, state of]. A condition due to deficiency of the thyroid secretion, resulting in a lowered basal metabolism. A lesser degree of cretinism.

Sym: May be obesity; dry skin and hair, both of which become lustreless. Low blood pressure, slow pulse, sluggishness of all functions, depressed muscular activity, goiter

TREATMENT Thyroid organotherapy, as adm. of desiccated thyroid* or thyroxin. Increase iodine in diet if iodine is deficient.

NP: Constipation is a marked feature of this disease, as is slow metabolism, with a subnormal temperature. Guard against chilling, as the patient feels the cold and the pulse is often feeble. Measures for overcoming constipation will be in order. If thyroid extract is ordered, watch for signs of hyperthyroidism. Observe the patient carefully and watch for overexertion during treatment with thyroid extract.

hypothyrosis (hi-po-thi-ro'sis) [G. *ypo*, under, + *thyreos*, shield, + *ōsis*]. Insufficiency of thyroid secretion. SYN: *hypothyreosis*.

hypotonia (hi-po-to-ni-ā) [“ + *tonos*, tone]. 1. Reduced tension; relaxation of arteries. 2. Loss of tonicity of the muscles or intraocular pressure.

hypotonic (hi-po-ton'ik) [“ + *tonos*, tone]. 1. Pert. to defective muscular tone or tension. 2. A solution of lower osmotic pressure than another.

hypotoxicity (hi'po-toks-is'i-ti) [“ + *toxikon*, poison]. A reduced toxic quality, only slightly poisonous.

hypotrichosis (hi'po-tri-ko'sis) [“ + *trix*, *trich-*, hair, + *ōsis*]. Abnormal deficiency of hair.

hypotrophy (hi-po'tro-fi) [“ + *trophē*, nourishment]. Progressive degeneration and functional loss of cells and tissues. SYN: *abiotrophy*.

hypotropia (hi-po'tro-pi-ā) [“ + *tropē*, a turning]. Ventrical strabismus downward.

hypouræsis (hi'po-u-re'sis) [“ + *ourēsis*, urination]. Insufficient urination.

hypouricuria (hi'po-u-ri-ku'ri-ā) [“ + *ouron*, urine, + *ouron*, urine]. Deficient uric acid in the urine.

hypouræcrinia [“ + “ + *krinein*, to separate]. Deficient urinary secretion.

hypovaria (hi-po-va'ri-ā) [“ + *L ovarium*, ovary]. Deficient internal secretion of the ovary and consequent retardation of puberty in girls.

hypovenosity (hi'po-ven-os'i-ti) [“ + *L. vcnōsus*, pert. to a vein]. Incomplete development of the venous system in an area, resulting in atrophy, or degeneration.

hy'poventila'tion [“ + *L. ventilātiō*, ventilation]. Subnormal amt of air in the lungs.

hypovitaminosis (hi'po-vi-tam-in-ō'sis) [“ + *L. vita*, life, + *amine* + *G. ōsis*]. A condition due to a lack of vitamins in the diet.

hypovolemia (hi'po-vo-le-mi-ā) [“ + *L. volumen*, volume]. Diminished blood supply. SYN: *oligemia*, *oligohemia*.

hypoxanthias (hi'pō-zan'thin) [“ + *xanthos*, yellow]. A leukoma, $C_2H_5NO_2$ in muscles and tissues in a stage of urea and uric acid formation. It is formed during protein decomposition. In small amts it is normal in urine.

hypoxemia (hi-pōks-e'mi-ā) [“ + *oxys*, acid, + *ama*, blood]. Insufficient oxygenation of the blood.

hypoxia (hi'pōks-i-ā). Anoxia; lack of an adequate amount of oxygen in inspired air such as occurs at high altitudes, reduced oxygen content or tension.

hypsibrachycephalic (hip'se-brak-e-sef-al'ik) [G. *ypsi*, high, + *brachys*, broad, + *kephalē*, head]. Having a broad and high skull.

hypsicephalic (hip'si-sef-al'ik) [“ + *kephalē*, head]. Having a skull with a cranial index above 75.1°.

hypsicephaly (hip-si-sef-al-i) [“ +

kephalē, head]. The condition of having a skull with a cranial index over 75.1°.

hypsiconchous (hip-si-kong'kus) [“ + *kogchē*, shell]. Having an orbital index above 85°.

hypsiloid (hip'sil-oid) [G. *ypsilon*, U or Y, + *eidos*, form]. U- or Y-shaped. SYN: *hyoid*.

h. cartilage. Y-cartilage.

h. ligament. Ligamentum iliofemorale.

hypsistaphylia (hip-si-staf-il'i-ā) [G. *ypsi*, high, + *staphyle*, uvula]. Having a narrow, high palatal arch.

hypsistenocephalic (hip-sist-en-o-sef-al'ik) [“ + *stenos*, narrow, + *kephalē*, head]. Having a cranial index over 75.1° SYN: *hypsicephalic*.

hypoceph'alous [“ + *kephalē*, head]. Having a cranial index over 75.1° SYN: *hypsicephalic*.

hypsokine'sis [G. *ypsos*, height, + *kinēsis*, motion]. Tendency to fall backward when standing, seen in paralysis agitans.

hypsosus (hip-son'o-sus) [“ + *nosos*, disease]. Mountain sickness, balloon sickness.

SYM: Epistaxis, headache, nausea.

hypsophobia (hip-so-fō-bi-ā) [“ + *phobos*, fear]. Fear of being at great heights. SYN: *acrophobia*.

hypurgia (hi-pur'ji-ā) [G. *ypourgia*, help]. Any minor factors which change the course of a disease, esp for the better.

hys'tera [G. *ystera*, uterus]. The uterus.

hyster'al'gia [“ + *algos*, pain]. Neuralgia of the uterus.

hysterectomy (his-ter-ek'to-mi) [G. *ystera*, uterus, + *ektome*, excision]. Removal of the uterus. The presence of tumors, both benign and malignant, is a common cause. The uterus may be removed through the abdominal wall or through the vagina.

NP: The patient is placed in dorsal position. The table is ready to be tipped into the Trendelenburg position. As soon as incision is made through the peritoneum, table should be put into Trendelenburg position. This procedure is the same for all abdominal pelvic work.

This position allows the intestines and abdominal organs to fall backwards from pelvis, so that they may be easily packed off with large pads or with a large roll of packing. The procedure following incision is the same as for the appendix.

DRESSING, Etc.: Borosalicylic acid powder, 4 1, 1 yard sterilized gauze, pad of cotton, aseptic adhesive strips, abdominal bandage. Perineal straps and safety pins, towels, gauze compresses, sheets, laparotomy sheet. Watch intake and output closely, prevent bladder distention, turn frequently. SEE: *laparotomy*.

h., abdominal. Removal of the uterus through an abdominal incision.

h., chemical. Destruction of the endometrium by strong caustic substances.

h., Porro. Subtotal hysterectomy following cesarean section.

h., subtotal. Removal of the uterus, leaving the cervix uteri in place.

h., supracervical. Same as subtotal.

h., supravaginal. Same as subtotal.

h., total. Removal of body and cervix.

h., vaginal. Removal of the uterus through the vagina.

hystere'sis [G. *ysterēsis*, a coming too late]. Failure of related phenomena to keep pace with each other.

hystereurynter (his-ter-û-rin'ter) [G. *yster*, uterus, + *eurynein*, to stretch]. An instrument for dilating the os uteri.

hysteria (his-ter'i-â) [G. *yster*, uterus]. A condition presenting somatic symptoms, simulating almost every type of physical disease, and a series of mental manifestations.

The mental attitude is calm, there is a not unfriendly aloofness, but psychotic indifference is quite another matter, and not seen in hysteria. There may be easy laughing and crying—episodes of emotionalism possibly without any apparent explanation, and even occurring in sleep. Episodic states known as fugues (sleeping-walking is a similar affair, occurring in sleep). In these, certain dissociated (repressed) ideas, emotions and goals develop a reality sufficient to constitute a secondary personality which now functions apart from the primary personality.

When the primary consciousness reasserts itself, there is a forgetting (amnesia) of the secondary state. The multiplication or alternation of personalities is quite distinct from schizophrenic splitting in which incongruities and confusion result from the co-existence of each phase of the personality more or less continuously.

An accurate definition is difficult because of extreme diversity of symptoms, a psychoneurosis found in a patient of low vitality, characterized by psychic weakness and undue susceptibility to autosuggestion.

Etiol. Variable, as in most psychic disturbances. It occurs in both sexes before and after adolescence both at periods of emotional and physical stress, as alternating crying and laughing.

Sym. Emotional instability, various sensory disturbances and a marked craving for sympathy which sometimes leads to fraud.

Paroxysmal convulsions. Preceded by intense pain in ovarian regions and head, and sensations of ball rising in throat (*globus hystericus*). Consciousness may not be lost. No injury is sustained, which aids in differential diagnosis.

Interparoxysmal: Motor, sensory or psychic. May be paralysis, tremor, incoordination, or internal disorders, local hyperesthesia, anesthesia or paresthesia.

Treatment: Hygienic, hydropathic, massage, electricity, diet, suggestive therapeutics. Complete isolation from sympathetic individuals. Place patient in a quiet place devoid of spectators. Cold applications to head, face, and neck are helpful. Quiet, firm suggestions are important. Sedatives are to be used under the direction of a physician.

RS *anthysteria*, *apathyria*, *atremia*, *cachinnation*, *deafness*, *globus hystericus*, *ox-eyes*.

h. major. Very severe h accompanied by epileptiform convulsions.

h. minor. Mild form of h without loss of consciousness.

hysteriac [G. *yster*, uterus]. A hysterical person.

hysterical, hysterical [G. *yster*, uterus]. Pert. to hysteria.

h. ataxia. Loss of sensation in leg muscles and skin in hysteria.

h. chorea. A form of h with choreiform movements.

hystericonvulsive (his-ter-ik-o-nû-ral'-jik) [' + *neuron*, nerve, + *algos*,

pain] Pert. to pain of hysterical origin, but resembling neuralgia.

hysteritis (his-ter-i'tis) [' + *-itis*, inflammation]. Inflammation of the uterus.

hystero-bubonocoele (his'ter-o-bu-bon'-o-sêl) [' + *boubôn*, groin, + *kêlê*, hernia].

Inguinal hernia surrounding the uterus.

hystero-cat'alepsy [' + *kata*, down, + *lêpsis*, seizure]. Major hysteria with cataleptic symptoms.

hysterocele (his'ter-o-sêl) [' + *kêlê*, hernia]. Hernia of the uterus, esp when gravid.

hystercervicotomy (his'ter-o-ser-vi-kot'-o-mi) [' + *L cervix*, neck, + *G tomê*, incision]. Cesarean section through the vagina. **Syn** *hystero-trachelotomy*.

hysteroceleisis (his-ter-o-kl'i-sis) [' + *kleisis*, closure]. Surgical closure of the os uteri.

hystero-cystocleisis (his'ter-o-sis'to-kl'i-sis) [' + *kystis*, a bladder, + *kleisis*, a closure]. Operation fastening the cervix uteri in the wall of the bladder.

hystero-dynia (his'ter-o-din'i-â) [G. *yster*, uterus, + *odynê*, pain]. Uterine pain. **Syn** *hystericalgia*.

hysteroepilepsy (his'ter-o-e'p-il-ep-si) [' + *epilêpsia*, seizure]. Major hysteria with violent epileptiform convulsions.

In addition to usual symptoms of epilepsy, anger, disgust, joy, surprise and other emotions are dramatically expressed when final stage (delirium) is reached.

hystero-frenic (his'ter-o-fren'ik) [' + *L frenâre* to restrain]. Arresting an attack of hysteria, noting pressure areas having this effect.

hystero-gastrorrhaphy (his'ter-o-gas-tror'-af-i) [' + *gastêr*, belly, + *raphê*, suture]. Fixation of uterus to gastric wall.

Syn *hystero-peru*.

hystero-genic [' + *gennan*, to produce]. Causing a hysterical attack.

hystero-oid (his'tei-oid) [' + *eidos* resemblance]. 1 Resembling hysteria. 2 Pert to hysteria.

hystero-kataphraxis (his'ter-o-kat'â-fraks'-is) [' + *kataphraxis*, a fencing in]. The operation of supporting the uterus by metallic sutures.

hystero-laparotomy (his'ter-o-lap-â-rot'-o-mi) [' + *lapara*, flank, + *tomê*, incision]. Uterine incision through abdominal wall abdominal hysterectomy.

hystero-lith (his'ter-o-lith) [' + *lithos*, stone]. A calculus in the uterus.

hystero-logy (his-ter-ol'-o-jî) [' + *logos*, knowledge]. Sum of what is known about the uterus.

hystero-lox'ia [' + *loxos*, slanting]. Oblique flexion of the uterus.

hystero-lysis (his-ter-ol'-i-sis) [' + *lysis*, loosening]. Operation of loosening the uterus from its adhesions.

hystero-malacia (his-ter-o-mal-â-si-â) [' + *malakia*, softening]. Uterine softening.

hystero-mania [' + *mania*, madness]. 1. Hysterical mania. 2 Nymphomania.

hystero-meter (his-ter-om'et-er) [' + *metron*, measure]. Device for measuring the uterus.

hystero-metry [G. *yster*, uterus, + *metron*, measure]. Measurement of the size of the uterus.

hystero-myoma (his-ter-o-mi-o-mâ) [' + *mys*, *myo*, muscle, + *ôma*, tumor]. Myoma or fibromyoma of the uterus.

hystero-myomectomy (his'ter-o-mi'-o-mek'-to-mi) [' + *ektomê*, excision]. Excision of a uterine fibroid.

hysteromyotomy (his'ter-o-mi-ot'o-mī) [" + " + *tomē*, incision]. Uterine incision for removal of a solid tumor

hysteroneurosis (his'ter-o-nū-ro'sis) [" + *neuron*, nerve, + *ōsis*]. A reflex neurosis due to uterine irritation.

hystero-oophorectomy (his'ter-o-o'of-o-rek'to-mī) [" + *ōon*, ovum, + *phoros*, bearing, + *ektomē*, excision]. Removal of the uterus and 1 or both ovaries

hysteropathy (his-ter-op'ath-i) [" + *pathos*, disease]. Any uterine disorder

hysteropexy (his'ter-o-peks'i) [" + *pēxis*, fixation]. Abdominal fixation of uterus

hysterophore (his'ter-o-fōr) [" + *phorein*, to carry]. Uterine pessary

hystero'pla [" + *ōps*, eye]. A hysterical visual defect.

hysteropsychosis (his'ter-o-si-ko'sis) [" + *psychē*, mind, + *ōsis*]. Mental disorder due to uterine disease

hysteroptosis, **hysteroptosis** (his-ter-op-to'si-a, -sis) [" + *ptōsis*, a dropping]. Prolapse of the uterus

hysterorrhaphy (his-ter-or'ā-fl) [" + *raphē*, sewing]. Suture of womb

hysterorrhexis (his-ter-o-reks'is) [" + *rēxis*, rupture]. Rupture of the uterus, esp. when pregnant

hysterosalpingography (his'ter-o-sal-pīng-gog'rā-fl) [" + *salpīx*, tube, + *graphein*, to write]. X-ray of the uterus and oviducts

hysterosalpingo-oophorectomy (his'ter-o-sal'pīn-go-o'o-for-ek'to-mī) [" + " + *ōon*, ovum, + *phoros*, bearing, + *ektomē*, excision]. Surgical removal of uterus, oviducts, and ovaries

hysterosalpingostomy (his'ter-o-sal-pīng-os'to-mī) [" + " + *stoma*, opening]. Anastomosis of the uterus with the distal end of the fallopian tube after excision of a strictured portion of the tube

hysteroscope (his'ter-o-skōp) [" + *skopein*, to examine]. Instrument for examining the uterine cavity

hysteroscopy (his-ter-os'ko-pl) [" + *skopein*, to examine]. Inspection of the uterus by use of mirror

hysterospasm [G *ysterā*, uterus, + *spasmos*, a spasm]. Uterine spasm

hysterosomatocleisis (his'ter-o-sto-mat'-o-klī'sis) [" + *stoma*, opening, + *kleisis*, closure]. Operation for vesicovaginal fistula.

Closure of the cervix uteri, making the vesical and uterine cavities into a common cavity by means of the opening between them

hysterostomatomy (his'ter-o-sto-mat'o-mī) [" + " + *tomē*, incision]. Surgical enlargement of the os uteri, incision of the os or cervix uteri.

hysterosyph'illis [" + *syn*, with, + *philein*, to love]. A hysterical manifestation due to syphilis.

hysterosystole (his'ter-o-sis'to-le) [" + *systole*, contraction]. A delayed contraction of the heart after its normal time, opp to *extra systole*

hysterotabetism (his'ter-o-ta'bet-izm) [" + *L tabes*, a wasting away, + *G ismos*, state of]. Condition of hysteria and tabes combined

hysterotokotomy (his'ter-o-to-kot'o-mī) [" + *tokos*, birth, + *tomē*, incision]. Cesarean operation

hysterotome [" + *tomē*, incision]. Instrument for incision of the uterus.

hysterotomotokia (his'ter-o-tom'o-to-ki-ā) [" + " + *tokos*, birth]. Cesarean section

hysterotomy (his-ter-ot'o-mī) [" + *tomē*, incision]. 1 Incision of the uterus 2 Cesarean section, *q v*.

hysterotrachelorrhaphy (his'ter-o-tra-kel-or'ā-fl) [" + *trachelos*, neck, + *raphē*, sewing]. A plastic operation for a lacerated cervix by paring the edges and suturing them together.

hysterotrachelotomy (his'ter-o-trak-el-ot'o-mī) [" + " + *tomē*, incision]. Surgical incision of neck of uterus

hysterotraumatic (his'ter-o-traw-mat'ik) [" + *trauma*, wound]. Pert to traumatic hysteria

hysterotraumatism (his'ter-o-traw'mā-tizm) [" + " + *ismos*, state of]. Hysteretic symptoms due to or following traumatism

hysterotris'mus [" + *trismos*, a spasm]. Uterine spasm

hystero'vagina-enterocele (his'ter-o-vaj'-in-o-en'ter-o-sē) [" + *L vagina*, sheath, + *G enteron*, intestine, + *kēlē*, hernia]. Hernia surrounding uterus, vagina, and intestines.

hystriciasis, **hystricism** (his-tri-si'a-sis, his'tri-sizm) [G *ystrix*, hedgehog]. 1 Erection of hairs like the spines of a hedgehog 2 A skin disease

Syn Thickened epidermis, warty growths, elongated and hypertrophied papillae **Syn** *ichthyosis hystrix*

hyther (hi'ther) [G *ydōr*, water, + *thermē*, heat]. The combined effect of humidity and temperature of atmosphere upon the body.

i. Abbr for *optically inactive*

I. Chem symb for *ampere* and *iodine*

ianthtropia (i-än-thi-no'pi-ä) [G *ianthinos*, violet colored, + *opsis* vision] Violet vision

-iasis [G] Suffix Same as *-osis* meaning the state or condition of, as *psoriasis*.

iatriaptics (i-ä-trä-lip'tiks) [G *iatria*, cure, + *alephein*, to anoint] Treatment byunction

iatic (i-at'iki) [G *iattros*, physician] Medical

iastrochem'istry [' + *chēmeia*, chemistry] Seventeenth century opinion that chemistry is the basis of all physiological phenomena

iastrogenic illness (i-ät-rög'ën-ik) Condition of anxiety produced in a patient by injudicious statements of a physician

iastrogeny (i-ä-trög'ën-i) Condition induced by a physician

i. disorder. Condition involving adverse effects induced by a physician in the care of his patients. Term implies that such effects could have been avoided by proper and judicious care on the part of the physician. The development of anxiety neuroses through thoughtless and ill-considered remarks, development of drug habituation, and the injudicious use of therapeutic measures are examples.

iatology (i-at-rol'o-ji) [' + *logos*, science] Medical science

iatrotechnics (i-at-ro-tek'niks) [' + *technē*, art] The art and technic of medicine and surgery

ice (is) [AS is]. Water frozen at temperature below 32° F (0° C)

i. bag, i. cap, i. collar. Devices for holding ice to be applied to a patient to obtain the effect of continuous cold in a circumscribed area

The affected part should always be covered with several thicknesses of cloth to prevent freezing

i. cravat. Ice pack applied around the neck

i. dry. Carbon dioxide in a solid form. Its temperature is -78.5° C (-110° F). Used as a commercial refrigerant, also used for therapeutic refrigeration in such skin diseases as *lupus erythematosus*

iceland moss (is'land). A lichen. It contains a form of starch, a slightly tonic demulcent. SYN *Cetraria*.

ichnogram (ik'no-gram) [G *ichnos*, footstep, + *gramma*, a writing] A footprint, taken standing

ichor (i'kor) [G *ichōr*, serum] Thin, fetid discharge from an ulcer or from a wound

ichoremia (i-kor-e'mi-ä) [' + *aima*, blood]. Septic or toxic blood poisoning due to presence of ichorous matter. SYN *ichorrhemia*.

ichorous (i'kor-us) [G *ichōr*, serum]. Resembling ichor or watery pus

ichorrhæa, ichorrhœa (i-ko-re-ä) [' + *rota*, flow]. Profuse discharge of ichorous fluid.

ichorrhemia (i-kor-re'mi-ä) [' + *aima*, blood]. Toxic or septic blood poisoning due to presence of ichorous matter. SYN *ichoremia*.

ichthammol (ik'tha-mol) A reddish brown, viscous fluid obtained by the destructive distillation of certain bituminous shale

Uses As a mild antiseptic and local stimulant in certain skin diseases.

DOSAGE Externally, 5-10% ointment or solution

INCOMPATIBILITIES Mineral acids, alkalies, calomel, resorcin, potassium iodide, etc.

ichthyism (ik'thi-izm) **ichthyismus** (ik'thi-iz'müs) [G *ichthys*, fish, + *ismos*, state of] Poisoning from eating stale or unfit fish

ichthyos [G] Combining form meaning fish

ichthyoid (ik'thi-oyd) [G *ichthys*, fish, + *eidos*, form] Fishlike

ichthyoil (ik'thi-öl) [' + *L oleum*, oil] A brand of ichthammol

DOSAGE 5-10 gr (0.3-0.6 Gm)

ichthyophobia (ik'thi-o-fö'bi-ä) [' + *phobos* fear] Aversion to fish

ichthyosis (ik'thi-osis) [' + *osis*]. Fish-skin disease. Congenital abnormality of the skin characterized by dryness, harshness, scaliness

ETIOLOGY Congenital with hereditary tendency probably as a result of persisting embryonic epidermis. Hypothyroidism may play a part in acquired cases, which are rare

SYM As noted, confined to skin, subject to irritation, giving rise to eczema, etc., with formation of spinous, nutmeg-grater-like lesions at pilosebaceous orifices

PATH Dermal, affecting horny layer, prickle layer, papillae

PROG Milder, clear up with adolescence. Severe, may be ameliorated.

TREATMENT Pilocarpine, thyroid internally. Locally, oils and greases after baths containing bran, borax, or sodium carbonate. SYN *saurosis*.

i. follicularis. I in which sebaceous and epithelial material accumulate about the hair follicles.

i. hystrix. A form with warts

i. sebacea. Functional disorder of the sebaceous glands. SYN *seborrhea*.

i. simplex. I with cutaneous roughening and dryness. SYN *xeroderma*.

ichthyotic (ik'thi-ot'ik) [G *ichthys*, fish]. Rel to ichthyosis.

I. C. N. Abbr. for *International Council of Nurses*.

iconolagny (i-kon'o-lag-ni) [G. *eikōn*, image, + *lagnēia*, lewdness] Sexual passion stimulated by pictures or statues or objects.

ICSH. Abbr for *Interstitial-cell-stimulating hormone* secreted by ant lobe of hypophysis.

icterepatitis (ik-ter-ä-pä-ti'tis) [G. *ikteros*, jaundice, + *epar*, liver, + *itis*, inflammation]. Hepatitis associated with jaundice.

icteric (ik-ter'ik) [G. *ikteros*, jaundice]. Pert. to jaundice.

i. fever. Jaundice combined with pernicious malaria.

i. index. A number obtained by matching blood serum in a colorimeter

against a standard solution of potassium dichromate (1:10,000), which gives a color approximately same as bilirubin.

A test for determining the intensity of the yellow color of blood serum. Since serum color depends upon bile pigment, the index is an indication of the concentration of this pigment in the blood. Valuable in study of jaundice.

The serum is diluted to known strength and then compared, the reading of the standard, divided by the reading of the serum and multiplied by the dilution gives the icteric index. Normal serum gives a value of 5. In patients with visible jaundice values above 15 are obtained.

icteritious (ik-ter-ish'us) [G. *ikteros*, jaundice]. Yellowish, resembling jaundice. *SYN* *icteroid*.

icteroanemia [' + *an-*, priv + *aima*, blood]. Icterus associated with anemia, hemolysis and splenic enlargement.

icterogenic, icterogenous (ik-ter-o-jen'ik, -oj'en-us) [' + *gennan*, to produce]. Causing jaundice.

icterohepatitis (ik'ter-o-hep-ā-t'itis) [' + *epar*, liver, + *itis*, inflammation]. Liver inflammation with jaundice.

icteroid (ik'ter-oyd) [' + *eidos*, form]. Resembling jaundice, yellow-hued.

icterus (ik'te-rus) [G. *ikteros*, jaundice]. Jaundice, *q.v.* Pigmentation of the tissues, membranes and secretions with bile pigment.

i. castrensis gravis. Serious camp jaundice. *SYN* *Weil's disease*.

i. castrensis levis. Mild camp disease of catarrhal form.

i. cythemolytic. A form caused by absorption of bile formed in excess quantities due to hemolysis.

i. febrilis. *Weil's disease*.

i. gravis. Acute yellow atrophy of liver with cerebral disorders.

i., hemolytic or nonobstructive. Rare chronic form, frequently congenital, with periodic attacks of intense hemolysis.

SYM Much the same as in obstructive icterus,* but staining not so intense. Sometimes found in acute yellow atrophy, the anemias and infectious fevers. Enlarged spleen.

TREATMENT Rest, liquid diet, treat the cause, splenectomy.

i. melas. Black jaundice.

i. neonatorum. Jaundice of the newborn. A type of hemolytic jaundice. It may be benign or malignant.

i., obstructive. Jaundice caused by obstruction to the flow of bile in the common or hepatic duct.

ETIOI. Duodenal catarrh, cholangitis, carcinoma, gumma, gallstones, cirrhosis of liver, cysts, parasites in ducts, pressure by tumors, hepatic abscess.

SYM Skin, mucous membrane and secretions stained yellow, first noticed in the conjunctivae. Stool light or clay-colored, urine dark, pulse low, temperature slightly subnormal. In extreme cases, delirium, convulsions, coma.

i. precox. Jaundice of secondary syphilis.

i., suppression. *ETIOI.* Caused by toxins in which destroy the liver cells and red blood cells.

SYM: Feces may be darker than normal, not clay-colored; no excessive amount of bile pigment in urine.

PROG: Quick recovery or speedy death.

i. typhoides. Acute yellow atrophied condition of liver.

ictom'eter [L. *ictus*, stroke, + G. *metron*, measure]. An instrument for estimating the force of apex beat.

ic'tus [L. stroke]. 1. A beat or stroke. 2. An attack.

i. cordis. A term applied to heart-beat.

i. epilepticus. Epileptic convulsion.

i. sanguinis. Apoplexy.

i. solis. Sunstroke.

id [G. *idios*, own]. 1. *BIOI.*: A biological germ structure carrying the hereditary qualities, "an ancestral germ plasm."

PSY The unconscious undominated by its ego, but by its own impulses, which are of an instinctive nature, such as the pleasure urge. 2. A suffix indicating certain secondary skin eruptions which appear some distance from site of primary infection. If etiologic agent of primary infection is known, the secondary lesion is designated by adding "id" as *tuberculid*, *trichophytid*.

ident (id'ant) [G. *idios*, own]. A chromosome containing all the ids regarded as hereditary factors.

-ide. *CHYM.* An ending indicating a binary compound, as *sodium chloride*.

ide'a [G. form, from *idein*, to see]. A mental image, a concept.

i., autochthonous (aw-tok'thon-us). An unaccountable one.

i., compulsive. A persistent, obsessional impulse or thought.

i., dom'inant. One controlling all one's actions and thoughts.

i., fixed. One that completely dominates the mind, as a delusion.

i. of reference. An impression that the conversation or actions of others have reference to oneself.

idea, flight of. Rapid speech, often disconnected and incoherent, in certain mental diseases.

ideation (i-de-a'shun) [G. *idea*, form, from, *idein*, to see]. The process of thinking, formation of ideas.

It is slow in dementias, depressions, and other organic brain diseases, and in narcotic intoxications, but quickened in early stage of intoxications. It is unduly active in manic-depressive insanity.

idée fixe (ē-dā fēks') [Fr.]. An obsession, a fixed idea. *SEE* *idea*.

ident'ical [L. *identicus*, the same]. Exactly alike.

i. twins. Twins developed from 1 fertilized cell. *SEE* *Heiln's law*, *twins*.

identifica'tion [' + *facere*, to make]. 1. A kind of daydream, as when one identifies himself with the hero of a book or play. 2. The process of determining the sameness of a thing or person with that described or known to exist.

i., anthropometric. The Bertillon system of *i. g.*

i., Bertillon system of. A system based on physical characteristics.

i., Galton system of. A system based on fingerprints.

i., palm and sole system of. A system based on prints of the palmar surface of hand and the plantar surface of the foot.

ideo- [G.]. Prefix. Pert. to mental images.

ideogenous (i-de-oj'en-us) [G. *idea*, form, + *gennan*, to produce]. Stimulated by an idea.

ideometabolism. Metabolic changes induced by mental or emotional factors.

ideomo'tion [' + L. *motus*, moving]. Muscular automatic movement activated by a dominant idea.

ideomo'tor [' + L. *motus*, moving]. Pert. to ideomotion.

ideophrenic (id-e-o-fren'ik) ["" + *phren-ikos*, insane]. Marked by abnormal ideas of a perverted nature.

ideoplastia (id-ē-ō-plās'ti-ā). Condition of the mind of a hypnotized person in which he is capable of receiving and responding to suggestions of the hypnotist.

ideovascular (id'ē-ō-vās'kūl-ar). Pertaining to vascular changes induced by ideas, memories, or emotions.

idio- [G.]. Prefix: Individual, distinct, in compound words.

idiocrasy [G. *idios*, own, + *krasis*, temperament]. Peculiarity which renders one susceptible to certain habits or drugs.

idiocratic (id'ī-o-krat'ik) ["" + *krasis*, temperament]. Pert to idiocrasy.

idiotcy [G. *idiōtēs*, uncouthness]. Mental deficiency usually congenital. See *idiot*.

1., **amaurotic family**. Form of *i.* seen in infants and small children in which there is increasing failure of vision and eventually death.

1., **Aztec**. *I.* combined with microcephalia.

1., **complete or profound**. *I.* in which primitive instincts are lacking, even that of self-preservation.

1., **cretinoid**. Endemic *i.* accompanied by stunted growth and frequently by goiter.

1., **diplegic**. *I.* marked by paralysis of all extremities in infants.

1., **epileptic**. *I.* accompanied by epilepsy.

1., **genetous**. *I.* of congenital origin.

1., **hemiplegic**. Hemiplegic manifestations in infants.

1., **hydrocephalic**. *I.* accompanied by chronic hydrocephalus.

1., **intrasocial**. *I.* in which mentality permits some occupation.

1., **microcephalic**. See *Aztec i.*

1., **Mongolian**. Congenital form of *i.* in which person has Mongolian features, the nose being broad, the eyes slanting and the skull flat.

1., **paralytic**. *I.* combined with paralysis.

1., **paraplegic**. *I.* combined with paraplegia.

1., **sensorial**. Mental deficiency caused by loss of 1 of the special senses.

1., **traumatic**. *I.* caused by an injury received in infancy or in early childhood.

idiog'amist [G. *idios*, individual, + *gamos*, marriage]. One incapable of the sexual act with more than a few persons because of sexual discrimination.

idiogenesis (id-ī-ō-jen'-ēs-īs). Of self origin or origin without known cause, esp. with reference to idiopathic disease.

idioglossia ["" + *glōssa*, tongue]. Inability to articulate properly so that the sounds emitted are like those of an unknown language.

idiosis (id'ī-o-l'ī-sin) ["" + *isos*, equal, + *lysis*, solution]. A hemolysin active against the cells of an individual of the same species.

idiolysin (id-ī-ol'ī-sin) ["" + *lysis*, solution]. A lysin in the blood not formed in response to injection of an antigen.

idiometritis (id-ī-o-me-tri'tis) ["" + *metra*, uterus, + *itis*, inflammation]. Inflammation of the uterine parenchyma.

idiomus'cular ["" + *L. musculus*, a muscle]. Pert. to the muscles independent of nerve control.

1. **contraction**. Motion produced by degenerated muscles without nerve stimulus.

idioneurosis (id-ī-o-nū-ro'sis) ["" + *neuron*, nerve, + *ōsis*]. Any functional neurosis arising without stimuli.

idiopathic (id-ī-o-path'ik) ["" + *pathos*, disease]. Pert to conditions without clear pathogenesis, or disease without recognizable cause, as of spontaneous origin.

idiopathy (id-ī-op'ā-thī) ["" + *pathos*, disease]. A primary disease without apparent external cause. Syn: *autopathy*.

idiophrenic (id-ī-o-fren'ik) ["" + *phrēn*, mind]. Pert. to or originating in the mind alone.

1. **psychosis**. An organic disease of the brain producing a mental disorder.

idioreflex. A reflex resulting from a stimulus which arises within the organ in which the reflex takes place.

idiosome (id'ī-o-sōm) ["" + *sōma*, body]. Spermatid's attraction sphere.

idiosyncrasy (id-ī-o-sin'krā-sī) ["" + *sygkrasis*, a mixture]. 1. Special characteristics by which persons differ from each other. 2. That which makes one react differently from others. A peculiar or individual reaction to an idea, an action, or some substance, as unusual susceptibility. Syn: *idiocrasy*.

1. **to drug**. When no effects are produced from large doses of a drug, or unusual effects from small doses or from certain drugs. Ex *digitalis*, *hypnotics*, *mercury*, *potassium iodide*, and *salicylates*.

1. **of effect**. When small doses of a drug create a poisonous or opposite effect, an unusual or no effect.

1. **to x-ray**. Natural or an inherent tendency on the part of the skin to react vigorously to minute doses of x-rays.

idiosyncratic (id'ī-o-sin'krā'tik) ["" + *sygkrasis*, a mixture]. Pert. to an idiosyncrasy. Syn: *idiocratic*.

idiot [G. *idiōtēs*, an uncouth person]. One with a congenital condition of feeble-mindedness, or a serious intelligence defect, a mental age less than 3 years, or an intelligence quotient of less than 20. See: *idiotcy*.

The idiot must be cared for as a child. Idiocy may be identified by a peculiar expression about the eyes, mouth open, and tongue protruding, with enlargement of the face.

RS *amaurotic family idiocy*, *Aztec*, *cephalone*, *degenerate*, *imbecile*, *moron*.

1., **amaurotic**. One born apparently normal but who, in a few months after birth, develops symptoms of idiocy, inability to hold the head up, imperfect vision and sometimes the macula shows a cherry-red spot. Failure of vision, paralysis and death follow.

1., **Aztec**. A microcephalic *i.*

1., **complete or profound**. One devoid of all primitive instincts, even that of self-preservation.

1., **hydrocephalic**. *I.* with chronic enlargement of head and atrophy of the brain.

1., **microcephalic**. One with skull too small for proportions of balance of body.

1., **Mongolian**. One who has a Mongolian cast of countenance, the nose being broad, the eyes slanting, and the skull flat.

idiotic [G. *idiōtēs*, an uncouth person]. Like an idiot; said of an idea or action.

idiotrophic (id'ī-o-trof'ik) [G. *idios*, own, + *trophē*, nourishment]. Capable of securing its own nourishment.

idiotropic [' + *tropē*, a turning] Turning inward mentally. Individual.

I. type. An introvert type satisfied by his own emotions, and by inner contemplation and pursuits, who is content to live apart from social contacts.

idiotypic (id'ī-o-tīp'ik) [' + *typos*, type]. Rel. to heredity.

idioventricular (id'ī-o-ven-trīk'ū-lar) [' + *L. ventriculus*, little belly] Pert. to the cardiac ventricle alone when dissociated from the auricle.

idrosis (id-ro'sis) [G. *idros*, sweat]. Excessive sweating. **SYN** *hidrosis*.

ig'niextirpation [*L. ignis*, fire, + *exstirpare*, to root out] Cautery excision.

ig'nioperation [' + *operari*, to work]. An operation by cautery.

ignipuncture (ig'ni-punk'tur) [' + *punctura*, a piercing] The use of heated needles in cauterization by puncture.

ignis (ig'nis) [*L. fire*]. Fire, cautery. **SYN**: *moza*.

I. sa'cer. An inflammatory skin disease. **SYN** *herpes zoster*.

I. Sanc'ti Anto'nii. Acute febrile disease with localized inflammation. **SYN** *erysipelas*, *St. Anthony's fire*.

Ileac (il'e-ak) [*L. ileum*, ileum fr. *G. eilein*, to twist] Pert. to the ileum.

Ileectomy (il'e-ek'to-mī) [' + *G. ektomē*, excision] Excision of the ileum.

Ileitis (il'e-ī'tis) [*L. ilium*, flank, + *G. -itis*, inflammation] Inflammation of the ileum. The membrane becomes inflamed and ulcerates, the affected portion becoming thick, rigid, and edematous and the lumen progressively narrowed. The lymph glands enlarge and the adjacent mesentery becomes thickened. Most often found in the terminal ileum, but it may spread to other parts of the bowel and to the cecum. Adhesions may be formed. Pain is centered around the umbilicus and right lower quadrant with general distention. Diarrhea alternates with constipation. Vomiting may occur. The stools show occult blood, and mucous shreds if bowels are loose.

I., regional. A nonspecific inflammatory, granulomatous lesion involving the terminal ileum. Age of average subject twenty-seven and a half years. It is nontuberculous. May be acute or chronic. The acute form simulates appendicitis. The chronic form may extend over many years, with diarrhea, abdominal pain, anemia, loss of weight, fistula formation, and eventually obstructive intestinal symptoms. Stools are soft and grayish or brown in color with abundant fecal particles.

Ileocecal (il'e-o-se'kal) [' + *caecus*, blind]. Rel. to the ileum and cecum.

I. valve. Sphincter muscles which guard the aperture of the ileum at the cecum, where the small intestines open into the ascending colon. It prevents food material from reentering the small intestines. **SEE** *Bauhin's valve*.

Ileocecum (il'e-o-se'kum) [' + *caecus*, blind]. The ileum and cecum combined.

Ileocolic [' + *G. kolon*, colon]. Pert. to the ileum and colon. **SEE**: *ileocecal*.

I. valve. Passage where food is prevented from reentering small intestines.

Ileocolitis (il'e-o-kol'itis) [' + *-itis*, inflammation]. Inflammation of mucous membrane of the ileum and colon.

Ileocolostomy (il'e-o-kol-os'to-mī) [' + ' + *stoma*, opening]. Anastomosis between ileum and colon.

Ileocolotomy (il'e-o-kolot'o-mī) [' + ' + *tomē*, incision]. Incision of ileum and colon.

Ileoproctostomy (il'e-o-prok-tos'tō-mī) [' + *G. prōktos*, rectum, + *stoma*, opening]. Establishment of opening bet ileum and rectum.

Ileorectostomy (il'e-o-rek-tos'tō-mī) [' + *L. rectum*, rectum, + *G. stoma*, opening]. Formation of passage bet ileum and rectum. **SYN** *ileoproctostomy*.

Ileosigmoidostomy (il'e-o-sig-moid-os'to-mī) [' + *G. sigma*, letter S, + *eidōs*, form, + *stoma*, opening] Surgical opening between the ileum and sigmoid flexure.

Ileostomy (il'e-os'to-mī) [' + *G. stoma*, opening] Creation of a surgical passage through abdominal wall into ileum.

Ileotomy (il'e-ot'o-mī) [' + *G. tomē*, incision] Incision into the ileum. **SYN** *ileostomy*.

Ileotransversostomy (il'e-o-trans-ver-sos'to-mī) [' + *transversus*, crosswise, + *G. stoma*, opening] Connection of the ileum with the transverse colon.

Iletin (il'e-tin) Insulin, *qv*.

Ileum (pl *ilea*) [*L. fr. G. eilein*, to twist] Lower 3rd portion of small intestines, from the jejunum to the ileocecal valve. It is about 12 ft. long. **SEE** *Illus* below.

Ileus (il'e-us) [*G. ileos*, intestinal colic]. Obstruction of small intestine.

Originally meant colic due to intestinal obstruction.

SYM Acute obstruction, sudden pain, paroxysmal, then continuous, constipation, persistent fecal vomiting, abdominal distention, collapse.

RS: intussusception, occlusion, congenital strangulation, torsion, volvulus.

I., adynamic. That caused by intestinal muscle paralysis.

I., dynamic, I., hyperdynamic. That caused by intestinal muscle contraction.

I., mechanical. That produced by an obstruction.

I., paralyticus. **SEE** *adynamic i.*

Il'iac [*L. iliacus*, pert to ilium] Rel to the ilium. **SEE** *psaos muscle* for illustration.

THE ILEUM

1. Appendix.
2. Ileocecal valve.
3. Duodenum.
4. Common bile duct.
5. Cystic duct.
6. Gallbladder.
7. Liver.
8. Portal vein.
9. Hepatic duct.
10. Hepatic artery.
11. Stomach.
12. Pancreas.
13. Jejunum.
14. Ileum.
15. Large intestine.
16. Rectum.

- 1. crest.** The hip. Upper free margin of the ilium. *Syn:* *crista iliaca*.
- 1. fascia.** Transversalis fascia over ant. surface of the iliopsoas muscle.
- 1. fossa.** Fossa iliaca, *q.v.*
- 1. region.** Inguinal region on either side of hypogastrum.
- 1. roll.** Sausage-shaped mass in left 1. fossa. Caused by induration of sigmoidal walls.
- 1. spine.** Spina iliaca
- Iliocolotomy** (il-i-o-kol-ot-o-mī) [L *ilium*, + *G. kolon*, colon, + *tomē*, incision]. Opening into the colon in the iliac or inguinal region.
- Iliofemoral** (il-i-o-fem-or-al) [“ + *femoralis*, pert to femur]. Pert. to the ilium and femur
- Ilioinguinal** (il-i-o-in-gwī-nal) [“ + *inguinalis*, pert to groin]. Pert. to the groin and iliac regions
- Iliolumbar** (il-i-o-lum-bar) [“ + *lumbus*, loin]. Rel. to the iliac and lumbar regions
- Iliometer** (il-i-om’e-ter) [“ + *G. metron*, measure]. Device for measuring the iliac spines.
- Iliopectineal** (il-i-o-pek-tin’e-al) [“ + *pecten*, a comb]. Rel. to the ilium and the pubes
- Iliopsoas** (il-i-o-so-as) [“ + *G. psoa*, loin]. The compound iliacus and psoas magnus muscles.
- 1. abscess.** An abscess in the psoas and iliacus muscles
- Iliosacral** [“ + *sacralis*, pert. to sacrum]. Pert. to the sacrum and ilium.
- Iliotibial** [“ + *tibialis*, pert. to tibia]. Pert to the ilium and tibia.
- 1. band.** A thick, wide fascial layer from the iliac crest to the knee joint
- Ilium** [L flank]. 1 The haunch bone The wide upper portion of the innominate bone. 2 The flank *Syn:* os ilium. *See* hip bone, Meckel’s diverticulum, sacroiliac.
- Ill** (il) [Ice. *illr*, sick, evil]. Indisposed; not healthy, diseased
- Illaqueation** (il’ā-kwe-a’shun) [L *illaquēdre*, to ensnare]. Turning an inverted eyelash by drawing a loop of thread behind it.
- Illegal** (il-lē-gāl) [L *in*, not, + *lēgalis*, pert to law]. Contrary to authorized law
- Illegitimate** (il’le-jit’l-mīt) [“ + *legitimus*, according to law]. 1 Not according to law; not authorized. 2. Born out of wedlock.
- Illness** (il’nēs) [Ice. *illr*, sick, + A.S. *-ness*, state of]. 1. State of being sick. 2. Ailment.
- Illuminating gas.** This is a mixture of various combustible gases, including hydrogen and carbon monoxide.
- Its poisonous effects are largely due to carbon monoxide, *q.v.*
- TREATMENT:** Resuscitation, *q.v.*
- Illumination** (il-lu-min-a’shun) [L *illumināre*, to light up]. 1. The lighting up of a part for examination or an object under a microscope. 2. Amt. of light thrown upon anything.
- 1., axial.** Light transmitted along the axis of a microscope.
- 1., central.** Axial illumination, *q.v.*
- 1., darkfield.** I. of an object under a microscope in which the central or axial light rays are stopped and the object illuminated by light rays coming from the sides, the object then appearing light against a dark background. Used to observe extremely

small objects such as spirochetes, colloid particles, etc.

1., direct. I. of an object under a microscope by directing light rays upon its upper surface

1., focal. The concentration of light upon an object by means of a mirror or a system of lenses

1., oblique. Illumination of an object from 1 side

1. (by) transmitted light. I. in which the light is directed through the object. Light may come directly from a light source or be reflected by a mirror.

Illuminism. Condition in certain psychotic states in which the patient has delusions of talking or communing with supernatural or exalted beings

Illusion [L *illusio*, fr. *illudere*, to mock] *Psy* Inaccurate perception; misinterpretation of sensory impressions, whereas a hallucination has no source in fact

Vague stimuli favor illusions, but essentially it is a disorder of ideation, as in toxic and exhaustive deliria. If an illusion becomes fixed it is said to be a *delusion*.

Illusional [L *illusio*, fr. *illudere*, to mock] Pert. to, or of the nature of, an illusion.

Image (im’ij) [L *imago*, likeness] 1 A mental picture with a likeness of an objective reality. 2 A more or less ac-

THE ILIUM

- 1 Tuber ischiadicum 2. Incisura ischiadica minor 3. Spina ischiadica. 4. Linea glutea inferior. 5. Incisura ischiadica major. 6. Linea glutea anterior. 7. Spina posterior inferior. 8. Spina posterior superior. 9. Linea glutea posterior. 10. Ala ossis ilium. 11. Labium mediale. 12. Linea intermedia. 13. Labium laterale. (11, 12 and 13 make up the cristae iliacae.) 14. Spina anterior superior. 15. Corpus ossis ilium. 16. Spina anterior inferior. 17. Facies lunata. 18. Fossa acetabuli. 19. Crista obturatoria. 20. Pecten ossis pubis. 21. Tuberculum pubicum. 22. Incisura acetabuli. (From Sabota-McMurrich: *Atlas of Human Anatomy*, 1930, G. E. Stechert & Co., New York.)

curate likeness of a thing or person.
3. The picture of an object such as that produced by a lens or mirror

1., after. A retinal impression which persists after the stimulus is removed. A positive after-image having the same color as the original; a negative after-image possesses complimentary colors.
1., direct, 1., erect. Picture from rays not yet focused.

1., double. Condition occurring in strabismus when the visual axes of the eyes are not directed toward the same object. The false image is formed in the eye that deviates, true image in the other eye. **See** *diplopia*.

1., false. **See** *1., double*.

1., inverted. 1. That is turned upside down

1., real. 1. formed by convergence of rays of light from an object.

1., true. **See** *1., double*.

1., virtual. **See** *direct 1.*

imagery (im'a-je-ri) [L. *imagō*, likeness]. Imagination; the calling up of events or mental pictures.

Mental imagery may be of various types, viz.:

1., auditory. When sounds can be recalled to mind, as thunder, wind, etc.

1., motor. When movement only is recalled, as the passing of a train. Motor-mindedness is recognized in the mastery of spelling. The constant repetition of movements in writing make for automatic habit formation and fixation of the visual word-image

1., tactile. When the feel of an object can be readily recalled.

1., taste and 1., smell. Mental conception of taste or odor sensations previously experienced. Often very weak

1., visual. Mental conception of an object seen previously. This is probably the commonest type of imagery. **RS** *afterimage*.

imagination [L. *imagō*, likeness]. The power of forming mental images of things, persons, or situations which are wholly or partially different from those previously known or experienced

image (im-a'go) [L. likeness]. 1. An image or shadow. 2. A memory, esp. of a loved one, developed during childhood that has become clouded by idealism and imagination, and which is not always a correct one. 3. The adult, sexually mature form of an insect.

imbalance [L. *in*, not, + *bilanz*, *bilanc*, two scales]. Out of balance. Without equality in power between opposing forces

1., autonomic. An 1. between sympathetic and parasympathetic divisions of the autonomic nervous system, esp. as pertains to vasomotor reactions

1., sympathetic. **SYN** *vagotonia* Increased excitability of the vagus nerve.

1., vasomotor. Involving impulses to blood vessels resulting in excessive vasoconstriction or vasodilation.

imbecile (im-be-sil) [L. *imbecillus*, weak, silly]. 1. One with defective mentality, but with intelligence greater than that of an idiot,* and with less than that of a moron. One with a mental age between 3 and 7 years, or a child with an intelligence quotient between 20 and 49, inclusive. **RS:** *degenerate, idiot, moron, pervers*.

2. Without strength of mind or body; esp. mentally weak. 2. Stupid.

imbecility [L. *imbecillitas*]. A state of mental deficiency intermediate between that of an idiot and a moron. **See:** *imbecile*

imbed' [L. *im*, in, + A.S. *bedd*, bed]. In

histology, to surround with a firm substance, such as paraffin or collodium, preparatory to cuttings sections. **See:** *imbed*.

imbibition (im'bi-bish'un) [L. *imbibere*, to drink]. The absorption of fluid by a solid body without a chemical change in either.

imbricate, imbricated (im'bri-kât) [L. *imbricare*, to tile]. Overlapping, as tiles, overlapping aponeurotic layers.

imbrication (im-bri-ka'shun) [L. *imbricare*, to tile]. 1. Overlapping, as tiles. 2. The overlapping of aponeurotic layers in abdominal surgery.

imida'zole or imina'zole. An organic compound characterized structurally by the presence of the heterocyclic ring

which occurs in histidine and histamine imide-. Prefix A compound with the bivalent atom group (NH).

immature (im-ma-tür') [L. *in*, not, + *maturus*, ripe]. Not fully developed or ripened

immediate [' + *mediäre*, to be in middle] Direct without intervening steps

1., agglutination. Healing by first intention.

1., auscultation. A. by ear applied to the body **See** *auscultation*.

1., cause. A cause directly originating a disease

1., contagion. Contagion by direct contact.

1., union. Healing by first intention

immedicable (im-med'i-ka-bl) [' + *medicabilis*, curable] Incurable

immersion (im-er'shun) [' + *mergere*, to dip]. Placing a body under water, or another fluid

In microscopy, the act of immersing the objective (then called an i lens) in water, oil, etc., preventing total reflection of rays falling obliquely upon peripheral portions of the objective.

1., homogeneous. 1. in which the stratum of air between objective and cover glass is replaced by a medium which deflects as little as possible the rays of light passing through the cover glass

1., lens, oil. A special lens used with cedar oil and producing a high magnification, useful in studying bacteria.

immiscible (im-mis'i-bl) [' + *miscere*, to mix]. Pert. to that which cannot be mixed, as oil and water

immobilization [' + *mobilis*, movable]. The making of a part or limb immovable.

NP. Watch for loosening of splints and extensions and prevent pressure sores

immune (im-ün') [L. *immunis*, safe]. 1. Protected or exempt from a disease. 2. Exempt from a certain disease by vaccination or inoculation.

1., bodies. Substances in those afflicted with an infectious disease formed by the tissues and possessing power to destroy or injure the disease-producing agent, or to neutralize its poisons.

They are found in the serum of coagulated blood, in blood plasma, and in lymph; they are also called antibodies,* and are classified as those of the 1st, 2nd, and 3rd order.

Each is the result of a specific antigen or disease-producing factor which acts only upon the same antigen. They have not been isolated, but are deter-

mined by the effect they cause. If the antigen is poisonous it is called a *toxin*, and its antibody is called an *antitoxin*. I. b. of 1st order. The antitoxins. I. b. of the 2nd order. The agglutinins and precipitins. I. b. of the 3rd order: Bacteriolysins and hemolysins.

RS: anaphylaxis, antibody, ceptor, immunity, immunology, opsonins, precipitin, proteolysis, toxin.

immunofacient (im-u-ni-fa'shent) [" + *facere*, to make]. Making immune.

immunity [L. *immunitas*, exemption]. The state of being resistant to injury, particularly by poisons, foreign proteins, and invading parasites.

Such resistance may be due in specific instances to the presence in the blood of antibodies, such as 1. *Antitoxins*, which counteract bacterial toxins. 2. *Precipitins* which render a foreign protein insoluble. 3. *Opsonins*, which increase the ability of leukocytes to ingest bacteria. 4. *Agglutinins*, which cause clumping of foreign cells. 5. *Lysins*, which dissolve such cells.

I. acquired. I. resulting from the development of active or passive immunity; opp. of natural or innate immunity.

I. active. I. resulting from the development within the body of substances which renders a person immune. This may result from having the disease or by the injection of the infectious organism, usually attenuated, or products produced by the organism.

I. congenital. I. present at birth. It may be natural or acquired, the latter being dependent upon antibodies received from the blood of the mother.

I. local. I. which is limited to a given area or tissue of the body.

I. natural. A more or less permanent immunity to disease with which an individual is born, the result of natural inherent factors. It may be the heritage of an individual, a race, or a species. It may be due to the natural presence of immune bodies, but other factors such as diet, differences in metabolism or temperature or adaptive features of infective organisms may be involved.

I. passive. Produced by actual injection of sera containing the antibodies into the subject to be protected.

immunity, words perf. to: antianaphylaxis, antiviral, apyretic, autarcesiology, autarcesis, autarctic, Ehrlich theory, immune, I. bodies.

immunization [L. *immunitas*, safety]. Becoming immune or the process of rendering a patient immune. SFX: autoimmunization, immunity.

immunizing unit. A unit which expresses an antitoxin's strength. It varies with different antitoxins. SFX: antitoxic unit.

immunohemistry (im-mu"no-kem'is-tri) [L. *immunis*, safe, + G. *chemia*, chemistry]. The chemistry of immunization. The chemistry of antigens, antibodies, and their relations to each other.

immunogenic (im-u-no-jen'ik) [" + G. *gennan*, to produce]. Inducing immunity.

immunologic (im-mu-no-loj'ik) [" + G. *logos*, science]. Pert. to immunology.

I. diseases. These are due to the action of antibodies, as in allergic hypersensitivity to antigens, or to specific reactivity of the tissues.

The phenomenon of anaphylaxis needs to be understood to gain a knowledge of immunology. SFX: anaphylaxis, serum sickness.

immunology [" + *logos*, study]. The study of immunity to diseases, as: 1. I. to microbic diseases. 2. Serology. 3. Immunologic diseases.

SFX: serology, serum, toxins, vaccination.

immunoprotein [L. *immunis*, safe, + G. *protos*, first]. Any protein immune body or substance that confers immunity.

immunotherapy (im-mu-no-ther'a-pli) [" + G. *therapeia*, treatment]. The production of immunity.

immunotoxin [" + G. *toxikon*, poison]. An antitoxin.

immunotransfusion (im-mu-no-trans-fu'-zhun) [" + *trans*, across, + *fusus*, poured]. Transfusion of blood from one who has been immunized by an autogenous vaccine.

immunoprotein [" + G. *protos*, first]. A bacteriolytic substance formed by the injection of attenuated bacterial cultures.

impacted [L. *impactus*, pressed on]. Pressed firmly together so as to be immovable. Term may be applied to a fracture in which ends of bones are wedged together, a tooth so placed in jaw bone that eruption is impossible; a fetus wedged in the birth canal; cerumen, calculus, or accumulation of feces in the rectum.

impaction (im-pak'shun) [L. *impactio*, a pressing together]. 1. Condition of being tightly wedged into a part, overloading of an organ, as the feces in the bowels.

impalpable [L. *in*, not, + *palpare*, to touch]. Felt with difficulty; hardly perceptible to the touch.

impaludism [L. *in*, into, + *palus*, marsh, + G. *ismos*, state of]. Malaria. SFX: paludism.

impar [L. *unequal*]. Unpaired. SFX: azgyous.

imparidigitate (im-par-i-di-j'i-tat) [" + *digitus*, finger. SFX: *perissodactylous*. Having uneven number of fingers or toes.

impedance [L. *impedire*, to hinder]. Resistance due to self induction, as that met by alternating currents in passing through a conductor; virtual as distinguished from ohmic resistance.

The resistance due to the inductive and condenser characteristics of a circuit is called *reactance*.

imperative [L. *imperativus*, commanding]. Obligatory; not controlled by the will; involuntary.

I. concept. An idea which dominates one, as a fear or doubt.

impercipient [L. *in*, not, + *percipere*, to perceive]. Inability to form a mental picture; lack of perception.

imperforate [" + *per*, through, + *forus*, a gangway]. Without an opening.

I. hymen. A hymen without an opening. Seldom discovered before puberty. Menstruation is interfered with and incision of hymen becomes necessary. SFX: hymen.

imperforation [L. *imperforatus*, not open]. State of being closed or occluded. SFX: atresia.

imperious acts. Tics and motions not under control of the will. Urges of compulsion states. SFX: *impulsion*.

impermeable [L. *in*, not, + *permedre*, to pass through]. Not allowing passage, as of fluids; impenetrable.

imprerious [" + *per*, through, + *via*, way]. Unable to be penetrated.

impetiginous (im-pe-tij'in-us) [L. from *impetere*, to attack]. Rel. to impetigo.

impetigo (im-pe-ti'go) [L. from *impetere*, to attack]. Inflammatory skin disease marked by isolated pustules which become crusted and rupture. Occurs principally around mouth and nostrils. **Syn:** *scrumpoz*. [Children esp. afflicted.]

i. contagiosa. A contagious form. **Syn:** Discrete, thin-walled vesicles and bullae which become pustular and thin crusted, appearing in crops. They may be flat and umbilicated with no tendency to rupture, and they are filled with a straw-colored fluid. They dry up as thin yellow crusts. No itching.

Etiol. Microbic, streptococcic and staphylococcic

Патн. Papillary layer inflammation involving rete and stratum corneum.

Treatment. Soaking off crusts (soapy water containing sodium carbonate), ointment. Painting with bacterial specifics. Penicillin and the broad spectrum antibiotics

i. herpeticiformis. Rare form occurring usually in puerperal women and accompanied by serious systemic disturbance

i. syphilitica. A pustular syphilide
i. variolosa. Pustules in late stage of smallpox. **Syn.** *melitagra* (2).

implant. 1. To transfer a part, to graft, to insert 2 That which is implanted, such as a piece of tissue, a pellet of medicine, or a tube or needle of radioactive substance

implantation (im-plan-ta'shun) [L. *in*, into, + *plantare*, to plant] 1 Grafting 2 Artificial placing of a substance under the skin into the blood, into the uterine canal, etc 3 Embedding of the developing blastocyst in the uterine mucosa

i. hypodermic. Introduction of an implant under the skin

i. parenchymatous. Introduction of medicinal substance into a neoplasm

i. teratic. Union of a fetal monster with a nearly normal fetus

implants [L. *in*, into, + *plantare*, to plant]. Capillary tubes of glass, gold, or platinum, containing radioactive substances for insertion into tissue

imponderable [L. *in*, not, + *pondus*, weight]. Having no appreciable weight, incapable of being weighed

impotence, impotency [“ + *potentiā*, power]. Weakness. Inability to copulate. Failure of sexual power.

Treatment. Diet, hygiene, aphrodisiac drugs, glandular products, retraining of the mental processes, correction of local infections or congestions, prostatic massage, surgery, and sexual rest.

i., anatomic, i., organic. 1. caused by a defect in the genitalia.

i., atonic. 1. resulting from paralysis of nervi erigentes which convey impulses bringing about erection.

i., functional. 1. not due to an organic or anatomical defect, usually of psychogenic origin

i., parietic. Failure of impulse.

i., psychic. Due to mental disturbance.

i., symptomatic. Due to poor health, drugs, presence of disease, etc.

impotent (im'pō-tēnt) [“ + *potentiā*, power]. 1. Unable to copulate. 2. Sterile; barren. [potence.]

impotentia [“ + L. *potentiā*, power]. **im-i. coeundi.** Inability on part of the male to engage in the sexual act.

i. erigen-di. Loss of power of erection.

impregnate (im-preg'nāt) [L. *impregnare*, to make pregnant]. 1. To render pregnant. To fertilize an ovum. 2. To saturate.

impregnated [L. *impregnare*, to make pregnant]. 1. Rendered pregnant. 2. Saturated.

i., carbon. Electrode having a carbon shell with core of various metals or salts of metals for use in a carbon arc lamp.

Impregnation (im-preg-na'shun) [L. *impregnare*, to make pregnant]. Fertilization of an ovum, fecundation

i., artificial. Artificial implantation of semen in the uterine canal

impres'sio [L. *impressio*]. A mark, as of 1 part upon another.

i. cardi'aca. Depression on surface of liver for the heart. BNA.

i. col'ica. Depression on under surface of right lobe of liver. BNA

i. digitata. A depression on the inner cranial surface

i. duodena'lis. Depression on under surface of liver beside the gallbladder indicating position of duodenum. BNA

i. gas'trica. Hollow under left lobe of liver indicating position of stomach. BNA.

i. rena'lis. Hollow on under surface of right lobe of liver adjacent to the right kidney. BNA.

impres'sion [L. *impressiō*]. 1 A hollow or depression in a surface. 2 Effect produced upon the mind by external stimuli. 3. Plastic imprint of the jaw and teeth for making a denture

i. digitate. 1 on inner surface of frontal bone for convolutions of the cerebrum

i., maternal. An effect supposedly produced upon the developing fetus by mental impressions such as strong emotions or shock experienced by the mother during pregnancy. Such is supposed to account for malformations or the marking of the fetus

impulse (im'puls) [L. *impulsus*, from *impellere*, to drive out]. 1 Act of driving onward with sudden force 2 An incitement of the mind, prompting an unpremeditated act 3. **Puys** A change transmitted through certain tissues, esp. nerve fibers and muscles, resulting in physiological activity or inhibition

i., cardiac. 1 The heart beat felt at the left side of the chest at the 5th intercostal space 2 I transmitted over the conductile tissue of the heart which are responsible for the contraction of the chambers of the heart.

i., ectopic. A cardiac impulse arising in some part of the heart other than the sinoatrial node

i., enteroceptive. Afferent nerve impulses arising from stimuli originating in receptors located in internal organs.

i., excitatory. One which stimulates activity.

i., exteroceptive. Afferent nerve impulses arising from stimuli originating in sense organs located on the body surface.

i., inhibitory. One which lessens activity.

i., morbid. An uncontrollable desire to perform an abnormal act.

i., nervous. A self-propagated excitatory state transmitted along a nerve fiber. It is the result of physicochemical changes occurring in the membrane of the nerve fiber. The impulse on reaching the termination of the fiber may (a) induce an impulse in another nerve cell or (b) induce activity in a tissue such as in muscles (contraction) or in glands (secretion), or (c) give rise to a sensation in the higher nervous centers.

i., proprioceptive. Afferent nerve im-

pulses arising from stimuli originating in joints, muscles, or tendons, or other sensory endings which respond to pressure or stretch

impulsion [L. *impulsus*, from *impellere*, to drive out]. Idea to do something or commit some act or crime suddenly imposed upon the subject which tortures him until the act is accomplished.

Clear consciousness of the proposed act followed by an agonizing struggle, defeat, and sense of relief following the act are characteristics of impulsions, obsessions, and of inhibitions. Impulsions may include (1) *Folie du doute*, or doubting mania, (2) obsessive fears of contact or delirium of touch, (3) agoraphobia, (4) dipsomania; (5) pyromania; (6) kleptomania; (7) homicidal or suicidal impulsions, (8) onomatomania, (9) arithmomania, (10) exhibitionism. *See cerebri/fugal, cerebripetal, imperious acts*

in. Chem symbol for indium

in- [L.] Prefix. *Not, in, inside, within*, also *intensive action*.

inactivate [L. *in*, not, + *activus*, acting] To make inactive.

inactivation [“ + *activus*, acting]. Rendering anything inert by using heat or other means

I. of complement. Loss of activity caused by heating serum to about 55° C (131° F) for half an hour

inadequacy (in-ad'e-kwa-si) [“ + *adaequare*, to be equal] Insufficiency; incompetence

I. renal. Inability of kidney to produce normal amt of urine with proper proportion of solids and of a sp. gr more than 1.014

inalimental (in-al-in-men'tal) [“ + *alimentum*, food] Unfit as food, not nutritious

inanimate [“ + *animatus*, alive] 1. Not alive, not animate 2. Dull, lifeless

inanity [L. *inanis*, empty] A condition due to lack of any food material essential to the body, such as general underfeeding, undernutrition, or caloric insufficiency.

ETIOI. It may be due to other causes than the food supply, such as faulty mastication, stenosis of alimentary canal, etc.

inappetence (in-ap'pe-tens) [L. *in*, not, + *appetere*, to long for] Lack of craving or desire, esp. for food.

inarticulate [“ + *articulus*, joined]. 1 Not jointed, without joints. 2 Unable to pronounce distinct syllables or express oneself intelligibly 3 Not given to expressing oneself verbally.

In articulo mortis [L.]. At the time of death.

inassimilable [L. *in*, not, + *assimilis*, similar]. Not capable of being utilized by the body for nutrition

Inborn. Innate or inherent, said of characteristics both structural and functional which are inherited or developed during intrauterine development

inbreeding [L. *in*, into, + A.S. *brédan*, to cherish]. Producing offspring from those closely related.

incandescent [L. *incandescere*, to glow] Glowing with light; white hot.

incarcerated [L. *in*, into, + *carcer*, prison]. Imprisoned, confined, constricted, as an irreducible hernia.

incarceration [“ + *carcer*, prison]. Legal confinement; imprisonment of a part; constriction.

inca'rial bone. Os inca; interparietal bone

inception [L. *inceptio*, taking in, begin-

ning]. 1. The beginning of anything. 2 Ingestion 3 Intussusception.

incest (in'sest) [L. *incestus*, unchastity, incest] Coitus between those of near relationship, a pathological phenomenon found in acquired or congenital states of mental weakness.

Incidence [L. *incidere*, to meet with]. The rate of occurrence of any event or condition, as I of a disease; the falling or impinging upon, touching, or affecting in some way.

Incident [L. *incidere*, to meet with]. 1 A happening, event, or occurrence 2 Apt. to happen, esp. in connection with some other event 3. Falling or striking, as a ray of light

Incineration (in-sin-er-a'shun) [L. *in*, into, + *cinis*, ciner-, ash]. Destruction by fire. *See cremation*.

Incipient (in-sip'i-ent) [L. *incipere*, to begin]. Beginning

Incise [L. *incisus*, from *incidere*, to cut into]. To cut, as with a sharp instrument.

Incised (in-sizd') [L. *incisus*, cut into]. Cut with a knife.

I. wound. One clearly cut

incision (in-sizh'un) [L. *incisio*, from *incidere*, to cut into] A cut made with a knife, esp for surgical purposes.

Incisive (in-si'siv) [L. *incisivus*, cutting into]. 1. Cutting, having the power of cutting. 2. Rel. to the incisor teeth.

I. bone. Ant. or medial part of the sup maxilla.

Incisor (in-si'zor) [L. *incisor*, a cutter]. 1 That which cuts. 2 That which applies to the incisor teeth 3 One of the cutting teeth. 4 in each jaw between the cuspids. *See dentition*.

I. prostatic. Surgical knife for incision of an enlarged prostate.

Incisura (pl *incisurae*) [L. a cutting into]. An incision or notch.

Incisure (in-si'zur) [L. *incisura*, a cutting into]. A notch or slit.

I's. of Schmidt and Lantermann.

Oblique lines on medullated nerve fiber sheaths.

Inclination [L. *inclinare*, to slope]. Leaning from the normal, or from the vertical, as a tooth.

Inclinometer (in-kli-nom'et-er) [“ + G. *metron*, measure] Device for measuring ocular diameter from vertical and horizontal lines

Inclusion [L. *inclusus*, enclosed]. Being enclosed or included.

I. cell. Lifeless, temporary, constituent of the protoplasm of a cell. *See cell*.

I. blennorrhoea. *See ophthalmia neonatorum* An inflammatory disease of the conjunctiva of newborn infants

I. bodies. Bodies present in the nucleus or cytoplasm of certain cells in cases of infection by filtrable viruses.

See Negri bodies

I. fetal. A twin monstrosity in which one, the parasite, is completely enclosed within its host, the *autosite*

incoercible (in-ko-er'sib-l) [L. *in*, not, + *coercere*, to restrain]. Uncontrollable; not able to be held in check

I. vomiting. Uncontrollable vomiting.

Incoherence (in-ko-her'ens) [“ + *cohaerens*, adhering] Inability to express oneself coherently, or to present ideas in a related order; sometimes due to interruption of one's thought processes

Incoherent (in-ko-he'rent) [“ + *cohaerens*, adhering]. Not coherent or understandable.

Incombustible [“ + *combustus*, burned]. Incapable of being burnt.

incompatibility [' + *compati*, to suffer with]. State which renders admixture of remedies unsuitable through chemical action, insolubility, formation of poisonous or explosive compounds, difference in solubility, or opposite action.

The quality of not being mixed without chemical changes, or without antagonizing the action of ingredients in a compound.

1. physiological. A condition in which 1 or more substances in a mixture have a different physiological action than other substances in the mixture

incompatible [' + *compati*, to suffer with] 1 Not capable of uniting in solution 2 Antagonistic in action, said of some drugs

1. transfusion. A transfusion in which the isoelectrolytes of the recipient react with the red blood cells of the donor resulting in intravascular agglutination and hemolysis

incompetence, incompetency [' + *competere*, to be suitable] Inadequate ability to perform the function or action normal to an organ or part

1. aortic. Regurgitation of blood through the aortic valves

1. of cardiac valves. Condition in which heart valves permit the return of blood beyond them when closed

1. ileocecal. Inability of ileocecal valve to stop the return of the material from the colon to the ileum

1. mental. Mental inability to retain charge of oneself or possessions

1. muscular. Imperfect closure of the cardiac valve due to weak action of papillary muscles

1. pyloric. Weakness of pyloric aperture which permits undigested food to leave the stomach and enter the duodenum

1. relative. Excessive dilatation of a cardiac cavity which makes perfect closure of opposite cardiac valve impossible

1. valvular. Leaky condition of 1 or more cardiac valves

incompetent [' + *competere*, to be suitable]. 1. One legally unable to execute a contract, such as a feebleminded or insane person 2 Incapable

incompressible [L *in*, not, + *compressus*, pressed together]. Compact, not compressible

incontinence [' + *continere*, to stop] 1. Inability to retain urine, semen, or feces, through loss of sphincter control, cerebral or spinal lesions 2 Lack of sexual restraint.

1. active. Discharge of feces and urine in the normal way at regulated intervals but involuntarily.

1. intermittent. Loss of control of bladder on sudden pressure or movement, because of interruption of voluntary path above the lumbar center.

1. of milk. Excessive milk flow. **SYN:** galactorrhea.

1. overflow. I caused by pressure of urine retained in the bladder

1. paralytic. Constant voiding of small amt. of urine and feces due to relaxation of sphincters from lumbar center destruction.

1. passive. Urinary i of a form in which there is a full bladder that doesn't empty normally, but urine drips away upon pressure.

1. of urine. Inability to control urination. Sphincter muscle always relaxed **SEE:** enuresis, scatacratia.

incontinencia [' + *continere*, to stop]. Incontinence.

1. alvi. Fecal i.

1. urinae. Involuntary continual dripping of urine

incoördinate [' + *coördinare*, to arrange] 1 Not able to make coordinate muscular movements 2 Unable to adjust one's work harmoniously with others

incoördination (in-co-or-di-na'shun) [' + *coördinare*, to arrange] Inability to produce harmonious, rhythmic, muscular action, but not due to weakness

ETIOI. The condition may be sensory, due to failure of afferent impulses to be transmitted from muscles, bones, and joints to coordination centers, or motor, due to disturbance in tone or harmony bet simultaneously acting muscle groups **SYN** asynergy.

increment (in'kre-ment) [L *incrementum*]. 1 Increase or addition 2 To increase or add to

incretin. A fraction of secretin, a hormone extracted from the duodenal mucosa, which induces hypoglycemia by increasing the output of insulin

incretion [L *incretus*, sifted in] 1 Internal secretion 2 Functional activity of an endocrine gland

incretogenous (in-kre-toj'en-us) [' + G, *gennan*, to produce] Pert to the internal secretions

incrustation [L *in*, on, + *crusta*, crust] Formation of crusts or scabs

incubation (in-ku-ba'shun) [L *incubare* to lie on] 1 The interval between exposure to infection and the appearance of the first symptom 2 Bact The period of culture development 3 The care of a premature infant in an incubator 4. The development of an impregnated ovum **SYN** latent period **SEE** Table I-11

incubator [L *incubare*, to lie on] 1 Apparatus for rearing premature babies in which the temperature may be regulated 2 Apparatus for cultivating bacteria 3 An apparatus for artificially hatching eggs

incubus (in'ku-bus) [L *incubare*, to lie upon] 1 A burden 2 A nightmare

incudal [L *incus*, anvil, from *incudere*, to forge]. Rel to the incus

incudectomy (in-ku-dek'to-mi) [' + G *ektomē*, excision]. Surgical removal of the incus.

incudiform (in-ku'di-form) [' + *forma*, shape]. Like an anvil in shape

incudomal'leal [' + *malleus*, a hammer]. Rel to the incus and malleus and articulation of the anvil and hammer in the tympanum

incudostapedial (in-kū-do-stā-pe'di-āl) [' + *stapes*, a stirrup] Pert to the incus and stapes and articulation bet anvil and stirrup in the tympanum

incurable [L *in*, not, + *curare*, to care for]. **SYN** *inmedicable* 1. Not capable of being cured 2. A person with an incurable disease

incus (pl. inci) [L *anvil*]. The middle of the 3 ossicles in the tympanum; the anvil. **incyclophoria** (in-si-klo-for-i'a) Median or negative cyclophoria; the turning of the eye inward toward the nose

incycloptrophia (in-si-klo'trōfi-ā). Cycloptrophia in which the eye turns inward towards the nose

in d. In dies, daily

indagation (in-da-ga'shun) [L *indagare*, to search]. An investigation, esp. examination of the genitalia at termination of puerperium

indenization (in-den-i-za'shun) [L *in*, into, + O. Fr. *deinzein*, from L. *de intus*,

Incubation and Isolation Periods in Common Infections

	Incubation Period	Isolation of Patient
Chickenpox	Two to 3 weeks	From school and from non-immune friends.
Common cold	One to 2 days	In bed for 2 days
Conjunctivitis of newborn	Usually 2 days	Strict until smears are negative
Diphtheria	Usually 2 to 5 days	Sixteen days after onset, or until 2 negative cultures.
Dysentery, amebic	Two days to 4 weeks	None
Dysentery, bacillary	Two to 7 days	As long as stools remain positive
Encephalitis	Four to 21 days	One week after onset
German measles	Two to 3 weeks	From school and nonimmune friends
Gonorrhea	One to 8 days	No sexual contact until cured
Influenza	One to 3 days	During acute stage
Malaria	Usually 2 weeks	Protected from mosquitoes
Measles	Eight to 10 days	Five days after appearance of rash
Meningitis	Usually a week	Two weeks after onset
Mumps	Usually 18 days	Until the glands recede
Paratyphoid fevers	About a week	Until stools are negative.
Pneumonia, lobar	One to 3 days.	Until bacteria in the sputum cease to be abundant
Polioomyelitis	One to 2 weeks	Two weeks from onset
Puerperal infections.	One to 3 days	Transfer from maternity wards
Rabies	Usually 2 to 6 weeks	Strict, danger to attendants
Scarlet fever	Up to a week	Three weeks after onset
Septic sore throat.	One to 3 days	During disease no handling of milk
Smallpox	Eight to 16 days	Strict in screened hospital wards
Syphilis	About 3 weeks	Should be enforced until surface lesions are healed in non-cooperative patients
Tetanus	Four days to 3 weeks	None
Trachoma	Unknown	Until lesions disappear
Tuberculosis	Variable	In "open" cases until properly educated
Tularemia	About 4 days	None
Typhoid fever	Usually 1 to 3 weeks	Until cultures of feces and urine are negative
Typhus fever	Usually 12 days	Lice and fleas are dangerous.
Undulant fever.	One to 5 weeks	None
Whooping cough	Usually a week	For 3 weeks after spasmodic cough
Vincent's angina.	Variable.	Preferably during the acute stage

from within). Arrest and development of cells in a part to which they have been carried by metastasis. *Syn* *in-migration*.

indentation (in' + dens, dent-, tooth). A depression or hollow.

index (in'deks) (pl. *indices*) [L. an indicator]. 1. The forefinger. 2. The ratio between the measurement of a given substance compared with that of a fixed standard.

i., alveolar. Degree of jaw prominence.

i., cephalic. Skull breadth multiplied by 100 and divided by its length.

i., cerebral. Ratio of greatest transverse to the greatest anteroposterior diameter of the cranium.

i., color. The proportion of hemoglobin to each red blood corpuscle, the normal being regarded as 100. *Syn* blood quotient.

i., gnathic. Degree of jaw prominence expressed by a number.

i., gonööpsonic. Opsonic i in gonococcal infection.

i., hemorenal. Ratio of blood's electrical resistance to urine's.

i., opsonic. The ratio of number of bacteria which are ingested by leukocytes contained in normal serum, compared with the number ingested by leukocytes in the patient's own blood serum.

i., pelvic. Ratio of pelvic conjugate and transverse diameters.

i., phagocytic. Average of bacteria ingested per leukocyte of blood.

i., refractive. Refraction coefficient.

i., thoracic. Ratio of thoracic anteroposterior diameter to transverse diameter.

indican (in'di-kän). Potassium salt of indoxyl-sulfate, found in sweat and urine, and formed from indol.

When in excess in urine it indicates putrefaction of proteins.

indicanemia (in-'dī-kan-e'mī-ā) [*indican* + *G. ama*, blood]. Indican in the blood.

indicanuria [' + *G. ouron*, urine] Excess of indoxyl-sulfate of potassium, a derivative of indol, in urine

In normal urine it is found in small quantities

indica'tion [*L. indicāre*, to point out] That which indicates the proper treatment

i., **causal**. That shown by a knowledge of the cause of a disease

i., **morbid**. That shown by diagnosis

i., **symptomatic**. That shown by symptoms

in'dicator [*L. indicāre*, to show] A substance which can be used to distinguish acid from alkali (In a more general sense, any substance which can be used to determine the completeness of a chemical reaction, as in volumetric analysis) The colors of indicators in common use are as in the table below

Uses 1 In titration of ammonia and other weak bases 2 Topfer's reagent, for determining free acid in gastric juice 3 In titrating weak acids and for determining combined acid in gastric juice

in'dif'ferent [*L. m*, not, + *differre*, to differ] Neutral; tending in no specific direction

indigenous (in-dij'en-us) [*L. indigenus*, born in] Native to a country or region

indigestible (in-dij-es'ti-bl) [*L. m*, not, + *digerere*, to separate]. Not digestible

indiges'tion [*L. m*, not, + *digerere* to separate] *SYN dyspepsia* Incomplete or imperfect digestion, usually accompanied by one or more of the following symptoms: pain, nausea, and vomiting, heartburn and acid regurgitation, accumulation of gas and belching It may be due to unimportant functional causes or it may be a symptom of a serious organic or functional disease

indigitation (in-dij-i-ta'shun) [*L. m*, in, + *digitus*, finger] Displacement of intestines by intussusception * *SYN invagination*.

indigouria (in'dij-gō-ū'rī-ā) [*G. indikon* Indian dye, + *ouron*, urine] Indigo in the urine

indirect [*L. indirectus*, not kept straight]. Not direct

i., **cell division**. Mitosis Single cell division in which a mitotic figure is not formed.

i., **reflexes**. 1 Passive flexion of 1 part following flexion of another 2 Passive flexion of 1 leg causing similar movement of opposite leg

indisposition [*L. m*, not, + *dispositus*, arranged] Disorder, any slight or temporary illness

indol(e). *SYN ketol* A solid, crystalline substance, C₈H₉N, found in feces. It is the product of bacterial decomposition

of tryptophane and is largely responsible for the odor of feces In intestinal obstruction it is absorbed and eliminated in the urine in the form of indican, q v

indolaceturia (in-dol-as-ē-tu'rī-ā) [*indol* + *L. acetum*, vinegar, + *G. ouron*, urine] Excretion of a considerable amt. of indolacetic acid in the urine

in'dolent [*L. m*, not, + *dolere*, to feel pain] 1 Indisposed to action 2 Inactive, not developing, sluggish

i., **ulcer**. One that is sluggish but not painful

indologenous (in-dol-oj'en-us) [*indol* + *G. gennan*, to produce] Causing the production of indol

indolu'ria. The presence of indol in urine

indoxyl (in-dok'sil) [*G. indikon*, indigo, + *oxys*, sharp] An oily substance, C₈H₇NO, sometimes found in urine of the apparently healthy, formed from the decomposition of tryptophane

indoxylemia (in-doks-i-le'mī-ā) [' + + *ama*, blood]. Indoxyl in the blood

indoxyluria (in-doks-il-u'rī-ā) [' + + *ouron*, urine] Excretion of indoxyl in urine.

induced (in-dūs'd) [*L. inducere*, to lead in]. Produced, caused [intentionally]

i., **abortion**. One brought about in-

induc'tance [*L. inducere*, to lead in] That property of an electric circuit by virtue of which a varying current induces an electromotive force in that circuit or a neighboring circuit

It is susceptible of measurement The unit of inductance, or "self-induction," is the henry.

induction (in-duk'shun) [*L. inducere*, to lead in]. 1 The process of causing or producing, as an abortion 2 The generation of electric current in a body by electricity in another body near it 3 In Embry the production of a specific morphogenic effect by a chemical substance from one part of the embryo to another Also called *evocation*

inductor'ium. An induction coil, q v

inductotherm (in-duk'to-therm) [' + *G. thermē*, heat] Device for producing pyrexia by electricity

inductothermy. Treatment of disease by artificial production of fever by electromagnetic induction

in'durate [*L. m*, in, + *durus*, hard] 1 To harden 2 Hardened

in'durated [' + *durus*, hard] Hardened

indura'tion [' + *durus*, hard] 1 The act of hardening. 2 An area of hardened tissue

SEE *Chaussier's areola*, *sclerosis*, *skin*.

i., **cyanotic**. An 1 from long continued venous hyperemia, pressure on vessels causing transudation of blood and serum and formation of a dark, hard mass

In the liver, spleen, etc., it leads to absorption of more or less of the paren-

Colors of Indicators

	Color		Range of pH
	toward acid	toward alkali	
Bromeresol purple	yellow	purple	5.2-6.8
Bromthymol blue	yellow	blue	6.0-7.6
Congo red (1)	blue	red	3.0-5.0
Dimethylaminoazobenzene (2)	red	yellow	2.9-4.0
Litmus	red	blue	4.5-8.3
Methyl orange	red	orange	3.1-4.4
Methyl red	red	yellow	4.2-6.3
Phenol red	yellow	red	6.8-8.4
Phenolphthalein (3)	colorless	red	8.3-10.0

chyma and to formation of new connective tissue.

i., fibrous, of the lung. A form of interstitial pneumonia. Hardened pigment forms red points on the lung.

i., specific. The initial lesion of syphilis.

in'durative [*in* + *durus*, hard]. Pert. to induration.

in'dusium. 1 A membranous covering 2 The amnion

i. griseum. The supracallosal gyrus, a rudimentary gyrus located on the upper surface of the corpus callosum

inebriant (in-e'bri-ant) [*L. inebrius*, drunken] 1. Any intoxicant 2 Making drunk

ine'briate [*L. inebrius*, drunken] To make drunk or to become intoxicated

inebriation (in-e'bri-a'shun). State of intoxication, *q.v.* *SYN* drunkenness, intoxication.

inelas'tic [*L. in*, not, + *G. elastikos*, elastic] Not elastic

inemia (in-e'mi-ä) [*G. is*, in-, fiber, + *aima*, blood] Excess fibrin or presence of inosite (muscle sugar) in the blood *SYN* mosemia.

inert [*L. inertus*, inert-, unskilled, idle] Not active, sluggish

inertia (in-e'ishi-ä) [*L. inactivity*] 1 Tendency of a body to remain in repose 2 Sluggishness, lack of activity

i., uterine. Absence or weakness of uterine contractions in labor

in extremis (in-eks-tre'mis) [*L.*] At the point of death

in'fant [*L. in/fans*]. 1 A babe. 2 A child not over 2 years of age. 3 In law, a minor, or one under legal age

i., artificial feeding of. *Precautions*

1 The feedings must be given *exactly* on time

2 Temperature of feeding should be 100° F. Test heat by shaking some of it on the back of the hand. See that bottle is not overheated and that it does not burn infant by coming in contact with it

3. Nipples should be kept in a boric acid solution and not fitted to bottle until ready to give. They should not be handled more than necessary, and before touching them one should be assured that the hands are clean. See that the hole in nipple permits a free, but not too rapid, flow of milk. The hole should not be too small. It may be enlarged with a heated needle

4. See that infant is changed before bringing in the feeding

5. In administering feeding, head and shoulders should be raised higher than the infant's abdomen, but it is better to hold infant while giving the feeding. See that the child is properly protected from drafts or cold. If being fed when in a reclining position the formation of gas may result in belching of the feeding. Change position of bottle as level of the fluid changes

6. See that nothing disturbs the child while being fed and that the feeding is not interrupted. Close observation is essential, as the baby must receive all the feeding, which will not be the case if it is regurgitated or lost from belching. Interruptions may cause air-swallowing, which results in gas distention and a feeling of fullness that may cause a rejection of necessary nourishment.

7. If an accumulation of gas interferes with the feeding, the usual methods of expelling the gas should be employed,

such as holding the child over the shoulder and patting it on the back. This should also be done after each feeding in order to expel any air

8. Do not rock a baby after it has been fed.

9. Water should be given bet feedings to maintain elimination and other body needs

9. The habit of finger sucking should not be permitted, as air-swallowing always results therefrom.

CARE OF NIPPLES AND BOTTLES. Both bottles and nipples should be soaked in cold water. Wash bottles with hot water and soap, using a brush for the purpose, and sterilize them by boiling in hot water. The nipples after being boiled may be kept in a boric acid solution.

i. development. For 3 days after birth a baby loses weight, in the next 4 days, however, it should regain its loss and weigh as much as it weighed at birth. From 1 year old to 10 years the yearly gain in the child should be 4 or 5 pounds, from 10 to 16 years the yearly growth should be about 8 pounds. Should hold up head by 4th month, sit up before 7th month, walk by 12th to 15th month, talk before 18th month.

i. feeding. The infant should not go to breast for at least 12 hours after delivery. If this limit is up at night, the next morning will be soon enough for the first nursing. The regular nursing schedule is not necessary until the milk comes in. The 3- or 4-hour nursing interval depends upon the physician, hospital, and the condition of the mother and the baby. The 3-hour interval is advocated by some physicians during the first 2 or 3 weeks. This keeps the breasts emptied, thereby relieving congestion, and increases the amount of the baby's fluid intake in 24 hours. Others prefer the 4-hour interval, especially if the infant is large.

The early cessation of night feedings is an advantage of the 3-hour schedule rarely attained in the 4-hour régime. The individual breast is stimulated by the 15-minute nursing period. Followed by the 6-hour rest period, this combination provides for maximum functioning.

COMPLEMENTARY FEEDING. This is an artificial feeding used to round out a breast feeding that is inadequate. It is better given immediately after the breast feeding rather than before it. It abets the utilization of breast milk without interfering with it, while supplying any breast milk deficiency that may exist.

SUPPLEMENTAL FEEDING. An artificial

Infant Development

Age	Length Inches	Weight Pounds	Girth Inches
At birth	19.5	7	13
1 month	20.5	7.75	..
2 months	21	9.5	..
3 months	22	11	..
4 months	23	12.5	15
5 months	23.5	14	..
6 months	24	15	16
7 months	24.5	16	..
8 months	25	17	..
9 months	25.5	18	..
10 months	26	19	..
11 months	26.5	20	..
12 months	27	21	17

feeding replacing breast feeding, one or several times daily. It is not as generally used as the complementary, since it operates against the stimulation of breast milk production, and so tends to reduce it even further.

COMPOSITION OF ARTIFICIAL FOOD: The basis of artificial infant feedings is cow's milk, which is modified by the addition of water and a carbohydrate. Sometimes lactic acid is added, although lemon juice, orange juice, and even dilute hydrochloric acid may be used. Estimation of the composition of the formula should be based upon the physiologic requirements of the infant. No less than $1\frac{1}{2}$ oz (45 cc) of milk per lb (450 Gm) of body weight are sufficient for this purpose, and may be increased to 2 oz. (60 cc) per lb. of body weight within a week or 10 days. Calculation is based upon a 4% fat milk and allows for introducing a weak but sustaining food.

Carbohydrate requirement in 24 hours is $1\frac{1}{10}$ oz (3 Gm) to each lb. (450 Gm) of body weight, exclusive of the 4% already in the milk. Fluid requirement is 3 oz (90 cc) to every lb. of body weight in 24 hours.

Unless an infant is immature or premature, there is no clinical reason for employing concentrated foods, such as evaporated milk, etc.

1., immature. One born near term, but underweight and poorly developed.

1., mature. One born at the end of 270-290 days.

1., premature. One born before term, but viable, having a birth weight of $5\frac{1}{2}$ lb. (2500 Gm) or less, with a "crown-heel" length of 47 cm or less; the birth weight being the most important factor. Includes larger number of immature infants. The younger the fetus at birth, the greater are its handicaps in carrying out its required body functions, and thus it needs far greater care than a normal or mature infant.

ARTIFICIAL FEEDING OF THE breast feedings are excessive quantities for artificial feeding. Slower and smaller increases of weight may be expected on artificial feedings.

Small feeding with a low fat content of concentrated mixtures which precipitate with a finely divided curd is desirable.

If fresh sweet milk is used as a basis it should be boiled 5 minutes over a direct flame, but this is not necessary when lactic acid milk is used. Evaporated milk, dried sweet or lactic acid milk, or condensed milk may be used as a safe substitute for sweet milk.

Carbohydrates are first added in 2% quantities and increased to 5% as required. Orange juice may be added by the 3rd week to counteract effect of the boiled milk. Begin with 5 drops daily and increase to 2 tablespoons, twice a day, by the end of the 8th week.

Cod liver oil should be fed before the end of the 3rd week, 2 drops daily, increasing to 60 drops by the 8th week. This is best divided into 2 feedings.

The feeding may be done with a medicine dropper. A nursing bottle also may be used, but the nipple should have a small bulb, or the rubber end of a medicine dropper.

1. pulse. At birth, 120-150 per min.; at the end of 1st year, 120-110, 3rd-4th yr., 100; at puberty, pulse is that of an adult.

1. respiration. At birth, 30-60 per min.; 1st yr., 25-30, 5th yr., 22-25; 14th yr., 20. **SEX:** pulse, respiration, temperature.

1. temperature. Normal (rectal), 98°-99° F. Subnormal more important than in adults.

infanticide (in-fan'tis-id) [L. *infans*, infant, + *caedere*, to kill]. 1. The killing of an infant. 2. One who takes the life of an infant.

infantile (in-fan'til) [L. *infans*, infant]. Pert to infancy.

1. hernia. Oblique inguinal hernia back of the peritoneal funicular process.

1. liver. Biliary cirrhosis* of children.

1. paralysis. Acute ant. poliomyelitis*.

1. tetanus. Tetanus which begins with stiffening of jaw muscles. **SYN** trismus nascentium or neonatorum.

infantilism (in-fan'til-izm) [" + G. *ismos*, condition]. A condition in which the mind and body make slow development. Failure to attain adult characteristics, physical or psychic.

1., angloplastic. I due to defective development of vascular system.

1., Brissaud's. Infantile myxedema.

1., cachectic. I caused by chronic infection or poisoning.

1., celiac. I caused by celiac disease.

1., dysthyroidal. I. caused by defective thyroid.

1., hepatic. I. combined with cirrhosis of liver.

1., hypophysial. **SYN** pituitary 1, Loran-Levi dwarfism. Dwarfism resulting from hyposecretion of growth promoting and gonadotrophic hormones of ant lobe of the hypophysis.

1., Herter's. I of the intestines.

1., idiopathic. Variety of arrested physical development, of unknown cause.

1., intestinal. I associated with chronic intestinal disorder, causing the child to gain no weight nor to grow.

1., Loran-Levi. Hypophysial 1, q v.

1., lymphatic. A form of 1. associated with lymphatism.

1., myxedematous. **SYN:** cretinism.

1., pancreatic. I. caused by defect in pancreatic function.

1., partial. Arrest in development of a lone tissue or part.

1., pituitary. Hypophysial 1, q v.

1., renal. I. caused by defect in renal function.

1., reversible. I commencing subsequent to completion of bodily growth.

1., sex. Continuation of childish traits, esp sex characteristics beyond the age of puberty.

1., symptomatic. I. caused by poor tissue development.

1., tardy. **SEE** reverse 1.

1., toxemic. **SEE** intestinal 1.

1., universal. Dwarfed stature, otherwise fairly normal development, except for absence of secondary sexual characteristics.

in'farct [L. *infarcire*, to stuff into]. An area of tissue in an organ or part which undergoes necrosis following cessation of blood supply. May result from occlusion or stenosis of supplying artery or more rarely occlusion of vein draining tissue. Usually conical in shape.

1., anemic. I in which blood pigment is lacking or decoloration had occurred. Also called white or pale infarct.

1., bland. I. in which infection is absent.

I., calcareous. I. in connective tissue in which calcareous salts have been deposited

I., cicatrized. I. which has been replaced or encapsulated by fibrous tissue

I., pale. An anemic infarct, *q v*

I., red. An I. which is swollen and red as a result of hemorrhage. Also called *hemorrhagic infarct*

I., uric acid. I. in kidney of a newborn infant due to obstruction of renal tubules by uric acid crystals

I., white. An anemic infarct, *q v*

infarction [*L. infarcire*, to stuff into]. 1. Formation of an infarct 2 Stoppage of a canal or passage, esp. by engorgement

I., cardiac. Myocardial infarction, *q v*

I., myocardial. I. in cardiac muscle, usually resulting from coronary thrombosis

I., pulmonary. I. in lung usually resulting from pulmonary embolism

infect. To cause pathogenic organisms to be present in or upon, as to *infect* a wound

infection [*L. inficere*, to taint] The state or condition in which the body or a part of it is invaded by a pathogenic agent (microorganism or virus) which, under favorable conditions, multiplies and produces effects which are injurious

Localized infection is usually accompanied by inflammation, but inflammation may occur without infection

The physician is esp. concerned with 3 conditions (a) Infections arising without known injury, (b) those arising in wounds of accidental origin, and (c) infections of operative wounds

Etiol. The principal causes of infections are agents belonging to the following groups: viruses, bacteria, Rickettsias, fungi, and animal parasites

Unknown Injury Inflammations may result from slight abrasions, but most of these infections are now attributed to focal infection, such as those of the tonsils and teeth, accessory sinuses, chronic middle ear infection, infection of wounds, or of the gastrointestinal tract

Known Injury Many of these are due to wounds. The character of the instrument causing the wound may influence the infection, as in the case of a rusty nail

Operative Wounds These infections may occur as the direct result of the operative technic, such as the use of

blunt instruments, or too vigorous wiping with sponges, and other surgical causes, and by postoperative exposure to sepsis

Sym. The symptoms of infection are those of inflammation. The 5 classical symptoms of the earlier medical writers are. *Dolor*, pain, *calor*, heat; *ruber*, redness; *tumor*, swelling, and *functio laesa*, disordered function.

Pain This is esp. prominent when the infection is confined within retaining cavities. The pain is in proportion to the virulence and extent of the infection.

Redness and Swelling Not evident when infection is within some rigid tissue or deep within some cavity; more apparent when superficial structures are involved. Discoloration would be a better term than "redness," as the color is more bluish or purple in advanced infections, while tuberculosis infections have long been called "white swellings."

Heat Heat may not be evident on the surface, but there may be considerable elevation of body temperature even with small infections

Disordered Function: This depends upon the part affected as well as upon the virulence. With almost all acute infections there is an increase of white cells and of polymorphonuclear leukocytes, a percentage of over 85% of the latter being of more import than leukocytosis *

The degree of prostration is out of proportion to the extent of the injury. There have been many deaths from infection following pricks of needles, small splinters of bone, a trifling cut, or an infection from the bristle of a brush, in which streptococcus was the inciting cause. In this type of infection a red streak may be seen running up the extremity from the site of injury, and following the superficial lymphatics. This red line is absent in staphylococcus infections of the lymphatic vessels.

Infection may be *local* or *general*. Local infections may be at the portal of entry, or remote if transferred by the blood or lymph

Site of Microorganisms may gain entry to the tissues through the *gastrointestinal tract*, as in typhoid fever, or through the *respiratory tract*, as in tuberculosis and common colds, or through *wounds*, as in rabies, or from *contaminated objects*, as in tetanus, or from *bites of insects*, as in malaria and yellow fever

The Commoner Protozoal Infections of Man

Disease	Primary Site of Infection	Parasite	Mode of Transmission
Malaria (1) Benign tertian (2) Benign quartan (3) Malignant	Erythrocytes	(1) <i>Plasmodium vivax</i> (2) <i>Plasmodium malariae</i> (3) <i>Plasmodium falciparum</i>	Mosquito (<i>Anopheles</i>)
Sleeping sickness	Blood plasma	<i>Trypanosoma gambiense</i>	Tsetse fly (<i>Glossina palpalis</i>)
Rhodesian sleeping sickness	Blood plasma	<i>T. rhodesiense</i>	Tsetse fly (<i>Glossina morsitans</i>)
Kala-azar	Reticuloendothelial cells and plasma	<i>Leishmania donovani</i>	The sand fly (<i>Phlebotomus argentipes</i>)
Amebic dysentery	Wall of large intestine	<i>Entamoeba histolytica</i>	Fecal (cyst) contamination of food and water

Lowered vitality and resistance make possible *subinfection* from bacteria whose normal habitat is in the body. All infections of mucous membranes are mixed infections. Foci of infections may be primary or secondary.

Methods of Air-borne Infection. Pathogenic organisms in the respiratory tract, discharged from the mouth or nose, may be borne on the air and settle on food, clothing, walls and floors, and if they are of the type which resists drying for a long period they may remain virulent until transmitted to another person. Coughing, sneezing, and expectorating may be responsible for "droplet infection," as bacteria are expelled into the air.

Animal Carriers. Some microorganisms may be carried from an animal to man by *direct contact*, *indirect transfer*, or by *intermediary hosts*.

Contact Infection. This is the result of transmission from person to person, as in kissing, coming in contact with those afflicted with communicable diseases, or with utensils handled by one with an infection.

Food-borne Infection. Bacteria may be communicated through food. Root and salad vegetables may carry bacteria from the soil or from manure. Cooking safeguards by destroying microorganisms on food.

Human Carriers. Some parasites may live in or upon the bodies of those who themselves do not suffer from them, but may be carried by them to others. Carriers may be (a) *Contact carriers*, or those who never show symptoms, (b) *incubationary carriers*, or those in whom the infection is starting but has not completed the incubation period, and (c) *convalescent carriers*, or those who have recovered but who still harbor the organism causing their disease.

Insect Vectors.* An insect may act as a physical carrier, as the housefly, which may transmit the typhoid bacillus, or one that acts as an active intermediate host, such as the Anopheles mosquito, which transmits malaria.

Prenatal Infection. This is the result of the fetus being infected from the mother's blood stream or from contiguity with the maternal membranes.

Soil-borne Infection. Soil-borne, spore-forming organisms commonly enter the body through wounds, as in tetanus and gas gangrene.

Water-borne Infection. Organisms producing typhoid, dysentery, cholera, and amebic infections may be carried through a water supply, or water in public pools used for bathing. These organisms may pass into the water from the feces of an infected person and be communicated to others.

1., acute. Appears suddenly and runs a short course.

1., a. exacerbation. Recurrence after a period of quiescence.

1., apical. I. located at the tip of root of a tooth.

1., chronic. One having a protracted course.

1., concurrent. Existence of two or more infections at the same time.

1., droplet. Acquired by inhalation.

1., endogenous. I. caused by bacteria, normally nonpathogenic inhabiting the digestive tract.

1., focal. One occurring in a focus or cavity, and acting as a focus for dissemination of infectious material to

other parts of the body. Ex: Apical tooth abscess causing infection of heart or joints.

1., food. See: *Food infections*.

1., local. I. caused by germs lodging and multiplying at one point in a tissue and remaining there, as a boil.

1., low grade. Loosely used term for a subacute or chronic infection with only mild inflammation and without pus formation.

1., metastatic. Local I. caused by germs circulated from a focus of infection.

1., mixed. Caused by 2 or more organisms.

1., pyogenic. I. resulting from pus-forming organisms.

1., secondary. One in which the organisms implant themselves upon an existing primary infection in tissues.

1., simple. Due to a single species of organism.

1., subacute. Intermediate bet acute and chronic.

1., terminal. One occurring in the late stage of a disease. Generally acute and septic, usually causing death.

infectious (in-fek'shus) [L. *infcere*, to make into] 1 Capable of being transmitted with or without contact 2 Pert to a disease due to a microorganism 3 Producing infection Sff *eruptive*

1. disease. Any disease caused by growth of pathogenic microorganisms in the body. May or may not be contagious.

Tabulation of Infectious Diseases

CHICKENPOX. Incubation period: Four to 27 days. Eruption appears: First 4 days. Begins to fade: About 4th day. Quarantine: About 22 days. Infection ceases: When every scab has disappeared.

DIPHTHERIA. Incubation period: One to 7 days. Quarantine: Nine days after exposure. Infection ceases: In 4 weeks if examination of nose and throat is negative and if there are no discharges or albuminuria.

GERMAN MEASLES (Rötheln). Incubation period: Seven to 18 days or longer. Eruption appears: Second to 4th day. Begins to fade: Fourth to 7th day. Quarantine: Two days. Infection ceases: Not less than 7 days from appearance of rash.

INFLUENZA. Incubation period: One to 4 days. Quarantine period: Five days. Infection ceases: Three days after normal temperature if all discharges have ceased.

MEASLES. Incubation period: Eight to 14 days. Eruption appears: Fourth day. Begins to fade: Fifth to 7th day. Quarantine: Sixteen days. Infection ceases: Not less than 2 weeks from appearance of rash.

MUMPS. Incubation period: Nineteen to 22 days. Quarantine: Twenty-four days. Infection ceases: Not less than 3 weeks and at least 1 week after subsidence of swelling.

SCARLET FEVER. Incubation period: One to 5 days. Eruption appears: Second day. Begins to fade: Fifth day. Quarantine: Seven days. Infection ceases: Not less than 4 weeks if no albuminuria and no discharge from nose or ears.

SMALLPOX. Incubation period: Twelve to 14 days. Eruption appears: Third or 4th day. Begins to fade: Ninth or 10th day. Quarantine: Sixteen days. Infection ceases: When every scab has appeared.

Fungus Infections

Disease	Causative Organisms	Structures Infected	Microscopic Appearances
Ringworm (tinea, pityriasis, etc.).	<i>Microsporon (audouinii, etc.)</i> .	Horny layer of epidermis and hairs, chiefly of scalp	Fine septate mycelium inside hairs and scales Spores in rows and mosaic plaques on hair surface
Ringworm (tinea, pityriasis, etc.).	<i>Trichophyton (tonsurans, etc.)</i>	Hairs of scalp, beard, and other parts Also nails	Mycelium of chained cubical elements and threads in and on hairs. Often pigmented
Favus.	<i>Achorion (schonleinii, etc.)</i> .	Yellow disks in epidermis round a hair. All parts of body, also nails	Vertical hyphae and spores in epidermis. Sinuous branching mycelium and chains in hairs
Epidermophytosis (Dhobie itch, etc.).	<i>Epidermophyton (inguinale, etc.)</i>	Infamed patches in inguinal axillary and interdigital folds Hairs not affected	Long, wavy, branched and segmented hyphae and spindle-shaped cells in stratum corneum.
Thrush (and tonsillomycosis).	<i>Monilia</i> .	White patches on tongue, mouth, and throat Some inflammation	Yeastlike budding cells and oval, thick-walled bodies in epidermis Some broad hyphae
Thrush (and tonsillomycosis).	<i>Oidium (albicans)</i> .	White patches on tongue, mouth, and throat Some inflammation.	Large hyphae and oval bodies, chains of spores at ends of hyphae
Fungal granuloma (sporotrichosis and blastomycosis).	<i>Sporotrichon (beurmannii, etc.)</i> .	Inflammatory thickening of skin with suppuration.	Oval spores and yeastlike cells in tissues and pus.
Fungal granuloma (sporotrichosis and blastomycosis).	<i>Cryptococcus</i> .	Inflammatory thickening of skin with suppuration.	Budding yeastlike cells, short hyphae and large capsulated spheroids in tissues and pus
Aspergillosis (and bronchomycosis).	<i>Aspergillus (fumigatus, etc.)</i> .	Pustules in external ear. Inflammatory and necrotic foci in lungs	Branched hyphae and spore-bearing fructifications in pus or sputum

TYPHOID FEVER: *Incubation period:* Seven to 21 days. *Eruption appears:* Seventh to 8th day. *Begins to fade:* Twenty-first day. *Quarantine:* Twenty-three days. *Infection ceases:* After 3 consecutive negative reports from bacteriological examination of feces and urine.

TYPHUS FEVER: *Incubation period:* Five to 14 days. *Variable Eruption appears:* Fourth to 8th day. *Begins to fade:* Fourteenth day. *Quarantine:* Sixteen days. *Infection ceases:* After 4 weeks.

WHOOPING COUGH: *Incubation period:* Seven to 14 days, but whooping may not appear for 3 weeks. *Quarantine:* Sixteen days. *Infection ceases:* Three to 5 weeks.

NOTE: Period of quarantine varies in different states. SEE *quarantine*, also, *names of infectious diseases*.

infecundity (in-fe-kun'di-ti) [*L. infecunditas*, sterility]. Barrenness, sterility in women.

inferior (in-fe'ri-or) [*L. inferus*, below]. Beneath; lower.

inferiority complex. Psy. A repressed state of mind in which one feels himself inferior to others. Such a group of ideas may be manifested by the assumption of superiority, often resulting in over-compensation. Opp. *superiority complex*. RS. *complex*.

infest' [*L. infestare*, to attack]. The harboring of parasites.

infestation [*L. infestare*, to attack]. The harboring of animal parasites, esp. macroscopic forms such as helminthes. *Infestation* is applied to forms which do not multiply within the body in contrast to *infection* which is applied to those which multiply.

infibulation (in-fib-u-la'shun) [*L. in, in, + fibula*, clasp]. 1. Fastening the labia of the vagina together, or the prepuce over the glans penis. 2. Joining the lips of wounds by clasps.

infiltrate (in-fil'trát) [*L. in, into, + filtrare*, to strain through]. 1. To pass into or through a substance or a space. 2. The material that has infiltrated.

infiltration (in-fil-tra'shun) [*L. in, into, + filtrare*, to strain through]. The process of a substance passing into and being deposited within the substance of a cell, tissue, or organ. Ex. I of a tissue or organ with blood corpuscles, or of a cell by fatty particles.

It must not be confused with degeneration, as in the latter condition the foreign substances are from changes within the cell.

i., amyloid. I. of tissue or viscera with a glycoprotein.

i., anesthesia. Injection of a cocaine or similar solution. See *anesthesia*.

i., calcareous. Deposits of calcium or magnesium salts within a tissue.

i., cellular. I. of cells, esp. blood cells, into tissues; invasion by cells of malignant tumors into adjacent tissue.

i., fatty. Deposit of fat in the tissues, or oil or fat globules in the cells.

i., glycogenic. Glycogen deposit in cells.

i., pigmentary. Of pigments.

i., purulent. Pus cells in a tissue.

i., serous. With diluted lymph.

i., urinous. With urine.

i., waxy. Amyloid degeneration.

infinite distance. 1. A distance without limits. 2. In vision, light rays coming from a point of any distance beyond 20 feet are practically parallel and accommodation is unnecessary.

infirm. Weak or feeble, esp. from old age or disease.

infirm'ary (*L. infirmarium*). A hospital, a place for the care of sick or infirm persons.

infirmity. 1. Weakness. 2. A sickness or illness.

inflammation [*L. inflammare*, to flame within]. Tissue reaction to injury, either direct or referred.

It is a defensive reaction to irritation, chemical, bacterial, mechanical, or toxic. It produces degeneration of the injured area, and repair ensues by aid of the tissue cells.

Inflammation is a conservative process modified by whatever produces the reaction, but it should not be confused with *infection*, the two are relatively different conditions, although one may arise from the other.

EXCIT. The reaction of tissue to injury of any kind may be the result of (a) Blows and foreign bodies, (b) chemicals, (c) electricity, (d) heat and cold (thermic causes), (e) microorganisms, (f) surgical operations (traumatic causes).

GENERAL SYMPTOMS. *Dolor*, pain; *calor*, heat, *rubor*, redness, *tumor*, swelling, and *functio laesa*, disordered function. In addition to the symptoms mentioned, the absorption of some of the constituents of inflammatory lymph may cause a slight rise of temperature (99°-101° F.), headache, loss of appetite, and a general feeling of discomfort.

PATHOLOGICAL CHANGES. (a) Vascular dilatation and changes in the blood. (b) Exudation of fluid from blood vessels into tissues with concomitant swelling, migration of leukocytes into the tissues, gelation of fibrinogen in intercellular spaces. If the injury is not too severe, these processes reach their maximum in six to eight hours, after which reparative processes take place. Blood vessels return to normal size, normal blood flow is re-established. Leukocytes degenerate or re-enter circulation, cellular disintegration or proliferation occurs, in which injured cells are replaced, swelling disappears with resorption of tissue fluid and digestion of fibrin.

Each type of cell has a particular rôle to play in the inflammatory process. The *monocytes** and *macrophages** are great scavengers for all kinds of dead tissue. The *polymorphs** are active in autolysis* and the destruction of bacteria, and the *lymphocytes** form a barrier against the spread of irritants and probably form the fundamental tissue from which the healing scar develops. These cells appear in inflammatory conditions at stated intervals, and in a definite order or succession, the macrophage, for instance, antedating the polymorph by a week, and the lymphocyte by several days.

NOMENCLATURE. Most words denoting inflammation end with the suffix *-itis*, which in itself pertains to inflammatory conditions. This suffix should not be pronounced as "eels." The principal inflammations of the various systems are.

Ear. Otitis externa, interna and media, mastoiditis.

The Eye. Conjunctivitis, dacryocystitis, iritis, keratitis, optic neuritis, panophthalmitis, uveitis.

Gastrointestinal Tract: Appendicitis, colitis, cholangitis, cholecystitis, duodenitis, enteritis, gastritis, hepatitis,

pancreatitis, peritonitis, periproctitis, peridontitis, parotitis, proctitis.

Miscellaneous Organs. Arthritis, carbuncle, dermatitis, furuncle, myositis, osteitis, osteomyelitis, perostitis, phlegmon, cellulitis, tendovaginitis.

Nervous System. Encephalitis, leptomeningitis, myelitis, neuritis, pachymeningitis, polyneuritis.

Respiratory System. Bronchitis, empyema, laryngitis, pharyngitis, pleurisy, pleuritis, pneumonia, rhinitis.

Urinary System. Balanitis, cystitis, cervicitis, epididymitis, endometritis, mastitis, myometritis, nephritis, oophoritis, pyelitis, prostatitis, perimetritis, parametritis, pyometra, pyosalpinx, orchitis, seminal vesiculitis, salpingitis, salpingo-oophoritis, urethritis.

Vascular System. Aortitis, endarteritis, endocarditis, epicarditis, lymphangitis, lymphadenitis, myocarditis.

I., acute. I in which the onset is rapid and the course relatively short.

I., adhesive. One conducive to the healing of wounds.

I., alternative. SYN *parenchymatous*. I of an organ in which degeneration of parenchymal cells is accompanied by proliferation of other cells.

I., bacterial. I induced by the growth of bacteria.

I., catarrhal. I of a mucous membrane characterized by the excessive secretion of mucus.

I., chronic. I which progresses slowly, is of long duration, and usually results in the formation of scar tissue.

I., exudative. One in which there is a large accumulation of blood cells and serum.

I., fibrinous. I in which the exudate is rich in fibrin.

I., hemorrhagic. I in which red blood cells are conspicuous in the exudate.

I., interstitial. I involving principally the noncellular or supporting elements of an organ.

I., purulent. I in which pus is formed.

I., reactive. One about a foreign body or a focus of infection.

I., serous. I in which the exudate is composed principally of serum.

I., suppurative. Purulent I, *q v*.

I., toxic. This is one due to toxin or poison.

Inflammation [L *inflammare*, to flame within]. Rel. to or marked by inflammation.

Inflation (in-fla-'shun) [L *in*, into, + *flare*, to blow]. Distention of a part by air, gas, or liquid.

Inflexion (in-flek-'shun) [' + *flectere*, to bend]. 1. An inward bending. 2. Change of tone or pitch of the voice, nuance.

Influence machine. A particular type of "static machine." Probably the only type used in physical therapy.

Influenza (in-flu-en-'za) [It *influenza*]. Grippe, an acute infectious disease characterized by fever, extreme prostration, pain in head and back, and generally by catarrh of respiratory or gastrointestinal tract. SYN *la grippe*. ETYOL. The causative agent is a virus, of which two types have been identified, type A and type B. A number of bacteria, esp Pfeiffer's bacillus (*Hemophilus influenzae*), pneumococci, streptococci, and staphylococci have been found in the lungs in fatal cases, but these are considered to be secondary invaders.

EPIDEMIOLOGY. Usually more prevalent in winter and spring. Young

adults, in robust health, appear to be particularly susceptible. This disease is contagious and is spread, in all probability, by immune carriers. It may occur endemically, or epidemically, and pandemics have been witnessed.

INCUBATION. One to 4 days.

SYM. Begins abruptly with lassitude, malaise, chilliness, severe pain in head and back, fever from 101°-103° F. Prostration out of proportion to the fever. Eyes injected, sneezing, hoarseness, and hard paroxysmal cough. In most cases, catarrh of respiratory tract is unusually marked. Less frequently, gastrointestinal symptoms predominate. With latter, there may be diarrhea and abdominal pain.

COURSE. Ordinarily runs from 4 to 5 days, and may terminate by crisis or speedy lysis. Pulse rate usually not increased in proportion to fever, may be 90 to 100. Blood pressure low, nosebleed not uncommon. Examination of blood demonstrates a leukopenia. Urinalysis generally demonstrates presence of albumen and casts.

In some epidemics, a striking symptom is a peculiar cyanosis, which is, in all likelihood, of toxic origin. In addition to the respiratory and gastrointestinal forms referred to, a nervous and fulminating type are sometimes described. In the latter forms, terms used to designate them are suggestive of predominating symptoms encountered.

COMPLICATIONS. Pneumonia, pleurisy, empyema, chronic bronchitis, abscess of lung, sinusitis, otitis media, pericarditis, myocarditis, and very rarely endocarditis, peripheral neuritis, meningitis, and encephalitis are still more rare.

DIFFERENTIAL DIAGNOSIS. Typhoid fever, smallpox in the prodromal stage, cerebrospinal meningitis, and pulmonary tuberculosis.

PROG. As a rule, outcome is favorable in absence of pulmonary complications. In patients with cyanosis, severe nerve disturbances, or bloody expectoration, prognosis must be extremely guarded.

NP. Prophylactic. Isolation of patients, disinfection of sputum, and application of aseptic methods in handling sufferers by attendants is of utmost importance; also, sometimes, the wearing of suitable masks. The avoidance of public gatherings and general application of hygienic methods deserve consideration. The use of certain vaccines may play a part in prevention.

Active. Isolation, absolute rest, good ventilation, and a selected diet. No specific treatment; care largely symptomatic. Alcohol and strychnine sometimes recommended as stimulants and codeine may afford relief for cough.

Influenzal (in-flu-en-'zal) [It. *influenza*]. Relating to influenza.

Infolding. Process of inclosing within a fold, an operation employed in the treatment of stomach ulcer in which the walls on either side of the lesion are sutured together.

Infra- [L]. Prefix *Below*.

infraaxillary (in-'frä-aks-'il-a-ri) [L. *infra*, beneath, + *axilla*, little axis]. Below the axilla.

infraclavicular [' + *clavicula*, little key]. Below the clavicle.

infracostal (in-frä-'kos'tal) [' + *costa*, rib]. Below a rib.

Infraction. An incomplete fracture of a

bone in which parts do not become displaced

infraglenoid (in'frā-glē'noyd) ['' + *G. glēnē*, cavity, + *eidōs*, form] Beneath the glenoid fossa. *SYN* *subglenoid*

infrahyoid (in'frā-hi'oid) ['' + *G. yoēdēs*, U-shaped]. Below the hyoid bone

inframammary ['' + *mamma*, breast]. Below the mammary gland

inframarginal ['' + *margō*, a margin]. Below any edge or margin.

infratemporal ['' + *convolutio*. The sup temporal one

inframaxillary ['' + *maxilla*, little jaw]. Below the jaw, submaxillary

infraocclusion ['' + *occlusiō*, a shutting up] Location of a tooth below the line of occlusion

infraorbital (in'frā-or'bi-tal) ['' + *orbita*, track] Beneath the orbit

infrapatellar (in'frā-pā-tel'ār) ['' + *patella*, a small plate] Below the patella.

infrapubic ['' + *pubēs*, hair on genitals] Below the pubis

infrared rays. Invisible heat rays beyond red end of spectrum

Their wave length ranges from 7,700 to 500,000 Angstrom units. Long-wave infrared rays (15,000-150,000 A.U.) are emitted by all heated bodies and exclusively by bodies of low temperature such as hot-water bottles and electric-heating pads. Short-wave infrared rays (7,200-15,000 A.U.) are those emitted by all incandescent bodies

Sources. The sun, electric arc, incandescent globe, and so-called infrared burners

Uses. Their energy is transformed into heat in a superficial layer of the tissues. They are used therapeutically

to stimulate local and general circulation and for relief of pain. They are also used to detect traces of selenium, a deadly poison, in foods, and in alloys and steel. *SEE* *radiation*, *ray*.

infrascapular [L. *infra*, below, + *scapula*, shoulder blade]. Beneath the shoulder blade

infraspinous ['' + *spina*, a thorn]. Beneath the scapular spine

infrasternal ['' + *G. sternon*, chest]. Beneath the sternum

infratrochlear (in'frā-trok'le-ār) ['' + *trochlea*, pulley]. Beneath the trochlea

infriction [L. *in*, on, + *frictiō*, rubbing] Rubbing of ointments into the skin.

SYN *inunction*.

infundibuliform (in-fun-dib'u-li-form) [L. *infundibulum*, funnel, + *forma*, form] Funnel-shaped.

i. fascia, i. process. The membranous layer investing the spermatic cord

infundib'ulin [L. *infundibulum*, funnel] A 20% solution of an extract of the posterior lobe of the hypophysis

infundibulum (in-fun-dib'u-lum) [L. funnel]. 1. Funnel-shaped passage of body 2. Tube connecting the frontal sinus with the middle nasal meatus 3. Stalk of the pituitary gland 4. Any renal pelvis division 5. Cavity formed by fallopian fimbriae 6. Terminus of a bronchiole. 7. Terminus at upper end of cochlear canal. 8. Conclike upper angle of right cardiac ventricle, from which the pulmonary artery arises. *SYN* *conus arteriosus*.

infusible [L. *infusio*, an infusion]. 1. Not capable of being fused or melted

1. The superficial veins of forearm.

2. Incision method showing the incision made, the distal end of the vein tied, and a second ligature being passed under the proximal end of the vein.

3. Incision method, showing cannula tied in place.

INFUSION, INTRAVENOUS SALINE

2. Capable of being made into an infusion.

Infusion (in-fu'zhun) [L. *infusio*, from *in*, into, + *fundere*, to pour]. 1. Steeping a substance in cold or hot water below boiling point to obtain its active principles. 2. Product obtained by such a process. SYN *infusum*. 3. Introduction of a liquid into a vein.

RS *apothem*, *autoinfusion*, *autoreinfusion*, *infiltration*, *intravenous*.

1. **intravenous**. Injection of a solution directly into a vein, usually the cephalic or median basilic vein. Normal saline intravenous solutions are usually temporary in effect due to loss of water in tissues. SEE *Illustration*, I-20

infusodecoction (in-fu'zo-de-kok'shun) [" + *de*, down, + *coquere*, to boil]. 1 Infusion followed by decoction. 2 A medicine made from a crude drug steeped in cold water and then in boiling water.

infusor (in-fu'zor) [L. *infusum*, an infusion]. Instrument for injecting a liquid slowly into a vein.

Infusoria (in-fu-so'ri-ä) [L. *infusum*, infusion]. Name formerly applied to a class of *Protozoa*, now called *Ciliata*.

infusum [L. infusion]. Liquid preparations made by treating vegetable substances with hot or cold water.

The drug is not subjected to boiling, as in making decoctions. When the strength and method of preparation are not otherwise specified, they are made by treating 5 parts of the coarsely comminuted drug with boiling water to make 100 parts. None are official.

ingesta (in-jes'tä) [L. *ingestum*, from *ingerere*, to carry in]. Food and drink received into the body through the mouth.

ingestion [L. *ingestum*, from *ingerere*, to carry in]. The process of taking material (particularly food) into the gastrointestinal tract, or by which a cell takes in foreign particles.

Ingras'ias' **apoph'yses**. The lesser wings of the sphenoid.

ingravescent (in-grav-es'ent) [L. *in*, upon, + *gravesco*, to grow heavy]. Becoming more severe.

ingredient [L. *ingrediens*, entering]. Any part of a compound or a mixture, a unit of a more complex substance.

in'growing [L. *in*, into, + A.S. *growan*, to grow]. Growing inward.

i. **nail**. One growing into the flesh. SYN *onyxia*.

inguen (in'gwen) [L. groin]. The groin.

inguinal (in'gwí-nal) [L. *inguinalis*, pert. to the groin]. Pert. to the region of the groin.

RS *bubo*, *bubonocous*, *groin*, *hernia*, *hystero-bubonocoele*.

i. **canal**. The one carrying the spermatic cord in the male, and the round ligament in the female. It is 1½ in. long, a potential source of weakness and may be the site of a hernia.

i. **glands**. Those of the groin.

i. **hernia**. Hernia in inguinal region.

i. **ligament**. SYN: *Poupart's ligament*. A fibrous band extending from ant. sup. iliac spine to the pubic tubercle.

i. **reflex**. One in females resembling cremasteric* reflex in males.

i. **region**. The groin. The iliac region on either side of the pubes.

i. **ring**. Int. opening of the i. canal (abdominal i. ring), and the end of the i. canal (subcutaneous i. ring).

INGUINAL CANAL

A, External oblique muscle; B, internal oblique muscle, C, transversalis muscle, D, conjoined tendon, E, rectus abdominis with sheath opened, F, transversalis fascia, G, cremaster, H, fundibular fascia.

inguinodynia (in'gun-o-din-i-ah) Pain in the groin or inguinal region.

inhal'ant [L. *in*, in + *haläre*, to breathe]. That which may be inhaled.

Inhalation (in-ha-la'shun) [" + *haläre*, to breathe]. 1 Act of drawing in of breath, vapor, or gas into the lungs, inspiration. 2 Introduction of dry or moist air or vapor into the lungs for therapeutic purposes, such as *amyl nitrite* to relieve attack of angina pectoris, *aromatic spirits of ammonia* used to overcome fainting.

SUBSTANCES INHALED: *Calomel*. The fumes from burning calomel are sometimes used for inhalation in syphilis of the throat.

Oxygen to relieve depressed breathing. *Steam inhalations* are given to overcome spastic conditions of the larynx and bronchi, to soften mucus, to aid in absorption of oxygen, to reduce dryness of mucous membranes and to provide heat and moisture to the membranes of the lungs and appendages, also in croup.

Stramonium to relieve spasmodic attacks of asthma.

Stramonium leaves and *belladonna* are used for local effect, the fumes relaxing the involuntary muscles of the bronchial tubes. SEE *anemopathy*, *steam tent*.

Inhale [" + *haläre*, to breathe]. To draw in the breath, to inspire.

Inhaler (in-ha'ler) [" + *haläre*, to breathe]. Device for inhaling medicinal vapors or steam.

Inherent [" + *haerere*, to stick]. Intrinsic; belonging to anything naturally, originally, not as result of circumstances.

i. **cauterization**. Deep cauterization.

Inheritance. The sum total of all that is inherited, that which is the result of hereditary factors within the egg and sperm.

i., **blending**. Type of i. in which characteristics of male and female parents appear to be blended in offspring. May result from lack of dominance or equal contributions of several pairs of multiple factors.

i., **cytoplasmic**. I. of traits due to self-duplicating mutable units present

in the cytoplasm of an egg such as plastids in plants.

Inherited. Received from one's ancestors; not acquired.

Inhibition (in-hib-ish'un) [L. *inhibitus*, from *inhibere*, to restrain]. 1. Act of repressing or state of being repressed; restraint. 2. **PRRS**. A stopping of an action or function of an organ. 3. **PSY**: Restraint of 1 mental process almost simultaneously by another opposed mental process, an inner impediment to free activity.

The best example of this important physiological phenomenon is the slowing or stopping of the heart which can be produced by electrical stimulation of the vagus

1. **psychic**. Arrest of an impulse, thought, action, or speech. The term is commonly applied to the denial of the sex instinct. **SYN** *suppression*.

Inhibitor [L. *inhibere*, to restrain] That which inhibits. For example. A chemical substance which stops enzyme activity or a nerve which suppresses activity of an organ innervated by it.

Inhibitory (in-hib'to-ri) [L. *inhibere*, to restrain] Restraining, preventing
1. **nerve**. A nerve which carries impulses which act to slow down or inhibit action in the organ or tissue supplied by its fibers

Inhibitrope (in-hib't-trôp) [" + G *trôpê*, a turning]. One in whom certain stimuli cause partial arrest of function

Iniac, **inial** (in'i-ak, -âl) [G *inion*, nape of neck]. Pert. to the inion

Inion (in'-on) [G *nape* of neck] 1. Occiput. 2. Back portion of neck 3. External occipital protuberance.

Initial (in-ish'al) [L. *initium*, beginning]. Incipient, rel. to the beginning, or commencing

initis (in-'tis) [G. *is*, in-, fiber, + *itis*, inflammation]. 1. Inflammation of fibrous tissue 2. Inflammation of a tendon. 3. Inflamed condition of a muscle. **SYN** *myositis*.

Inject' [L. *injectus*, from *injicere*, to throw in]. To introduce fluid into the body or its parts artificially.

Injected [L. *injectus*, thrown in]. Filled by injection of fluid, congested.

Injection (in-jek'tshun) [L. *injectus*, from *injicere*, to throw in]. 1. Forcing of a fluid into a vessel or cavity or under the skin. 2. Substance introduced in this manner. 3. State of being injected, congestion

NP All equipment to be used must be sterilized. The nurse must wash her hands before assembling the syringe and securing the needle. Expel air and measure dosage accurately. Cleanse site of injection with alcohol and sterile cotton before injection and after withdrawal of needle. Rinse syringe and needle, sterilize

RS: *aquapuncture*, *autoplasmotherapy*, *Cason's reaction*, *cirsenchysis*, *douche*, *enema*.

1. **air**. Spinal i. of air to locate a growth, degree of central atrophy in general paresis, and to find cause of epilepsy.

1. **epidural**. Spinal i. given to relieve pain in limbs in tabes dorsalis or tabes paresis and in gastric crisis.

1. **hypodermic**. A subcutaneous one, generally in front of thighs, or outer part of arms or forearms.

1. **intracardial**. Into the heart.

1. **intracutaneous**. Injections into the skin, a method employed in giving of

serums and vaccines when a local reaction is desired.

1. **intramuscular**. Into intramuscular tissue, usually in front of thigh or in 1 of the buttocks

1. **intra-peritoneal**. I. into the peritoneal cavity

1. **intravenous**.* Into a vein.

1. **lipiodol**. Spinal i. to locate spinal cord block or tumor.

1. **rectal**. Into the rectum; an enema

1. **sclerosing**. I. into a vessel to bring a tissue of a substance which will bring about obliteration of the vessel or hardening of the tissues

1. **spinal**. I. into the spinal canal

1. **subcutaneous**. I. beneath the skin.

SYN *hypodermic i.*

1. **vaginal**. A douche.

injectors [L. *injicere*, to throw in]. Various instruments for injecting medicinal fluids, making hypodermic injections and for transfusion of blood and intravenous injection

Injury [L. *injuria*, a hurt or wrong] A hurt or damage

SYM There may be progressive fall in blood pressure, subnormal temperature, shallow, rapid breathing, cold, clammy, pale skin constituting shock. There is disturbance of blood balance, exhaustion of adrenal glands, blood vessel dilatation and bleeding into capillaries, draining arteries and veins, decreasing return flow to the heart and inducing collapse

TREATMENT Avoid rough handling, the loss of fluids, body heat, and exposure of tissue in burns. Cover all wounded surfaces, apply heat and plenty of fluid if conscious, or, if shock is profound, fluids may be administered intravenously. Solutions of glucose are of great value. Blood transfusion may be necessary if there is hemorrhage. One to 2 pints of hot coffee or tea if patient is conscious. Hot water bottle against liver. In case of broken bones and laceration, stop hemorrhage, make comfortable, but do not move patient until physician arrives

1. **egg-white**. I. resulting from biotin deficiency. It is produced in experimental animals by feeding raw egg white or its antibiotin component, avidin.

1. **steering wheel**. I. following automobile accidents in which driver is thrown forward against steering wheel resulting in contusion of heart

Ink poisoning. Many of the poisonings ascribed to ink are in the form of dermatitis. Several types of materials may be responsible. Ordinary ink may cause irritation, either because of irritating nature, or because of susceptibility of particular skins. Sometimes cleaning materials used in removing ink stains have been found to be causative agents

SYM Redness, occasionally small pustules and cracking.

F. A. TREATMENT: Wash with alcohol, soap and water. Rinse carefully, apply a bland dressing, as calomel, cold cream, etc.

In'lay [L. *in*, in, + **AS** *leccan*, to lie]. A solid filling made to the shape of a cavity of a tooth and cemented into it.

In'let [" + **A.S.** *lætan*, to let go]. Passage leading to a cavity.

1. **of the pel'vis**. The upper opening into the pelvic cavity.

Innate [" + **nativ**, born]. Inborn; inherent.

Innervate (in-nur'vât) [" + *nervus*,

nerve]. To stimulate a part as the nerve supply of an organ

Innervation (in-er-va'shun) [*in* + *nervus*, nerve]. 1. Stimulation of a part through the action of nerves 2. The distribution and function of the nervous system 3. The nerve supply of a part

1. collateral. Supply of nervous force through an adjacent nerve tract to a part of which original nerve supply has been injured or destroyed

1. double. I of an organ with both sympathetic and parasympathetic fibers

1. reciprocal. I of antagonistic muscles of a limb by which impulses of central origin which induce an action such as flexion bring about inhibition of the opposing extensors

Innidiation (in-nid-i-a'shun) [*in* + *nidus*, nest]. Multiplication of cells in a part to which they have been carried by metastasis

Innocent (in-o'sent) [L. *in*, not, + *nocere*, to injure] Benign, not malignant. SYN: *innocuous*.

Innocuous (in-inno-cuus). Hairless

Innominate (in-nom-i-nät) [L. *innominatus*, unnamed] Nameless

1. artery. Right artery arising from the arch of the aorta, dividing into the right subclavian and right common carotid arteries

1. bone. Os *innominata*. The hip bone, composed of the *ilium*, *ischium*, and *pubis*, united to form the pelvis by the sacrum and coccyx

1. veins. Right and left vein, each formed by union of internal jugular with subclavian veins.

Innoxious (in-ok'shu) [L. *in*, not, + *noxius*, harmful] Not harmful.

Inochondritis (in'o-kon-di'tis) [*in* + *chondros*, cartilage, + *itis*, inflammation] Inflammation of a fibrocartilage.

Inochondroma (in'o-kon-dro'mä) [*in* + *oma*, tumor] A chondroma or tumor with much fibrous tissue; fibrochondroma

Inoculability (in-ok-u-lä-bil'i-ti) [L. *inoculare*, to engraft] Quality of being susceptible to transmission of infection by inoculation

Inoculable [L. *inoculare*, to engraft]. 1. Transmissible by inoculation 2 Susceptible to a transmissible disease 3 Capable of being inoculated

Inoculate [L. *inoculare* to engraft, from *in*, on, + *oculus*, bud] To inject a pathologic microorganism or virus into the body

Inoculation (in-ok-u-lä'shun) [L. *inoculare*, to engraft] Intentional introduction of a virus into the system as a preventive against the acquisition of certain diseases. It may be antiphtheric, antirabic, antitetanic or antityphoid

1. animal. The injection of pathogenic organisms into laboratory animals for the purpose of determining their presence, the virulence of the organisms, the action of drugs upon them, or to induce antibody formation.

Inoculum [L. *in*, on, + *oculus*, bud]. A substance or virus introduced by inoculation.

Inocyst (in'o-sist) [G. *is*, in-, fiber, + *kystis*, a bladder] A fibrous capsule.

Inocystoma (in'o-sis-to'mä) [*in* + *oma*, tumor] Fibrous tumor undergoing cystic degeneration

Inoepithelioma (in'o-ep-i-the-li-o'mä) [*in* + *epi*, upon, + *thêlê*, nipple, + *oma*, tumor]. Epithelioma containing fibrous tissue.

ino'genous [*in* + *gennan*, to produce]. Forming tissue or produced from it.

Inchymenitis (in-o-hi-men-itis) [*in* + *ymên*, membrane, + *itis*, inflammation]. Inflammation of any fibrous membrane or of an aponeurosis

Inollomyoma (in'o-li-o-mi-o'mä) [*in* + *leios*, smooth, + *mys*, *myo-*, muscle, + *oma*, tumor]. A smooth muscle tissue tumor

in'olith [*in* + *lithos*, stone]. A concretion formed from fibrous tissue

Inoma (in-o'mä) [*in* + *oma*, tumor]. A fibrous tumor. SYN *fibroma*.

inomyoma (in-o-mi-o'mä) [*in* + *mys*, *myo-*, muscle, + *oma*, tumor] A fibrous tissue myoma SYN *fibromyoma*.

inomyositis (in-o-mi-o-si'tis) [*in* + *itis*, inflammation] Chronic muscular inflammation with connective tissue hyperplasia. SYN *fibromyositis*.

Inomyxoma [*in* + *myxa*, mucus, + *oma*, tumor] A mixed myxoma and fibroma SYN *fibromyxoma*

Inoneuroma (in'o-nu-ro'mä) [*in* + *neuron*, nerve, + *oma*, tumor] A mixed neuroma and inoma SYN *fibroneuroma*.

Inoperable [L. *in*, not, + *operâre*, to work]. Unsuitable for being operated upon without danger of death

Inopexia [G. *is*, in-, fiber, + *pêxis*, fixation] Tendency of the blood to spontaneous coagulation in the vessels

Inorganic [L. *in*, not, + G. *organon*, an organ] 1 In chemistry, occurring in nature independently of living things, substances not containing carbon 2 Not pert to living organisms

1. acid. An acid composed of inorganic constituents SYN *acid*, *mineral*.

1. chemistry. C dealing only with inorganic compounds

1. compound. One without carbon

Inosclerosis (in-o-skle-ro'sis) [G. *is*, in-, fiber, + *sklêrôsis*, hardening]. Increased fibrous tissue density

Inoscopy [*in* + *skopein*, to examine] Diagnosis by examining fibrinous deposits in body fluids

inos'culating [L. *in*, in, + *osculum*, little mouth] Directly communicating; anastomosing

Inosculation (in-os-ku-lä'shun) [*in* + *osculum*, little mouth] Union of two vessels; anastomosis *

Inosemia (in-o-se'mi-ä) [G. *is*, in-, fiber, + *gema*, blood] 1 An excessive amount of fibrin in the blood 2 The presence of inositol in the blood

Inosinic acid [G. *is*, in-, fiber, + L. *acidus*, sour] A mononucleotide present in muscular tissue which upon hydrolysis yields hypoxanthine and d-ribose-5-phosphoric acid

Inosite (in'o-sit) [G. *is*, in-, muscle] Inositol, q.v

Inositis (in-o-si'tis) [G. *is*, in-, fiber, + *itis*, inflammation]. Inflammation of fibrous tissue.

Inositol (in'o-sit'ol). SYN *Inosite*, *Bios*, *1. mouse antialopeia factor*, *muscle sugar*. Hexahydroxycyclohexane, a sugar-like crystalline substance (C₆H₁₂(OH)₆) found in the liver, kidney, skeletal and heart muscle, and also present in the leaves and seeds of most plants. It is a vitamin, deficiency of which in experimental animals results in loss of hair, eye defects, and retardation of growth.

Inosituria (in'o-si-tu'ri-ä) [*in* + *ouron*, urine]. Inosite in the urine.

Inosteotoma (in'os-te-o-to'mä) [*in* + *stear*, *steat-*, fat, + *oma*, tumor]. Fatty tumor with fibroma.

inossuria (in-o-su'ri-ä) [G. *is*, *in-*, fiber, + *ouron*, urine]. Inosite in the urine. SYN *inosituria*.

inquest [L *in*, into, + *quaerere*, to seek].

- 1 A legal medical examination of a corpse to ascertain the cause of death.
- 2 The act of inquiring

insalivation ["" + *saliva*, spittle]. The process of mixing saliva with food, as in chewing

insalubrious [L *in*, not, + *saluber*, healthful] Not healthy or contributing to health

insane (in-sän') ["" + *sanus*, sound]. Mentally deranged; pert. to insanity.

insanitary ["" + *sanus*, sound]. Not conducive to health, unhealthful, esp. pert. to filth

insanity [L *insanitas*]. Legal term for mental derangement; a psychosis. A general term for unsoundness of mind or any mental disorder or psychosis. In legal medicine, the state or mental condition characterized by (1) inability to distinguish between right and wrong, (2) possession of delusions or hallucinations which prevent an individual from looking after his own affairs with ordinary prudence, or which render him a menace to others; (3) actions resulting from impulses of such intensity that they cannot be resisted

The common law recognizes 4 forms: *lunacy*, *idiocy*, *accidental loss of understanding*, and *deprivation of understanding*. Only a few states permit divorce for insanity, and then the condition must have continued for a sufficient number of years to indicate incurability

LUCID INTERVALS An insane person during lucid intervals, may enter into a legal contract, a marriage, a business, buying and selling, providing at the time he or she is capable of entering into such matters with an understanding of all that is implied. The mental capacity at the time determines the validity of such acts and *not the condition before or after*.

RS' *paralysis*, *phobia*, *psychosis*, *restraint*.

1., affective. Affective psychosis, *q.v.*

1., alcoholic. Alcoholic psychosis, *q.v.*

1., alternating. Manic-depressive psychosis, *q.v.*

1., choreic. I accompanying Huntington's chorea

1., circular. Alternating *1., q.v.*

1., climacteric. Mental illness occurring during or near the time of the menopause

1., communicated. Folie a deux in which delusions of one person are transmitted to and accepted by a second person

1., compulsive. I in which the actions of a person are the result of obsessions or impulses over which he has no control

1., cyclic. Circular or alternating insanity, *q.v.*

1., delusional. I. in which delusions or hallucinations are characteristic

1., emotional. SEE *psychosis*, *affective*

1., imitative. A form of folie a deux in which the insane actions of one are imitated by another

1., imposed. Folie a deux in which delusions and hallucinations of one are imposed on another with whom he is closely associated

1., impulsive. I. characterized by the commission of acts, usually of a violent nature, as a result of sudden uncontrollable impulses.

1., induced. Communicated *1., q.v.*

1., manic-depressive. Manic-depressive psychosis, *q.v.*

1., moral. I. characterized by the commission of immoral acts although reasoning and intellectual processes are normal

1., senile. I due to degenerative processes of old age

1., toxic. I resulting from the effects of a poison, such as alcohol, opium, or other drugs

insatiable (in-sä'shi-a-bl) [L *insatiabilis*] Incapable of being satisfied or appeased

inscriptio (in-skrip'shvo) [L a writing] Inscription

1., tendin. Tendinous band

inscription (in-skrip'shun) [L *in*, upon, + *scribere*, to write] Body of a prescription which gives the names of the drugs prescribed and dosage

insect [L *insectum*] Common name for any of the class *Insecta* of the phylum *Arthropoda*. Insects of medical importance are flies, mosquitoes, lice, fleas, and the true bugs

1., bites and stings. In general insects when they bite inject an acid substance resembling formic acid, consequently they may be relieved by alkalis, such as ammonia water, baking-soda paste, or even soap rubbed on the wound

Bees, wasps, and hornets which they sting inject an unknown organic substance for which there is no specific antidote. If a "stinger" is found in the wound it should be removed

insect, words pert. to: "acar-" words, bedbug, bee stings, bites, chiggers, foreign bodies, hornet, jiggers, pediculosis, phthiriasis, tularemia, vermin, wasp.

insecta. SYN *Ilcerapoda* A class of the phylum *Arthropoda* characterized by three distinct body divisions (head, thorax, abdomen), three pairs of jointed legs, trachea, and usually two pairs of wings. Insects are of medical significance in that some are parasitic, some serve as carriers or vectors of pathogenic organisms and some are annoying pests causing injury by their bites or their stings

insecticide (in-sek'ti-sid) [L *insectum*, insect, + *caedere*, to kill] 1 An agent used to exterminate insects 2 Destructive to insects

insemination (in-sem-in-a'shun) [L *in*, into, + *semen*, seed] 1 Discharge of semen from the penis into the vagina during coitus. 2 Fertilization of an ovum

1., artificial. Artificial injection of semen into the uterine canal. Sometimes resorted to in sterility of the husband. Legal complications as to heritage and inheritance may arise and psychological results may be disastrous to all concerned. SEE *impregnation*.

insensible [L *in*, not, + *sensibilis*, sensible] 1 Unconscious without feeling or consciousness. 2 Not perceptible.

insertion [L *in*, into, + *serere*, to plant].

1 The manner or place of attachment of a muscle to the bone that it moves.

2 A putting into

1., velamentous. Attachment of the umbilical cord to the edge of the placenta

insheathed. Enclosed, as by a sheath or capsule; encysted

insidious (in-sid'i-us) [L *insidiösus*, cunning]. Stealthy, treacherous, hidden, not apparent, as a disease that does not exhibit early symptoms of its advent.

insight. PSY: Understanding of oneself or of any nervous or mental difficulties one may have.

insipid. Without taste, lacking in spirit or animation

in situ [L.] In position

insolation (in-so-la'shun) [L. *insolare*, to place in the sun] 1 Any exposure to the rays of the sun 2 Heat- or sunstroke

Exposure. Not more than twice a day and not more than five minutes at a time to begin with and never more than 90 minutes. Temperature, pulse, blood and urine should be observed after each treatment in those who are sick

Dermatitis is always a danger even to the well. The public needs to be warned against undue exposure to the sun's rays which may result as dangerously as any other burn. See *heat, heat exhaustion, heat stroke, heat therapy*.

insoluble (in-sol'u-bil) [L. *in*, not, + *solvere*, to dissolve] Incapable of solution or of being dissolved

insomnia (in-som'ni-ä) [“ + *somnus*, sleep] Chronic inability to sleep, or sleep prematurely ended or interrupted by periods of wakefulness

Error. Heavy late meal, with some coffee and other stimulants, including sugar in any form, overtiredness, mental fatigue, worry, excitement and principally the fear of being unable to sleep

NP & TREATMENT. Remove exciting cause. Train the mind in self-control, remove fear of lack of sleep. Do not try to sleep if too wakeful. Sit up and read until tired. Hot foot bath, drink of hot water or milk before retiring. Small amount of plain food before retiring permitted

Change of occupation if necessary and possible. Physical exercise during day, and a walk in fresh air at night after dinner. Cold wet cloths about wrists. Constitutional treatment. No mental work after dinner. Those complaining about insomnia generally secure more sleep than they realize. Some require much less sleep than others. Inability to sleep continuously through the night is not a pathological condition. See *agrypnotic, anhyposis, anthyypnotic, sleep, somnambulism, vigil*.

inspect [L. *inspectus*, from *inspicere*, to examine] To examine visually

inspection [L. *inspectus*, from *inspicere*, to examine] The ocular examination of the external surface of the body. See *abdominal, chest, and circulatory system*.

inspiration (in-spi'r-shun) [L. *in*, upon, + *spirare*, to breathe] To sprinkle] Sprinkling with powder or a fluid

inspiration (in-spi'r-a'shun) [L. *in*, in, + *spirare*, to breathe] Inhalation, drawing air into the lungs. Opp. of *expiration*, *q.v.*

Inspiration may be costal or abdominal, the latter being deeper. The breaking point reached in from 23-77 seconds, is the limit of ability to hold the breath.

RATE. 16-18 respirations per minute in an adult. See *respiration*.

MUSCLES of Ext. intercostals, diaphragm, levatores costarum, pectoralis minor, scaleni, serratus post., sup., sternocleidomastoid

RS. air, apnea, asphyxia, breathing, Cheyne-Stokes respiration, dyspnea, hyperpnea, lungs, respiration, ventilation.

1., crowing. Peculiar noise in laryngismus stridulus* or spasmodic croup *

1., external. Interchange of gases in the lungs.

1., forcible, difficult, labored. I. in which the muscles of I are assisted by inspiratory auxiliaries (i.e., muscles attached to chest which by contraction

increase the thoracic cavity directly or indirectly by furnishing fixed support whereby other muscles may act more advantageously). If movements become excessively labored, there is brought into coordinate action every muscle in the body which can either directly or indirectly increase the cavity of the thorax.

1., full. I. in which lungs are filled as completely as possible (voluntarily, as in determining the amount of complementary air, or involuntarily, as in cardiac dyspnea).

1., internal. Interchange of gases in the tissues

inspiratory (in-spi'rä-tor-i) [“ + *spirare*, to breathe] Pert. to inspiration

inspissate (in-spis'ät) [“ + *spissare*, to thicken] To thicken by evaporation or absorption of fluid

inspissated (in'spis-sä-ted) [“ + *spissare*, to thicken]. Thickened by absorption, evaporation or dehydration

inspissation (in-spis-sä'shun) [“ + *spissare*, to thicken] 1 Thickening by evaporation or absorption of fluid 2 Diminished fluidity or increased thickness

in'step [origin uncertain] Arch on upper surface of foot in the middle, in front of ankle

instillation (in-stil-a'shun) [L. *in*, into, + *stillare*, to drop] Pouring in a liquid drop by drop

in'stillator. An apparatus for introducing drop by drop liquids into a cavity

instinct (in'stinkt) [L. *instinctus*, impulse]

1. Inherent (racial) patterns of expression normally manifested under suitable conditions, usually heavily loaded with emotional value (libido in its widest sense). Innate urges, principally voluntary, with which one is born and which are necessary for the preservation of life. An innate, complex, coordinated, behavior pattern characteristic of a race or species and usually having an adaptive value 2. An urge, uncontrolled by reason, to react to stimuli of an emotional nature

The term is often misapplied to intuition. Some only recognize 1 *Self-preservation*. 2 *Sex*. 3 *Herd instinct*. Others include 4 *Flight or fear*. 5 *Repulsion*. 6 *Curiosity*. 7 *Pugnacity*. 8 *Self-assertion*. 9 *Self-abasement*. 10 *Parental*. 11 *Reproduction*. 12 *Acquisitiveness*. 13 *Construction*. Undoubtedly some of these are acquired characteristics. Fisk says the “mother instinct” is only an acquired characteristic

instinctive [L. *instinctus*, impulse] Determined by instinct

instrument (in'stru-ment) [L. *instrumentum*, tool] A tool or piece of apparatus.

instrumental (in'stru-men'tal) [L. *instrumentum*, tool] 1 Pert. to instruments 2. Being the cause of anything

1., delivery. Delivery of a fetus with forceps.

instrumentation [L. *instrumentum*, tool]

The use of instruments, and their care **instruments, care and sharpening of.** After operation collect, count and unlock instruments. Cleanse by rinsing with warm water to remove blood, and again with hot water and potash soap, place under hot water faucet and allow boiling water to run on them, dry at once with gauze.

To remove rust use cleanser sparingly, else surface of instrument will be injured in course of time.

Reliable sterilization of instruments before an operation can always be assured by boiling in a 1% solution of carbonate of soda for 15 minutes. Car-

bonate of soda prevents rusting of the instruments. The dipping of an instrument into alcohol or even pure carbolic acid cannot be relied upon for making it surgically clean.

SHARPENING. *Washita stone* is best for dull instruments as it cuts away the metal faster. *Aikansas stone* is better for finishing. Glycerin is best lubricant. Entire edge of knife should be covered in one sweep. Hold knife at angle of 30°. All knives should be honed before used. Blunt instrument's should be kept highly polished. Rub with fine emery paper and polish with rouge and chamois skin or gauze. Do not use emery paper on saws. Sharpen with three-cornered files. Silver instruments should not come in contact with rubber, or be exposed to atmosphere. Wrap in dry gauze.

insufficiency (in-suf-fish'en-si) [L. *in*, not, + *sufficiens*, sufficient] The condition of being inadequate for its purpose.

1., **aortic.** An imperfect closure of the aortic valves.

1., **cardiac.** Inability of heart to function normally.

1., **gastric.** Inability of the stomach to empty itself. [function properly]

1., **hepatic.** Inability of the liver to

1., **mitral.** In which the mitral valve inefficiently closes with rhythmic action of the heart.

1., **muscular.** Condition in which a muscle is unable to exert its normal force and bring about normal movement of the part to which it is attached. Term applied esp. to eye muscles.

1. of the **ocular muscles.** Absence of dynamic equilibrium of ocular muscles.

1., **renal.** Inability of the kidney to remove waste products from the blood at the normal rate.

1., **valvular.** Imperfect cardiac valve closure, permitting leakage of blood.

insufflate [L. *insufflāre*, to blow into]. 1. To blow in, as in the lungs of a newborn infant. 2. To blow a medicated powder or medicinal vapor into a cavity.

insufflation [L. *insufflāre*, to blow into] The act of blowing a vapor or powder into a cavity, as the lungs.

insufflator (in-suf-fla-tor) [L. *insufflāre*, to blow into]. Device for blowing powders into a cavity.

insula [L. *insula*] 1. The central lobe (island of Reil) of the cerebral hemisphere. It is a triangular area of the cerebral cortex lying in the floor of the lateral fissure. 2. Any round cutaneous body or patch.

insular (ins'u-lar) [L. *insula*, island]. Rel. to any insula.

insulation [L. *insulāre*, to make into an island]. 1. The protection of a body or substance with a nonconducting medium so as to prevent the transfer of electricity, heat, or sound. 2. The material or substance which insulates.

The electrical resistance of an insulator is expressed in megohms, a unit representing a million ohms.

insulator [L. *insulāre*, to make into an island]. That which insulates; specifically, a substance or body that interrupts the transmission of electricity to surrounding objects by conduction; anything that exerts great resistance to the passage of an electric current by conduction. *See nonconductor.*

insulin [L. *insula*, island]. 1. A hormone secreted by the beta cells of the islets of Langerhans of the pancreas. Called the *antidiabetic hormone*. It can be readily crystallized as a zinc salt

although nickel, calcium, and cobalt also are effective. It is a protein with a maximum molecular weight of 48,000. Insulin is essential for the proper oxidation and utilization of blood sugar (glucose) and for maintenance of the proper blood sugar level. Inadequate secretion of insulin results in improper metabolism of carbohydrates and fats and brings on diabetes characterized by hyperglycemia and glycosuria. Insulin when injected into a diabetic produces the following effects: normal storage of glycogen in the liver and muscle tissue, reduction in blood sugar level, disappearance of ketosis and hyperlipemia, prevention of excessive breakdown of protein, increase in respiratory quotient; and increase in resistance to infective diseases. The secretion of insulin is primarily dependent upon the concentration of blood glucose, an increase of blood sugar bringing about an increase in the secretion of insulin.

First discovered and used successfully by Sir F. G. Banting in diabetes. Not a cure, and not necessary in every case. Makes possible a greater metabolism of carbohydrates without evidence of glycosuria. Prepared from animal pancreas.

DOSE. Should always be expressed in units rather than in cubic centimeters or minims. There is no average dose of insulin for diabetics, each case must be studied individually. The dose depends upon the amount of dextrose in such a diet as the patient is unable to metabolize, i. e., the total dextrose minus the dextrose excretion. A convenient formula is

Average grams of d-glucose excreted =
1.5

sufficient units of insulin to render most patients aglycosuric. In general, it is advisable to keep the volume per injection at from $\frac{1}{2}$ - $\frac{3}{4}$ cc., choosing the strength which will give the required number of units in this volume or less.

ADM. The long-acting (depot) insulins are usually taken in a single dose for the 24 hours before breakfast subcutaneously. The older, short-acting insulins are usually reserved for emergencies (diabetic coma) and for those rare individuals who cannot tolerate the depot type.

1., **amorphous.** I to which zinc or other metallic ions have not been added.

1., **crystalline.** I which has been precipitated in the presence of zinc or other metallic ions.

1., **depot.** Insulin that is absorbed slowly from the site of injection.

1., **globin.** I combined with globin from blood. It forms a clear solution producing effects longer than those of regular insulin but shorter than those of protamine insulin.

1., **hexamine.** I combined with hexamethylene tetramine.

1., **histone.** Insulin to which has been added the simple protein histone derived from the thymus.

1., **histone zinc.** Histone insulin to which zinc has been added. The hypoglycemic effect is more prompt, though prolonged, than with protamine zinc insulin. It makes possible a continuously normal blood sugar level and freedom from glycosuria in many.

1., **NPH.** Abbr for *neutral-protamine-Hagedorn*, a mixture containing 0.5 mg of protamine to each 100 units of insulin. Quick-acting, with effects of long duration.

1. protamine. I. combined with protamine, a simple protein derived from the spermatozoa of fishes

1. protamine zinc. A preparation of insulin, modified by the addition of protamine and a zinc salt

Uses. Same as for unmodified insulin, but has a more prolonged action, its administration is usually but once a day

1. protamine zinc, clear (soluble). A water-clear preparation with more protamine zinc and glycerin than that present in p z insulin

1. shock. Condition resulting from an overdose of insulin resulting in reduction of blood sugar level below normal (hypoglycemia)

Sym. Excessive hunger, thirst, and nervousness, fear and excitability. Rapid pulse, flushing, pallor and sweating, fainting, convulsions, coma

Treatment. Eating sugar or candy, orange juice, glucose, other carbohydrates and injections of glucose into the blood if patient is unconscious. Adrenalin is of great though transient value

1. shock therapy. The treatment of schizophrenia and other mental disorders by the injection of insulin. Sufficient insulin is injected to produce unconsciousness, the dosage being carefully regulated during course of treatment. When a deep coma is reached, the patient is brought out of the comatose condition by the administration of glucose followed by a meal rich in carbohydrates

It is a dangerous procedure with a relatively high mortality and should be employed only by those who are fully equipped, fully qualified, and thoroughly familiar with all aspects of this method. It is essential to have available at all times suitable solutions of dextrose for interrupting the hypoglycemic state which is artificially created

1. tannate. A combination of insulin with tannic acid

1. tolerance. The degree to which the body responds to the injection of insulin

insulinemia (in-su-lin-e'm-l-ä) [*in* + *G. aima*, blood]. An undue amt of insulin in the blood

insulinogetic (in-su-lin-o-jen'ik) [*in* + *G. gennau*, to produce]. Caused by hyperinsulinism

insulinoid (in'su-lin-oid) [*in* + *G. eidos*, resemblance]. Resembling or having the properties of insulin

insulogenic (in-su-lo-jen'ik) [*in* + *G. gennan*, to produce]. Produced by overproduction or overadministration of insulin. *Syn.* *insulinogenic*

insuloma [*in* + *G. oma*, tumor]. A tumor of the island of Reil or of the islands of Langerhans

insulopathic [*in* + *G. pathos*, disease]. Rel. to or caused by abnormal insulin secretion

insusceptibility (in'sus-sep'ti-bil'i-ti) [*in*, not, + *susceptus*, undertaken]. Incapability of becoming infected with a germ disease. *Syn.* *immunity*

integration (in-te-gra'shun) [*L. integrare*, to make whole]. 1. Assimilation. 2. A harmonious relationship of the parts constituting the whole of anything.

1. primary. Early recognition of the body and its psyche as apart from one's environment

1. secondary. The process involved in developing the adult personality, through sublimation of the sex instinct and its components

integrator (in'te-gra-tor) [*L. integrare*, to

make whole]. Device for measuring body surfaces

integument (in-teg'u-ment) [*L. integumentum*, a covering]. 1. A covering. 2. The skin, consisting of the *corium* or *dermis*, and *epidermis*.

integumentary (in-teg-u-men'tä-ri) [*L. integumentum*, a covering]. Rel. to the integument. *Syn.* *cutaneous*, *dermal*.

intellect [*L. intellectus*, from *intelligere*, to understand]. The mind, or understanding; conscious brain function.

intellectual [*L. intellectus*, from *intelligere*, to understand]. 1. Pert to the mind. 2. Possessing intellect

intelligence [*L. intelligere*, to understand]. The capacity to comprehend relationships. The ability to think, the ability to solve problems and to adjust to new situations

There must be no emotional distortion. If intelligence-testing is to be accurate, a series of graded questions must be asked, the further one can go in answering them correctly, the greater is supposed to be one's intelligence

1. quotient (IQ). An index of mental age or intelligence determined through the subject's answers to arbitrarily chosen questions, obtained by dividing the mental age by the chronological age and multiplying by 100. After the age of 15, IQ is merely a standard score which places an individual in reference to the scores of others within his age group

IQ	Classification
Above 140	"Near" genius or genius
120-140	Very superior intelligence.
110-120	Superior intelligence
90-110	Normal, or average, intelligence
80-90	Dullness
70-80	Very dull, deficiency, dullness
Below 70	Definite feeble-mindedness

1. test. A test designed to determine the intelligence of an individual. A number of tests have been devised including the Binet t., Babcock-Levy t., Stanford-Binet t., and others. Tests are used as a basis for determining intelligence quotient (IQ), *q v*

intemperance [*L. in*, not, + *temporare*, to moderate]. Excess in the use of anything, lack of moderation

intensifying [*L. intensus*, intense, + *facere*, to make]. Making intense

1. screen. A thin sheet of celluloid or other substance coated with a finely divided substance which fluoresces under the influence of roentgen rays and is intended to be used in close contact with the emulsion of a photographic plate or film for the purpose of reinforcing the image. A fluorescent screen.

intensimeter [*in* + *G. metron*, measure]. An instrument, often a selenium cell or ionization chamber, designed to measure the intensity of a beam to about 14,000 Angström units.

intensity (in-ten'si-ti) [*L. intensus*, tight, intense]. 1. The degree or extent of activity, strength, force, electric current, etc. 2. The state or quality of being intense

1. of roentgen rays. The attribute of a beam of roentgen rays which determines the rate of ionization of air at a given point, under the conditions stipulated in the definition of roentgen. It is

expressed in roentgens per unit of time.
SEE *rays*.

intensive (in-ten'siv) [L. *intensus*, intense]. Rel. to or marked by intensity
intention (in-ten'shun) [L. *intentio*, a stretching]. 1 A natural process of healing 2. Goal or purpose

i., first. Healing without granulation or suppuration

i., second. Healing by adhesion of two granulated surfaces with suppuration.

i., third. Healing of an ulcer, wound, or cavity by filling by granulation and followed by cicatrization. SEE *first i., granulation, resolution, second i., third i.*

i. tremor. One exhibited or intensified when attempting coordinated movements.

inter- [L.]. Prefix. In the midst, between.

interarticu-lar [L. *inter*, between, + *articulus*, joint] 1. Bet two joints 2. Situated bet. two articulating surfaces

interatrial (in-ter-at'ri-äl) [" + *atrium*, hall]. Located bet. the atria of the heart. SYN *interauricular*.

interauricular (in-ter-aw-rik'u-lar) [" + *auricula*, auricle]. 1. Situated bet the auricles or pinnae 2. Interatrial

in-ter-brain [" + A. S. *braegan*, brain]

The hinder original part of the forebrain including the *thalamus*, pineal body (*epithalamus*) and geniculate bodies (*metathalamus*). SYN *diencephalon*, *thalamencephalon*.

intercadence (in-ter-ka'dens) [" + *cadere*, to fall] A supernumerary pulse wave bet two regular beats

intercalary (in-ter-kal-a-ri) [" + *caläre*, to call] 1. Inserted between as something in addition, extraneous 2. Pert to an upstroke on a pulse tracing which

comes bet. two pulse beats, intercalated
intercalated (in-ter-kal-at-ed) [L. *inter*, between, + *caläre*, to call] 1. Inserted between as something in addition, extraneous. 2. Pert to an upstroke on a pulse tracing, which comes between two pulse beats, intercalary

i. disks. SEE *disk, intercalated*

i. ducts. Short, narrow ducts which lie between secretory ducts and the terminal alveoli in the parotid and submaxillary glands and the pancreas

intercarot'ic [" + G. *karoun*, to stupefy].

Bet the ext. and int. carotid arteries

in-tercartilagin'ous [" + *cartilägo*, cartilage]. Connecting or bet cartilages

intercellular (in-ter-sel-u-lar) [" + *cellula*, little cell]. Bet. the cells of a structure.

interchondral (in-ter-kon'dral) [" + G. *chondros*, cartilage] Bet. cartilages. SYN *intercartilaginous*.

intercilium (in-ter-sil'i-um) [" + *cilium*, eyelid]. The space bet. the eyebrows. SYN *glabella*.

interclavicular [" + *clavicula*, little key]. Bet the clavicles

intercolumnar (in-ter-kö-lum'nar) [" + *columna*, column] Bet. columns

i. fascia. A membrane bet pillars of the abdominal ring, enclosing the spermatic cord.

i. fibers. Intercrural fibers

intercondylar, intercondyloid, intercondy-lous [" + G. *kondylos*, condyle] Bet. two condyles (the rounded eminence at the articular end of a bone)

intercostal [" + *costa*, rib] Bet the ribs
i. muscles, external. Outer layer of muscles between the ribs originating on the lower margin of each rib, being

L. Cassell '39

CHANGES IN SIZE OF THORAX DURING INSPIRATION

A. Back view. The contraction of the external intercostal muscles raises the ribs, makes them flare laterally, and so increases the transverse diameter of the thorax.
B. Side view. The contraction of the sternocleidomastoid muscle aids the external intercostals in raising the ribs, and so increases the anteroposterior diameter of the thorax. (Highly schematic.)

inserted on the upper margin of the next rib. They elevate the ribs, enlarging the thorax thus functioning in inspiration. See Fig. p. 1-28.

i. muscles, internal. Those bet. the ribs lying beneath the external intercostals, function uncertain.

intercostohumeral [' + + humerus, shoulder]. 1. The post lateral branch of second intercostal nerve supplying the skin of the arm. 2. Similar branch of the third intercostal nerve.

intercourse [' + cursus, from *currere*, to run]. 1. Social contacts. 2. The sexual act. SYN. *coition*, *coitus*, *copulation*.

intercris'tal [' + *crista*, crest]. Bet. two crests of a bone, organ, or process.

intercrural (in-ter-krur'al) [L. *inter*, between, + *crus*, *crur*-, limb]. Bet. two crura.

intercurrent [' + *currere*, to run]. 1. Intervening. 2. Pert. to a disease attacking a patient with another malady.

intercusp'ing. The fitting together of the surfaces of opposing teeth.

interden'tal [' + *dens*, *dent*-, tooth]. Bet. the teeth.

interdentium (in-ter-den'shi-um) [' + *dens*, *dent*-, tooth]. The space bet. any two contiguous teeth.

interdigita'tion [' + *digitus*, fingers]. 1. Interlocking of toothed or fingerlike processes. 2. Processes so interlocked.

interfascic'ular (in-ter-fas-ik'u-lar) [' + *fasciculus*, bundle]. Bet. fasciculi.

interfemor'al (in-ter-fem'or-al) [' + *femoralis*, pert. to the thigh]. Bet. the thighs.

interference. Clashing or colliding
i. of impulses. Condition in which two excitation waves, upon approaching each other and meeting in any part of the heart, are mutually extinguished.

interfibrillar, interfibr'illary [' + *fibrilla*, a small fiber]. Bet. fibrils.

interfil'ar [' + *filum*, thread]. Bet. the fibrils of a reticulum.

interganglion'ic [' + *gagglion*, a swelling]. Bet. ganglions. [globules]

interglob'ular [' + *globulus*, globule]. Bet.

i. spaces. Gaps in dentin due to failure of calcification. SYN. *Czermak's spaces*.

interlob'ar [' + *lobus*, lobe]. Bet. lobes.

interlobi'tis [' + + *G-itis*, inflammation]. Inflammation of the pleura separating the pulmonary lobes.

interlob'ular [' + *lobulus*, lobule]. Bet. lobules of an organ. [the lung]

i. emphysema. Air bet. the lobes of

intermar'riage [' + *maritare*, to marry].

1. Marriage bet. persons of two different races or tribes. SYN. *miscegenation*. 2.

Marriage bet. blood relations.

intermaxillary [L. *inter*, between, + *maxilla*, jaw]. Between two maxillae.

intermediary (in-ter-me'di-ā-ri) [' + *mediāre*, to divide]. 1. Situated bet. two bodies. 2. Occurring bet. two periods of time.

i. amputation. One performed during the stage of inflammatory fever.

i. body. An amboceptor; an immune body. See *Ehrlich's side-chain theory*.

i. metabolism. The series of intermediate compounds formed during digestion before the final excretion or oxidation products are eliminated from the body.

intermedin (in-ter-me'din) [' + *mediāre*, to divide]. A pituitary hormone from pars intermedia of hypophysis. It is of little significance in humans; in lower forms it acts on chromatophores (pigment cells).

intermediolateral [' + + *latus*, lateral, side]. Intermediate but not central.

i. tract of spinal cord. A lateral tract bet. the dorsal and ventral horns.

intermeningeal (in-ter-men-in'je-āl) [' + *mēnigx*, membrane]. Bet. the meninges.

intermenstrual. Between the menses, or menstrual periods.

intermis'sion [' + *mittere*; from *mittere*, to send]. 1. Interval bet. two paroxysms of a disease. 2. Temporary cessation of symptoms.

intermit'tence [' + *mittere*, to send]. 1. Condition marked by intermissions in the course of a disease or of a process. 2. A loss of one or more pulse beats.

intermittent (in-ter-mit'tent) [' + *mittere*, to send]. Ceasing at intervals.

i. fever. One in which there is complete absence of symptoms bet. paroxysms of the fever. See *malaria*, *undulant fever*, *remittent fever* for *illus*.

i. pulse. One in which a beat is dropped at intervals, significant of cardiac exhaustion, serious in pneumonia.

i. temperature. One that reaches the normal line at intervals during the course of a fever.

intermus'cular [' + *musculus*, muscle]. Bet. muscles.

intern (in'tern) [L. *internus*, within]. An assistant resident physician or surgeon on a hospital staff, usually a recent graduate. Cf. *externe*.

intern'al [L. *internus*, within]. Within the body. Within or on the inside, enclosed, inward. Opp. of external.

i. bleeding. Internal hemorrhage, *q.v.*

i. capsule. See *capsule*, *brain* (internal of).

i. ear. The vestibule, semicircular canals, and cochlea.

i. injury. Any injury not visible from the outside, as injury to the organs of cupping the thoracic, abdominal, or cranial cavities.

SYN. Vary with structures involved. Ordinarily, profound shock, patient is pale, cold, perspiring freely with an anxious expression, may be semicomatose. Pain usually intense at first, and may continue, or gradually diminish as patient grows worse.

In severe injuries, pain may not be manifested. The pulse is very feeble, fast, often irregular. Patient may be very restless, breathless, and usually has shallow respiration.

F. A. TREATMENT. Above all, patient should be kept very quiet and warm. Do not give anything by mouth, and do not give stimulants, as they may exaggerate bleeding. Transportation must be done very cautiously. Patient's head and shoulders should be lowered and extremities elevated at least 45°. This may be done by placing patient on a chair, box, or a folded coat. Massage and a firm bandage of the extremities may be helpful in maintaining circulation. Most of these patients require operation.

i. medicine. Medicine as opposed to surgery.

i. secretion. That of the ductless glands which, entering the blood stream, activates other glands and organs. SYN: *hormones*, *q.v.*

See: *secretion*, *ductless gland*, *endocrine*.

international unit. One defined and adopted by the International Conference for Unification of Formulæ.

international x-ray unit of intensity. Quantity of x-radiation, which, when secondary electrons are fully utilized and wall

effect of chamber is avoided, produces in 1 cc. of atmospheric air at 0.0° C. and 76 cm. mercury pressure, such a degree of conductivity that one electrostatic unit of charge is measured at saturation current. Designated by r.

interne (in'tern) [L. *internus*, within]. An assistant resident physician or surgeon on a hospital staff, usually a recent graduate. **SYN**: *intern*. **SEE**: *externe*.

internist [L. *internus*, within]. One who treats internal diseases, not a surgeon.

internode [L. *inter*, between, + *nodus*, node]. Space bet. adjacent nodes.

internunc'cial [" + *nuncius*, messenger]. Acting as a connecting medium.

1. **neuron**. One between two other neurons in a neural pathway

interoc'ptive [L. *inter*, within, + *ceptus*, from *capere*, to take]. In nerve physiology, concerned with sensations arising within the body itself, as distinguished from those (as, for instance, sight) arising outside the body.

interoceptor (in'ter-o-sep'tor) [" + *ceptor*, from *capere*, to take]. A receptor activated by stimuli within the body

1. **general**. An end organ carrying sensations of hunger, thirst, visceral pain, nausea, sexual and circulatory sensations.

2. **special**. One for smell and taste.

interofec'tive [" + *afectus*, from *officere*, to influence]. 1. Pert. to that which concerns the interior of an organism 2. Cannon's term concerning the autonomic nervous system

in'tero-infe'rior. Pert. to an inward and downward position

interol'ivary [L. *inter*, between, + *oliva*, olive]. Bet. the olivary bodies.

interor'bial [" + *orbita*, orbit]. Bet. the orbits.

inteross'eous [" + *os*, bone]. Situated or occurring bet. bones, as some muscles and ligaments

interpalpebral (in-ter-pal'pe-bral) [" + *palpebra*, eyelid]. Bet. the eyelids.

interpar'ietal [" + *paries*, pariet-, wall]. 1. Bet. walls 2. Bet. the parietal bones 3. Bet. the parietal lobes of the cerebrum

1. **bone**. **SYN**: *inca bone*, *incarial bone*

2. **suture**. Sagittal suture

interparoxys'mal [" + G. *paroxysmos*, spasm]. Bet. paroxysms

interpeduncular (in'ter-pe-dunk'u-lar) [" + *pedunculus*, peduncle]. Bet. peduncles.

interphalangeal (in'ter-fā-lan'jē-āl) [" + *phalangx*, phalanx]. In a joint bet. two phalanges

interpolar (in'ter-po-lar) [" + *polus*, pole]. Bet. two poles.

1. **path**. Path of galvanic current through tissues bet. poles.

interprox'imal [" + *proximus*, next]. Bet. two adjoining surfaces.

1. **space**. Triangular space bet. two adjacent teeth.

interpu'bic [" + *pubes*, pubes]. Bet. the pubic bones.

interpu'pillary [" + *pupula*, pupil]. Bet. the pupils.

1. **distance**. Distance between centers of the two pupils of the eyes

interrenal [" + *ren*, kidney]. Bet. the kidneys.

interrupt'er [" + *ruptus*, broken]. A mechanical or electrolytic device for making and breaking (closing and opening alternately) an electrical circuit. Such a device is ordinarily employed in low voltage, direct current circuits.

interscap'ulum [" + *scapula*, shoulder

blade]. Area bet. the shoulders or scapulae.

interscap'ular [" + *scapula*, shoulder blade]. Bet. the scapulae.

1. **reflex**. Scapular muscular contraction following percussion or stimulus bet. the scapulae.

interscap'ulum [" + *scapula*, shoulder blade]. Section of back bet. shoulder blades. **SYN**: *interscapulum*.

intersex. An individual having both male and female characteristics; a sex intergrade

inter'stice [L. *interstitium*, a thing standing bet.]. A space or gap in a tissue or structure of an organ

interstitial (in-ter-stish'al) [L. *interstitium*, thing standing bet.]. 1. Placed or lying bet., pert. to interstices or spaces. 2. Occupying space bet. essential parts of an organ which comprises its proper tissue, opp. to *parenchymatous*.

1. **cells of testes**. Cells of Leydig, located in groups between the seminiferous tubules. They produce the internal secretion (testosterone) of the testes

intersystole (in-ter-sis'to-le) [L. *inter*, bet., + G. *systole*, contraction]. The period bet. the end of the auricular systole and the commencement of the ventricular systole

intertrigo (in-ter-tri-go) [" + *tritum*, from *terere*, to rub]. A superficial dermatitis in the folds of the skin. **SEE**: *erythema intertrigo* **SYN**: *paratrimma*.

intertrochanteric (in'ter-tro-kān-ter'ik) [" + G. *trochanter*, runner]. Bet. the femur's two trochanters.

1. **line**. The ridge bet. the greater and lesser trochanters of femur on post aspect of the bone

intertubular (in-ter-tu'bu-lar) [" + *tubulus*, tubule]. Bet. or among tubules.

interureter'al (in'ter-u-re'ter'al) [" + G. *oureter*, ureter]. Bet. the two ureters. **SYN**: *interureteric*.

interureteric (in'ter-u-re-ter'ik) [" + G. *oureter*, ureter]. Bet. the ureters **SYN**: *interureteral*.

intervaginal (in-ter-vaj'in-al) [" + *vagina*, sheath]. 1. Bet. sheaths. 2. Within the vagina

interval (in'ter-val) [" + *vallum*, a breastwork]. 1. The space or time bet. two objects or periods 2. Break in the course of a disease or bet. paroxysms

1. **a.-c.**, 1. **atriocarcotid**, 1. **auriculocarcotid**. In a venous pulse-tracing, the interval between onset of the presystolic wave (a) and the systolic (c) wave. It indicates the time required for impulses to travel from S-A node to ventricle, normally about 0.2 sec

2. **a-s-V-s**. That bet. beginning of atrial systole and ventricular systole, measured in man from an electrocardiogram

1. **c.-a.-l.**, **cardio-arterial**. The time bet. apex beat and radial pulsation.

1. **focal**. Distance bet. ant. and post focal point of the eyes

1. **isometric**. Bet. onset of ventricular systole and opening of the semilunar valves **SYN**: *presphygmie*, *qv*

1. **lucid**. Brief remission of symptoms in a psychosis.

1. **passive**. The rest period of the heart

1. **postsphygmie**. I. bet. closure of semilunar valves and opening of semilunar valves and opening of atrio-ventricular valves

1. **presphygmie**. Brief period bet. the ventricular systole and opening of the semilunar valves.

Intervascular (in-ter-vas'ku-lar) [" + vas-cu-lum, a vessel] Situated bet blood vessels.

Interventricular (" + ventricu-lum, a small cavity). Bet. the ventricles.

Intervertebral (" + vertebra, joint] Situated bet. two adjacent vertebrae

I. disk. Broad and flattened disk of fibrocartilage bet. the bodies of vertebrae, as in *sympysis*.*

Intestinal [L *intestinum*, intestine]. Pert. to the intestines

I. digestion. The mixture of food and secretions described under duodenal* digestion moves on rapidly through the jejunum and is then detained for some hours in the lone remaining part of the small intestine, the ileum

I. d., chemical. The hydrolysis of

starches and sugars to monosaccharides is accomplished by enzymes provided by the pancreatic and intestinal juices. The fats are emulsified by the bile, and then hydrolyzed by the action of the lipase (steapsin) of the pancreatic juice.

The digestion of proteins, begun in the stomach by the pepsin, is carried on by the trypsin of the pancreatic juice, by the erepsin of the intestinal juice, and by other enzymes. The result is a rather fluid mixture of food and secretions, stained with bile. The products of the chemical action are monosaccharoses, fatty acids, glycerol, and amino acids, and they are actively absorbed

I. d., mechanical. Both digestion and absorption are accelerated by a continual mixing and moving of the intestinal

INTESTINAL TRACT

1. Bladder. 2. Cecum. 3. Ascending colon. 4. Transverse colon. 5. Duodenum. 6. Gallbladder. 7. Liver. 8. Esophagus. 9. Aorta. 10. Stomach. 11. Small intestine. 12. Sigmoid flexure.

contents. A column of chyme may be broken into segments by contractions of the circular intestinal musculature; the segments may reunite and then again divide at the same point or elsewhere (rhythmic segmentation). A column may suddenly move several cm., remain stationary for a time, and then either return or advance.

The area of the absorbing surface is increased by the presence of permanent circular folds in the intestine, the entire surface is studded with fine villi which stud the folds as well as the spaces between them. At the end of the ileum the advance of the chyme is halted by the ileocolic sphincter. Peristalsis driving chyme towards it thus results in a churning effect. The sphincter opens at intervals to allow chyme to spurt into the first section of the large intestine, the colon. For ensuing phenomena, see *colon, digestion in the, also intestines*.

1. flora. Bacteria in intestines of which *Bacillus acidophilus* is the most favorable.

At birth no bacteria are present in the intestines. Favorable bacteria may protect the body from invasion by unfavorable ones, which cannot thrive in an acid condition.

1. gases. Carbon dioxide, hydrogen, methane, methylmercaptan, and sulfurated hydrogen.

1. juice. A secretion of the crypts of Lieberkuhn. The secretion is induced by mechanical stimulation of the mucosa which brings about secretion through local reflexes in Meissner's plexus. A chemical substance produced by the intestinal mucosa, also induced secretion. This substance is thought to be secretin, a duodenal hormone, and by others to be a different substance called *enterocrinin*.

Comp. I juice varies in composition and consistency. It is usually cloudy in appearance due to presence of cells and mucus. Its reaction is alkaline (pH 7.0-8.5) due to presence of sodium bicarbonate. It contains the following enzymes: an enzyme complex consisting of many peptidases, formerly considered as a single enzyme (*erepsin*), a weak lipase, maltase, sucrase (invertase), lactase. See *Intestinal digestion*.

1. obstruction. Acute. Small intestine usually involved. Due to intussusception, strangulation, volvulus (twists), foreign bodies, knots, adhesions, tumors, stricture, and gallstones in intestines.

Sym. Pain localized and intense. Temperature subnormal or normal, vomiting, constipation and distention of abdomen.

Treatment: Irrigation of colon and stomach, cracked ice, but no food by mouth. Surgical.

Chronic: Involves large intestine. Due to stricture, inflammation, abscesses, tumors, fecal matter or chronic peritonitis, and gallstones may obstruct feces. Gradual constipation, pain becoming more severe in few days followed by acute symptoms.

Treatment: Diet restricted, enemas, surgical.

1. putrefaction. The chemical changes by bacteria in the intestine, forming the following: indol, skatol, paracresol, phenol, phenylpropionic acid, phenylacetic acid, paraoxyphenylacetic acid, hydroparamuramic acid, fatty acids, carbon dioxide, hydrogen, methane, methylmercaptan, and sulfurated hydrogen.

1. reflex. Intestinal contraction and relaxation above a portion of bowel which is stimulated.

intestine (in-test-in) [*L. intestinum*]. The alimentary canal extending from the pylorus to the anus.

It is nearly six times the length of the body, and is divided into the small intestine and the large intestine or colon.

PALPATION OF THE I. *Fecal accumulations.* Feel like tumor but hard and resistant, but if one finger be pressed steadily upon them for 1 or 2 minutes will at last indent like a large snowball, most frequently collect in descending colon. "There is not the slightest elasticity about them and indentation remains after pressure is removed" (Simpson).

PERCUSSION OF I. In normal condition large intestine furnishes a more amphoric percussion sound than the stomach. When filled with liquid or solid accumulations, the situation of these accumulations can be marked out on the surface by dullness on percussion. As these accumulations most frequently collect in the descending colon the percussion sound over this portion is usually less resonant than over the ascending or transverse colon.

According to Dr. Bennet, in a practical point of view it is often useful to determine whether a purgative by the mouth or an enema is likely to open bowels most rapidly. If there is dullness in left iliac fossa in the track of descending colon, that portion of the intestine must be full of feces, and an enema is indicated. If the sound in left iliac fossa is tympanic and in right dull the enema is of little service, as it will not extend to the cecum, and purgatives by mouth are indicated.

1., large. The large intestine extends from the ileum to the anus, and consists of cecum with vermiform appendix, colon, and rectum.

Mucous coat resembles that of small I. q.v., although glands are smaller and there are no villi.

The beginning of the large intestine is the *cecum*, a pouch situated on right side, about 2x3 inches, adjoining the ascending colon.

Attached to the cecum is the *vermiform appendix*, about 3-4 inches long, function unknown.

The colon averages 4-6 ft. in length. The first portion of *ascending colon* extends from the cecum to the under surface of the liver where it turns to the left as the *transverse colon*. Its bend is the right colic or hepatic flexure. The transverse colon passes horizontally to the left to the region of the spleen where it turns downward as the *descending colon*. This turn is the *splenic flexure*. The descending colon continues downward on the left side of the abdomen until it reaches the pelvic brim and curves like the letter S and is placed in front of the sacrum to become the *rectum*. This S-shaped section is known as the "*sigmoid colon*". The rectum, about 6-8 inches long, passes downward to terminate in the lower opening of the tract, the *anus* or *anal opening*.

1., small. This begins with the *duodenum*, 8-10 inches long, which receives the food mass from the stomach through the pylorus, the bile from the liver and gallbladder, and the pancreatic juice from the pancreas. It connects with the *jejunum*, about 8 ft. long, which is usu-

LONGITUDINAL SECTION OF
SMALL INTESTINE

1 Serous coat 2 Longitudinal muscular fibers 3 Circular muscular fibers 4 Crypts of Lieberkuhn 5 Mucosa 6 Solitary nodule 7 Intestinal gland 8 Villus 9 Mucosa

ally empty after death. The jejunum, in turn, joins the *ileum* or twisted intestine, about 12 ft long, which is attached to the large intestine by the *ileocecocolic valve* that controls passage of food into large I.

In the wall of the small intestine are found Brunner's glands, intestinal glands (crypts of Lieberkuhn), blood and lymph vessels (lacteals), and lymphatic tissue in the form of solitary nodules or aggregated nodules (Peyer's patches SEE Fig above). The inner surface is thrown into folds (circular folds) and lining the entire surface are minute fingerlike villi through which the products of digestion (simple sugars, amino acids, and fatty acids and glycerol) are absorbed. There are over five million villi providing an absorbing surface of over 100 feet. Villi range from 1/8 to 1/2 of an inch in length.

Intestine, words pert. to: abenteric, alvine, alvinolith, angulation, anthrax, antiperistalsis, antistalsis, aperitic, ascariadial, atavicosis, Brunner's glands, celiac disease, celioposy, Cercomonas intestinalis, Chilomastix mesnili, cholecystenterorrhaphy, choledochenterostomy, cholera infantum, chyle, chylifaction, circumintestinal, colic, colon, copremia, crepitation, diarrhea, digestion, int. dysentery, "enter. words," flora, ileitis, ileocecal, ileus, "ileo- words," indigestion, intestinal digestion, intestinal flora, intestinal juice, intestinal obstruction, intussusception, invertin, mesentery, obstipation, tormina, valvulae conniventes, villi, villus.

intestinum (in-tēs-tī'nūm) [L.] Intestine. I. **rectum**. BNA. The rectum.

intima [L. innermost]. Innermost coat of a structure, as a blood vessel. SYN. *tunica intima*.

intimal (in-tīm-al) [L. *intima*, innermost]. Pert. to the inner coat of a blood vessel, the intima.

intimi'tis [" + G. -itis, inflammation]. Inflammation of an intima.

intol'erance [L. *in*, not, + *tolerāre*, to bear.] Inability to endure or incapacity for bearing, as pain, or the effects of a drug or other substance.

intoxicant. An agent which produces intoxication.

intoxica'tion [" + G. *toxikon*, poison] 1 State of being intoxicated, esp. of being poisoned by a drug or toxic substance. 2. Intoxicated from overindulgence in alcoholic beverages. 3. Drunk SEE: *alcoholism*, *autointoxication*.

The determination of alcohol content is frequently of value in the diagnosis of intoxication from alcohol, especially in differentiating other disorders. Normally the alcohol content of body tissues and fluids is negligible. Upon ingestion of alcoholic fluids the alcohol rapidly increases in the blood and is excreted in the urine. The urine concentration will generally be slightly less than that of the blood. To be representative the tests must be made immediately. Results are expressed as "milligrams of alcohol per cubic centimeter of blood or urine." One milligram per cubic centimeter represents a condition of "decent and decorous," 2 milligrams "distinctly drunk," 3 milligrams "drunk and disorderly," 4 milligrams "dead drunk."

I., **acid**. I. resulting from acidosis.

I., **alkaline**. I. resulting from alkalosis.

I., **intestinal**. Autointoxication.

I., **water**. I. resulting from excessive intake or undue retention of water.

intra- [L. I. Prefix meaning within.]

in'traabdominal [L. *intra*, within, + *abdominalis*, pert. to abdomen]. Within abdomen.

I., **pressure**. Pressure within the abdomen.

intraarterial [" + G. *artēria*, artery]. Within the atria of the heart.

intraarticular (in-trā-ar-tik'u-lar) [" + *articulus*, joint]. Within a joint.

intracapsular [" + *capsula*, little box]. Within a capsule.

I., **fracture**. One occurring within the capsule of a joint.

intracartilaginous (in'tra-kar-tī-laj'in-us) [" + *cartilago*, gristle]. Within a cartilage or cartilaginous tissue.

intracellular (in-trā-sel'u-lar) [" + *cellula*, cell]. Within cells.

intracranial [" + G. *kranion*, skull]. Within the cranium or skull.

intracutaneous [" + *cutis*, skin]. Within the substance of the skin. SYN: *intra-dermal*.

I., **reaction**. One following injection of tuberculin into the skin.

intracystic [" + G. *kystis*, bladder]. Inside a bladder or cyst.

intrad (in'trad) [L. *intra*, within]. Inwardly; toward the inner part.

intradermal [" + G. *derma*, skin]. Within the skin. SYN: *intracutaneous*.

intradermoreaction (in'trā-derm'o-re-ak'shun) [" + " + L. *rē*, back, + *actus*; from *actere*, to do]. One resulting from the injection of a reagent into substance of the skin.

intraduct (in'trā-dukt) [" + *ductus*, a canal]. Inside a duct.

in'traduodenal [" + *duodeni*, twelve]. Within the duodenum.

intradural [" + *durus*, hard]. Within or enclosed by the dura mater.

intrafebrile [" + *febris*, fever]. During the febrile stage.

intrafilar [' + *filum*, thread]. Within a network.

i. mass. The fluid portion of proto-plasm. **SYN:** *hyaloplasm*, *paramitome*, *paraplasm*.

intracem'al. Within a bud or the expanded ending of a nerve, as a taste bud.

intrafigament'ary [' + *ligamentum*, a binding]. Within the leaves of a ligament.

Usually used in referring to fibroid tumors or cysts of the ovary that have grown within the broad ligament.

intrafigamentous (in'tra-lig-à-men'tus) [' + *ligamentum*, a binding]. Within a ligament.

intraflob'ular [' + *lobulus*, lobule]. Within a lobe.

intrafloc'ular [' + *loculus*, a cavity]. Within the cavity of any structure.

intrafumb'ar [' + *lumbus*, a loin]. Within the lumbar region or portion of the spinal cord.

intrafuml'al (in-trà-lu'mf-nal) [' + *lumen*, *lumin-*, light]. Within interior of any tubular structure. **SYN** *intrafubal*.

intrafustoiditis (in-tra-mas-toid-i'tis) [' + *G. mastos*, breast, + *eidos*, form, + *-itis*, inflammation]. Inflammation of the antrum and mastoid process. **SYN.** *endofustoiditis*.

intrafural [' + *murus*, a wall]. Within the walls of a hollow organ or cavity.

intrafural'cular [' + *musculus*, a muscle]. Within a muscle.

i. infection. Hypodermic injection of drugs into a muscle.

intrafural'al. Within the nasal cavity.

intrafural'cular [' + *oculus*, eye]. Within the eyeball.

intrafural'al. Within the mouth.

intrafural'cular (in-tra-pà-rf'e-tal) [' + *paries*, *pariet-*, wall]. 1. Within the parietal lobe of the cerebrum. 2. Intramural.

intrafural'cular [' + *G. peritoneum*, peritoneum]. Within the peritoneal cavity.

intrafural'cular [' + *G. pleura*, rib]. Within the pleural cavity.

intrafural'cular [' + *pons*, *pont-*, bridge]. Within the *pons Varoli*.

intrafural'cular, **intrafural'cular** (in-tra-sf'kik, kl-kál) [*L. infra*, within, + *G. psychê*, mind]. Having a mental origin or basis, such as conflicts and complexes.

intrafural'cular [' + *pulmō*, *pulmon-*, lung]. Within the lung cavity.

intrafural'cular (in-trà-pi-ret'ik) [' + *G. pyretos*, fever]. During the period of fever. **SYN** *intrafural'cular*.

intrafural'cular [' + *spina*, spine]. 1. Ensheathed, within a sheath. 2. Within the spinal canal. **SYN** *intrafural'cular*.

intrafural'cular (in-tra-the'kal) [' + *G. thêkê*, sheath]. Intrafural: within spinal canal.

intrafural'cular (in-trà-tho-ras'tik) [' + *G. thōraz*, *thorak-*, chest]. Within the thorax.

intrafural'cular (in'trà-trak'e-āl) [' + *G. trachea*, trachea]. Introduced into, or inside, the trachea.

i. anesthesia. A. administered through a catheter passed down the trachea.

in'trafu'bal [' + *tuba*, hollow tube]. Within a tube, esp. the fallopian tube.

in'trafympan'ic [' + *G. tympanon*, drum]. Within the tympanic cavity.

intrafural'cular [' + *uterus*, womb]. Within the uterus.

i. douche. D. for washing out interior of the uterus. **SEX:** *douche*.

intrafural'cular (in-trav-a-sa'shun) [' + *vas*, vessel]. Passage into the blood vessels of

matter formed outside of them through traumatic or pathological lesions.

intrafural'cular. Within blood vessels.

intrafural'cular (in-tra-ve'nus) [*L. intra*, within, + *vena*, vein]. Within or into a vein.

i. infusion. Injection into a vein of an isotonic solution to secure an immediate result as in hemorrhage, to stimulate in shock or collapse and to dilute poisons in toxemia.

SOLUTIONS: Normal saline, Dawson's Locke's, Fischer's, Ringer's, glucose, 5-10%, sodium bicarbonate, 4%.

TEMPERATURE 98.6°, body temperature.

QUANTITY 250-500 cc.

SITE Median basilic or median cephalic vein.

Preparation same as for i. injection but a needle or cannula is used, pointing toward heart. The vein must be exposed if cannula is used. Introduction should be very slow, taking at least 15 minutes for 500 cc.

i. injection. Surface over skin is sterilized, tourniquet or bandage applied to middle of arm, the median cephalic or median basilic vein at front of elbow being used. Hypodermic needle is inserted in the vein, pointing upward. Pressure should be loosed before injection, which should be given very slowly.

i. medication. The injection of a sterile solution of a drug or an infusion into a vein.

Neosalvarsan, among other drugs, may be administered best intravenously to prevent pain and tissue reaction. A danger exists which should be minimized by best possible technique.

i. treatment. This may consist of (a) intravenous injection or (b) intravenous infusion. The injection is usually known as the introduction of a solution into a vein with a hypodermic syringe. The infusion is usually known as the introduction of a solution in a larger quantity—250-500 cc. by means of a burette, needle, and rubber tubing.

intrafural'cular (in-tra-ven-trik'u-lar) [' + *ventriculus*, ventricle]. Within a ventricle.

intrafural'cular [' + *vita*, life]. During period of living.

i. stain. One which when introduced into a living organism is taken up by living cells.

in'tra vī'tam [*L.*] During life.

intrafural'cular [*L. intrinsecus*, on the inside]. Located entirely within or pertaining exclusively to a part.

i. muscles. Those which have their origin and insertion entirely within a structure, as the intrinsic muscles of the tongue, larynx, or eye.

intra- [*L.*] Prefix meaning in or into.

intrafural'cular [*L. intrō*, into, + *ducere*, to lead]. Device for controlling, directing and placing an intubation tube within the trachea. **SYN** *intubator*.

intrafural'cular (in-tro'it-us) [' + *ire*, to go]. Any aperture in the body.

i. canalis sacralis. Terminal opening of spinal canal at end of sacrum.

i. laryngis. Upper opening of larynx.

i. vaginae. Ext. orifice of vagina.

intrafural'cular [' + *jectus*, from *jacere*, to throw]. Psy: Identification of the self with another, or with some object, the victim assuming the supposed feelings of the other personality.

intromission (in-tro-mish'un) [' + *missus*: from *mittere*, to send]. An insertion or placing of one part into another, as the entry of the penis into the vagina.

intromittent (in-tro-mit'ent) [*+* + *mittere*, to send]. Conveying or injecting into a cavity or body, as the ejaculation of semen into the vaginal canal.

1. organ. Penis, which carries seminal fluid into body of the female.

introspection. Looking within, esp examination of one's mind.

intussusception (in-tro-sus-sep'shun) [*+* + *suscipere*, to receive] **Invagination.** 1 Growth of cells from within by the synthesis of new protoplasm from food-stuffs. 2 The invagination, slipping, or folding of one part of the intestine into an adjoining segment, usually the distal segment. 80% of cases occur in children under two. **SYN** intussusception.

Proc. Usually death unless surgery is resorted to.

introversiōn (in-tro-ver'shun) [*+* + *versio*, a turning] 1. Turning inside out of a part or organ. 2. **Psy.** The condition of an introvert, *q.v.* **Invertism**, dwelling within one's self and withdrawal from the external environment, as characterized in such pathological states as hypochondriasis,* melancholia,* and schizophrenia.*

introvert [*+* + *vertare*, to turn] 1. **Psy.** A personality reaction type characterized by the withdrawal from reality, fantasy formation, and stress on the subjective side of life adjustments, seen pathologically in extreme form in schizophrenia. **OPP** extrovert, *q.v.* 2 *v.* To invaginate.

intubate (in'tu-bāt) [*L in*, into, + *tuba*, a tube]. To insert a tube in a part, esp. the larynx. **SYN** invaginate.

intubation (in-tu-bā'shun) [*+* + *tuba*, a tube]. Insertion of a tube into the larynx through the glottis for entrance of air, or to dilate a stricture.

Tube used is 1½-3 inches long. Usually allowed to remain 5 days. Sometimes for months.

Position. Patient held upright in lap of assistant, head upon assistant's left shoulder, arms secured by wrapping sheet about patient's body or being grasped by elbows. Another assistant stands behind patient with hands firmly grasping the head and holding gag in place. Patient so held that body, neck and head are kept naturally in a straight line.

NP. Never leave patient alone, do not feed for two or three hours after intubation; nursing infants may go to breast, soft diet to others, keep on back or in sitting position.

intubator [*+* + *tuba*, a tube]. Device used in inserting a tube into the larynx.

intumesce (in-tū-mes') [*L. intumescere*, to swell up]. To enlarge or swell.

intumes'cence [*L. intumescere*, to swell up]. A swelling or the process of enlarging. **SYN.** tumefaction.

intumescent (in-tu-mes'ent) [*L. intumescere*, to swell up]. Swelling or becoming enlarged.

intussusception (in-tus-sus-sep'shun) [*L. intus*, within, + *suscipere*, to receive]. 1. Growth of cells by deposit of particles bet. those already existing. 2 **Invagination**.

The slipping of one part of an intestine into another part just below it. Noted chiefly in children—more common in males—usual seat ileocecal region.

Proc. Death usually results from gangrene, peritonitis, or collapse. Sometimes a favorable termination from sloughing

and adhesion of serous surfaces. **SEE:** ileus.

intussuscep'tum [*+* + *suscipere*, to receive]. The inner segment of intestine which has been pushed into another segment.

intussusciptions (in'tus-sus-sip'ti-ens) [*+* + *suscipiens*, receiving]. That portion of intestine which receives the intussusceptum.

inulase (in'u-lās). An enzyme that converts inulin into levulose.

in'ulin. 1. A polysaccharide found in plants yielding levulose. 2 An expectorant.

inunction (in-un'k'shun) [*L in*, into, + *ungere*, to anoint]. Ointment or medicated substance rubbed into the skin, to secure a local or a more general or systemic effect.

Medicated substances include cocoa butter, cod liver oil and mercurial compounds. If mercury is absorbed there may be danger of salivation or damage to the kidneys. Belladonna may be ordered by a physician.

inustion [*+* + *ustus*, from *urere*, to burn]. Cauterization, burning.

in u'tero [*L*]. Within the uterus.

in vac'uo. Within a cavity or a space from which air has been exhausted.

invaginate (in-vaj'in-āt) [*L in*, into, + *vagina*, sheath] 1 To ensheath. 2 To insert one part of a structure within a part of the same structure. 3 **Intussusception**. 4 In Emb., to grow in or from an ingrowth or in pocketing, esp. the ingrowth of the wall of the blastula which results in the formation of the gastrula.

invaginated [*+* + *vagina*, sheath]. Enclosed in a sheath, ensheathed.

invagination [*+* + *vagina*, sheath]. 1 The process of becoming ensheathed. **SYN.** intussusception. **SEE** egestion.

in'valid [*L in*, not, + *validus*, strong]. 1. Not well, weak. 2 A sickly person.

invasin. Hyaluronidase, *q.v.*

inva'sion [*L in*, into, + *vasus*, from *vadere*, to go]. 1 That period of a disease following entrance of infective organisms and preceding the appearance of symptoms. 2 The entrance of bacteria or other infectious organisms into the body and their distribution to the tissues.

invermination [*+* + *verminare*, to be wormy]. Infestation by intestinal worms. **SYN.** helminthiasis.

inverse-square law. The intensity of radiation at any distance is inversely proportional to the square of the distance bet. the irradiated surface and a point source.

inversion (in-ver'shun) [*L in*, into, + *versio*, a turning]. 1 Turning inside out of an organ, *e.g.*, the uterus. 2 In chemistry, the process of converting sucrose (which rotates the plane of polarized light to the right) into a mixture of dextrose and levulose, which mixture rotates the plane to the left.

The resulting mixture is called invert sugar, and the enzyme which catalyzes this conversion is called invertase. **SEE.** enzyme.

1. psychic. Lack of harmony bet. the physical and psychic self or sex.

1. sexual. Deviation from normal sex relationship, diametrically opposite, *i.e.*, sexual interest in one of the same sex. **SYN.** homosexuality.

1. uterine. A condition in which the fundus of the uterus protrudes through the cervix, and in some cases through the vaginal introitus. May be acute or chronic, the acute type usually occurring immediately postpartum as a result of

too vigorous placental expression or pulling on the placental cord when the placenta is fixed in the uterus. The chronic type is usually due to tumors of the fundus uteri that pull themselves and the uterus through the cervix

in'vert [' + *vertere*, to turn]. 1 One who, or that which is opposite the normal. See *homosexual*. * 2 (in-vert'). To turn inside out or upside down

1. sugar. A term usually applied to a mixture of levulose and dextrose, formed by inversion of sucrose by enzyme, invertase. See *carbohydrate*, *inversion*, *sugar*.

invertase (in-ver'tās) [' + *vertere*, to turn]. A sugar-splitting ferment or enzyme found in the intestinal juice. It causes the inversion of sugar

inver'tebrate. Without a backbone, an animal lacking a spinal column

invertin (in-ver'tin). An intestinal ferment which converts cane sugar into invert sugar. Syn. *invertase*.

invest'ing [L. *in*, in, + *vestire*, to clothe]. Ensheathing, encircling with a sheath or coating, as tissue, surrounding

invest'ment. A covering or sheath

inver'terate [' + *vetus*, *vetere*, old]. Chronic, firmly seated, as a disease or a habit

in vit'ro [L]. In a glass, as in a test tube

in vivo [L]. In the living body

in'volucre, involu'crum [L. *in*, in, + *volvere*, to wrap]. 1 A sheath or covering. 2 The covering of newly formed bone enveloping sequestrum in infection of bone.

invol'untary [L. *in*, not, + *voluntās*, will]. Independent of or even contrary to volition.

involution (in-vo-lu'shun) [L. *in*, into, + *volvere*, to roll]. 1 A turning or rolling inward. 2 The reduction in size of the uterus following delivery. 3 The retrogressive change in vital processes or in an organ after fulfilling their functions, such as that which follows the menopause. 4 A backward change. 5 Diminishing of an organ in vital power or in size. 6 In Bact., degression from the usual morphological type such as occurs in certain bacteria when grown under unfavorable conditions

1. forms. Bacteria possessing abnormal and unusual forms

1. of uterus. Return of uterus by absorption to normal size after childbirth

1. senile. Shriveling of an organ or part from old age

1. sexual. Cessation of menstrual function. Syn. *climacteric*, *menopause*

involutional (in-vō-lu'shun-āl) [' + *volvere*, to roll]. Concerning involution or a turning inward.

1. melancholia. M associated with senile and presenile types and manic-depressive group

Occurs in the climacteric period, somewhat more frequently in women than in men. Stands alone in the classification of the psychoses

SYM. 1. No evidence of physical disease. 2. Irregular menstruation or cessation. 3. Anemic. 4. Loss of weight. 5. Foul breath and coated tongue. 6. Expression of being miserable. 7. Temperature usually subnormal. 8. Diminished perspiration. 9. Sleeplessness. 10. Movements slow. 11. Dry and scaly skin. 12. Pulse feeble. 13. Flabby muscles. 14. Decreased urine. 15. Shallow respiration. 16. Constipation. 17. Digestion upset. 18. Large joints more or less rigid. 19. De-

lusions frequent. 20. May refuse food. 21. May commit suicide.

FORMS OF. Simple. 19, absent, 21, possible. *Delusional*. Very marked. *Agitated*. Reverse of No 10, noisy expressions, 18, smaller joints continually in motion, picking at skin

iodalbin (i-ō-dal'bin). A compound of iodine and albumen containing approximately 21.5% iodine

Uses. Same as the inorganic iodides

Dosage. Average, 5-10 gr (0.3-0.6 Gm)

Iodamoeba (i-ō-dā-mē'ba). A genus of nonpathogenic amebae found in the intestinal tract. Their cysts are peculiar in that they are irregular in shape, nucleus usually single, and they possess a vacuole filled with glycogen which stains brown in iodine

1. butschlii. SYN. *I. wilmsi*. A small, sluggish ameba found in the large intestine of man. Also found in monkeys and pigs. It is nonpathogenic

iodikon (i-ō-de-kon). Brand of soluble iodophthalin

Uses. For x-ray study of the gall-bladder.

iodine (i'ō-din) [G. *iōdēs*, violet colored]. A nonmetallic element belonging to the halogen group. It is a black, crystalline substance having a density of about five. It melts at 114°C and boils at a slightly higher temperature, giving off a characteristic violet vapor. **SYM.** 1. Atomic no. 53. Atomic weight, 126.92

FUNCTIONS. Development and functioning of the thyroid gland, formation of thyroxine and prevention of goiter, regulation of basal metabolic rate. The amount of iodine in the entire body averages 50 mg., of which one-third to one-fifth (10-15 mg.) is found in the thyroid. Iodine content of the blood varies from 5 to 10 micrograms per 100 cc. Daily requirement for iodine is about 100 micrograms. A growing child or a pregnant woman needs several times as much as an adult. Those under emotional strain and the adolescents likewise need more iodine

SYM OF DEFICIENCY. A def of iodine in the diet leads to simple goiter characterized by thyroid enlargement and hypothyroidism. This may result in retardation of physical, sexual, and mental development in the young, a condition called *cretinism*

SOURCES. *Er.* Broccoli, cod liver oil, iodized salt, fish, esp halibut and salmon, shell fish. *Good.* Barley, bran, butter, carrots, cherries, corn, green beans, loganberries, oatmeal, spinach, peas, asparagus. The iodine content of vegetables depends upon the locality in which grown

POISONING. **SYM.** Brown stains on mouth and throat, which appear shriveled, burning sensation in throat followed by vomiting and diarrhea. The vomitus is yellow or brown, dizziness.

F A TREATMENT. Empty stomach by means of stomach pump or an emetic. Give starch, flour and water, or barley and water in large quantities. Stimulate if necessary.

INCOMPATIBILITIES. *alkaloids.*

Uses. Tincture of iodine (a 2 or 3% solution in alcohol) is used as a disinfectant and germicide. It is used as a preventative of simple goiter and, in the form of Lugol's solution, is invaluable in the treatment of exophthalmic goiter. Dosage is 10 to 40 minims daily. It is also used in the treatment of syphilis and tuberculosis

1., radioactive. ¹³¹I, an isotope of I with an atomic weight of 131. Used in

diagnosis of thyroid disorders and in the treatment of toxic goiter and thyroid carcinoma.

I., tincture of. A solution of 20 gm iodine and 24 gm sodium iodide in 1000 cc of dilute alcohol.

Iod'inin. A purple pigment produced by certain bacteria which inhibits the growth of streptococci, esp. *Streptococcus hemolyticus* it is effective in very dilute solutions.

Iodism (I'ô-dizm) [*G. iôdês, violet colored*]. Condition induced by prolonged use of iodine or its compounds. SEE *iodine poisoning*.

I'odize [*G. iôdês, violet colored*] To administer or impregnate with iodine.

I'odized [*G. iôdês, violet colored*]. Impregnated with iodine.

I. salt. Salt containing 1 part sodium or potassium iodide to 5000 parts of sodium chloride. SEE *salt*.

Iodoform [*G. iôdês, violet colored*, + *L. forma, form*]. USP. Yellow powder made by the action of iodine on acetone in the presence of an alkali.

ACTION AND USES. A local analgesic, antiseptic, and stimulant.

DOSAGE: Externally in the form of a dusting powder, or as a surgical dressing in the form of gauze impregnated with the drug.

INCOMPATIBILITIES. Mercuric oxide, calomel, silver nitrate, tannin, balsam of Peru.

Iodoformism [" + " + *G. ismos, state of*] Poisoning caused by iodoform.

Iodophilia (i-ô-dô-fil-i-â) Condition in which certain cells, esp. polymorphonuclear leukocytes show a pronounced affinity for iodine, the cells acquiring a brownish-red color. Seen in pathologic conditions such as acute infections and anemia.

I., intracellular. I in which color changes occur within the cells.

I., extracellular. I in which substances in the plasma outside the cells are colored.

Iodoth'rapy [" + *therapeia, treatment*]. Use of iodine medication.

I'odum [*L.*] Iodine.

I'on [*G. iôn, going*]. Molecular constituent, i. e., one or more atoms, carrying an electric charge.

A free-wandering particle carrying an electric charge, consisting of an atom or group of atoms into which the molecules of an electrolyte are divided, or one of the electrified particles into which the molecules of a gas are divided by ultraviolet rays, gamma rays, or x-rays, or by other ionizing agents.

Ions occur (1) in gases, esp. at low pressures, under the influence of strong electrical discharges, x-rays, and radium, and (2) in solutions of acids, bases, and salts. Such moving particles render the gas or solution capable of conducting the electric current, and on reaching the electrodes they are discharged.

Ions which carry positive charges and which consequently discharge at the negative electrode (cathode) are called cations, examples are the hydrogen in aqueous solutions of acids and the sodium in aqueous solutions of sodium chloride.

Ions which carry negative charges will appear at the positive electrode (anode) and are, therefore, called anions; an example is the chlorine in aqueous solutions of hydrochloric acid or of sodium chloride. Thus in the reaction

is represented the ionization of hydrogen

chloride (hydrochloric acid) when dissolved in water, it means that when the electric current is passed through the solution hydrogen gas will appear as bubbles at the cathode, while chlorine will appear at the anode.

ion'ic [*G. iôn, going*]. Pert. to ions.

I. medication. The introduction of chemical ions into the superficial tissues for medicinal purposes by means of a direct current.

The basic rules are: Like forms of electricity repel each other, unlike forms attract each other. Bases, metallic radicals, and alkaloids are electropositive and should be placed at the positive pole. Acids and acid radicals are electronegative and should be placed at the negative pole. Ex. Potassium iodide for the introduction of free iodine should be placed at the negative pole, cocaine hydrochloride for local anesthesia at the positive pole. SYN *iontophoresis* 2, *q.v.*

ionization [*G. iôn, going*]. The dissociation of compounds (acids, bases salts) into their constituent ions.

ionize [*G. iôn, going*] To separate into ions, ionization, *q.v.*

I'onom'eter [" + *metron, measure*]. An instrument consisting of an ionization chamber, an electroscope and an electric charging current designed to measure the amount of radiation used by roentgen rays or radium and to measure the intensity of the rays themselves. SEE *roentgenometer*.

ionotherapy (i-on-ô-ther-â-pl) [" + *therapeia, treatment*] 1. Introduction of ions into the body 2 [*G. iôn, violet*]. Treatment of disease with violet rays. SYN *iontophoresis*, 1.

iontophoresis (i-on-ô-to-fo-re'is) [" + *phorain, to carry*] 1. Process of electrical current traveling through salt solution causing migration of metal ion to negative pole and radical ion to positive pole. 2. Introduction of various ions into tissues through the skin by means of electricity. SYN *ionic medication*.

iontoquantimeter (i-on-ô-kwon-tim'e-ter) [" + *L. quantus, how much*, + *G. metron, measure*]. Instrument used to measure the amount of radiation used by, and the intensity of, roentgen rays. SEE *roentgenometer*.

iontoradiometer (i-on-ô-to-ra-di-om'e-ter) [" + *L. radius, ray*, + *G. metron, measure*]. Instrument for measuring the amount and intensity of roentgen rays. SEE *roentgenometer*.

iontotherapy (i-on-ô-to-ther-â-pl) [" + *therapeia, treatment*] Treatment by forcing ions into the body electrically.

iophobia (i-ô-fo-bi-â) [*G. iôs, poison, rust*, + *phobos, fear*] 1. Fear of being poisoned. SYN *toxophobia*. 2. Fear of touching any rusty object.

iotacism (i-ô-ta-sizm) [*G. iôta, letter i*] Defective utterance marked by constant substitution of an *ê* sound (Greek *iota*) for other vowels.

ipeacac (ip-e-kak). USP. A dried root of a plant (*ipecacuanha*), grown in Brazil. **ACTION AND USES.** Specific against amebic dysentery. Also an expectorant, emetic, and diaphoretic.

DOSAGE. As expectorant, 1 gr. (0.06 Gm.); as emetic, 15 gr. (1.0 Gm.). SEE *emetine*.

ipral sodium (ip'ral). A proprietary derivative of barbital; a persistent acting hypnotic.

DOSAGE. 2-4 gr. (0.12-0.25 Gm.). **Ipsation** (ip-sa'shun) [*L. ipse, self*]. Practice of masturbation.

ipsilateral, ipsilateral (ip-si-lat'er-al, ip-so) [L. *ipse*, same, + *latus*, later-, side]. On the same side. Affecting the same side of the body.

Thus, when the right patellar tendon is tapped, a knee-jerk is observed on the same side. Said of findings (paralysis) appearing on same side of body as brain or spinal cord lesion producing them. Opp. of *crossed*, *contralateral*. SYN *homolateral*.

IQ. Abbr. for *intelligence quotient* *

Ir. Abbr. for *internal resistance*.

ir'al'gia [G. *iris*, *iris*, + *algos*, pain]. Pain felt in the iris. SYN *iridalgia*.

iridadenosis (ir'id-ad-e-nō'sis). A glandular affection of the iris.

iridal (ir'id-al) [G. *iris*, *irid-*, *iris*]. Rel. to the iris.

iridalgia (ir'id-al'jī-ā) [" + *algos*, pain]. Pain felt in the iris. SYN: *ir'al'gia*.

iridauxesis (ir'id-dawk-se'sis) [" + *auxēsis*, increase] Increase in size of the iris. SYN: *iridocyclos*.

iridectome (ir'id-ek'tōm) [" + *tomē*, a cutting] Instrument for cutting the iris.

iridectomesodialysis (ir'id-ek'tō-mes'o-dī-al'i-sis) [" + *ektomē*, excision, + *mesos*, middle, + *dialysis*, loosening]. Formation of an artificial pupil, by separating adhesions on inner margin of iris.

iridectomize (ir'id-ek'tō-mīz) [" + *ektomē*, excision]. To excise a portion of the iris.

iridectomy [" + *ektomē*, excision]. Surgical removal of a portion of iris i., *optical*. I done for purpose of making an artificial pupil.

iridectropium (ir'id-ek-tro'pī-um) [" + *ektropion*, eversion]. Partial eversion of the iris.

iridemia [" + *aima*, blood] Bleeding from the iris.

iridencleisis (ir'id-en-klī'sis) [" + *egklein*, to lock in] Iris inclusion operation, the iris being incarcerated in the wound, thereby forming a fistula lined with iris tissue. Performed in glaucoma.

iridentropium (ir'id-den-tro'pī-um) [" + *entropion*, inversion]. Partial inversion of the iris.

irideremia (ir'id-er-e-mī-ā) [" + *erēmia*, lack] Partial or total absence of the iris. SEE *aniridia*.

iridesis (ir'id-ē-sis) [" + *desis*, a binding] Formation of an iris artificially, by ligation.

iridie (ir'id'ik) [G. *iris*, *irid-*, *iris*]. Rel. to the iris. SYN *iridal*.

irido' [G.]. Combining form, pert. to the

iridoavulsion (ir'id-o-av-ul'shun) [G. *iris*, *irid-*, *iris*, + L. *avulsio*, tearing away]

Tearing away (avulsion) of the iris.

iridocapsulitis (ir'id-o-kap-sū-lī'tis) [" + L. *capsula*, little box, + G. *-itis*, inflammation]

Iritis with inflammation of the capsule of the lens.

iridocoele (ir'id-o-sēl) [" + *kēlē*, hernia]

Protrusion of a portion of the iris through a defect in the cornea.

iridochorioiditis, iridochoroiditis (ir'id-o-ko-ri-oi-dī'tis) (ir'id-o-ko-roy-dī'tis)

[" + *chorioidēs*, skinlike] Inflamed condition of both iris and choroid.

ir'idocoloboma [" + *kolobōma*, mutilation]. Congenital defect or fissure of the iris.

iridocyclectomy (ir'id-o-si-klek'tō-mī) [" + *kyklos*, circle, + *ektomē*, excision].

Surgical removal of iris and ciliary body.

iridocyclitis (ir'id-o-si-klī'tis) [" + *-itis*, inflammation]. Inflammation of iris and ciliary body.

iridocystectomy (ir'id-o-sis-tek'tō-mī) ["

+ *kystis*, a bag, + *ektomē*, excision]. Plastic formation of an artificial pupil.

iridodesis (ir'id-od-es-is) [" + *desis*, a binding]. Ligature of part of iris to form an artificial one. SYN *iridesis*.

ir'idodiagno'sis [" + *dia*, through, + *gnōsis*, knowledge]. Diagnosis of disease by changes in color and form of the iris.

iridodialysis (ir'id-o-dī-al'i-sis) [" + *dialysis*, loosening]. The separation of the outer margin of the iris from its ciliary attachment, usually due to trauma, forming an artificial pupil.

iridodila'tor [" + L. *dilatāre*, to dilate]. Substance causing dilatation of the pupil.

iridodonesis (ir'id-o-do-ne'sis) [" + *dōnesis*, tremor] Tremulousness of iris, seen in an aphakic eye or one with subluxated lens. SYN: *luppus*.

iridokinesis (ir'id-o-kin-e'sis) [" + *kinēsis*, motion]. The contracting and expanding movements of the iris.

iridoleptynsis. Thinning or atrophy of the iris.

iridology (ir'id-dol'o-jī) [" + *logos*, study]. The study of changes in the iris during course of a disease.

iridomalacia (ir'id-o-ma-lā'sī-ā) [" + *malakia*, softening]. Softening of the iris.

iridomedialysis (ir'id-o-med-i-al'i-sis) [" + L. *medius*, in middle, + G. *dialysis*, loosening]. Separation of inner marginal adhesions of iris. SYN *iridomesodialysis*.

iridomesodialysis (ir'id-o-mes'o-dī-al'i-sis) [" + *mesos*, middle, + *dialysis*, loosening] Separation of adhesions around the inner border of iris.

iridom'tor [" + L. *motor*, motion]. Rel. to movements of the iris.

iridon'cus [G. *iris*, *iris*, + *ogkos*, tumor]. Tumefaction of the iris or development of a tumor.

ir'idoparalysis [" + *paralysis*, a loosening]. Paralysis of the iris. SYN: *iridoplegia*.

iridoparelysis (ir'id-o-par-el'kī-sis) [" + *parelysis*, protraction] Dislocation of pupil due to prolapse of the iris.

iridoperiphacitis, iridoperiphakitis (ir'id-o-per'i-fā-sī'tis, -per'i-fā-klī'tis) [" + *peri*, around, + *phakos* lens, + *itis*, inflammation] Inflammation of the iris and ant. portion of capsule of the lens.

iridoplegia (ir'id-o-ple'jī-ā) [" + *plēgē*, stroke] Paralysis of sphincter of iris.

I., accommodative. Inability of iris to contract when stimulated by accommodation.

I., complete. I in which the iris fails to respond to any stimulation.

I., reflex. Absence of light reflex with retention of accommodation reflex (Argyll-Robertson pupil).

iridoptosis (ir'id-to-ptō'sis) [" + *ptōsis*, a drooping] Prolapse of the iris.

iridorrhesis (ir'id-or-reks'is) [" + *rēsis*, rupture] Rupture of or a tearing of the iris away from its attachment.

iridosclerotomy (ir'id-o-skle-rot'o-mī) [" + *sklēros*, hard, + *tomē*, incision]. Piercing of the sclera and of the border of the iris.

iridosteresis (ir'id-o-stē-re'sis) [" + *stērēsis*, loss]. Removal of the iris or a portion of it.

iridot'asis [" + *tasis*, a stretching]. Stretching the iris for glaucoma.

iridotomy (ir'id-to'tō-mī) [" + *tomē*, incision]. Incision of iris without excising a piece, done for the purpose of making a new aperture in the iris when the pupil is closed.

Indicated in eyes that had been operated on for cataract but which have lost

their sight through subsequent iridocyclitis. Also done in seclusio pupillae.

NP: All dressings, sponges, cotton, gauze, compresses, drains, towels, sheets, safety pins, etc., must be sterilized before using.

Iris (G). The colored contractile membrane suspended between the lens and the cornea in the aqueous humor of the eye, separating the ant. and post. chambers of the ball and perforated in the center by the pupil. It regulates by contraction and dilatation the entrance of light.

ANAT. The free inner edge rests on the lens when the pupil is contracted or partially dilated. The iris separates the ant. and post. chambers of the eyeball. The iris contains two muscles, the sphincter pupillae (circular fibers) about one millimeter wide, and the dilator pupillae (meridionally arranged fibers) extending from sphincter pupillae to root of iris. The former is supplied through the oculomotor nerve with parasympathetic fibers derived from the ciliary ganglion, the latter by sympathetic fibers from the sup. cervical ganglion.

The color of the iris depends on the pigment in the stroma cells and in the cells of the retinal layers.

SEE aniridia, aquocapsulitis, chorooiditis, heterochromia iridis, "irid-" words

I. bombé. Seen in annular post. synechia (seclusio pupillae). The iris is bulged forward by the pressure of the aqueous humor which cannot reach the ant. chamber.

I., chromatic asymmetry of. Difference in color of the two sides. One may be blue or gray and the other brown. May occur in early iritis or cyclitis. A normal condition except in those of neuropathic tendencies.

I., contraction reflex. Normal contraction on exposure to light.

I., piebald. Dark discoloration in irregularly shaped area. May be in one or both eyes.

Irish moss. A genus of seaweeds; *Chondrus crispus*.

Iritic (i-rit'ik) [G. *iris*, iris]. Rel. to the iris.

Iritis [' + itis, inflammation]. Inflammation of the iris.

Sym: Pain, photophobia, lacrimation, diminution of vision, the iris appears swollen, dull, and muddy; the pupil is contracted, irregular and sluggish in reaction.

Treatment: *Constitutional* (sweating, catharsis, etc., internal medication for pain, and directed toward etiological factors). *Local* (atropine, diionin, local heat in form of compresses, dark glasses).

I., plastic. I. in which the fibrinous exudate forms new tissue.

I., primary. When the process develops in the iris itself. Seen in general diseases as syphilis, tuberculosis; metastatic in infectious diseases, gonorrhea and focal infections, also occurs in trauma and sympathetic ophthalmia.

I., purulent. One with a purulent exudate.

I., secondary. When the inflammation spreads from neighboring parts as diseases of cornea and sclera.

I., serous. Serum forming the exudate.

Iridomy (i-rit'o-mi) [' + tomé, incision]. Formation of an artificial pupil. **Syn:** *tridotomy*.

Iron [A.S. *iren*] (L. *ferrum*). **Sym:** Fe. A metallic element widely distributed

in nature. Atomic weight 55.85. Its compounds (oxides, hydroxides, salts) exist in two forms: ferrous, in which iron has a valence of two, and ferric in which it has a valence of three. It is widely used in the treatment of certain forms of anemia. Its compounds have an astringent and styptic action.

Iron is essential for the formation of chlorophyll in plants, although it is not a constituent of chlorophyll. It is an essential constituent of hemoglobin.

Functions. Iron is necessary for life, being an essential component of hemoglobin and essential for the formation of red blood corpuscles and also a component of certain respiratory enzymes, esp. the cytochrome system. It plays a role in the nutrition of epithelial tissues. There are approximately 3 Gm. of iron in the adult body, distributed as follows: 65% in hemoglobin, 15% in the reticuloendothelial tissues (liver, spleen, bone marrow) and 20% in remaining tissues. Iron is stored in the tissues principally as *ferritin*. Iron is absorbed from the food in the small intestine; it passes, in the blood, to the bone marrow, here it is used in making red corpuscles. A corpuscle, after circulating in the blood for a few weeks, is destroyed by the liver, and its iron is used over again. About 0.012 Gm. of iron is lost by a woman in the course of each average menstrual period, hence the normal, nonpregnant woman does not need much more iron than does a man.

Copper in the food is necessary for the utilization of iron. It is stored in the body and is reused repeatedly. The infant's food is poor in iron so it draws upon its store to such an extent that its reserve supply may be exhausted before the child is six months old. 10-16 mg. of iron per day are necessary in the diet of the average person. 0.015 Gm. is the normal amt. obtained from daily intake of food, this being equal to the daily loss. 25 mg. are needed in anemia.

Iron also acts as a means of transportation of oxygen. It is needed for tissue respiration, the development of blood cells, hemochromagen synthesis and for the normal complexion. Various forms of iron are used in medicine.

Manganese and cobalt, in addition to copper, are necessary for proper utilization of iron.

Iron, as a component of hemoglobin, is essential in the transportation of oxygen. It is needed for tissue respiration, the development of blood cells, hemochromagen synthesis, and for the normal complexion. Various forms of iron are used in medicine.

DEFICIENCY Sym: Anemia, lowered vitality, pale complexion, retarded development, decreased red blood cells and hemoglobin.

Sometimes a disturbance in iron metabolism occurs in which an iron-containing pigment, *hemosiderin*, and *hemofusarin* are deposited in the tissues. This gives rise to *hemochromatosis*. Excessive deposition of hemosiderin in the tissues such as may occur as a result of excessive breakdown of red cells is called *hemosiderosis*.

Sources. Ex. Almonds, apricots, bran, beans, cauliflower, celery, chard, dandelions, Boston brown bread, Graham bread, egg yolk, kidney, lettuce, liver, oatmeal, oysters, soy beans, whole wheat. Good. Apricots, beans, figs, green beans, beef, cabbage, cucumbers, currants, dates, duck, goose, lamb, molasses, oranges, parsnips, peppers, peas, potatoes, prunes, radishes, raisins, rhubarb, pineapples,

tomatoes, peanuts, turnips, cornmeal, mushrooms. There is less iron in carrots and milk than in other foods. Recent investigations show that only 50% of the iron in spinach and some other vegetables is assimilable by the body.

I. arc. One of the commonly employed sources of ultraviolet radiation for therapeutic purposes

I., high diet. Foods rich in iron and blood building substances are emphasized, i. e., liver, beef heart, kidney, red meats, green leafy vegetables (esp. spinach), apricots, peaches, raisins, apples, prunes, molasses

Irr'omy [*G. iris, iris, + tomē, incision*]. Formation of an artificial pupil. **Syn.** *tridotomy, tritomy.*

Irra'diate [*L. irradiāre, to illumine*]. To administer x-rays or other forms of radiation.

Irra'diating [*L. irradiāre, to illumine*]. Diverging or spreading out from a common center.

Irradia'tion [*L. irradiāre, to illumine*]. 1. Therapeutic application of roentgen rays, radium rays, ultraviolet rays or other radiation to a patient. 2 Application of form of radiation to an object or substance to give it therapeutic value, or increase that which it already has. 3 Phenomenon in which a bright object on a dark background appears larger than a dark object of the same size on a bright background. 4 The spreading in all directions from a common center for exam nerve impulses, the sensation of pain

R.S. Grenz ray, heliotherapy, radium, roentgen ray and ultraviolet

I., Interstitial. Therapeutic irradiation by the insertion into the tissues of capillary tubes containing radon.

I. of reflexes. The spread of a reflex to an increasing number of motor units upon increasing the strength of the stimulus

Irr'educible (*Ir-re-du'si-bl*) [*L. in, not, + re, back, + ducere, to lead*]. Not capable of being reduced, or made smaller.

Irr'e'vance [*' + relevans, raising*] **Psy** Giving an answer not in harmony with question

Irr'espirable (*Ir'rē-spi'ra-bl*) [*' + re-, again, + spirāre, to breathe*]. Unfit for breathing as a gas, or incapable of being breathed.

Ir'rigate [*L. in, into, + rigāre, to carry water*]. To wash out with a fluid.

Ir'riga'tion [*' + rigāre, to carry water*]. The cleansing of a canal by the injection of water or other fluids as an enema, or the washing of a wound.

From 2-3 pt. of saline or antiseptic solution at 103° F. are used for wounds.

I., bladder. Washing out of bladder for treatment of inflammation.

NP: Articles Needed. The same as for a catheterization plus Sterile funnel about 3 in. diameter. Solution ordered, in sterile pitcher, covered and warmed to 105° F. Bedpan.

If medication is ordered for instillation following irrigation have it ready in medicine glass covered with fold of sterile gauze

Note: The irrigating can with tubing and a tapered glass connector may be used instead of the pitcher and funnel. A return-flow or double glass catheter may be used. This must have a 6 in. piece of small caliber rubber tubing on its inflow branch to connect with glass connector.

Procedure. 1. The patient may be placed on the bedpan and catheterized

or she may be catheterized first and the pan put in place after that. 2 Catheterize but do not remove catheter. 3. Attach funnel to free end of catheter. Do not put your fingers *inside* funnel. 4. Hold funnel up and pour full of solution, allowing almost all of it to run in, then refilling. Do this 3 times and the 4th time fill funnel and turn it down quickly toward bedpan. This will siphon off contents of bladder. 5 Repeat until amount of solution ordered has been used or until solution returns clear. 6 If irrigating can is used, attach small end of connector to catheter and let 4 oz. of solution flow in gently. Detach catheter and allow fluid to run out into bedpan. Repeat. 7. If return-flow catheter is used just keep solution running gently, as it will return by other side of catheter. 8 Run medication ordered through catheter as soon as irrigation is finished. 9 Care for patient and equipment. 10 Record treatment.

BLADDER IRRIGATION Time By whom done. Solution used Kind. Amount. Temperature Appearance of return flow. Bloody Mucus shreds, etc Medication instilled. Reaction of patient.

I., colonic. The flushing of the colon with water. **SEE** colonic i., enema.

Ir'riga'tor [*' + rigāre, to carry water*]. Device with hose attachment used for purpose of flushing or washing a part or cavity with fluids

I., Hyam's. Instrument for applying prolonged irrigation to the urethra, cervix, and vagina, with hot solutions at an exact temperature under accurate control.

Ir'ritability [*L. irritāre, to tease*]. 1 Excitability. 2 The ability to respond in a specific way to a change in environment, a property of all living tissue. 3 Condition in which a person, organ, or a part responds excessively to a stimulus. 4 Quick response to annoyance, impatience

I., muscular. Normal response of muscle to a stimulus

I., nervous. Response of a nerve to stimulus

Ir'ritable [*L. irritāre, to tease*]. 1 Capable of reacting to a stimulus. 2 Sensitive to stimuli

I., heart. **Syn** *neurocirculatory asthenia, q.v., effort syndrome, soldier's heart*. A syndrome characterized by forceful uncomfortable heart beats, tachycardia, auricular flutter and fibrillation, faintness, fatigue and other symptoms

I., joint. A condition sometimes following a sprain, marked by recurring attacks of acute or subacute inflammation

Ir'ritant [*L. irritāre, to tease*]. An agent which, when used locally, produces more or less local inflammatory reaction. Anything which induces or gives rise to irritation. **Ex** *todine*

I., poisons. These include a large number of poisons of great variety, not including the corrosive acids or alkalies. They cause pain in the mouth, esophagus, and stomach, nausea, vomiting, and great thirst, abdominal cramping, bloody diarrhea, and diminished urine.

TREATMENT: Varies. **See:** name of poison.

Irrita'tion [*L. irritāre, to tease*]. 1. Reaction to that which is irritating. 2. Extreme reaction to pain or pathological conditions. 3. Normal response to stimulus of a nerve or muscle.

I., spinal. A neurastenic condition

characterized by tenderness along the spinal column, numbness and tingling in the limbs, and susceptibility to fatigue

I., **sympathetic**. The response of an organ to irritation in another organ

Irritative [L. *irritare*, to tease]. Pert. to that which causes irritation

Irromation (ir-ru-ma'shun) [L. *irromare*, to give suck] Form of perversion marked by intromission of the penis into another individual's mouth **SYN** *fellatio*

Isambert's disease (e-zahm-bairz). Tuberculosis ulceration of the larynx and pharynx

Ischemia (is-ke'mi-ä) [G. *ischēin*, to hold back, + *aima*, blood] Local and temporary anemia due to obstruction of the circulation to a part

Ischesis (is-ke'sis) [G. *ischēin*, to hold back]. Suppression of a discharge, esp. a normal one

Ischiac, **ischial** (is'ki-äk, is-ki-ad'ik) [G. *ischion*, hip] **SYN** *ischiatric*. Pert. to the hipbone esp. the ischium

Ischial (is'ki-al) [G. *ischion*, hip] Pert. to the ischium

Ischialgia (is-ki-äl'i-ä) [+ *algos*, pain]. Neuralgic pain in the hip **SYN** *sciatica*

Ischiatic (is-ki-at'ik) [G. *ischion*, hip] Pert. to the ischium or hipbone **SYN** *sciatic*

Ischialitis (is-ki-äl'i-tis) [+ *-itis*, inflammation] Sciatic nerve inflammation

Ischidrosis (is-ki-dro'sis) [G. *ischēin*, to hold back, + *idrosis*, sweat] Suppression of perspiration

Ischio- [G.] Prefix pert. to the ischium.

Ischiobulbar (is'ki-o-bul'bar) [G. *ischion*, hip, + L. *bulbus*, bulb] Rel. to the ischium and urethral bulb

Ischiocavernosus. 1 A muscle extending from the ischium to the penis or clitoris. It assists in the erection of these structures. 2 Pert. to the ischium and corpora cavernosa of the penis or clitoris

Ischiocele (is'ki-o-sēl) [+ *kēlē*, hernia]. Hernia through the sciotic notch

Ischiococcygeus (is'ki-o-kok-si'f'e-us) [+ *kokkyz*, coccyx] 1 Musculus coccygeus 2 Post. portion of the levator ani

Ischiofemoral (is'ki-o-fem'or-al) [+ L. *femur*, femur-, thigh]. Rel. to the ischium and femur

Ischiofibular [+ L. *fibula*, buckle]. Rel. to the ischium and fibula

Ischiohebotomy (is'ki-o-he-bot'o-mi) [+ *ēbē*, pubes, + *tomē*, a cut] Division of ascending ramus of the pubes, and of the ischiopubic ramus. **SYN** *ischiopubiotomy*

Ischiomenia (is-ki-o-me'nī-ä) [G. *ischēin*, to check, + *mēnes*, menses]. Suppression of the menses. **SYN** *ischomenia*

Ischioneuralgia (is-ki-o-nu-räl'i-ä) (G. *ischion*, hip, + *neuron*, nerve, + *algos*, pain). Neuralgic pain in the hip. **SYN** *sciatica*

Ischiopubic (is-ki-o-pu-bik) [+ L. *pubes*, the pubes]. Rel. to the ischium and pubes

Ischiopubiotomy (is'ki-o-pu-bi-ot'o-mi) [+ *tomē*, a cut, incision]. Division of the ischiopubic ramus and ascending ramus of the pubes **SYN** *ischiohebotomy*

Is'chiorectal [+ L. *rectus*, straight] Pert. to the ischium and rectum.

I., **abscess**. * Collection of pus in fatty cavity on either side of rectum.

If it breaks internally into the rectum an anal fistula may result.

Ischium (is'ki-um) (Pl. *ischia*) [G. *ischion*, hip]. Post. and inferior parts forming

the lower portion of innominate or hipbone.

Ischochymia (is-ko-ki'mi-ä) [G. *ischēin*, to check + *chymos*, chyme]. Retention of food in dilatation of the stomach

Ischogalactic (is-ko-gal-ak'tik) [+ *gala*, galact-, milk]. 1 Causing suppression of breast milk. 2 Agent which checks milk secretion **SYN** *antigalactic*, *lactifuge*

Ischomenia (is-ko-me'nī-ä) [+ *mēnes*, menses]. Menstrual suppression or retention.

Ischoretic (is-ku-ret'ik) [+ *ouron*, urine] 1 Relieving or pert. to ischuria 2 That which relieves urinary retention or suppression

Ischuria (is-ku'ri-ä) [+ *ouron*, urine]. Suppression or retention of the urine

Island (i'land) [AS *igland*]. A structure detached from surrounding tissues, or characterized by difference in structure, an islet

I., **of Langerhans**. An islet of Langerhans, *q.v.*

I., **pancreatic**. An islet of Langerhans, *q.v.*

I., **of Reil**. The *insula*, a lobe of the cerebral cortex comprising a triangular area lying in the floor of the lateral or sylvian fissure. It is overlapped and hidden by the gyrus of the fissure which constitute the operculum of the *insula*

Islet (i'lēt) [Fr. *isle*, island] A tiny isolated mass of 1 kind of tissue within another type

I., **of Langerhans**. Isolated masses of cells located in the pancreas, consisting of three types of cells, alpha or A cells, beta or B cells, and D cells. The islets produce the internal secretions of the pancreas which include *insulin*, the antidiabetogenic hormone, and *glucagon*, a hyperglycemic-glycogenolytic factor (HFC). Destruction or impairment of the functioning of the islets gives rise to diabetes. *q.v.*

-ism [G. *ismos*]. Suffix. Condition, or theory of principle or method

iso- [G.] Combining form meaning equal

isoagglutinin (i-so-ag-glū'tin-in) [G. *isos*, equal, + L. *agglutinare*, to glue to] Antibody in a serum which agglutinates the blood cells of those of the same species from which it is derived.

RS: agglutinin, blood grouping, *iso-hemagglutinin*

I''so-ag-glū'tin-o-gen. One of two substances designated A and B which may be present in red blood cells. Cells containing these substances become agglutinated when mixed with serum containing corresponding isoagglutinins (anti-A or anti-B)

isobare (i'so-bär) [+ *baros*, weight]. One of two or more chemical bodies having same atomic weight, and which may have similar or unlike properties

I'sobody [+ A. S. *bodig*, body]. An antibody acting on animals of the same species, from which it is derived.

isocellular [+ L. *cellula*, little cell]. Composed of equal and similar cells

isochromatic (i-so-kro-mat'ik) [+ *chrōma*, color]. Having the same color.

isochromatophil (i'so-kro-mat'o-fil or fil) [+ *philein*, to love]. Having same affinity for a dye

isochronal (i-so-kro-nal) [+ *chronos*, time]. Acting in uniform time, or taking place at regular intervals

isochronic [+ *chronos*, time]. Performed in uniform time or at regulated intervals. **SYN** *isochronal*

isochronous (i-sok-ro-nus) [+ *chronos*, time]. Performed in equal time. **SYN:** *isochronal*

isochroous (i-sok'ro-us) [+ *chroa*, color]

Of uniform color. SYN *isochromatic*.

isocolloid (i-so-kol'oid) [+ *kollōdēs*, glutinous] A colloid having the same composition in every transformation.

isocomplement [+ *L. complere*, to complete]. One from the same individual or species which provides the amboceptor.

isocoria (i-so-kō'rī-ā) [+ *kore*, pupil]. Equality of diameter of pupils.

i'so-cort'ex. SYN *homogeneous cortex*. The neopallial cortex consisting of six horizontal layers of nervous tissue.

isocytotoxin (i'so-si'tō-tox'sin) [+ *kytos*, cell, + *toxikon*, poison] A cytotoxin destructive to cells of the same species from which it is derived.

isodactylism (i-so-dak'til-izm) [+ *daktylos*, finger, + *ismos*, state] Condition of having fingers and toes of equal length.

isodiometric (i'so-di-a-met'rik) [+ *ais*, across, + *metron*, measure] Having equal diameters.

isoelectric (i-so-e-lek'trik) [+ *elektron*, amber]. Having equal electric potentials.

i'soenergetic [+ *energeia*, energy] Showing equal force.

isogam'ete [+ *gametē*, husband or wife]. A cell which, through conjugation or fusion with a similar cell, reproduces.

isogenesis (i-so-jen'es-is) [G *isos*, equal, + *genesis*, production] Similarity in morphological development.

i'sograft [+ *L. graphium*, grafting knife.] A graft taken from another individual or animal of the same species. OPP *autograft*. SEE *heterograft*.

isohemagglutinin (i'so-hem-ag-glu'tin-in) [+ *aima*, blood, + *L. agglutināre*, to glue to] Substance normally present in most human blood serum and responsible for the clumping of corpuscles observed when incompatible bloods are mixed.

The clumping is ascribed to the interaction of an agglutinin in the corpuscles with a specific agglutinin in the foreign serum. In transfusions, the corpuscles of the donor are exposed to an overwhelming quantity of the recipient's plasma, therefore the agglutinin content of the donor's corpuscles and the agglutinin content of the recipient's serum are the factors which determine compatibility.

Assuming that there are but two possible agglutinogens, red corpuscles from a given donor may contain both, either, or neither. If the agglutinin, *alpha*, can react only with agglutinin A, one can construct a table from which compatibilities can be deduced (Jansky system). See table.

Literature, particularly rules as to interpretation of blood groups, must be interpreted cautiously because of the wide use of an alternative system of numbering in which groups I and IV of the above system are interchanged. SEE *blood grouping, table, below*.

i'sohemol'ysin [+ *aima*, blood, + *lysis*, dissolution] Substance destroying red blood corpuscles of animals of same species from which it is obtained. SEE *hemolysin*.

i'sohemol'ysis [G *isos*, equal, + *aima*, blood, + *lysis*, dissolution]. Action of an isohemolysin.

isohypercytosis (i'so-hi'per-si-to'sis) [+ *yper*, above, + *kytos*, cell, + *-ōsis*]. Increase of leukocytes, the proportion of varieties being unchanged.

isohypocytosis (i'so-hi'po-si-to'sis) [+ *ypo*, under, + *kytos*, cell, + *-ōsis*]. De-

crease in number of leukocytes with proportion of varieties unchanged.

isocoria (i'so-i-kō'rī-ā) [+ *eikōn*, image]. Equality in size of two retinal images.

isoeonic (i'so-i-kō'n'ik) [+ *eikōn*, image]. Having equal retinal images.

is'oimmuniza'tion. Immunization of an individual against the blood of an individual of the same species, esp the development of Rh-agglutinins in an Rh-mother in response to agglutinogens present in transfused Rh + blood or developed in a Rh + fetus.

i'solate [It. *isolare*, from *L. insulāre*, to detach] 1. To separate or detach from other persons, as during an infectious disease. 2. To free from a chemical combination.

isolation [It. *isolare* from *L. insulāre*, to detach] Limitation of movement and social contacts of patient suffering from, or a known carrier of communicable disease, in contradistinction to *quarantine*, which limits the movements of exposed or contact persons. SYN *sequestration*. 2. SEE *quarantine*.

i. ward. Hospital ward where patients suffering from communicable diseases may be kept apart from the rest of the patients.

isoleucine (i-so lu'sen) An amino-acid formed during hydrolysis of fibrin and other proteins.

isolophobia (i-so-lo-fō'bī-ā) [L *insulāre*, to detach, + G. *phobos*, fear]. Fear of being alone.

isolyisin (i-sol'is-in) [G. *isos*, same, + *lysis*, dissolution] Substance which dissolves red corpuscles of animals of the same species from which it is obtained. SYN *isohemolysin*.

isol'ysis [+ *lysis*, dissolution] Destruction of red blood corpuscles produced by an isolyisin. SYN: *isohemolysis*. SEE *hemolysis*.

isolytic [+ *lysis*, dissolution]. Rel. to isolyisins.

isomer (i'so-mer) [+ *meros*, part] One of a set of chemical substances having an equal number of atoms, but different order of atomic arrangement in the molecule. SEE *metamer*, *polymer*.

isomeric (i-sō mer'ik) [G *isos* same, + *meros*, part] Pertaining to isomerism. *qv*

isomerism (i-som'er-izm) [+ *meros*, part, + *ismos*, state of] State of being composed of compounds of the same number of atoms, but having different atomic arrangement in the molecule. SEE *metamerism*, *polymerism*.

isomet'ric [G *isos*, equal, + *metron*, measure] Having equal dimensions. OPP *isotonic*.

i. contraction. C of a muscle in which shortening is prevented. Tension is developed, but no mechanical work performed, all energy being liberated as heat.

i. contraction phase. The first phase in contraction of the ventricle in which ventricular pressure increases but there is no decrease in volume of contents because semilunar valves are closed.

i. muscle. PHYS: Contraction in which a muscle increases its tension without shortening.

isometro'pia [+ " + *ōps*, eye]. Same retraction of the two eyes.

isomorph'ism [+ *morphē*, form, + *ismos*, state of]. Condition marked by possession of the same form.

isomorphous (i-so-mor'fus) [+ *morphē*, form]. Possessing the same shape.

isonormocytosis (i'so-nor'mo-si-to'sis) [+

+ *L. norma*, rule, + *G. kytos*, cell, + *-osis*. State of having leukocytes normal in number and proportion of varieties.

isop'athy [' + *pathos*, disease] Therapeutic administration of the virus that caused the disease.

isophoria (i-so-to'ri-ā) [' + *phorein*, to carry]. Equal tension of vertical muscles of the eyes with visual lines in same horizontal plane, both hyperphoria* and hypophoria* being absent

iso'plastic. Term applied to a graft taken from one individual and transplanted to another of the same species

iso'se'rother'apy [' + *L. serum*, whey, + *G. therapeia*, therapy] Treatment with serum from one having had the same disease as the patient

isoserum [' + *L. serum*, whey] A serum from one having the disease for which a patient is to receive treatment

isosporea. A genus of *Sporozoa* belonging to the order *Coccidia*

i. hominis. A parasitic protozoan inhabiting the small intestine of man. It is nonpathogenic

isosthenuria (i-so-she-no'ri-ā) [' + *sthenos*, strength, + *ouron*, urine] The decreased variation in specific gravity of nephritic urinary specimens

isostimula'tion [' + *L. stimulāre*, to excite] Cell stimulation by injection of the same cell substance

isother'apy [' + *therapeia*, treatment] Treatment by active causal agent of a disease. *SYN isopathy*

isother'mal [' + *thermē*, heat] Of an equal degree of heat

isothermognosis (i'so-ther-mog-no'sis) [' + " + *gnosis*, knowledge] Abnormal perception in which stimulation by pain, heat, and cold are all felt as heat

isotonia [' + *tonos*, tone, tension] The maintenance of equal tension in two solutions or substances

isotonic (*G isos*, equal, + *tonos*, tension) 1. Having the same tension or tone

2. Having the same osmotic pressure, i.e. *isosmotic* *OPP isometric*

i. muscle contraction. Muscle contraction in which tension developed is less than resistance of load, hence muscle shortens and mechanical work is performed

i. solutions. Those having the same osmotic pressure

isotonicity (i-so-to-nis'ti) [*G isos*, equal, + *tonos*, tension] The state or condition of being isotonic

isotope (i'so-tōp) [*G isos*, equal, + *topos*, part] One of a series of chemical elements which have nearly identical chemical properties but which differ in their atomic weights

isotropic (i-so-tro'pik) [' + *tropos*, a turning]. 1. Possessing similar qualities in every direction. 2. Having equal refraction.

isotyp'ical [' + *typos*, type] Belonging to the same variety or classification

issue (is'shu) [*O Fr*; from *L exire*, to go out]. 1. Offspring 2. A suppurating sore maintained by a foreign body in the tissue and acting as a counterirritant

i. pea. Small round foreign body used in tissues as a counterirritant

-ist [*G istēs*]. Suffix. One who or an agent that does

isthmectomy (is-mek'to-mī) [*G isthmus*, narrow passage, + *ektomē*, excision]. Excision of an enlarged isthmus, esp of the thyroid gland. *SYN median strumectomy*.

isthmian (is'mī-an) [*G isthmus*, narrow passage]. Rel. to an isthmus.

isthmitis (is-mī'tis) [' + *-itis*, inflammation] Inflammation of the throat or fauces.

is'thmochole'sis [' + *cholē*, bile, + *-osis*]. Catarrh of fauces accompanied by bilious disturbances

isthmoparalysis (is'mo-par-al'i-sis) [' + *paralysis*, a loosening] Paralysis of the muscles of the fauces. *SYN isthmoplegia*.

isthmoplegia (is'mo-ple'ji-ā) [' + *plēgē*, a stroke] Facial paralysis.

isthmospasm [' + *spasmus*, spasm]. Isthmian spasm, as of the fauces or of the fallopian tubes

isthmus (is'mus) [*G. isthmus*, narrow passage] 1. A narrow passage connecting two cavities 2. A narrow structure connecting two larger parts

3. A constriction bet two larger parts of an organ, or anatomical structure

i. aortic. Constriction in fetal aorta between ductus arteriosus and left subclavian artery. Sometimes persists in adults

i. of eustachian tube. Narrow portion of eustachian tube

i. faucium. Path bet fauces and mouth.

i. pharyngeal. Opening between naso- and oral pharynx

i. of thyroid. Band joining thyroid lobes

i. of uterine tube. The narrow portion nearest the uterus

i. of uterus. Transverse constriction between cervix and body

isu'ria [*G isos*, equal, + *ouron*, urine] Excretion of urine at a uniform rate, hour by hour

itch [*A S. giccan*, to itch] 1 Irritation of skin, inducing desire to scratch. *SYN. pruritus* 2 Scabies. *SEE Names in alphabetical order*

ETIOI. Many diseases, bacteria, molds, animal parasites, allergy, urticaria, and possibly some mental states. *Ex* Body louse, chilblains, folliculitis, heat and irritation, jaundice, cancer, and particularly diabetes

TREATMENT. Depends upon cause. Calcium used if due to allergy. Rest, soothing lotions, and freedom from mental distress

i. mite. *Sarcoptes scabiei*.

itch'ing. Pruritus. Irritation of the skin, causing desire to rub or scratch the part

-ite [*G i*]. Suffix denoting *of the nature of*. In chemistry a salt of an acid having the termination *-ous*.

it'er [*L a way*] Passageway bet. two anatomical parts

i'teral. Pert to an iter

ithycyphosis, ithyokypshosis (ith'i-si-fō'sis, ith'i-o-ki-fō'sis) [*G ithus*, straight, + *kyphos*, humped]. Kyphosis with backward projection

ithylordosis (ith'i-lor-dō'sis) [' + *lordōsis*, a bending forward]. Lordosis without lateral curvature of the spine

-itis (i'tis) [*G i*]. Suffix *inflammation of*.

I.U. Abbr. for immunizing unit *International unit*.

I'vy poisoning. Dermatitis caused by contact with poison ivy

The plant is easy to recognize, inasmuch as its leaflets are always in groups of three and rather thick and shiny. The toxic principle is found only in the sap. The sap, fresh or dry, is found in or on practically all parts of the plant.

IMMUNITY. There is no absolute immunity to ivy poisoning though the susceptibility varies enormously even in the same individual

SYM: Always an interval bet. time of contact of poison with skin and first appearance of symptoms, varying from

a few hours to several days, and depending on amount of poisoning, on susceptibility of the patient, and possibly condition of skin. Moderate itching or burning sensation soon followed by small blisters, later manifestations vary. May be swelling, or a flat area (papules), or diffuse swelling, skin becoming red and swollen, swelling being deep and boggy. This may not come on for several days.

As blisters increase some break and skin is covered with constant coating of serum, accompanied by marked discomfort, which feels like a combination of burning, itching, heaviness, and increased sensitiveness, and there is limitation of motion. May have increase in temperature, and prostration. Duration varies from several days to approximately two or three weeks.

P. A. TREATMENT Locally, most advisable treatment is to wash carefully soon after contact with a yellow soap and water, followed by repeated swabbings of alcohol. After this procedure, do not bathe as there is tendency to spread to unaffected parts. A 5% solution of ferric chloride has long been used, and 10% sodium thiosulfate as a wet dressing is helpful. The antihistaminic drugs, benadryl, pyribenzamine, etc., aid in overcoming the dermatitis and may be given in large dosage at bedtime, since they have a tendency to cause sleepi-

ness. Paraldehyde in a dose of $\frac{1}{2}$ ounce also is useful to give a restful night. Cortisone and ACTH often give dramatic results but should be reserved for the very severe cases.

Ixo'des. A genus of ticks, many of which are parasitic on man and animals. They are of importance as transmitters of disease to domestic animals and man. Among pathogenic organisms transmitted are those causing tick paralysis in domestic animals and tularemia in man.

ixodiasis (iks-o-di'a-sis) [G. *ixôdês*, like birdlime] 1. Lesions of the skin caused by tick bites. 2. Any disease caused by ticks, as Rocky Mountain fever.

ixodic (iks-od'ik). Pert. to or caused by ticks.

ixodidae. A family of ticks belonging to the order *Acarina*, class *Arachnida*. Comprises the hard-bodied ticks including the genera *Ixodes*, *Amblyomma*, *Hyalomma*, *Haemaphysalis*, *Rhipicephalus*, *Boophilus* and *Dermacentor*. All are parasitic and of importance as pests or in the transmission of disease in domestic animals and man. Among diseases transmitted are Rocky Mountain spotted fever, anaplasmosis, tularemia, brucellosis, and several others.

ixomyelitis (iks-ô-mi-e-l'i'tis) [G. *ixôdês*, like birdlime, + *myelos* marrow, + *-itis*, inflammation] Inflammation of the spinal cord in the lumbar region.

J. Symb for the *joule* and for *Joule's equivalent*.

Jaboulay's button (zhah-oo-lā'). Two cylinders which may be screwed together for lateral intestinal anastomosis.

Jaccoud's sign (zhā-koo'). 1. Movement of chest wall in adherent pericardium, indicating leukemia. 2. Irregular and low pulse with raised temperature in adult tuberculous meningitis.

Jack-et [Fr. *jaquette*, from Sp *jaco*, jacket]. A plaster of Paris or leather bandage applied to the trunk to immobilize spine or correct deformities.

J., Sayre's. Plaster of Paris jacket used as a support for deformity of the spinal column.

J., strait. Device for restraining the arms of a violently insane person. SYN *camisole*.

J., Willock's respiratory. A type of jacket for strengthening the respiratory movements in emphysema of the lungs.

Jack-knife or reclining position. The patient lies on the back with shoulders elevated, thighs flexed on abdomen, legs on thighs, the thighs being at right angles to the abdomen. Employed when passing a urethral sound.

Jack-screw. A threaded screw to expand the arch in regulating teeth.

Jacksonian epilepsy. A localized form with spasms confined to one part or one group of muscles. SEE *epilepsy*.

Jacob's membrane. Retinal layer of rods and cones.

J.'s ulcer. Epithelioma, usually of the face, which slowly eats away soft tissue and bones. SYN *rodent ulcer*.

Ja'cobson's cartilage. One of two narrow longitudinal cartilages lying along anterior portion of inferior border of nasal septum. They are rudimentary in man.

J.'s nerve. Nervus tympanicus.

J.'s organ. SYN *vomeronasal organ*. Rudimentary sac in nasal septum.

J.'s sulcus. Portion of middle ear containing branches of tympanic plexus.

Jacquemier's sign (zhak-me-ār'). Blue or purplish color of the vaginal mucosa, indicating pregnancy.

Jactitation (jak-ti-tā'shun) [L. *jactitare*, to toss]. Convulsive movements. Restless tossing. Changing from one posture to another, usually characteristic of severe mental and febrile affections.

J., periodic. Chorea.

Jadelot's lines, furrows, or traits (zhad-loz'). Three lines on the face, said to indicate disease in children.

J.'s labial l. Down from corner of mouth, seen in respiratory diseases.

J.'s nasal l. From lower border of ala nasi about outer side of orbicularis oris muscle, seen in abdominal disorders.

J.'s ocular l. From inner canthus toward glenoid fossa, observed in cerebral disease.

Jaeger's test types (ya'gerz). Lines of type of various sizes, printed on a card for testing close visual acuteness.

Jail fever. Typhus fever, *q.v.*

Jaksch's anemia or disease (yakshs). Infantile anemia with lymphatic enlargement and changes in spleen. SYN *infantile pseudoleukemia*.

jal'ap, USP. The dried tuberous root of the plant of the same name.

Action and Uses. Purgative, in the form of compound powder.

Dosage. 15 gr. (1.0 Gm.).

James' powder. Official antimonial powder.

James' town weed. Antispasmodic and local anodyne. Old name for Jimson weed (*stramonium*). *q.v.*

Poisoning. F. A TREATMENT. Same as atropine, *q.v.*

Janet's disease (zhā-nez'). A neurosis characterized by obsessions and phobias.

SYN *psychasthenia*.

Japanese method (of resuscitation). Drawing forward the tongue and making rapid passes with paper fans soaked in water and aqua ammonia. The object is to get as much of the vapor of ammonia into the lungs as possible.

Jargon [O Fr. a chattering]. Unintelligible speech. SYN *paraphasia*.

Jar'gonaphasia [' + G *a-*, priv., + *phasis*, speech]. A form of aphasia* in which words are jumbled so that speech is unintelligible. SYN *paraphasia*.

Jar'vis' snare. A snare for removing growths.

jaundice (jawn'dis). SYN *icterus*, *q.v.* A condition characterized by yellowness of skin, white of eyes, mucous membranes and body fluids, due to deposition of bile pigment resulting from excess bilirubin (hyperbilirubinemia) in the blood. It may result from obstruction of bile passageways, excess destruction of red blood cells, or disturbances in functioning of liver cells.

J., acathetic. Form caused by functional hepatic cell disorder.

J., acholuric. J without bile pigment in the urine.

J., black. J to an extreme degree, icterus melas.

J., catarrhal. J resulting from inflammation of the liver. Now considered identical with infectious hepatitis, *q.v.*

J., congenital. J occurring at or shortly after birth due to maldevelopment of biliary apparatus.

J., congenital hemolytic. SYN: *chronic acholuric J.*

J., spherocytic anemia. A familial, hereditary disorder characterized by increased fragility of red blood cells, splenomegaly, and hemolytic anemia.

J., hematogenous. Hemolytic jaundice, *q.v.*

J., hemolytic. An inherited, chronic disease marked by increased fragility of red blood cells. Characterized by anemia, increased destruction of red blood cells, absence of bile pigment in urine, and splenomegaly.

J., hepatocanalicular. J. resulting from changes in the bile canaliculi, the liver cells remaining relatively normal.

J., hepatocellular. J resulting from changes in liver cells.

J., hepatogenous. ETIOI: Due to catarrh of bile duct and duodenum, pressure from tumors or blood vessels, parasites, stricture of gallduct or obstruction by gallstones.

Sym: Yellow skin and mucous membranes. Light-colored feces, dark urine,

nausea, itching anorexia, and mental depression.

1. homologous serum. A form resembling infectious hepatitis. Follows injection of homologous serum containing inducing agent.

1. infectious. Infectious hepatitis, *q.v.*

1. malignant. Acute yellow atrophied condition of the liver.

1. of newborn. *J.* affecting newborn infants. *SYN.* *icterus neonatorum.*

1. obstructive. That due to a mechanical impediment to the bile flow.

SYM. 1. Symptoms of gastroduodenal catarrh usually precede, i.e., coated tongue, anorexia, fetid breath, epigastric distress, vomiting, and perhaps diarrhea, yellow skin and conjunctivae, light stools and dark urine 2 In acute cases slight fever and swelling of the liver, which is tender to touch.

PROG. Favorable, duration, few days to several weeks.

TREATMENT. Rest, liquid diet, constitutional remedies, surgery

1. parenchymatous. Hepatocellular

1. posthepatic. *J.* resulting from obstruction of flow of bile ducts. May be incomplete or complete

1. prehepatic. A rare benign form in which there is no demonstrable liver damage. Also called *familial nonhemolytic jaundice*

1. regurgitation. *J.* due to bile entering lymph channels of the liver and thence being conveyed to the blood. May result from biliary obstruction or lesions involving bile capillaries.

1. retention. *J.* resulting from inability of liver cells to remove bile pigment from circulation

1. spirochetal. *SYN.* *Weil's disease*. An acute infectious disease due to a spirochete, *Leptospira icterohaemorrhagiae*

1. toxic. *J.* resulting from bacterial toxins or poisons such as phosphorus, arsenamine, carbon tetrachloride, etc.

1. xanthochromic. *J.* without bile pigment in the urine, but with yellowish discoloration of soles and palms

jaw [Mid Eng *jawe*, from A S *cheowen*, to chew]. Either or both the maxillary and mandibular bones, bearing the teeth and forming mouth framework

1. dislocation of the. Such dislocations are uncomfortable and extremely embarrassing to the patient. They may occur on either side, in which instance the tip of the jaw is pointed away from the dislocation.

On the normal side, just in front of the ear, may be felt a little hollow or depression which is often tender. If both sides of the jaw are dislocated, the jaw is pushed downward and forward. In either event, there is pain and difficulty in speech and the condition is often accompanied by shock. Backward dislocation of the jaw is rare.

CAUSES. Dislocations of the jaw are most often caused by a blow to the face or a fall on the chin, but occasionally they are caused by chewing large chunks of food, by yawning, or by hearty laughing. Individuals who have frequent dislocations of the jaw should be under a doctor's care to prevent recurrence.

REDUCTION OF: These dislocations are reduced by placing well padded thumbs inside of the mouth on the lower molar (back) teeth with the fingers running along the jawbone as a lever. The thumbs should be pressed downward to-

wards the patient's lips and the fingers upward towards the patient's nose. Give a twisting motion to the jaw and at the same time with the wrist and elbows press backward toward the neck. The jaw gliding over the ridge of bone may be felt and just as this occurs the jaw usually snaps into place. When this motion is noted, it is desirable to move the thumbs outwardly towards the cheeks to avoid the thumbs being crushed bet. the molars

This snapping into place is due to an involuntary spasm of the muscles pulling the jaw as though an overstretched rubber band were attached to it. Following the reduction, an immobilizing bandage or double cravat should be applied

1. jerk reflex. Clonic movement resulting from percussing or stroking lower jaw.

1. lock. 1 Tonic spasm of jaw muscles preventing opening of mouth. 2 Tetanus, *q.v.*

1. lumpy. *SYN.* *actinomycosis*, *q.v.* Fungous disease affecting the jaw, brain, lungs and gastrointestinal tract. Common in cattle and sometimes affecting humans

1. swelling of. Lower. May be due to alveolar abscess, a cyst, gumma, sarcoma, or actinomycosis. Upper. Occurs in alveolar abscess, parotid tumor, parotitis, carcinoma, sarcoma, and necrosis of bone or disease of antrum

jaw, words pert. to: admaxillary, alveolar, alveolate, alveolus, anognathous, biomaxillary, brachygnathia, epulis, gnathic, hypognathous, jerk 1, mandible, maxilla, maxillary, ramus, submaxillary, tetanus, trismus

jaw winking. Elevation of the upper eyelid when there is depression of the lower jaw

je'orin. A glucopolipin found in the liver, spleen, muscles, and other tissues

jeccorize (jek''or-iz) To treat a food substance in such a way that it possesses the therapeutic value of cod liver oil, as the exposure of milk to ultraviolet rays

je'cur (je'kur) [L.] The liver.

jejunal (je-ju'nal) [L. *jejunum*, empty]. Rel. to the jejunum.

jejunectomy (je-ju-nek'to-mi) ["" + *G. ek-tomē*, excision] Excision of part or all of the jejunum

jejunitis (je-ju-ni'tis) [L. *jejunum*, empty. + *G. -itis*, inflammation]. Inflammation of the jejunum.

jejuno- [L.] Combining form referring to the jejunum

jejunocolostomy [L. *jejunum*, empty. + *G. kolon* colon, + *stoma*, mouth] Formation of artificial passage bet. jejunum and colon.

jejunoileitis (je-jun'o-li-e-i'tis) ["" + "" + *-itis*, inflammation]. Inflamed condition of jejunum and ileum

jejunoileostomy (je-ju''no-il-e-os'to-mi) ["" + *G. ileum*, ileum, + *stoma*, mouth]. Formation of a passage bet. jejunum and ileum.

jejunolejunostomy (je-ju''no-je-ju-nos'to-mi) ["" + *jejunum*, empty. + *G. stoma*, mouth]. Formation of a passage bet. two parts of the jejunum.

jejunostomy (je-ju-nos'to-mi) ["" + *G. stoma*, mouth]. Surgical creation of a permanent opening into the jejunum

jejunotomy (je-ju-not'o-mi) ["" + *G. tomē*, incision]. Surgical incision into the jejunum

jejunum (je-ju''num) [L. empty] The second portion of the small intestine

extending from the duodenum to the ileum. It is about 8 feet in length, comprising about two-fifths of the small intestine.

Said to be empty after death.

j., inflammation of. *Sym:* Absence of diarrhea, colic, distention of abdomen, borborygmus, flocculent or semisolid stools, containing undigested food, unchanged bile, and some mucus. Tenderness over midabdomen relieved by pressure.

jelly [*L. gelare*, to freeze]. A thick semisolid, gelatinous mass.

j., contraceptive. A jelly introduced into the vagina for the prevention of conception. It may act as an occlusive agent or it may serve as a vehicle for spermicidal substances.

j., mineral. Petrolatum, petroleum jelly.

j., petroleum. Petrolatum.

j., vaginal. A jelly introduced into the vagina for therapeutic or contraceptive purposes.

j., Wharton's. Soft gelatinous connective tissue that constitutes the matrix of the umbilical cord.

Jen'ner's stain. Folin methylene blue stain.

jerk (jerk) [*Imitative Origin*]. 1. A sudden muscular movement. 2. Term applied to certain reflex actions resulting from striking or tapping a muscle or tendon. *See reflex*.

j., elbow. External stimulation of triceps when stretched, produces involuntary extension of forearm.

j., jaw. Result of striking lower jaw with mouth open. Indicative of cerebral lesion.

j., knee. Forward jerk of foot upon striking patellar tendon, when knee is flexed at right angles. Absent in locomotor ataxia, infantile paralysis, meningitis, diabetes, destructive lesions of lower part of cord and certain forms of paralysis. Increased in affections of pyramidal areas, brain tumors, spinal irritability and sclerosis, lateral or cerebrospinal. *Syn: patellar tendon reflex.*

j., wrist. When hand is held down at arm's length, the hand being in extreme extension, lateral clonic movements of the hand occur, normal phenomenon.

jig'ger (*Dermatophilus penetrans*). *Syn: chigoe, nigua*. Common name for parasitic flea belonging to the species *Tunga penetrans*, q.v.

jim'son weed. *Stramonium*, q.v.

Jocasta complex (jo-kas'tā). A term implying a mother and son complex from part taken by Jocasta, mother in the Oedipus complex, who was the wife and mother of Oedipus.

jodium (yo'doim) [*G.*]. Iodine.

Joffroy's reflex (jof'roy). Twitching of gluteal muscles when pressure is made against buttocks.

J.'s sign. 1. Absence of facial muscle contraction when eyes turn upward in exophthalmic goiter. 2. Inability to do simple sums in arithmetic. An early sign of general paralysis.

johim'bine. Alkaloid aphrodisiac.*

joint [*L. junctura*, a joining]. An articulation. The point of juncture bet. two bones. *See Table in Appendix.*

A joint is usually formed of fibrous connective tissue and cartilage. It is classified as being immovable (*synarthrosis*), slightly movable (*amphiarthrosis*), and freely movable (*diarthrosis*).

SYNARTHROSIS: Joint in which the 2 bones are separated only by an intervening membrane, as the cranial sutures.

AMPHIARTHROSIS: 1. Joint having a fibrocartilaginous disk bet. the bony surfaces (*symphyses*), as the symphysis pubis. 2. Joint with a ligament uniting the 2 bones (*syndesmosis*), as the tibiofibular articulation.

DIARTHROSIS: Joint in which the adjoining bone ends are covered with a thin cartilaginous sheet and joined by ligament lined by a synovial membrane, which secretes a lubricant.

Grouping is according to motion. Ball and socket (*enarthrosis*), hinge (*ginglymus*), condyloid, pivot (*trochoid*), gliding (*arthrodia*), and saddle joint.

Movements of joints are of 4 kinds: **Gliding**, in which 1 bony surface glides on another without angular or rotatory movement; **angular**, occurring only bet. long bones, increasing or decreasing the angle bet. the bones, **circumduction**, occurring in joints composed of the head of a bone and an articular cavity, the long bone describing a series of circles, the whole forming a cone, and **rotation**, in which a bone moves about a central axis without moving from this axis. In angular movement, if it occurs forward and backwards, it is called **flexion and extension**; away from the body, **abduction**, and toward the median plane of the body, **adduction**.

INJURIES: Contusions, sprains, dislocations and penetrating wounds.

j., amphidiarthrodial. J. both ginglymoid and arthrodial.

j., arthrodial. *See gliding j.*

j., ball and socket. J. in which round end of one bone fits into cavity of another bone. *Syn: enarthrosis.*

j., biaxial. J. possessing two chief movement axes at right angles to each other.

j., bilocular. J. separated into two sections by interarticular cartilage.

j., bleeders'. J. hemorrhage in hemophiliacs.

j., Brodie's. Arthrodial neuralgia due to hysteria.

j., Budin's. Congenital cartilaginous band bet. squamous and condylar parts of the occipital bone.

j., capsule. The sacklike structure which encloses the ends of bones in a diarthrodial joint. Consists of an outer fibrous and an inner synovial layer and contains synovial fluid.

j., cavity. The articular cavity or space enclosed by the synovial membrane and articular cartilages. It contains synovial fluid.

j., Charcot's. A disease in advanced syphilis. Wasting away of muscles below the joint.

j., Chopart's. Union of remainder of tarsal bones with os calcis and astragalus.

j., cochlear. Hinge j. permitting lateral motion.

j., compound. J. made up of several bones.

j., condyloid. J. permitting all forms of angular movements except axial rotation.

j., Cruveilhier's. Atlanto-odontoid j.

j., diarthrodial. A joint characterized by the presence of a cavity within the capsule separating the bony elements, thus permitting considerable freedom of movement.

j., dry. Arthritis of chronic villous type.

j., ellipsoid. J. having two axes of motion through the same bone.

j., enarthrodial. *See: ball and socket j.*

Joints, Table Comparing Diseases of¹

	Acute Rheumatism	Rheumatoid Arthritis	Osteoarthritis	Gout
Age	Children and young adults	25 and over	Middle and old age	Middle and old age
Sex	Either	Chiefly women	Either	Chiefly men
Cause	Unknown? allergic reaction to streptococci	Often focal sepsis (streptococci)	Trauma, old age, degenerative changes	Uric acid in blood, due to disordered purin metabolism
Joints	Usually large joints, subsiding in one and commencing in another	Multiple, including small joints of hands and feet	Usually one large joint, e. g., hip, knee, shoulder	Several, e. g., great toe, knee, elbow, hands.
Pyrexia	At onset	In acute stages	Nil	During acute attack
Permanent Deformity	Nil	Spindle-shaped joints. Often gross deformity	Often slight	Deformity mainly from "chalky" deposits
Heart	Often affected	Not affected	Not affected	Often arteriosclerosis

¹Sears' *Medicine for Nurses*

j., false. False j. formation subsequent to a fracture.

j., flail. J which is extremely relaxed, the distal portion of limb being almost beyond the control of the will

j., ginglymoid. J having only forward and backward motion, like a hinge.

j., gliding. Diarthrosis permitting a gliding motion.

j., hemophilic. SEE bleeders' j.

j., hinge. SEE ginglymoid j.

j., immovable. SYN synarthrosis J in which a cavity is lacking between the bones

j's., intercarpal. Articulations which the carpal bones form in relation to one another

j., irritable. Inflamed spasmodic condition of joint of unknown cause

j., Lisfranc's. Tarsometatarsal j

j., midcarpal. J separating the navicular, lunate, and triangular bones from the distal row of carpal bones

j., mixed. J with surfaces joined by fibrocartilaginous disks

j., mouse. Loose cartilage or other body in a joint.

j., movable. SEE diarthrodial j. SYN diarthrosis.

j., m., slightly. SYN amphiarthrosis.

j., multiaxial. SEE ball and socket j

j., pivot. SYN rotary j, trochoid j A joint which permits rotation of a bone, the joint being formed by a pivot-like process which turns within a ring, or by a ringlike structure which turns on a pivot

j., polyaxial. SEE ball and socket j.

j., receptive or reciprocal. Saddle joint, q.v.

j., rotary. A pivot joint, q.v.

j., saddle. A joint in which the opposing surfaces are reciprocally concavoconvex.

j., screw. A cochlear j., q.v.

j., simple. J. composed of two bones.

j., spheroid. Multiaxial j. with spheroidal surfaces.

j., spiral. SEE cochlear j.

j., synarthrodial. SEE immovable j.

j., tomato. Pain in the joints wrongly attributed to eating too many tomatoes.

j., trochoid. SEE rotary j.

j., uniaxial. J. moving on a single axis.

j., unilocular. J. with a single cavity.

joint, words pert. to: abarthrosis, abarthric, acampsis, amarthrosis, ambo, amphiarthrosis, amphidarthrosis, ankylosed, ankylosis, aparthrosis, "arthro-words," articular, articulate, articulation, articulus, artus, biarticlar, Boucharde's nodes, capsula articularis, capsular ligament, "capsul-" words, carpit, Charcot's j., Chauffard's syndrome, clasp-knife rigidity, condylarthrosis, coxa, diarthrosis, dysarthria, dysarthrosis, elbow, enarthrosis, ginglymoid, ginglymus, gomphosis, haversian glands, hinge j, hydrarthrosis, junctura, luxation, manipulation, meningosis, metrortherapy, mobilization, nearthrosis, olecranonarthrosis, olecranon, omarthrosis, orthopedics, osteoarthrosis, pyarthrosis, schindylesis, socket, suture, symphysis, synarthrodia, synarthrosis, synchondrosis, syndesmosis, synovia, synovial membrane, synovitis, syntaxis, trochoides

Jolles' test (yöl'es). Test for biliary pigments in urine

joule (jool). Work done in one second by current of one ampere against a resistance of one ohm.

Joule's equivalent (jools). Amt. of work which, if converted into heat, will raise temperature of one pound of water 1° F.

J.'s law. 1. Rate of heat production in a part of a circuit is equal to the resistance of that part of the circuit multiplied by the square of the current. 2. In gas expansion, with no change in the amount of heat in a given quantity of gas, and no external work performed, there is no change in temperature

jugal [L. *yugum*, yoke]. 1. Connected or united as by a yoke. 2. Pertaining to the malar or zygomatic bone

j. bone. Malar or zygomatic bone.

j. process. Temporal bone process forming zygomatic arch. SYN: zygomatic process.

juga'le [L. *yugum*, yoke]. The point at the margin of zygomatic process.

jugate [jü'gät] [L. *yugatus*, joined]. 1. Coupled, yoked. 2. Having ridges.

ju'gular [L. *jugulum*, throat]. Pert. to the throat

j. foramen. Opening formed by jugular notches of the occipital and temporal bones

j. fossa. Depression in the petrosal portion of the temporal bone for the jugular vein.

j. ganglion. Nodes of vagus root and glossopharyngeal nerve in j. foramen.

j. process. Projection from occipital bone toward the temporal bone

j. veins. *External,* receives the blood from the ext. of the cranium and the deep parts of the face. It lies superficial to the sternocleidomastoid muscle as it passes down the neck to join the subclavian vein. *Internal,* receives blood from the brain and superficial parts of the face and neck. It is directly continuous with the transverse sinus, accompanying the internal carotid as it passes down the neck, and joins with the subclavian vein to form the innominate vein. *See Illustration, below*

They are more prominent during expiration than during inspiration. Also during cardiac decompensation.

jugulate (jug'u-lät) [L. *juguläre*, to cut the throat]. To arrest quickly a process or disease by therapeutic measures.

jugula'tion [L. *jugulare*, to cut the throat]. Sudden arrest of a disease by therapeutic means

jug'ulum [L. neck]. Neck or throat

ju'gum [L. a yoke]. Ridge or furrow connecting two points

j. penis. Forceps for temporarily compressing the penis.

j. petrosus. Eminence on petrous section of temporal bone showing the position of sup. semicircular canal. **SYN:** *arcuate eminence.*

juice [L. *jus*, broth] Liquid that exudes or is expressed from any part of an organism

j., alimentary. The digestive juices

j., gastric. Secretions of the stomach, consisting of water, salts, pepsin, and free hydrochloric acid. **SEE:** *gastric juice.*

j., intestinal. A clear, yellowish, viscid fluid, alkaline in reaction, secreted by Lieberkuhn's crypts. **SYN:** *succus entericus.* **SEE:** *intestinal juice.*

j., pancreatic. A clear, viscid alkaline

VEINS OF RIGHT SIDE OF NECK

1 External jugular vein 2 Posterior jugular vein 3 Carotid artery. 4 Occipital veins 5 Posterior auricular veins 6 Temporal veins 7 Facial vein 8 Superior thyroid vein. 9. Internal jugular vein. 10 Anterior jugular vein 11 Subclavian vein.

digestive juice of the pancreas poured into the duodenum. It contains the enzymes *trypsin*, *amylase*, and *lipase* or *steapsin*.

jujitsu, [jujitsu]. A system of physical training for developing the art of self-defense without weapons in which the opponent's weight and strength are used to his disadvantage. Esp. developed in Japan.

jumentous (jū-men'tus) [L. *jumentum*, beast of burden] Like that of a horse, said of odor of urine.

jum'per. One with nervous disorder who is startled easily or who jumps at sound of a loud noise. See *palmus*.

junction (junk'shun) [L. *unctio*, a joining] The place of union or coming together of two parts.

j. mucocutaneous. A jct. between the skin and a mucous membrane.

j. myoneural. SYN *motor end-plate*. Meeting point of a nerve with the muscle to which it is distributed.

j. sclerocorneal. Meeting point bet. the sclera and the cornea marked on the external surface of the eyeball by the outer scleral sulcus.

junctura (junk-tu'ra) [L. a joining] Suture of bones. Articulation.

junk [L. *juncus*, a bulrush] Cushion utilized in fracture dressing.

junk'et [It. *quincata*, cream cheese] Flavored curds and whey.

Junod's arm or boot (zhu-nō'z') Airtight casing into which limb is placed and air exhausted, to relieve congestion.

jurymast (ju'ri-mast) [L. *jurare*, to be right, + AS *masc*, a stick] Apparatus for support of head in disease of the spine.

jusculum (jus'ku-lum) [L. broth]. Broth or soup.

Juster's reflex. Finger extension instead of flexion when palm of hand is irritated.

jus'to major [L. larger than normal]. Bigger than normal, as a *pelvis*.

j. m'ior [L. smaller than normal]. Smaller than normal, as a *pelvis*.

Jus'tus' test. A test for syphilis determined by the reaction on hemoglobin of a dose of mercury.

jute (jūt) [Sanskrit *jūta*, matted hair] Fiber used in dressings.

juvantia (Ju-van'shi-ā) [L. *juvare*, to aid] Adjuvant medicines which intensify action of other drugs or assist them.

juvenile. 1 Pert to youth or childhood. 2 Young, immature.

j. cell. A metamyelocyte or white blood cell.

juxta- [L. near to] Prefix. Close proximity.

jux'taartic'ular [' + *articulus*, joint] Situated close to a joint.

juxtaglomerular. Near or adjacent to a glomerulus.

j. apparatus. A structure consisting of myoepithelioid cells forming a cuff surrounding the arteriole leading to a glomerulus of the kidney.

j. cells. Myoepithelioid cells resembling those of the carotid body present in the juxtaglomerular apparatus. Their function is unknown.

juxtangi'na [' + *angina*, a choking] Inflamed condition of pharyngeal muscles.

juxtaposition (juks'ta-po-zish'un) [' + *positio*, place] Position that is adjacent or side by side. SYN *apposition*, *contiguity*.

juxta'pyloric [' + G. *pyloros*, pylorus] Near the pylorus or pyloric orifice.

juxtaspinal [' + *spina*, thorn] Near the spinal column.

K

K Chem symb for *kali*um, potassium.
ka. Abbr for *cathode*.
Ka'der's operation. Surgical formation of a gastric fistula with feeding tube inserted through valvulae flap.
Kaes' feltwork. Nerve fiber network in cerebral cortex.
kaf'ir pox. Modified smallpox with pustules not umbilicated and without a secondary rise in temperature. SYN *alastrim*.
Kahl'baum's disease. Cyclic dementia with marked muscular tension. SYN *kata-tonia*, *q.v.*
Kahl'er's disease. Destructive bone marrow disease. SYN *multiple myeloma*, *q.v.*
Kahn test. 1 A flocculation test for the diagnosis of syphilis.
 Positive reaction based upon appearance of a white precipitate when an alcoholic extract of normal heart muscle is added to the blood serum of one afflicted with syphilis.
 2 Test for presence of carcinoma.
kai (kif) [Arabic *gay*, quiescence]. A dreamy, tranquil state induced by drugs.
kainophobia (ki-no-fō'bī-ā) [G *kainos*, new, + *phobos*, fear]. Abnormal aversion to new situations and things. SYN: *neophobia*.
kais'erling, Kais'erling's solution. Liquid used in preserving pathological specimens.
kakergasia (kak-er-gas'ī-ā) [G *kakos*, bad, + *ergasia*, work]. 1. Minor psychosis, a term used in place of "neurosis" and "psychoneurosis" when psychodynamic and not primarily nervous. 2. Poor mental functioning. SYN *merergasia*.
kakergastic (kak-er-gas'tik) [+ *ergasia*, work]. Pert to minor psychoses.
 Applied to those still relatively normal, afflicted with vagaries not of a holergastic nature. SYN *merergastic*.
kakesthe'sia [+ *aisthēsis*, sensation]. 1. Any disorder of sensibility. 2. Malaise.
kakidro'sis [+ *idrōsis*, sweat]. Unpleasant odor of the sweat. SYN: *bromidrosis* [neuropathy].
kak'ke [Japanese]. Endemic form of polykaksomia.
kakosmia (kak-oz'mī-ā) [G *kakos*, bad, + *osmē*, smell]. Perception of bad odors which do not exist. SYN *cacosmia*, *parosmia*.
kakotrophy (kak-ō'trōf-i) [+ *trophē*, nourishment]. Malnutrition. SYN: *cacotrophy*.
kala azar (kā'la-a'-zar) [Native, "black fever"]. SYN *Leishmaniasis*. Visceral leishmaniasis, an infectious disease, common in the East. There are several types which differ as to preference for children or adults, incidence in domestic animals, and transmitting agent. The disease is characterized by lesions of the reticuloendothelial system, esp. the liver and spleen. It is often fatal.
 Etiol. *Leishmania donovani*, a flagellated protozoan. The organism is transmitted by sandflies of the genus *Phlebotomus*; however, direct infection through nasal secretions, urine, and feces is possible.
kallēmia (kal-i-e'mī-ā) [L *kali*, potash, + G *ama*, blood]. Potassium in the blood.
kali'genous (kal-i-jēn-us) [+ G *gennan*, to produce]. Forming potash.

kalimeter (kal-im'e-ter) [+ G *metron*, measure]. Device for determining degree of alkalinity of a substance. SYN *alkalimeter*.
ka'lium [L]. (K) Potassium. A mineral element necessary to the growth of cells, esp. those of the muscles and blood. SEE *potassium*.
kallikrein (kāl-ik'rē-in). A vasodilator substance obtained from normal urine. Its origin is unknown, although it is present in the pancreas in considerable amounts.
kaolin (kā'o-lin). A yellowish white powder, occurring as a decomposition product of feldspar.
 Uses. Internally as an absorbent, externally, as a protective by absorbing moisture.
 Dosage: ½ oz. (15 Gm.).
kaolinitis (kā'o-lin-ō'sis). Pneumokoniosis caused by inhaling kaolin particles.
kaomagma (kā'ō-mag'ma). A 20% suspension of colloidal kaolin in 2½% aluminum hydroxide.
 Uses. In intestinal inflammation, dysentery, colitis, etc.
 Dosage: ½ oz. (15 cc.).
k. with mineral oil. Kaomagma with 20% mineral oil.
 Dosage: ½ oz. (15 cc.).
Kapo'si's disease. Diffuse atrophic skin condition. SYN. *zoderma pigmentosum*, *q.v.*
Karell cure (ka'rel). Rest in bed, milk slipped in small amounts (not over a quart a day for 5 or 6 days), for treatment of cardiac disease, high blood pressure, and renal insufficiency.
K. diet. A saltless diet constituting a fraction of usual normal diet, given in small quantities at definite intervals, gradually increased by adding other foods, intended to relieve the vital organs. For the first 7 days 200 cc of milk constitutes diet, given every 4 hours bet. 8 A.M. and 8 P.M., after which soft boiled egg and toast, unsalted butter, cereal, and cream soups are added twice a day, and after 10th day chopped meat, vegetables, and rice boiled in milk, custard, and dextrimalose are added.
 Diet low in calories, vitamins, and iron.
K. d., modified. Found useful when milk is not well tolerated. Food value, water, and salt content only slightly changed.
karyo- [G *karyon*, nucleus]. Prefix: Referring to a cell's nucleus.
kar'yochromat'ophil [+ *chrōma*, color, + *philein*, to love]. Having nucleus which stains.
karyochrome (kar'i-o-krōm) [+ *chrōma*, color]. The cell of a nerve with an easily staining nucleus.
karyoc'lasia [G *karyon*, nucleus, + *klasis*, a breaking]. SYN: *karyorrhexis*. The fragmentation of a cell nucleus.
karyogamy (kar'i-og'ā-mī) [+ *gamos*, marriage]. Union of nuclei in cell conjugation.
karyogen (kar'i-o-jen) [+ *gennan*, to produce]. A compound of iron in certain cell nuclei.
karyogenesis (kar'i-ō-jēn'ē-sis) [G *karyon*, nucleus, + *genesis*, production].

Formation and development of a cell nucleus.

karyokinesis (kar'ī-o-kin-e'sis) [+ + *kinēsis*, movement] 1 Changes taking place in a nucleus during indirect cell division. SYN *mitosis* 2 In a narrower sense, nuclear division only.

karyokinetic (ka'ri-o-ki-net'ik) [+ + *kinēsis*, movement] 1 Pert. to karyokinesis 2 Ameboid.

karyolobism (kar'ī-o-lo'bizm) [G *karyon*, nucleus, + *L lobus*, lobe, + *G ismos*, state of] Condition in which the nucleus of a cell is lobed as in polymorphonuclear leukocytes.

kar'yolymph [+ + *L lymphā*, lymph] Fluid in meshes of the nucleus. SYN *nuclear sap*.

karyolysis (kar-i-ol't-sis) [+ + *lysis*, dissolution] The destruction of a nucleus or loss of affinity for basic dyes. SYN *chromatolysis*.

karyolytic [G *karyon*, nucleus, + *lysis*, dissolution]. Producing or rel. to karyolysis.

karyomitome (kar-i-om'ī-tōm) [+ + *mitos*, web] Network of the cell nucleus.

karyomitos (kar'ī-o-mit-o'sis) [+ + + *-ōsis*]. Nuclear changes in cell division. SYN *karyokinesis*.

karyomorphism (ka'ri-o-mōr'fizm) [+ + *morphē*, form, + *ismos*, state of] The form of a cell nucleus.

karyon (kar'ī-on) [G] The cell nucleus.

karyophage (kār'ī-ō-fā) [G *karyon*, nucleus, + *cleus*, + *phagēin*, to eat] An intracellular protozoan parasite which destroys the nucleus of a cell.

karyorrhexis (kar'ī-o-rek'sis) [+ + *rēxis*, rupture] Fragmentation of the chromatin in nuclear disintegration.

karyosome (kar'ī-o-som) [G *karyon*, nucleus, + *soma*, body] SYN *chromatin nucleolus* 1 Chromatin mass at nodes of nuclear network 2 A spherical mass of chromatin designated *false nucleolus* to differentiate it from the true nucleolus.

karyotheca (kar'ī-o-the'kā) [+ + *thēkē*, sheath] The enveloping membrane of a cell nucleus.

kata- [G]. Prefix. Down.

katabolism [G. *kata*, down, + *ballein*, to throw, + *ismos*, stage of] The breaking down process in metabolism. SYN *catabolism*.

kataphrax'is [+ + *phrazis*, a blocking]. Surgical formation of metallic supports for an organ.

kataplasia (kāt-ā-plā'sī-ā) SYN *cataplasia* Reversion of a degenerating or atrophied cell to the form of a developing or embryonic cell.

katastasis (kāt-ā-stā'sis) [G *katastelēm*, to check] SYN *catastasis* Term for gastric downward moving wave of contraction which occurs without a preceding wave of inhibition.

katathermometer (ka'ta-ther-mom'e-ter) [G. *kata*, down, + *thermē*, heat, + *metron*, measure]. A thermometer for measuring the efficiency of ventilation and cooling and drying processes, i. e., the measurement of the cooling power (or, in a very warm atmosphere, of the warming power) of the atmosphere exerted on surface of the thermometer, approximately body temperature (37° C. or 98.6° F.) in millicalories (1/1000 Gm. calories) per square centimeter per second and to find air velocities.

The dry kata gives the cooling power by radiation and convection. The wet kata gives the cooling power by radiation, convection, and evaporation.

katatonia (kat-a-tō'ni-a) [+ + *tonos*, tension] SEE: *catatonia*.

katelectrotonus (kat'el-ek-trot'o-nus) [+ + *electron*, amber, + *tonos*, tension] Increased excitability in a muscle or nerve in area near cathode during passage of a current. SYN *catelctrotonus*, q.v.

katharometer [G *katharos*, pure, + *metron*, measure] Electrical device to measure basal metabolic rates.

kathisophobia (kath-i-so-fō'bī-a) [G *kathizein*, to sit down, + *phobos*, fear] Fear of sitting down, and subsequent inability to sit still.

kation (kat'ī-on) [G *kation*, descending] Element appearing at the cathode or negative pole in electrochemical decomposition. SYN *cation*.

katotro'pia [+ + *tropos*, a turning] Tendency of the eyeball to drop too far downward. SYN *katophoria*.

KBr. Potassium bromide.

KC.H.O. Potassium acetate.

KCl. Potassium chloride.

KClO. Potassium hypochlorite.

KClO. Potassium chlorate.

K.CO. Potassium carbonate.

kefir, kefir (ke'fer) [Caucasian] A preparation of curdled milk.

kelectome (ke'lek-tōm) [G *kēle*, tumor, + *tomē*, incision] Instrument for removing specimen of tumor tissue.

kelis (ke'lis) [G *kēlis*, stain, scar]. 1 Skin disease with pigmented pink and purple patches and lesions leaving scars. SYN *morphea* 2 Skin tumor of dense tissue. SYN *keloid*.

Kel'log's inspiratory lift-exercise. Abdominal exercise for the puerperium.

Kel'ly pad. A drainage pad for the operating table or bed made by wrapping one end of a rubber sheet over a rolled small blanket, forming a bolster, the bolster is twisted round like a horseshoe to form the pad, the free part of the sheet forming the apron. Also commercial inflatable rubber pad of horseshoe shape used in same way.

keloid (ke'loid) [G *kēlis*, scar, + *eidōs*, form] 1 Scar tissue. 2 A new growth of the skin consisting of dense tissue, most common in the colored race.

k., acne. SYN *dermatitis papularis capillitis* Hypertrophic scars on nape of neck at border of scalp.

Etiol. Suppurative folliculitis.

k., Addison's. Skin disease with pigmented patches and lesions. SYN *morphea*, q.v.

k., Alibert's. Growth of fibrous tissue usually at the site of a scar resembling a true keloid.

Etiol. Predisposition a factor, essentially cause unknown.

Sym. Oval, elongated, or irregularly shaped mass, single or lobulated, tender, painful, with burning or pricking sensation. Ranges in size from that of a bean to that of a hand. It sends out clawlike processes as it increases in size.

Prog. Usually permanent if removed, but sometimes returns.

Treatment: X-rays, radium, carbon dioxide snow.

k. en plaque. Circumscribed hard plate elevated a little over surface and imbedded in the skin.

keloidosis (ke-loi-dō'sis) [+ + *-ōsis*]. The formation of keloids.

kelotomy (ke-lot'o-mī) [G *kēlē*, hernia, + *tomē*, incision]. Operation for strangulated hernia through tissues of the constricting neck.

Kenny treatment. Treatment originated by Sister Kenny, an Australian nurse, for anterior poliomyelitis. Consists of application of hot, moist packs to affected muscles, and early re-education of muscles, first through passive exercise and then by active movements as soon as possible. Rigid fixation of paralyzed limbs is disparaged.

kenogenesis (ken-o-jen'é-sis) [G. *koinos*, common, + *genesis*, formation] Deviation from the normal in course of development.

kenophobia (ken-o-fō'bī-ā) [G. *kenos*, empty, + *phobos*, fear] Fear of empty spaces.

kephalin (kef'a-līn) [G. *kephalē*, head]. Commercial headache remedy. SYN *cephalin*.

ker'asin. A cerebroside isolated from brain tissue.

keratalgia (ker-a-tal'jī-ā) [G. *keras*, *kerat-*, horn, + *algos*, pain] Neuralgia of the cornea.

keratectasia (ker-a-tek-ta'sī-ā) [" + *ektasis*, extension]. Conical protrusion of the cornea.

keratectomy (ker-ā-tek'tō-mī) [" + *ektomē*, excision] Excision of portion of cornea.

keratiasis (ker-ā-tī'a-sis) [G. *keras*, *kerat-*, horn] Horny wart formation.

kerat'ic [G. *keras*, *kerat-*, horn]. Rel. to horn. SYN *corneous*, *horny*.

ker'atin [G. *keras*, *kerat-*, horn]. A scleroprotein substance in hair, nails, and horny tissue, insoluble in gastric juice. Used for coating pills which should not be dissolved in the stomach.

keratinous (ker-a'tīn-us) [G. *keras*, *kerat-*, horn] Pert. to or composed of keratin.

keratitis (ker-a-tī'tis) [" + *-itis*, inflammation] Inflammation of cornea.

k., aspergillar. K. of cornea due to infection from a mold.

k., band shaped. Whitish or grayish band extending across the cornea.

k. bullosa. The formation of large, quite resistant blebs in the cornea of blind trachomatous eyes with increased tension.

k., deep. SEE *interstitial k.*

k., dendritic. Superficial branching corneal ulcers. [ity in middle of cornea.]

k. disciformis. Gray disk-shaped opacity.

k., fascicular. Corneal ulcer resulting from phlyctenules which spread from limbus to center of cornea accompanied by fascicle of blood vessels.

k., herpetic. Vesicular keratitis in herpes zoster. [pus in ant chamber.]

k., hypopyon. Serpiginous ulcer with k., *interstitial*. Deep form of nonsuppurative k. with vascularization, occurring usually in syphilis and rarely in tuberculosis. Commonly found between 5th and 15th years. [and loss in vision.]

SYN. Pain, photophobia, lacrimation, **k., lagophthalmic.** Desiccation of cornea due to defective closure of lids.

k., mycotic. Produced by mold fungi **k., neuroparalytic.** Dull and slightly cloudy insensitive cornea seen in lesions of fifth nerve.

k., parenchymatous. SEE: *interstitial k.* **k., phlyctenular.** Circumscribed inflammation of conjunctiva and cornea accompanied by formation of small projections called phlyctenules which consist of accumulations of lymphoid cells. The phlyctenules soften at the apices, forming ulcers.

k., punctate. Cellular deposits on post. surface of cornea seen in diseases of uveal tract.

k., purulent. K. with formation of pus. **k., sclerosing.** Triangular opacity in deeper layers of cornea, associated with scleritis.

k., superficial punctate. Small gray spots in superficial layers of cornea, beneath Bowman's membrane, occurring in young persons.

k., trachomatous. K. with abnormal membrane on cornea. SYN *pannus*.

k., traumatic. K. caused by wound of the cornea.

k., vasculonebulous. SEE *trachomatous k.*

k., xerotic. Softening, desiccation and ulceration of cornea. SYN. *keratomalacia*.

TREATMENT. Local Calomel dusted on the eyeball, yellow oxide of mercury ointment 1-2%, hot compresses, atropine, antiseptic solutions. **General:** Proper diet with elimination of sweets and plenty of fresh air, cod liver oil, good general hygiene.

kerato-, kerat- [G.]. Combining form Rel. to horny substances or to the cornea.

keratocele (ker-at'o-sēl) [G. *keras*, *kerat-*, horn, + *kēlē*, hernia, tumor] Protrusion or herniation of Descemet's membrane through the floor of corneal ulcer.

keratoconjunctivitis (ker'a-lō-kōn-junk-tī-vī'tis) Inflammation of the cornea and the conjunctiva.

k., epidemic. An acute, self-limited infection due to a virus.

k., flash. K. resulting from exposure of the eyes to intense ultraviolet irradiation.

k., virus. Epidemic k., *q v*.

keratoconus (ker-at-o-kō'nus) [" + *konos*, cone] Conical protrusion of center of cornea without inflammation.

keratoderma (ker-ā-lō-dēr'mā) [G. *keras*, *kerat-*, horn, + *derma*, skin] 1. Keratodermia, *q v* 2. The cornea.

keratodermatitis (ker'ā-to-der-mā-tī'tis) [" + " + *-itis*, inflammation] Inflammation of the horny layer of the skin with proliferation.

ker'atoder'mia [G. *keras*, *kerat-*, horn, + *derma*, skin] 1. Hypertrophy of the stratum corneum or horny layer of the epidermis, esp. on the palms of hands and soles of feet producing a horny condition of the skin.

keratogenous (ker-ā-toj'en-us) [" + *gennan*, to produce]. Causing horny tissue development.

ker'atoglo'bus [" + L. *globus*, circle]. Globular protrusion and enlargement of cornea seen in congenital glaucoma.

keratohelcosis (ker'a-to-hel-ko'sis) [" + *eklosis*, ulceration]. Corneal ulceration.

keratohyalin. A substance present in the form of granules in the cytoplasm of cells in the stratum granulosum and thought to be a precursor of keratin.

ker'atoid [" + *eidos*, form]. Horny or resembling horn or corneal tissue.

keratoiditis (ker'ā-toid-i'tis) [" + " + *-itis*, inflammation]. Inflammation of the cornea.

keratiritis (ker'a-to-i-ri'tis) [" + *iris*, iris, + *-itis*, inflammation]. Inflammation of the cornea and iris.

keratoleptynsis (ker'ā-to-lep-tin'sis) [" + *leptynein*, to make thin]. Removal of the corneal surface, then covering the area with bulbar conjunctiva.

keratoleukoma (ker'ā-to-lu-kō'mā) [" + *leukos*, white, + *ōma*, tumor]. White corneal opacity.

keratolysis (ker-ā-to-lī's-is) [" + *lysis*, loosening]. 1. Loosening of horny layer of the skin. 2. Shedding of the skin at regular intervals.

keratolytic [' + *lysis*, loosening]. Rel. to or causing keratolysis. **SYN.** *desquamative*.

keratoma [G. *keras*, *kerat-*, horn, + *ōma*, tumor]. 1. A callosity 2 A horny growth. **SYN.** *keratosis*.

keratomalacia (ker-'at-o-ma-la-'sī-ā). **SYN.** *xerotic keratitis*. Softening of the cornea seen in early childhood due to deficiencies of vitamin A.

keratome (ker-'at-ōm) [' + *tomē*, incision]. Knife for incising the cornea.

keratometer (ker-'at-ōm-'et-er) [' + *metron*, meter]. An instrument for measuring the curves of the cornea.

keratomycosis (ker-'at-o-mī-'ko-'sīs) [' + *mykes*, fungus, + *ōsis*]. Fungous growth on the cornea.

keratono'sis [' + *nosos*, disease]. Any noninflammatory disease of the horny layer of the skin.

keratonyxis (ker-'ā-to-nī-'k'sīs) [' + *nyssein*, to puncture]. Corneal puncture, esp. surgical puncture.

keratoplasty (ker-'ā-to-plas-'tī) [' + *plasia*, to form]. Plastic operation on the cornea.

keratoprotein [' + *prōtos*, first]. The protein of the hair, nails, epidermis, etc.

keratorrhesis (ker-'ā-to-rek-'sīs) [' + *rrhis*, rupture]. Corneal rupture.

keratoscleritis (ker-'ā-to-skī-'rīt'is) [' + *sklēros*, hard, + *-itis*, inflammation]. Inflammation of both cornea and sclera.

keratoscope (ker-'at-o-skōp) [' + *skopem*, to examine]. An instrument for examination of the cornea.

keratocopy [' + *skopein*, to examine]. Examination of the cornea and its reflection of light.

keratose (ker-'ā-tōs) [G. *keras*, *kerat-*, horn]. Horny.

keratosis (ker-'ā-tō-'sīs) [G. *keras*, *kerat-*, horn, + *ōsis*]. 1 Horny growth 2 Any condition of the skin characterized by the formation of horny growths or excessive development of the horny growth.

k. blennorrhagica. Condition associated with gonorrheal arthritis characterized by development of horny growths, esp. on hands and feet.

k. climatericum. A skin disease occurring in women during the menopause, characterized by a circumscribed hyperkeratosis of the palms and soles.

k. follicular. **SYN.** *Darier's disease*, *trichosty follicularis*, *psorospermosis*.

k. palmis et plantaris. Chronic disorder showing thickening of horny layer of palms and soles.

Error: Congenital, usually hereditary, occurring in several generations.

PROG. Alleviation but no cure.

TREATMENT. Keratolytics, x-rays.

k. pilaris. Inflammatory disorder, chronic in course.

SYM. Accumulation of horny material at follicular orifices, giving to affected surfaces a nutmeg-graterlike appearance, commonly in those with rough, dry skin. Most pronounced in winter, on lateral aspects of thighs and upper arms, with possible extension to legs, forearms and scalp.

TREATMENT. Tonics in anemic and debilitated. Locally, green soap, alkaline baths, rosewater ointment or glycerin lotion. In bearded region soothing cream and "once-over" shaving with very keen razor. **SYN.** *pityriasis pilaris*.

k. seborrhoeica. Flat, rough, crusted or scaly keratic lesion.

ETIOLOGY. Inherent peculiarity of skin—harshness with evidence of long-standing

dry seborrhea, with long continued exposure to strong sunlight and sudden temperature changes.

SYM. Keratoid, nevold, acanthoid or verrucose types, occurring in elderly and in those with long-standing dry seborrhea, on face, scalp, interscapular or sternal regions and backs of hands, yellowish, grayish, brownish sharply circumscribed lesions covered with a firmly adherent scale, greasy or velvety on trunk or scalp, but harsh, rough and dry on face or hands. Never disappear spontaneously and are potentially malignant.

TREATMENT. Earlier keratoid lesions removed by bland grease with subsequent occasional lubrication of site. Avoidance of alkaline soaps and water. For verrucose, nevold, and advanced keratoid forms, carbon dioxide snow. Those showing malignant change are treated as carcinoma of the skin. **SYN.** *senile wart*, *seborrheic wart*.

k. senilis. Dry, harsh skin of the aged.

keratome (ker-'at-o-tōm) [' + *tomē*, incision]. A knife for incising the cornea. **SYN.** *keratome*.

keratotomy (ker-'at-o-tō-mī) [' + *tomē*, incision]. Incision of cornea.

keranoneurosis (kē-'raw-'no-nū-'ro-'sīs) [G. *keranos*, lightning, + *neuron*, nerve].

A neurosis from fear of a thunderstorm or from lightning stroke.

keranophobia (kē-'raw-'no-'fo-'bī-ā) [' + *phobos*, fear]. Dread of thunder and lightning.

kerectomy (ke-'rek-tō-mī) [G. *keras*, cornea, + *ektomē*, excision]. Excision of a portion of the cornea.

kerion (ke-'ri-on). A form of *tinea tonsurans* with swollen discharging lesions.

k. celsi. **SYN.** *tinea kerion*. Inflammation of the hair follicles of the beard and scalp with formation of pustules.

kerithery [G. *keras*, wax, + *therapeia*, treatment]. Treatment of burns and denuded surfaces with liquid paraffin.

Kerkring's folds or valves. Transverse folds of intestinal mucous membranes.

SYN. *placae circulares*, *valvulae conniventes*.

kerne'kerus. A form of icterus neonatorum occurring in infants in which nuclear masses of the brain and spinal cord undergo pathologic changes accompanied by deposition of bile pigment within them.

Kernig's sign. A symptom of meningitis, evidenced by reflex contraction and pain in the hamstring muscles when attempting to extend the leg after flexing the thigh upon the body.

ketogenesis (ke-'to-jen-'ē-'sīs) [*ketone* + *G. genesis*, production]. Production of ketones or acetone substances.

ketogenic diet (ke-'to-jen-'ik) [' + *G. genan*, to produce]. One that produces acetone or ketone bodies, or mild acidosis. Highly beneficial in epilepsy.

Protein maintenance allowable. Carbohydrates are increased 10 Gm. per month after 3 months. Protein increased and alternated with carbohydrates 6 to 9 months later, and fat reduction 12 months later. Yeast for vitamin B and calcium lactate to insure adequate calcium, recommended by Peterman. Both fats and proteins yield antiketogenic as well as ketogenic derivatives.

Carbohydrates yield no ketogenic bodies and are 100% antiketogenic. Fats yield 90% ketogenic bodies and are 10% antiketogenic.

Proteins yield 46% ketogenic bodies and

are 54% antiketogenic. The ratio usually necessary to produce ketosis is ketogenic to antiketogenic 2.5 to 1, or 3 to 1.

For a 10 yr.

old child

	% cals.
Carbohydrates	60
Protein	136
Fat	1593

Total

	Cals.
For a 5 yr. old child	60
	72
	1188
	1320

Minimum protein, high fat, low carbohydrate. Fatty acid glucose varies with the ease with which ketosis is attained and with the intensity of ketosis desired **ketohex'ose**. A nonsaccharide consisting of a six-carbon chain and containing a ketone group, in addition to alcohol groups *EXAM fructose*

ke'tol. Crystalline substance formed in intestine and pancreas during putrefaction and digestion

ketol'ysis [' + *G lysis*, dissolution] The dissolution of acetone or ketone bodies

ketoly'tic [' + *lysis*, dissolution] Pert. to ketolysis

ketone (ke'tōn). Oxidation product of a secondary alcohol Organic chemical

substance of the general formula
$$\begin{array}{c} R \\ | \\ >C=O \\ | \\ R \end{array}$$

The simplest example is *acetone*. The ketone acids in the body are the end products of fat metabolism

k. bodies. A group of compounds produced during the oxidation of fatty acids, which includes acetoacetic acid, β-hydroxybutyric acid, and acetone *SEE ketosis*

k. threshold. Ketone level in the blood above which ketone bodies appear in the urine

ketonemia (ke-to-ne'mi-ā) [*ketone* + *G aima*, blood] Acetone bodies in the blood. *SYN acidosis*

ketonuria (ke-ton-u'ri-ā) [' + *G ouron*, urine] Acetone bodies in the urine

ketoplas'ia [' + *G plassein*, to form]. The formation or excretion of ketones

ketoplas'tic [' + *G plastikos*, formed] Pert. to ketoplasia or formation of ketones.

ke'tose. A carbohydrate containing the ketones.

ketosis (kē-tō'sis) [*ketone* + *G -ōsis*, disease] The accumulation in the body of the ketone bodies acetone, β-hydroxybutyric acid, and aceto-acetic acid

It is frequently associated with acidosis and is often misnamed acidosis Ketosis results from the incomplete combustion of fatty acids, generally from carbohydrate deficiency or inadequate utilization, and is commonly observed in starvation, high fat diet, pregnancy, following ether anesthesia, and most significantly in diabetes mellitus Large quantities of these ketone bodies may be eliminated in the urine (ketonuria). The presence of ketosis is easily determined by testing for the presence of acetone or diacetic acid in the urine, a ketonuria being 1 of the first evidences of beginning acidosis in diabetes. *SEE acidosis*.

17-ke'tosteroid. One of a group of neutral steroids having a ketone group in position 17. They are produced by the adrenal cortex and gonads and appear normally in the urine Among them are androsterone, dehydroisandrosterone, and 11-hydroxyisandrosterone.

Key-Ret'zius foram'ina. Passages in the pia mater carrying the choroid plexus to the fourth ventricle.

Kg. Abbr. for kilogram.

KHCO₃. Potassium bicarbonate.

KHSO₄. Potassium bisulfate.

KI. Potassium iodide

kibe (kib) [Welsh *cibi*, chilblain]. Inflamed patch on hands or feet caused by exposure to cold *SYN chilblain, q.v.*

kid'ney [A *S. cwith*, womb, + *Ice. nyrá*, kidney] One of two glandular, bean-shaped bodies, purplish-brown in color, situated at the back of the abdominal cavity, one on each side of the spinal column which excrete waste matter in the form of urine

The upper level is opp. the 12th thoracic (dorsal) vertebra, the lower level opp the 3rd lumbar vertebra The right kidney is slightly lower than the left one.

WEIGHT 120-180 Gm (4-6 oz.) Size, about 11.5 cm (4½ in.) long, 5-7.5 cm (2-3 in.) broad, and 2.5 cm. (1 in.) thick.

INTERIOR OF KIDNEY
DISTRIBUTION OF VESSELS

1. The ureter. 2. Renal vein. 3. Renal artery. 4. Renal pyramids.

Each kidney is embedded in fatty tissue known as an *adipose capsule* and surrounded by the renal fascia, a sheath of fibrous tissue, which helps to hold the kidney in place. The concave border of the kidney faces the median line, the center of the concave border opening into a fissure called the *hilum*.

The ureter enters the kidney through the hilum into the *pelvis* of the kidney. The outer portion of the kidney is the *cortex*, a mass of cortical substance, the inner portion (medullary substance) is the *medulla*.

Within the cortical substance are found the arteries, veins, convoluted tubules, and glomerular capsules, while the medulla contains the renal pyramids, conical masses with papillae projecting into the cuplike cavities (calyces) of the pelvis.

Each kidney contains from 8 to 18 pyramids made up of collecting tubules, lymphatics, and blood vessels, the pyramids being penetrated by the cortical substance and supporting them, these extensions are known as the renal columns, or columns of Bertini

RIGHT KIDNEY, POSTERIOR VIEW OF SECTION

1. Cortex 2. Renal pyramid. 3. Calyx. 4. Pelvis. 5. Ureter.

The cortical and medullary substance is composed of renal tubules, connective tissue, blood vessels, nerves, and lymphatics. The renal tubule or nephron constitutes the structural and functional unit of the kidney. Each consists of a capsule, proximal convoluted portion, loop of Henle and distal convoluted duct, which leads to a collecting duct. The capsule, called the glomerular or Bowman's capsule, encloses a globular mass of capillaries, the glomerulus. The capsule and the enclosed glomerulus comprise the malpighian or renal corpuscle. The renal corpuscles are located principally in the cortex.

URINE FORMATION Urine consists of water (95%) and solids (5%), the latter being in solution. The solids include organic constituents (urea, hippuric acid, uric acid, creatinine) and inorganic constituents, principally salts of sodium and potassium. The kidneys remove these substances from the blood thus acting to maintain homeostasis of the blood and body fluids. Urine is formed by the processes of filtration and reabsorption. As blood passes through the glomerulus, water and dissolved substances are filtered through the capillary walls and the inner or visceral layer of Bowman's capsule, resulting in formation of the glomerular filtrate. Blood cells and colloidal substances such as proteins are retained within the capillaries. The glomerular filtrate passes through the renal tubules to the collecting ducts, during the course of which all of the sugar and some of the salts and other substances are selectively reabsorbed into the capillaries surrounding the tubule. There is some evidence that the cells of the tubules may add by the process of secretion some substances, such as urea and uric acid to the urine. The final product now known as urine passes through straight collecting ducts into larger collecting ducts (papillary ducts) which open on the tips of the renal

papillae. There urine is discharged into the minor calyces of the renal pelvis, and then is conveyed by the ureters to the bladder. Periodically the bladder discharges its contents to the outside through the urethra (micturition).

Substances which are entirely or almost entirely reabsorbed during passage through the tubule are known as high threshold substances. These include glucose and chlorides of sodium, potassium, calcium, and magnesium. These are important blood constituents and excreted only when their concentrations in the blood are above normal. Low or nonthreshold substances are those which are reabsorbed only in limited quantities or not at all. These are usually waste products of metabolism such as urea, uric acid, and creatine which appear in considerable quantities in the urine.

The formation of urine is a continuous process, the rate of filtration being dependent primarily upon the blood pressure within the glomeruli. Osmotic pressure exerted by proteins within the blood plasma tends to hold water and dissolved substances within the blood vessels so that the effective filtration pressure (45 mm Hg) is the difference between capillary blood pressure (70 mm Hg) and osmotic pressure (25 mm Hg). General blood pressure and the velocity of blood flow are primary factors in the rate of urine formation.

The volume of urine excreted daily varies from 1000 cc to 2000 cc (avg 1500 cc). The amount varies with water intake, nature of diet, degree of body activity, environmental and body temperature, age, blood pressure, and many other factors. Pathological conditions may affect the volume and nature of the urine excreted.

NERVE SUPPLY From renal plexuses forming rich networks about renal vessels. Include both sympathetic and parasympathetic (vagal) fibers.

SYMPTOMS OF KIDNEY DISEASE Lumbar pain, renal colic, disturbances in micturition (anuria, oliguria, or pain on micturition), presence of blood, pus, or abnormal substances in the urine, tenderness or swelling in costovertebral region, enlargement or diminution in size of kidney, edema.

KIDNEY EXAMINATION By palpation, intravenous pyelography, cystoscopy, panendoscopy.

k., amyloid. K in which is the seat of amyloid degeneration.

k., branny. K in which spots of fatty degeneration give it the appearance of containing bran.

k., contracted. The small k. of chronic interstitial or diffuse nephritis.

k., cystic. One that has undergone cystic degeneration.

k., embolic contracted. A contracted k. in which embolic infarction of the renal arterioles produces degeneration of renal tissue, and hyperplasia of fibrous tissues produces irregular contraction.

k., fatty. One with fatty infiltration or degeneration of tubular, glomerular, or capsular epithelium, or of vascular connective tissue.

k., floating. One which is displaced and movable.

k., gouty. One with necrosis of renal connective tissue.

k., granular. A slow form of chronic nephritis, in which the size is diminished, and color is red with hard, fibrous, and granular texture.

k., hobnail. Granular k.

k., hogback. Pigback k., q.v.

- k., horseshoe.** Congenital malformation with sup or inf extremities united by an isthmus of renal or fibrous tissue, in the form of a horseshoe.
- k., lardaceous.** Chronic nephritis, often secondary to syphilis, with infiltration with lardaceous matter, of the malpighian bodies, arteries, tubes, and epithelium.
- k., large mottled.** A type of chronic parenchymatous nephritis.
- k., large red.** One resembling that of acute parenchymatous nephritis.
- k., large white.** A chronic parenchymatous nephritis, resulting from an acute inflammation, the organ exceeding 12 oz in weight.
- k., movable.** Displaced or loosened. **SYM** Dragging, heavy pains in abdomen, worse when erect, melancholia, hysteria, gastrointestinal disturbance, sensitive enlarged or abnormally placed **k**. **TREATMENT** Dietetic Surgical **SYN** *nephroptosis*.
- k., pigback.** A congested **k** bearing a longitudinal ridge on its vertex. Common in alcoholic subjects.
- k., polycystic.** **K** bearing many cysts.
- k., red contracted.** Gouty kidney.
- k., sacculated.** A condition in which the organ has been absorbed and only the distended capsule remains.
- k., senile.** One with atrophy of the glomeruli and tubules seen in old age.
- k., small red granular.** Granular **k**.
- k., stones.** **SYN** renal calculus, *q.v.* renal lithiasis. Concretions present in the pelvis of the kidney. They are composed principally of oxalates, phosphates, and carbonates and vary in size from small granular masses to an inch in diameter. When level of urinary colloids is high there is an absence of stones. This level is higher in Negroes and in women than in men. Administration of hyaluronidase prevents stone formation and checks increase of size of same. It releases intercellular ground substance of human tissues and a colloid that coats individual salt crystals with a protective jellylike coating. **SEE** colloid, *hyaluronidase*.
- k., surgical.** Suppurative pyelonephritis following operation upon urinary tract.
- k., syphilitic.** One with fibrous bands running across it, also caseating gummata, due to syphilis.
- k., wandering.** A floating **k**.
- k., waxy.** **SEE** lardaceous **k**.
- Klenböck unit.** Measurement of x-ray dosage, 1/10 of erythema dose.
- Kiernan's spaces.** The spaces bet. the lobes of the liver.
- Kiesselbach's area** (ke'sel-bahks) An area on the ant inferior portion of the nasal septum. The commonest site for septal bleeding.
- Kilian's pelvis.** Pelvis affected with osteomalacia. **SYN** *pelvis spinosa*.
- kilo-** [G.] One thousand.
- kilogram** [G] *chilio*, a thousand, + *gramma*, a weight. One thousand grams or 2.2 lbs avoirdupois. **ABBR** kg.
- kiloliter** (kil'o-lē-ter) [Fr. *kilotre*]. One thousand liters.
- kilometer** [Fr. *kilomètre*]. One thousand meters, or 3281 feet (roughly 0.6 of a mile). **ABBR** km.
- kilonem.** A unit of nutrition equivalent to 667 calories, the energy provided by one liter of milk.
- kil'ovolt** [G] *chilio*, a thousand, + *volt*. One thousand volt unit.
- kil'owatt.** A unit of electrical energy equal to one thousand watts. **ABBR** kv.
- kilurane** (kil'u-ran) A unit of radioactivity, equivalent to one thousand uranium units.
- kinesthesia** (kin'an-es-the'zī-ā) [G. *kinein*, to move, + *au-*, priv., + *aisthēsis*, sensation] Inability to see extent of movement, or direction resulting in ataxia.
- kinase** (kin'ās) [G] *kinein*, to move. An organic substance which activates a proenzyme or zymogen.
- kinematics** [G] *kinein*, to move. Science of motion.
- kineplastic** [G] *kinein*, to move, + *plastikos*, formed. Pert to kineplasty.
- kin'eplasty** [' + *plassein*, to form] A form of amputation so that motion is imparted to an artificial limb.
- kinergy** (kin-er'jet-i) [' + *ergon*, energy] The potential capacity for kinetic energy.
- kinesalgia** (kin-es-al'jī-ā) [G] *kinēsis*, movement, + *algos*, pain. Pain attending muscular movement.
- kinesia** (kin-es'ī-ā) [G] *kinesis*, motion. **SYN** *kinetosis*. Sickness caused by motion, as seasickness, car sickness.
- kinesialgia** (ki-ne-sī-al'jī-ā) [' + *algos*, pain]. Pain caused by muscular movements. **SYN** *kinesalgia*.
- kinesiatrics** (ki-ne-sī-at'riks) [' + *iatrikos*, curative] Treatment involving active and passive movements. **SYN** *kinesotherapy*.
- kinesimeter.** An apparatus for determining the extent of movement of a part.
- kinesiodic** (ki-ne-sī-od'ik) [' + *odos*, path]. Pert. to paths through which motor impulses pass.
- kinesiology** (kin-es-i-ōl'ō-jī) [G] *kinesis*, motion, + *logos*, study. The study of muscles and muscular movement.
- kinesioneurosis** (ki-ne'sī-o-nū-ro'sis) [' + *neuron*, nerve, + *-ōsis*]. Functional disorder marked by tics and spasms.
- k., external.** **K.** affecting external muscles.
- k., vascular.** **K.** of the vasomotor system.
- k., visceral.** **K.** affecting muscles of internal organs.
- kinesiotherapy** (ki-nē'sī-ō-thēr'ā-pī) Therapeutic exercises. **SYN** *kinesiotherapy*.
- kinesis** (kin-es'is) [G]. Motion.
- kinesitherapy** [' + *therapeia*, therapy] Treatment by movements.
- kinesod'ic** [' + *odos*, path]. Rel to the conveyance of motor impulses.
- kinesthesia** (kin-es-the'zī-ā) [' + *aisthēsis*, sensation]. 1. Ability to perceive extent or direction, or weight of movement. 2. Illusion of gliding through space.
- kinesthesiometer** (ki'nes-the-zī-om'ē-tēr) [' + ' + *metron*, measure] Instrument for testing the muscular reaction.
- kinesthetic** [' + *aisthēsis*, sensation]. Rel. to kinesthesia.
- kinetic** (ki-net'ik) [G] *kinēsis*, motion]. Pert to or consisting of motion.
- kinetosis** (ki-ne-to'sis) [' + *-ōsis*]. Any disorder caused by motion, such as seasickness, car sickness, etc. **SYN** *kinesia*.
- kinotherapy** (ki-net'o-ther'ā-pī) [' + *therapeia*, treatment]. Treatment that employs active and passive movements. **SYN** *kinesiotherapy*.
- king's evil.** Constitutional condition characterized by glandular swellings in neck and inflammation of joints and mucosa. So called, because it was thought curable by touch of a king. **SYN**: *scrofula*.

kinom'eter [G. *kinein*, to move, + *metron*, measure]. Instrument which measures displacements of the uterus

kinomom'eter [' + *metron*, measure] Device which measures degree of motion of fingers and toes.

kinone (ki'nōn) *Quinone*

ki'otome [G. *kiōn*, column, + *tomē*, incision]. Instrument for amputating the uvula.

klotomy (kl-ot'o-mī) [' + *tomē*, incision]. Use of the kiotome in amputating the uvula.

Kisch's reflex (kīsh). *SYN' auriculopalpebral reflex* Closure of an eye resulting from stimulation of heat or some tactile irritant on the ext. auditory meatus or deeper portions of canal up to tympanum

Kite apparatus. Apparatus for reeducation of weak muscles and for assistance in overcoming contractures of forearm, wrist and fingers.

KJ. Abbrev. for *knee jerk*

KK. Abbrev. for *knee kick* (knee jerk).

kl. Abbrev. for *klang* and *kiloher*

Klausner's reaction or test. Serum of an assumed syphilitic is covered with distilled water in a test tube. Turbidity at plane of contact will show if syphilis is present.

Klebsiella (kleb-sī-el'ā) A genus of bacteria of the family Enterobacteriaceae. They are short, plump, gram-negative bacilli which form capsules. They are nonmotile and do not form spores. Frequently associated with respiratory infections. Commonly called the Friedlander group

K. ozaenae. Species associated with ozena. *SLC ozenia*.

K. pneumoniae. Friedlander's bacillus in certain pneumonias. Also found as a secondary invader in other respiratory infections such as bronchitis or sinusitis

K. rhinoscleromatis. The cause of rhinoscleroma.

Klebs-Loeffler bacillus (klebs-lef'ler) The bacillus of diphtheria. *SYN Corynebacterium diphtheriae*. *SEE diphtheria*.

Klemperer's test meal. Milk, 500 cc, 2 rolls, 70 Gm. This is given on an empty stomach and aspirated 2 hr later

klepto- (klēp'tō) [G. *kleptein*, to steal] Combining form meaning to steal

kleptolagnia (klep'to-lag'nī-ā) [G. *kleptein*, to steal, + *lagneia*, lust] Sexual gratification derived from stealing.

kleptomania (klep-to-ma'nī-ā) [' + *ma-*

nia, madness]. Impulsive stealing, the motive not being in the intrinsic value of the article to the patient. There is often deep regret following the act.

kleptoma'niac [' + *mania*, madness] 1. A psychopathic personality suffering from impulsive stealing 2. Pert. to kleptomania

kleptophobia (klep-to-fo'bl-ā) [' + *phobos*, fear] Morbid fear of stealing

Klieg eye (klēg) Conjunctivitis, lacrimation and photophobia from exposure to the intense lights used in making moving pictures

Kline test, Kline-Young test. A microscope slide precipitation test for presence of syphilis

Klon'dike bed. Outdoor sleeping bed that protects patient from draughts

Klumpke's paralysis (kloomp'kez) Atrophic paralysis of forearm

km. Abbr. for *kilometer*

KMnO₄. Potassium permanganate

Knapp's forceps. A forceps with blades like rollers for expressing trachomatous granulations on the palpebral conjunctiva

knead'ing [A S *cneadan*, to press a man] A form of massage, consisting of grasping, wringing, lifting, rolling, or pressing part of a muscle or group of muscles. *SYN pétrissage*.

knee [A S *cneōw*] The ant. aspect of the leg at the articulation of the femur and tibia, also the articulation itself, covered anteriorly with the patella or kneecap. Formed by the femur, tibia, and patella

RS geniculate, geniculum, 'genu-' words, 'gon-' words, housemaid's k., patella, popliteal.

k., Brodie's. A chronic, fungoid synovitis of the knee joint in which the affected parts become soft and pulpy

k.-chest position. Resting upon the knees and chest with forearms supporting the head. *SEE position*.

k., dislocations of the. Displacement of the knee

Dislocations of the knee in themselves are unusual. The so-called dislocation of the knee is usually due to various injuries of the joint and of the complicating structures of the knee, such as the tearing of the crushed tendons or ligaments, or slipping of the cartilages, etc., and should be treated either by a straight splint, as in a fracture of the kneecap, or 2 splints, one on either side of the knee, as in a fracture, and the

KNEE-CHEST OR GENUPECTORAL POSITION.

patient should be transported to a hospital as quickly as possible.

k., game. A lay term for internal derangement of knee joint

PATH. Usually a torn semilunar cartilage, a fracture of the tibial spine, or an injury to the collateral or cruciate ligaments

SYM. Pain or instability, locking, and weakness

F. A. TREATMENT. Immobilize with a post, splint plus heat and massage. Surgical exploratory arthrotomy may be necessary

k., housemaid's. Inflamed condition of the bursa in front of the patella, with accumulation of fluid therein, frequently seen in scrubwomen.

k., in-. The condition in which the knees come together while the ankles are far apart, caused by an outward distortion of the leg throwing knee inside the normal line. **SYN.** *genu valgum, knock-k.*

k., of the internal capsule. The curve at the meeting place of the ant. and post. limbs of the internal capsule

k., jerk reflex. The reflex contraction or clonic spasm of the quadriceps muscle, produced by sharply striking the ligamentum patellae when the leg hangs loosely flexed at right angles. It is seen normally in health, but is usually absent in locomotor ataxia, multiple neuritis, lesions of the lower portion of the spinal cord, lesions of the ant. gray horns of the cord, meningitis, infantile paralysis, pseudohypertrophic paralysis, atrophic paralysis, etc., and increased in spinal irritability, lesions of the pyramidal tract, cerebral tumors, sclerosis of the brain and cord, etc. **SYN:** *patellar reflex* **SEE** *jerk*.

k., joint. The articulation of the femur and tibia

k., knock. An outward distortion of the leg, throwing knee inside the normal line. **SYN.** *genu valgum, in-k.*

k., lawn tennis. A sprain of int. semilunar cartilage of knee joint

k., locked. Condition in which the leg cannot be extended. Usually due to displacement of semilunar cartilage

k., out-. Bowleg. **SYN.** *genu varum, knee-cap.*

THE PATELLA. The patella

knelling-squatting position. The patient stoops with knees pressed against the abdomen, and with trunk erect, employed in childbirth in difficult cases.

Knipp cure (nip). Application of water in various forms and degrees of temperature in the cure of disease, esp. wading in cold, dewy grass. **SYN.** *hydrotherapy*.

knippism (nip'izm). Walking barefoot in dewy grass, bathing in cold water, etc., as a cure of disease

knife (nif) [A. S. cnif]. A cutting instrument

k., electric. A knife carrying a high frequency cutting current.

knif'ing [A. S. cnifian, to make knots]. The union of pieces of a fractured bone.

KNO₃. Potassium nitrate, niter, saltpeter.

knock-knee. Condition of having the knees turned inward. **SYN.** *genu valgum, in-knee.*

knockout drops. Colloquial name for chloral hydrate given in alcoholic beverages to produce rapid coma

knot. 1. An intertwining of a cord or cordlike structure so as to form a lump or knob. 2. In surgery, the intertwining

of the ends of a suture, ligature, bandage, or sling so that the ends will not slip or become separated. 3. In anatomy, an enlargement forming a knoblike structure.

k., false. An external bulging of the umbilical cord resulting from the coiling of the umbilical blood vessels.

k., Hensen's. **SYN.** *Hensen's node.* A knoblike structure at the anterior end of the primitive streak

k., primitive. Hensen's knot, *q. v.*

k., syncytial. A protuberance formed by many nuclei of the syntrophoblast and found on surface of a chorionic villus

k., true. A knot formed by the fetus slipping through a loop of the umbilical cord

Koagamin. Commercial preparation of blood coagulant

K. O. C. Abbr. of *cathodal opening contraction*. **SYN.** *COC*

Kocher's reflex (kô'kér). Contraction of abdominal muscles following moderate compression of testicle.

Koch's bacillus (kôks). **SYN.** *Mycobacterium tuberculosis*. The bacillus of tuberculosis

K's law or postulates. To prove an organism the cause of a disease or lesion, 1st, microorganism in question must appear in lesion at all times, 2nd, pure cultures must be obtained from it, 3rd, pure cultures when inoculated into susceptible animals must reproduce the disease or pathological condition and, 4th, the organism must be obtained again in pure culture from the inoculated animal

K's lymph. Tuberculin.

K's phenomenon. Local inflammatory reaction resulting from injection of tuberculin into the skin of a person who has been previously exposed to the tubercle bacillus

KOH. Potassium hydroxide

Kohlrausch's fold or valve (kôhl'rowshs). Fold of mucous membrane extending into rectum, rectal valve. **SYN.** *plica transversalis recti*.

kollonychia (koy-lo-nik'i-ä) [G. kollos, hollow, + onyx, onych-, nail]. Malformation of the fingernails, outer surface is concave

koinotropic type (koin'o-trop'ik) [G. koinos, common, + tropos, a turning]. Term applied to one who can give and take, as the "good mixer"

ko'la. Cardiac and nerve stimulant derived from *Sterculia acuminata*. Its principal ingredients are caffeine, theobromine, and colatin

Kolmer test. 1. A modification of the Wassermann test. 2. Complement fixation test for some infectious diseases.

kolp- [G.] Prefix Vagina.

kolp'itis [G. kolpos, vagina, + -itis, inflammation]. Inflammation of vaginal mucous membrane. **SYN.** *colpitis*.

kolpotomy [" + tomē, incision]. A vaginal operation. **SYN.** *colpotomy, electrolytomy*.

kol'yone. [G. kolyein, to hinder]. 1. An antacid opposing action of a hormone. 2. An endocrine that diminishes activity of cells. **SYN.** *chalone, colyone*.

kolyptic (ko-li-pep'tik) [" + pepsis, digestion]. Retarding digestion

kolyphrenia (kol-i-fre-ni-ä) [" + phrēn, mind]. Exaggerated mental inhibition.

kolyseptic (ko-li-sep'tik) [" + sēpsis, putrefaction]. Antiseptic.

kolytic (ko-li'tik) [G. kolyein, to hinder].

Hindering or presenting or checking, as a reaction to a stimulus

Kondoleon's operation (kōn-dō'lē-ōn) Surgical removal of layers of subcutaneous tissue to relieve elephantiasis

koniocortex. The cortex of the sensory areas, so named because of its granular appearance

koniology [G *kōnis*, dust, + *logos*, study]. Science of dust and its effects **SYN** coniology.

koniometer (ko-ni-om'ē-ter) [“ + *metron*, measure] Device for estimating amt of dust in the air

koniopsis (ko-ni-ō'sis) [“ + -ōsis, intensive]. Any morbid condition caused by dust **SYN** coniosis.

kopf-tetanus. Tetanus developing subsequent to head wounds

kopiopia (ko-pl-ō'pī-ā) [G *kopos*, fatigue]. Eyestrain **SYN** copiopia

Koplik's spots. Small red spots with bluish white centers on the oral mucosa, particularly in the region opposite the line of junction of the molar teeth

A diagnostic sign in measles before the rash appears Not infrequently, the spots disappear as the eruption develops

kopophobia. Abnormal fear of fatigue or exhaustion

Kopp's asthma. **SYN** laryngismus stridulus Spasm of the glottis in infants not over two years of age Thought to be due to an enlarged thymus

koronion (ko-ro'ni-on) [G *korōnē*, crest] Apex of coronoid process of the mandible

koroscopy (kor-os'ko-pl) [G *korē*, pupil, + *skopein*, to examine] Shadow test for refraction of the eye

Korsakoff's psychosis or syndrome (kor'sak-ōfs). One characterized by a psychosis with a polyneuritis, disorientation, muttering delirium, insomnia, illusions and hallucinations, painful extremities, rarely a bilateral wrist drop, more frequently bilateral foot drop with pain or pressure over the long nerves

Occurs as a sequel to chronic alcoholism **SYN** polyneuritic psychosis

Kottmann's reaction or test. A blood serum reaction test to indicate whether or not the thyroid gland is functioning

koumiss (koo'mis) [Tartar] Fermented milk beverage **SYN** kumyss.

Kraepelin's classification (kra'pā-linz) A classification of mental disease into 2 groups the manic-depressive and the schizophrenic

kraurosis (kraw-rō'sis) [G *krauros*, dry] Atrophy and dryness of skin and any mucous membrane, esp of the vulva

The subcutaneous fat of the mons pubis and labia disappears, clitoris and prepuce atrophy, and stenosis of the vaginal orifice is common Flssures may develop Epithelioma are prone to occur most frequently in postmenopausal women or those who have had ovaries removed

Etiol. Probably hypoestrinism

k. penis. **SYN** balanitis xerotica obliterans, Stuhmer's disease Condition in which the glans penis atrophies and becomes shriveled

k. vulvae. An atrophy of the skin and mucosa, seen in elderly women which pathologically consists of a marked atrophy of the vulvar skin, and which is characterized clinically by severe itching.

The skin has a white marblelike appearance, and frequently shows excoriations as a result of the scratching. A large percentage of these cases, if allowed to go on without operative inter-

ference, undergo malignant degeneration. **SYN** leukoplakic vulvitis.

Krause's end bulb. An encapsulated sensory receptor found widely distributed in connective tissue underlying the skin and mucous membranes It is the end organ for cold sensations

K.'s glands. Small mucous acinous glands located beneath the fornix conjunctiva They are accessory lacrimal glands and open into the fornix

K.'s membrane. Thin, dark disk transversely crossing through and bisecting clear zone of a striated muscle and bisecting the clear zone (isotropic disk) of a striated muscle fiber Also called the Z disk The portion between two Z disks constitutes a sarcomere

K.'s valve. Mucous membrane fold at juncture where lacrimal sac narrows into nasal duct **SYN** Beraud's valve.

kreatinine (kre-at'in-in) Creatinine, *q.v.* **kreotoxin** [G *kreas*, flesh, + *toxikon*, poison] A poison in flesh due to a micro-organism [Meat poisoning]

kreotoxism [“ + “ + *ismos*, state of] **kresep'tol**. A cresol disinfectant more active than the solution cresol compound, USP, made with a specially purified cresol free from objectionable impurities present in ordinary official cresol

Action Antiseptic, germicidal, disinfectant, and deodorant

Uses For cleansing and disinfecting wounds and sores, for disinfecting the hands, surgical instruments, towels, bed linen, sickroom utensils, closets, drains, and excreta, such as sputum, urine, or feces

kresol (kre'sol) USP Brownish yellow fluid from coal tar, used as a germicide. **SYN** cresol, *q.v.*

Krishaber's disease (krēs-ā-bairs') Neurosis marked by dizziness, sleeplessness, palpitation and syncope

Kromayer lamp (kro'mī-er) Water cooled, mercury quartz lamp for local ultraviolet treatments

Krompecher's tumor (krōm'pek-ers) Rodent ulcer **SYN** Jacob's ulcer.

Kronecker's center (krōn'ek-ers). The inhibitory center of the heart.

Krönig's area or field (kra'nig). Resonant region in the thorax over the apices of the lungs

Kruk'enberg's tumor. A malignant tumor of the ovary, usually bilateral, and secondary to malignancies, esp of the gastrointestinal tract

Histologically these tumors consist of myxomatous connective tissue and cells having a signet ring arrangement of their nuclei The epithelial tissue resembles malignancy of the original site.

kryp'ton [G *kryptos*, hidden] A gaseous element found in small amts. in the atmosphere **SYMS** Kr

K₂SO₄. Potassium sulfate.

kumiss, **kumyss** (koo'mis). 1 Cow's milk with sugar and yeast after fermentation. 2 Fermented mare's milk **SYN** koumiss.

Kund'rat's lymphosarcoma. Lymphosarcoma which affects adjacent glands, but does not invade neighboring organs

Kupffer's cells. See under cell

Kussmaul's coma (koo'smawis). Diabetic coma.

kyesteln, **kyesteln** (ki-es'te-in) [G *kyēsis*, conception]. A scum which floats on the standing urine of pregnant women.

kyllosis (ki-lō'sis) [G *kyllōs*, twisted]. Clubfoot.

ky'matism [G *kyma*, wave, + *ismos*, state of]. Twitching of isolated segments of muscle **SYN** myokymia.

ky'mogram. A tracing or recording made by a kymograph

kymograph (kí'mō-gráf) [G *kyma*, wave, + *graphein*, to write] An apparatus for recording wavelike or cyclic activity. Widely used in physiology to record activities such as blood pressure changes, muscle contractions, respiratory movements, etc. Consists of a drum rotated by a spring or electric motor. Drum is covered by a paper upon which the record is made

ky'moscope [' + *skopein*, to examine] Device for measuring variations in blood pressure

kyogenic (kí-o-jen'ík) [G. *kyēsis*, pregnancy, + *gennan*, to produce]. Inducing pregnancy

kypho- [G] Prefix. Humped

kyphorachitis (kí'fō-rā-kí'tis). Rachitic deformity involving thorax and spinal column. Results in development of anteroposterior hump

kyphoscoliosis (kí'fō-skōl-i-ō'sis). Lateral curvature of the spine accompanying anteroposterior hump

kyphosis (kí-fō'sis) [G humpback] Syn *humpback*, *spinal curvature* Exag-

geration or angulation of normal posterior curve of spine. Gives rise to condition commonly known as humpback, hunchback, or Pott's curvature. Also refers to excessive curvature of the spine with convexity backward. The former may be due to congenital anomaly, disease (tuberculosis, syphilis), malignancy, or compression fracture. The latter may result from faulty posture, osteo- or rheumatoid arthritis, rickets, or other conditions

kyphotic (kí-fot'ík) [G *kyphōsis*, humpback] Affected by or pert to kyphosis

ky'rin. A protein resisting tryptic digestion, which yields amino acids when treated with an acid

kyrtorrhachic (kír-to-rak'ík) [G. *kyrtos*, curved, + *rachis*, spine] Spinal curvature with concavity backward.

kysthitis (kís-thí'tis) [G. *kysthos*, vagina, + *-itis*, inflammation] Inflammation of the vagina. Syn *colpitis*, *vaginitis*.

kysthoptosis (kís-thop-to'sis) [' + *ptōsis*, a falling] Prolapse of the vagina.

kyto- [G] Prefix, denoting cell. See *cyto-*

L

L. Abbr. for Latin. *Lactobacillus*, *left*, *length*, *lithium*, *light sense*, *liter*.

L.. Symb. for *limes death*, *q v*.

L. Symb. for *limes zero*, *q v*.

l- In chem., symb. for *levo* (left, or counterclockwise).

La. Symb. for *lanthanum*.

lab. *lab. ferment.* SYN *zymogen*. One of a number of enzymes produced by bacteria which have the power to coagulate liquid proteins. EXAM *rennin*.

Labarraque's solution (lāb-ar-āk') Chlorinated soda solution, a disinfectant.

Labbe's vein (lā-bā'). Vein connecting lateral to sup. longitudinal sinus.

la'bia (sing *labium*) [L]. 1 Lips. 2 The lips of the vulva.

RS *clitoris*, *Hottentot's apron*, *mons veneris*, *nymphas*, *nymphoncus*, *smegma*, *vagina*.

l. majora. The 2 folds of cellular adipose tissue lying on either side of the vaginal opening and forming the lateral borders of the vulva. Lozenge shaped.

Their medial surfaces unite anteriorly above the clitoris to form the *anterior commissure*; posteriorly they are connected by a poorly defined *posterior commissure*. They are separated by a cleft, the *rima pudendi*. In young girls, their medial surfaces are in contact with each other concealing the labia minora and vestibule. In older women, the labia minora may protrude between them.

l. minora. Two thin folds of integument which lie within the labia majora and enclose the vestibule. Anteriorly each divides into two smaller folds which unite with similar folds from the other side and enclose the clitoris, the more anterior one forming the prepuce (*preputium clitoridis*) of the clitoris, the posterior one forming the *frenulum clitoridis*. In young children they are entirely hidden by the labia.

labial (la'bi-al) [L *labium*, lip]. 1 Pert. to the lips. 2 Letter formed by the lips.

l. glands. Many racemose glands bet. labial mucosa and orbicularis muscle opening on lip's inner surface.

labialism (la'bi-al-izm) [L *labialis*, pert. to lip, + G. *ismos*, state of]. Defective speech in which labial sounds are stressed.

labidometer (la-bi-dom-et-er) [G. *labis*, forceps, + *metron*, measure]. Forceps for measuring fetal head in pelvis.

labile (lab'il) [L. *labi*, to glide]. Not fixed, unsteady, easily disarranged.

lability (lab-il'i-ti) [G. *labi*, to glide]. State of being unstable or changeable.

labimeter (lab-im-et-er) [G. *labis*, forceps, + *metron*, measure]. Forceps (or attachment to) for measuring fetal head. SYN *labidometer*.

labioalveolar (lab'i-ō-āl-ve-ol-ar) [L *labium*, lip, + *alveolus*, little hollow]. Pert. to lips and tooth sockets.

labiocervical (lab'i-ō-ser'vī-kāl) [“ + *cervix*, *cervic*, neck]. Pert. to lips, and the neck of a tooth.

labioglossolaryngeal (la'bi-o-glos'o-lar-in'je-āl) [“ + G. *glōssa*, tongue, + *larynx*, larynx]. Pert. to lips, tongue, and larynx.

labioglossopharyngeal (la'bi-o-glos'o-far-in'je-āl) [“ + “ + *pharynx*, throat]. Pert. to the lips, tongue, and pharynx.

labiograph (la'bi-o-graf) [“ + G. *graphein*, to write]. Device for registering the lip movements in speaking.

labiology (lā-bi-ol o-jī) [“ + G. *logos*, study]. Study of the lip movements in speaking or singing.

labiomancy (la'bi-o-man'si) [“ + G. *manēia*, foretelling]. Interpreting speech by reading lip movements.

labiomental (la-bi-ō-men'tal) [“ + *mentum*, chin]. Pert. to the lower lip and chin.

labiomycosis (la'bi-o-mi-kō'sis) [“ + G. *mykes*, fungus, + *-ōsis*]. Any disease of the lips due to presence of a fungus.

labiopalatine (la'bi-ō-pal'ā-tin) [“ + *palatum*, palate]. Relating to the lips and palate.

labioplasty (la'bi-o-plas'tī) [“ + G. *plassein*, to form]. Plastic surgery of the lips. SYN *cheiloplasty*.

labiotenaculum (la'bi-o-ten-ak'u-lum) [L *labium*, lip, + *tenaculum*, a hook]. Instrument for holding lips during an operation.

la'bium (pl *labia*) [L lip]. A lip or a structure like one. SFR *labia*.

l. cerebri. Margin of the cerebral hemispheres overlapping the corpus callosum.

l. inferius. Lower lip.

l. majus (pl *labia majora**) One of 2 lateral boundaries of the vulva with adipose tissue and hair.

l. majus pudendi. L. majus, *q*.

l. minus (pl *labia minora**) L. minora, *q*.

l. minus pudendi. L. minus. SYN *nympha*.

l. superius. The upper lip.

l. sympanicum. Outer edge of organ of Corti.

l. urethrae. Lateral margin of meatus urinarius externus.

l. uteri. Thickened margin of the cervix uteri.

l. vestibulare. Vestibular or inner edge of organ of Corti.

la'bor [L work]. SYN *parturition*, *delivery*, *childbirth*. The physiological process by which the fetus is expelled from the uterus at term.

Normal appearance 280 days after last menstruation.

Labor is divided into 3 stages.

FIRST STAGE *Dilatation*. Lasting from the onset of uterine contractions until the cervix uteri is dilated completely.

SECOND STAGE *Expulsion*. From the time of complete dilatation until the expulsion of the fetus.

THIRD STAGE *Placental*. From the time of expulsion of the fetus until the expulsion of the placenta.

PREPARATION Well ventilated, sunny room, temperature 65° during labor, 70° after. Bed with fresh, well-aired linen and a pad previously prepared, of heavy paper covered with cotton wool, the whole covered with cheesecloth, large enough to cover middle third of bed. This receives the discharge and is easily removed and replaced by

a similar fresh one, keeping the bed in good condition.

The patient is given enema if bowels have not moved freely within 12 hours; bladder emptied if nature does not attend to it.

The vulva and mons veneris and thighs rendered thoroughly aseptic (patient will have taken a bath as soon as indications appeared that labor was drawing near), pubic hair about vulva shaved or closely clipped. Long stockings, made of cotton flannel or tennis flannel, reaching to the hips, should be drawn on, protecting limbs from exposure. The gown to be worn turned up and smoothly fastened out of the way above the waist, an old sheet or cloth pinned comfortably about the waist next to body.

After the third stage, by removing soiled pad, stockings and old sheet, gown may be brought down and patient is in good condition for rest without being disturbed.

A large number of old soft white cloths should be at hand aseptically clean, in case of hemorrhage. Also a number of vulva pads prepared for receiving the lochia, vessels of boiled water, cooled and kept tightly covered, should be provided and plenty of boiled hot water be at hand. Many obstetricians carry with them a stout strap with stirruplike ends for the hands, which may be thrown about the foot of bed to aid in expulsive movements.

FIRST STAGE. Ascertain amount of dilation and the presentation. In ordinary cases only physician and nurse desired in room. Cold water or other cool, refreshing beverage only refreshment required unless protracted.

Ordinarily full dilation is accomplished within 6 hours. Sometimes in a very short time, at others much longer. Patient may walk about or make herself comfortable till second stage. Should then take her position on the pad on left side with breech near edge of bed, thighs flexed at right angles on abdomen and legs on thighs, feet against foot of bed as support during the expulsive efforts. Or the dorsal position (on the back) may be assumed. Pains become stronger and closer together.

SECOND STAGE. During last of first stage or beginning of second, the membranes rupture and a portion of liquor amnii is discharged.

Pains come every 3 minutes or closer, head advances, and fetus is soon expelled, as head appears, attendant should bear his right hand upon the perineum in such a manner as to encircle the labia as much as possible with thumb and fingers, and while drawing down with these upon the labia must press gently forward and upward upon the perineum with the palm of same hand.

Ascertain that cord is not about child's neck. Have at hand a saucer of warm olive oil and as body advances rub it into all the places covered with the vernix which will then easily be removed later. Have at hand a cup of warm, sterilized water, after cleansing hands in the bowl which has been at hand throughout, containing some antiseptic, as creolin or lysol or whatever is preferred, dip bit of absorbent cotton in the sterilized water and thoroughly wash child's eyes and dry with bit of the cotton.

If by this time cord has stopped pulsating (usually in about 5 minutes), tie a ligature about 5 inches from the abdomen, another an inch nearer the placenta and cut between them. After thoroughly cleaning the cord and allowing blood to flow from it toward abdomen, take ends of first ligature and tie cord tightly one-half inch from abdomen (after ascertaining that no part of intestine protrudes into cord), this leaves a loop of umbilical cord which prevents hemorrhage or entrance of infection.

As the child is fully expelled the sheet covering the mother should be dropped between her and the child, who should be wrapped in a warm blanket at hand to receive him. The remaining portion of liquor amnii follows the expulsion and uterus contracts upon itself. This ends second stage.

THIRD STAGE. Return of pain (usually a lull after completion of second stage); this marks expulsion of placenta—may occur within 20 minutes or not for hours. Uterus is found low down, hard, globular and size of fetal head.

Expulsion of placenta without retention of shreds of membrane may be accomplished by twisting movement on cord as placenta appears in vulva, contraction of uterus and avoidance of hemorrhage may be aided by gentle massage of uterus through abdominal wall. After expulsion of placenta examine perineum to see if there is any laceration, if deep, repair at once, tie knees together to prevent pulling apart of wound. If tear is slight, leave for nature to heal and avoid infection. Caution used on changing pad at vulva not to tear out stitches by too hasty removal of pad.

Allow few moments' rest, then quickly remove all soiled bedding and apparel, bring down the pinned up gown, draw down shades and leave patient to rest on no account have any conversation at this time.

From time to time feel if uterus is contracting as desired and that there is no hemorrhage. If labor is complicated by malpositions different tactics must be pursued in the different stages to suit the individual case.

There is still no ideal anesthetic. The current varying successful methods of amnesia, analgesia, and anesthesia are morphine-scopolamine, sodium amylal, paraldehyde and rectal ether, ether-oil, pentobarbital with or without scopolamine, nitrous oxide and oxygen alone or with ether, ether alone, nitrous oxide and ethylene, evipal, pentothal, pernocton, pantopon, epidural anesthesia and pudendal nerve block. **See pregnancy.**

1., artificial. Labor brought on by the use of ecbolics or hydrostatic bags.

1., complicated. Any complication occurring during the course of labor.

1., dry. Labor after most of the amniotic fluid has been drained away.

1., false. Uterine contractions coming on before the onset of actual labor.

1., induced. Labor brought on by the use of ecbolic hydrostatic bags, or any other method that may be used.

1., instrumental. Labor completed by mechanical means, such as the use of forceps.

1., missed. The patient goes through actual labor but the fetus dies and is not expelled.

l., multiple. Labor with 2 or more fetuses.

l., precipitate. Rapidly completed labor that occurs without the aid of an accoucheur.

l., premature. Labor coming on between the 7th month of gestation and full term.

l., spontaneous. Labor that is completed without external aid.

labor, words pert. to: abortion, acyesis; "amni-" words, ante partum; apnoia, apnoic; asynclitism, bag of waters, bag, hydrostatic, ballotement, basilysis, basiotripsy; bipara, biparous; bradycotia, breech presentation, brow presentation; bruit, placental, caput succedaneum, caul; cephalhematoma, cephalic version, cephalotomy; cesarean section; cesarotomy, chorda umbilicalis, cleidotomy, conception, conjugate; Crede's method, cross birth, delivery; disengagement; dystocia; ecbollic; eclampsia, embryectomy, embryo, embryotomy, embryotocia, embryulcia, enycesis; eutocia, fetus, fixity, gestation, Hegar's sign; hourglass contraction, impetigo herpeticiformis, maneuver, mimetic, obstetrician, obstetrics; placenta, puerpera; puerperal, puerperium, quintuplets, restitution, Schultze's method; show, synticism, vagitus, xerotocia

laboratory (lab'or-i-to-ri) [L. *laboratorium*, work place]. A place equipped for analytical or experimental work.

Laborde's method (respiration stimulation). Stimulation of the respiratory center in asphyxiation by a series of rhythmical traction movements upon the tongue.

labrum (pl *labra*) [L. *lip*] Lip, or lip-like structure, the upper lip of an insect.

OSSEOUS LABYRINTH, ANTERIOR VIEW

A Ampulla. B External semicircular canal. C Posterior semicircular canal. D Superior semicircular canal. E Ampullae. F Vestibulum. G Fenestra ovalis. H Cochlea. I Fenestra rotunda.

labyrinth (lab'i-rinth) [G. *labyrinthos*, a maze]. 1. Intricate communicating passages. 2. The internal ear consisting of osseous and membranous labyrinths.

l., bony. Osseous labyrinth, *q.v.*

l., ethmoidal. The lateral mass of the ethmoid bone. Includes the sup and middle conchae and encloses the ethmoidal air cells.

l., membranous. Structure in osseous labyrinth consisting of utricle and sacule of vestibule, 3 semicircular ducts, and the cochlear duct. All are filled with endolymph. [*q.v.*]

l., olfactory. The ethmoidal labyrinth,

l., osseous. Consists of vestibule, 3 semicircular canals, and cochlea. Channelled out of petrous portion of temporal bone.

labyrinthectomy (lab-i-rin-thek'tō-mī) [" + *ektomē*, excision]. Excision of the labyrinth.

labyrinthine (lab-i-rin'thin) [G. *labyrinthos*, a maze]. 1. Pert. to a labyrinth. 2. Intricate or involved, as a labyrinth.

labyrinthitis (lab-i-rin-thi'tis) [" + *-itis*, inflammation]. Inflammation (acute or chronic) of labyrinth.

Error: Primary infection, complication of influenza, otitis media, or of meningitis.

Sym. Vertigo, vomiting, nystagmus.

RS. Meniere's disease.

labyrinthotomy (lab-i-rin-tho'tō-mī) [" + *tomē*, incision]. Incision of the labyrinth.

lac (lak) [L.]. 1. Milk. 2. Milky medicinal substance.

lacerate (las'er-āt) [L. *lacerāre*, to tear]. To tear, as into irregular segments.

lacerated (las'er-a-ted) [L. *lacerāre*, to tear]. Torn, broken.

laceration [L. *lacerāre*, to tear]. A wound or irregular tear of the flesh.

l. of cervix. Bilateral, stellate, or unilateral tear of the cervix uteri caused by childbirth.

l. of perineum. Injury to perineum caused by childbirth. If extending through sphincter ani muscle it is complete.

lacetus (lā-ser'tus) [L.]. 1. Muscular part of the arm. 2. A muscular or fibrous band.

l. cordis. Muscular tissue bands on inner cardiac surface. **Syn** *trabecula carneae*.

l. fibro'sus. Aponeurotic band from the biceps tendon to the bicipital or semilunar fascia of forearm.

lacrimal (lak'rīm-āl) [L. *lacrima*, tear]. Pert. to the tears.

THE LACRIMAL APPARATUS.

1. Inferior rectus muscle; 2. lower eyelid; 3. eyeball; 4. lateral rectus muscle; 5. lacrimal gland; 6. superior rectus muscle; 7. upper lacrimal duct; 8. lacrimal caruncle; 9. medial palpebral ligament; 10. inferior lacrimal duct; 11. lacrimal sac; 12. lower eyelid; 13. middle meatus; 14. opening into inferior meatus; 15. inferior turbinate; 16. maxillary sinus; 17. infra-orbital nerve.

l. apparatus. Structures concerned with secretion and conduction of tears. Includes 1 gland and its excretory ducts, 1 canaliculi, 1 sac, and nasolacrimal duct, which empties into nasal cavity.

l. bone. One at inner side of the orbital cavity.

l. duct. Syn: 1. *canaliculus*. One of two ducts sup and inf which convey tears from lacrimal lake to the lacrimal sac.

l. gland. The gland which secretes the tears. A comp tubuloalveolar gland located in orbit, superior and lateral to the eyeball. Consists of a large superior portion (*pars orbitalis*) and a smaller inferior portion (*pars palpebralis*).

l. reflex. Secretion of fluid resulting from irritation of corneal conjunctiva.

l. sac. Upper dilated portion of nasolacrimal duct situated in groove of lacrimal bone. Upper part is behind infernal tarsal ligament. Measures 12 mm in vertical and 6 mm in transverse diameter.

lacrimation [*L lacrima*, tear] Secretion and discharge of tears.

lacrimator. A substance which induces the secretion of tears.

lacrimation (lak-rim-ot'-o-mi) [l' + *G tonic*, incision]. Incision of lacrimal duct.

lactacidase [*L lac*, milk] Enzyme in lactic acid bacteria which converts sugars to lactic acid.

lactacidemia (lakt-as-id-e'mi-ä) [l' + *acidus*, sour + *G aima*, blood] Lactic acid in the blood. Syn *lactacidemia*.

lactaciduria (lakt-a-sid-u'ri-ä) [l' + *G ouron*, urine] Lactic acid excreted in the urine.

lactagogue (lak'tä-gog) [*L lac*, milk, + *G agogos*, leading]. Agent which induces secretion of milk.

lactalase (lak'tä-läs) [l' + *ase*, enzyme]. Ferment converting dextrose into lactic acid.

lactalbumin [l' + *albumen*, coagulated white of egg]. The albumin of milk and cheese, a soluble simple protein.

When milk is heated, the lactalbumin coagulates and appears as a film over the top of the milk.

Comp Carbon 52 19, hydrogen 7 18, nitrogen 15 77, oxygen 23 13, and sulfur 1 73.

lactase [*L lac*, milk, + *ase*, enzyme]. An intestinal sugar splitting enzyme converting lactose into dextrose and galactose, found in intestinal juice.

See *enzyme*, *maltase*, *sucrase*, *sugar*.

lactate (lak'tät). [*L lac*, milk] A salt derived from lactic acid.

lactation (lak-tä'shun) [*L lactatio*, a suckling] 1 The period of suckling in mammals. 2 The function of secreting milk.

DIET. The mother during this period needs additional calcium to offset its loss in the milk. One qt of milk, an egg, and meat are needed once a day. Fruits, vegetables, and whole grain cereal should be added.

lacteal (lak'te-äl) [*L lac*, milk] 1 Pert to milk. 2 An intestinal lymphatic that takes up chyle and passes it to the lymph circulation, and by way of the thoracic duct to the blood vascular system.

See *absorption*, *lymphatic*.

lactescence (lak-tes'ens) [*L lactescere*, to become milky] Condition of becoming, or resembling milk.

LACTIFEROUS GLANDS.

Dissection of the lower half of the female mamma, during the period of lactation. In the left hand side of the dissected part, the glandular lobes are exposed and partially unraveled, and on the right hand side the glandular substance has been removed to show the reticular loculi of the connective tissue in which the glandular lobules are placed. 1 Upper part of the mammary or nipple. 2 Areola. 3 Subcutaneous masses of fat. 4 Reticular loculi of the connective tissue which support the glandular substance and contain the fatty masses. 5 One of three lactiferous ducts shown passing toward the mammary where they open. 6 One of the sinus ducts or reservoirs. 7 Some of the glandular lobules which have been unraveled. 8 Others massed together.

lac'tic [L. *lac*, milk]. Pert. to milk

l. acid. SYN *oxypropionic acid* A colorless syrupy liquid ($C_3H_5O_3$) formed in milk, sauerkraut, and in certain types of pickles by the fermentation of the sugars by microorganisms. It is also formed in muscles during activity by the breakdown of glycogen (glycolysis). Medicinally lactic acid is used as a spermatoxicidal agent, a caustic antiseptic, and as a dietary constituent.

l. acid fermentation. The production of lactic acid from carbohydrates by the action of various bacteria. Occurs commonly in milk and milk products.

lact'icemia (lakt-i-se'mi-ā) [l' + G *aima*, blood] Lactic acid in the blood. SYN *lactacidemia*

lactiferous (lakt-if'er-us) [l' + *ferre*, to bear] Secreting and conveying milk

l. ducts. Ducts of the mammary gland

l. glands. 1 The mammary glands 2 Montgomery's glands (consisting of 20 to 24 glands in the areola of the nipples. See *Ill.* p. L-5)

lactification (lakt'ti-fi-ka'shun) [l' + *facere*, to make] Lactic acid production.

lactifuge (lakt'ti-fuj) [l' + *fugere*, to expel] 1 Stopping milk secretion 2 Agent stopping milk secretion SYN *ischogalactic*.

lactigenous (lakt-tij'en-us) [l' + *gennan*, to produce] Producing milk

lactigerous (lakt-tij'er-us) [l' + *gerere*, to carry] Secreting or conveying milk

lac'tin [L. *lac*, milk] Lactose, sugar of milk

lactinated (lakt'in-āt-ed) [L. *lac*, milk]. Containing or prepared with milk sugar

lactivorous (lakt-iv'or-us) [l' + *vorare*, to devour] Living upon milk

lactobacilline (lakt-o-bas'il-in) [l' + *bacillus*, little rod] A preparation of lactic acid bacilli (1) to counteract intestinal putrefaction, (2) to cause lactic acid fermentation

Lactobacillus (lakt-o-bā-sil'us) [l' + *bacillus*, little rod] A genus of bacteria belonging to the family *Lactobacteriaceae*. They are gram-positive, nonmotile rod-shaped organisms which do not produce spores and are acid resisting. They produce lactic acid from carbohydrates. They are responsible for the souring of milk.

L. acidophilus. A lactic acid forming organism found in the intestinal contents of infants. It produces lactic acid fermentation of milk.

L. basophilus. Nonmotile Gram-positive rods found in gastric contents especially in cancer of stomach.

L. bulgaricus. Forms the sour milk known as yoghurt.

L. casei. A type found in cheese.

L. casei factor. Folic acid, q.v.

L. caucasicus. Kephir-producing ferment.

L. helveticus. Type found in Swiss cheese.

L. odontolyticus. Thought to be a cause of dental caries.

L. panis. Type occurring in sour dough.

lactobutyrometer (lakt'o-bu ti-rom'et-er) [l' + G *boutyron*, butter, + *metron*, measure] Instrument for estimating the butter fat content of milk.

lactocoele (lakt'o-sēl) [l' + G *kēlē*, hernia]. Cystic tumor of breast due to occlusion of a milk duct. SYN *galactocoele*.

lactocrit (lakt'o-krit) [l' + *kritēs*, judge].

Instrument for determining the amt of fatty substance in milk.

lactodensimeter (lakt-o-den-sim'et-er) [l' + *densus*, thick, + G *metron*, measure]. Instrument for determining specific gravity of milk.

lactoflavin. Riboflavin, q.v.

lactogenic. Inducing the secretion of milk.

l. hormone. Prolactin, q.v.

lactoglobulin (lakt'to-glob'ū-lin) [L. *lac*, milk, + *globulus*, globule] A protein found in milk.

lactolase (lakt'o-lās) [L. *lac*, milk + *ase*, enzyme] An enzyme forming lactic acid. SYN *lactacidase*.

lactolin (lakt'o-lin) [L. *lac*, milk] Condensed or evaporated milk.

lactometer (lakt-tom'et-er) [l' + G *metron*, measure] Device for determining the specific gravity of milk.

lactophosphate (lakt'o-fos'fāt) [l' + *phosphas*, phosphate] A salt derived jointly from lactic and phosphoric acid.

lactorrhoea (lakt-or-re-ā) [l' + G *roia*, flow] Discharge of milk between nursings and after weaning of offspring. SYN *galactorrhea*.

lactoscope (lakt'to-skōp) [l' + G *skopein*, to examine] Device for determining quality of milk.

lac'tose [L. *lac*, milk] $C_{12}H_{22}O_{11} + H_2O$. A disaccharide which on hydrolysis yields glucose and galactose.

Bacteria can convert it into lactic and butyric acids, as in the souring of milk. 4-7% are found in the milk of all mammals. Its presence in the urine may be indicative of obstruction to flow of milk after cessation of nursing. Commercially, a fine powdered, white substance that will not dissolve in cold water.

USP Crystalline sugar obtained from evaporation of cow's milk. Used as modified milk for infant feeding, or supplementary food for adults, as a diluent. SYN *milk sugar*. SEE *disaccharose*.

Dosage 1-6 oz. (30.0-180.0 Gm.) per day.

lactoserum (lakt-o-sēr-um) [l' + *serum*, whey] 1 Blood serum of an animal inoculated with milk, used to precipitate specific caseins from milk. 2 The whey of milk. [lactose]

lacto'sum [L. *lac*, milk] USP term for **lactosuria**.

lactosuria (lakt-to-su'ri-ā) [l' + G *ouron*, urine] Occurrence of milk sugar (lactose) in the urine.

Frequent during pregnancy and lactation. Identified by osazone crystal.

lactotherapy (lakt-o-ther'a-pl) [l' + G *therapeia*, therapy] 1 Treatment with milk diet. 2 Medicinal treatment of nursing infant with drugs given to mother to be excreted in milk. SYN: *galactotherapy*.

lac'totoxin [l' + G. *toxikon*, poison] A milk ptomaine.

lactovegetarian. 1 Pert to milk and vegetables. 2 One who lives on a diet of milk and vegetables.

lacuna (la-ku'na) (pl *lacunae*) [L. a pit] 1 A small, hollow space, such as that found in bones, in which lie the osteoblasts. 2 A gap or hiatus found in cartilage or bone in which lie cartilage or bone cells.

l., absorption. Howship's 1, q.v.

l., blood. SEE *l. trophoblastic*.

l., bone. One of the isolated ovoid spaces bet osseous lamellae, connected by canaliculi, containing a protoplasmic body or bone cell.

l., Howship's. A pit or groove in bone where resorption or dissolution of bone

is occurring. Usually containing osteoclasts.

l., intervillous. SYN *intervillous space*. A space in the placenta occupied by maternal blood and into which fetal placenta villi project.

l., laterales. Irregular diverticula on either side of the sup sagittal sinus into which the arachnoidal granulations project.

l., magna. Largest of orifices in Litre's glands.

l., Morgagni. The larger of the openings of the urethral glands, *q.v.*, found in proximal portion of the cavernous urethra.

l., pharyngis. Pit at pharyngeal end of eustachian tube.

l., trophoblastic. Irregular cavities in the syncytiotrophoblast which develop into intervillous spaces or lacunae, *q.v.*

l. of the urethra. One of those in mucous membrane of the urethra, esp. along the floor and in the bulb. They are the openings of urethral glands.

l., vasorum. Internal aperture of femoral canal.

l., venous. Endothelial lined spaces in the dura mater which communicate with the meningeal veins and blood sinuses esp. the sup sagittal sinus.

lacunar (la-ku'nar) [L *lacuna*, pit] Pert. to lacunae.

lacunula (la-ku'nu-lā) [L little pit] Small or minute lacuna.

lacus (la kus) [L lake] Collection of fluid in small hollow or cavity.

l., lacrimalis. Space at inner canthus of eye where tears collect.

Laënnec's cirrhosis (lan-eks') Atrophic cirrhosis of liver. SYN *hobnail liver*.

L's pearls. Round gelatinous masses in asthmatic sputum.

L's râle. Modified subcrepitant râle due to mucus in bronchioles.

L's thrombus. Globular thrombus in heart.

lag [Welsh *llaq*, slow] 1 Period of time bet application of stimulus and resulting reaction. SYN *lag phase*. 2 Early period following bacterial inoculation into culture medium.

lageniform (lag-en'i-form) [“ + *forma*, shape] Flask-shaped.

lagging (lā'ging) [Welsh *llaq*, slow] Retarded movement of chest in pulmonary tuberculosis.

lagophthalmos, lagophthalmus (lag-of-thal'mos, -mus) [G *laqōs*, hare, + *ophthalmos*, eye] Incomplete closure of palpebral fissure when lids are shut, resulting in exposure and injury to bulbar conjunctiva and cornea.

Etiol. Contraction of a scar of eyelid, atony of orbicularis palpebrarum, exophthalmos. Incomplete closure of the lids during sleep is seen in hysteria, in exhausted adults, and often in healthy children. SYN *hare's eye*.

lag phase [Welsh *llaq*, slow, + G *phasis*, appearance] The period after a stimulus is administered to the time of its response. SEE *lag*.

la grippe (la grip') [Fr. the grip]. Acute infectious disease of respiratory or gastrointestinal tract. SYN *influenza, q.v.*

lally (lā'i-tl) [G *laos*, the people] Portion of public nonprofessional in field of special professions.

lake. A small fluid-cavity. SEE *lacus*.

laked [AS *lacu*, lake] Said of the blood in hemolysis* or disintegration of the red blood corpuscles, freeing the hemoglobin into the blood plasma.

lak'ing [AS *lacy*, lake]. Freeing of hemoglobin from red blood corpuscles.

laky (lāk'i [AS *lacu*, lake] 1. Resembling a lake. 2. Having the color of blood following hemolysis.

lalia'try (lal-i'a-tri) [G *lallein*, to babble, + *latria*, therapy] Study and treatment of speech disorders and defects.

lalia'tion, lal'ling [G *lallein*, to babble]. A babbling form of stammering. Infantile form of speech. The constant use of "l" instead of "r."

lalognosis (lal-og-no'sis) [“ + *gnōsis*, understanding] Understanding of prattle or speech.

laloneurosis (lal-o-nū-rō'sis) [“ + *neuron*, nerve, + *-osis*]. Speech impairment of neurotic origin.

lalop'athy [G *lallein*, to babble, + *pathos*, disease] Any disorder affecting the speech.

lalophobia (lal-ō-fō'bī-ā) [“ + *phobos*, fear] Morbid reluctance to speak due to fear of stammering or committing errors.

laloplegia (lal-o-ple'jī-ā) [“ + *plēgē*, a stroke] A paralysis of speech muscles without affecting action of tongue.

lalorrhea (la-lor-re'ā) [“ + *roia*, flow]. Abnormal flow of speech.

lamarckism or **Lamarck's theory** (lam-ark'-ism) Theory that evolutionary changes are the result of environmental changes that basic inherent needs or changes necessitated by environmental modifications bring about the development of an organ that use accentuates the development of a structure, disuse brings about its loss or atrophy, that acquired characters are inherited and passed on to descendants. Theory lacks experimental proof and is not generally accepted by Western scientists.

lamb (lām) [AS *l*] The young of sheep.

	Ar. Serp.	Pro.	Fat Car.
1 Roasted	115 Gm	35 2	6 8
2 Quarters	75 Gm	23 0	5 6 2
1 Cn 0 058, Mg 0 118, K 1 694, Na 0 421, P 1 078, Cl 0 378, S 1 146, Fe 0 0150			
1 Vit A	10 +,	B +,	G +
2 Vit A	++ +		

lambda (lam dā) [G *lambda*, letter L] Point or angle of junction of lambdoid and sagittal sutures.

lambdacism (lam dā-sizm) [G *lambda*, letter L] 1 Stammering of *l* sound. 2 Inability to pronounce *l* sound properly.

lambdoid, lambdoidal (lam doid, lam doid'-al) [“ + *eidōs*, form] Shaped like Greek letter L.

l., ligament. Ligamentum fundiforme pedis.

l., suture. Suture bet the occipital and 2 parietal bones.

Lambia intestinalis (lam-bī-ā in-test-i-nal'is) Flagellate protozoan parasite found in intestine. *Giardia lamblia, q.v.*

lambliasis (lam-bī-ā-sis) *Giardiasis, q.v.*

lame. Disabled in limb, esp. in leg or foot, also applied to weak or painful condition as a *lame back*.

lamella (lam-el'a) [pl. *lamellae*] [L. a little plate, leaf]. 1. A medicated disc of gelatin inserted under lower eyelid and against the eyeball used as a local application to eye. 2. A thin plate or scale.

l., bone. Thin layer of ground substance of osseous tissue.

l., circumferential. SYN *basal lamella*. general lamella L found on the external surface or lining the marrow cavity of a bone.

l., concentric. Plate of bone surrounding a haversian canal.

l., intermediate. Bone lamella filling irregular spaces bet. concentric lamellae.

l., interstitial. SYN: ground lamella. Bone lamella filling irregular spaces bet concentric lamellae

l., medullary. The osseous lamella surrounding and forming wall of medullary cavity of tubular bones.

l., periosteal. Bone lamella next to and parallel with the periosteum, forming ext portion of bone

l., triangular. Small fibrous lamina bet chorioid plexuses of 3rd ventricle of the brain

l., vitreous. Inner boundary of the chorioid

SYN: Bruck's membrane, *lamina basalis*.

lamellar (lam-el'lar). Arranged in thin plates or scales

lameness. Limping, or abnormal gait, hobbling, resulting from partial loss of function in a leg May be due to maldevelopment, injury, or disease

lam'ina (pl *laminae*) [L a thin plate]

1. A thin, flat layer or membrane. 2 The flattened part of either side of the arch of a vertebra

l., anterior elastic. SYN *Bowman's membrane* Thin membrane in cornea separating surface epithellum and substantia propria

l., basalis. SYN *lamina elastica*, *Bruch's membrane* Layer of chorioid touching retinal pigmented layer

l., Bowman's. Basement membrane beneath epithellum of cornea

l., choriocapillaris. BNA Chorioid's middle layer containing close mesh of capillaries SYN *membrane, Ruysch's*

l., cribrosa. Cribiform plate of the ethmoid bone

l. c. sclerae. Portion of sclera forming a sievelike plate through which pass fibers of the optic nerve to the retina

l., dental. An epithelial plate which grows gumward from the labial lamina From it arise the enamel organs of the future teeth

l., labial. A thickened band of epithellum which grows from the ectodermal covering of the primitive jaw It splits into two sheets by development of the labial groove, thus giving rise to the vestibule of the mouth From it arises the dental lamina, q v

l., medullary, inner. Internal medullary Layer of fibers passing from thalamus to the red nucleus

l., papyr'cea. A thin, smooth, plate of bone on lateral surface of lateral mass of ethmoid bone, forms orbital plate

l., perpendicular. Thin sheet of bone forming perpendicular plate of the ethmoid bone Supports upper portion of nasal septum

l. propria. SYN *tunica propria* (of mucous membranes) A thin layer of fibrous connective tissue which lies immediately beneath the surface epithellum of mucous membranes

l., quadrigemina. Layer of gray matter forming roof of aqueduct of Sylvius and forming the corpora quadrigemina

l., rostral. Continuation of the rostrum of the corpus callosum and the lamina terminalis of the third ventricle

l., spiralis. One which divides the int. of spiral canal of cochlea into 2 scalae and divides into 1 spiralis ossea, and 1 spiralis membrana

l., suprachoroida. Outermost layer of the chorioid

l., terminal. Thin sheet of tissue forming the anterior border of the third ventricle.

l. vitrea. SYN *lamina basalis*, *lamina elastica*, *membrane of Bruch* Smooth, transparent membrane covering inner surface of chorioid

laminated (lam'in-ät-ed) [L. *lamina*, thin plate] Arranged in layers or laminae.

lamination (lam-in-ä'shun) [L. *lamina*, thin plate] 1. Layerlike arrangement. 2. In embryotomy, the slicing of the skull

laminec'tomy [' + G. *ektomē*, excision]. The excision of a vertebral post arch

NP Keep patient off back in position specified by physician

laminitis (lä-min-i'tis) [' + G. -itis, inflammation] Inflammation of a lamina

lamp, therapeutic [G *lampein*, to give light] Device for producing and applying light, heat, radiation, and various forms of radioactivity for the treatment of disease.

l., infrared. Heat lamp, a lamp which develops a high temperature, emitting infrared rays from 7,000 to 16,000 Angstrom units. Rays penetrate only a short distance (5 to 10 mm.) into the skin. Effect is principally on surface blood vessels and nerve endings

lamprophonia (lam-pro-tō'nī-ä) [G *lampros*, clear, + *phōnē*, voice] Marked distinctness or clearness of voice

lamprophonic (lam-prō-fō'nik) [' + *phōnē*, voice] Possessing a clear voice

lance (lans) [L *lancea*, spear] 1 Two-edged surgical knife 2 To incise with a lancet

lancet (lan'sët) [L. *lancea*, spear] Pointed surgical knife with 2 edges

lancinating (län'si-nat-ing) [L *lancināre*, to tear] Sharp or cutting, as pain

Lancisi's nerves (lan-che'zī) Striae in corpus callosum SYN *striae longitudinales*, q v.

Landouzy-Dejerine atrophy (lan-dü-ze'dä-zhē-rēn') Atrophy of muscles of face and scapulohumeral group

Landry's paralysis (lan-dre') A form of paralysis in which loss of motor power in lower extremities gradually extends to upper extremities and to circulatory and respiratory centers without sensory manifestations, trojic changes, etc SYN *acute ascending paralysis*.

land scurvy. Severe variety of purpura with hemorrhage by the mucosa SYN *purpura hemorrhagica*

Lane's disease (län). Chronic intestinal stasis.

L.'s kinks. Bending or twisting of intestine at various points as result of upright position of body

L.'s operation. Short circuiting of the colon for chronic constipation, colitis, or obstruction

Langerhans' islands (lahng'er-hahns) SEE *islands of Langerhans*

Lange's test (läng'ē). Diagnosis of cerebrospinal syphilis by degree of gold precipitation in varying concentrations of colloidal gold solution and spinal fluid—4/10% salt solution

Lange's layer. The cytotrophoblast, a cellular layer present in chorionic villi of the placenta

langour (läng'yēr). Feeling of weariness or exhaustion as from illness; lack of vigor or animation, lassitude

lanolin, anhydrous (lan'ō-lin). USP The purified, fatlike substance obtained from the wool of sheep

Uses As an ointment base, having the property of absorbing water, and the advantage of not becoming rancid

l., hydrous. USP. Wool fat containing about 25% water.

Uses: Same as for l., anhydrous.

lanugo (lan-oō'go) [L. *lana*, wool]. 1. Downy hair covering the body. 2. Fine downy hairs that cover the body of the fetus, esp. when premature.

laparectomy (lap'ā-rēk'tō-mī) [G. *lapara*, loin, + *ektomē*, excision]. Excision of strips or gores in abdominal wall. SYN: *enterectomy*.

laparo- [G.]. Combining form pert to the flank and to operations through the abdominal wall.

laparocholecystotomy (lap'ar-o-kol'e-sis-tot'o-mī) ['' + *cholē*, bile, + *kystis*, bladder, + *tomē*, incision]. Incision into gallbladder through abdominal wall.

laparocolostomy (lap'ar-ō-kō-lōs'tō-mī) ['' + *kolon*, colon, + *stoma*, opening]. Formation of permanent opening into colon through abdominal wall.

laparocolotomy (lap'ar-ō-kō-lōt'ō-mī) ['' + *tomē*, incision]. Incision of colon through abdominal wall, forming an artificial opening. SYN: *laparocolostomy*.

laparocolpotomy (lap'ar-ō-kol-pot'ō-mī) ['' + *kolpos*, vagina, + *tomē*, incision]. Incision over Poupert's ligament dissecting peritoneum to vagina which is incised transversely, enabling dilation of cervix and extraction of child through os uteri. SYN: *celiocolotomy*, *laparocolotomy*.

laparocystectomy (lap'ar-o-sis-tek'tō-mī) ['' + *kystis*, bladder, + *ektomē*, excision]. Removal of an extrauterine fetus or of contents of a cyst through an abdominal incision.

laparocystidotomy (lap'ar-o-sist-I-dōt'ō-mī) [G. *lapara*, loin, + *kystis*, bladder, + *tomē*, incision]. Bladder incision through the abdominal wall.

laparocystotomy (lap'ar-o-sis-tot'o-mī) ['' + *tomē*, incision]. Incision of abdomen to remove contents of a cyst or an extrauterine fetus.

laparocystrotomy (lap'ar-o-el-I-trot'o-mī). Abdominal incision to aid in removal of fetus. SEE *cesarean operation*.

laparoenterostomy (lap'ā-rō-ēn-tēr-ōs'tō-mī) ['' + *enteron*, intestine, + *stoma*, opening]. Formation of aperture into intestine through abdominal wall.

laparoenterotomy (lap'ar-o-en-ter-ot'o-mī) ['' + *tomē*, incision]. Opening into intestinal cavity by incision through the loins.

laparogastrostomy (lap'ār-ō-gās-trōs'tō-mī) [G. *lapara*, loin, + *gastēr*, belly, + *stoma*, opening]. Formation of permanent gastric fistula through abdominal wall. SYN: *celiogastrostomy*.

laparogastrostomy (lap'ar-o-gas-trot'o-mī) ['' + *tomē*, incision]. Abdominal incision into stomach.

laparohepatotomy (lap'ār-ō-hēp-ā-tōt'ō-mī) ['' + *ēpar*, *ēpat-*, liver, + *tomē*, incision]. Incision of the liver through abdominal wall from side.

laparohysterectomy (lap'ar-o-his-ter-ek'tō-mī) ['' + *ystera*, uterus, + *ektomē*, excision]. Abdominal removal of uterus.

laparohystero-oophorectomy (lap'ar-o-his'ter-o-o'phor-ek'tō-mī) ['' + *ōon*, ovum, + *phoros*, bearer, + *ektomē*, excision]. Removal of uterus and ovaries through an abdominal incision. POSITION: *Dorsal*.

laparohysteropexy (lap'ar-o-his'ter-o-peks-I) ['' + *pēxis*, fixation]. Abdominal fixation of the uterus.

laparohysterosalpingo-oophorectomy (lap'ār-ō-his'tēr-ō-sāl-pln'gō-ō'fō-rek'tō-mī) [G. *lapara*, loin, + *ystera*, uterus, + *salpīgē*, tube, + *ōon*, ovum, + *phoros*, bearer, + *ektomē*, excision]. Removal of uterus, fallopian tubes, and

ovaries through abdominal incision. SYN: *celiophysterosalpingo-oophorectomy*.

laparohysterotomy (lap'ar-o-his-ter-ot'o-mī) ['' + *tomē*, incision]. Abdominal incision into uterus. SEE: *cesarean section*.

laparoleiotomy (lap'ar-o-il-e-ot'o-mī) ['' + *eilein*, to twist]. Abdominal incision into ileum.

laparokelyphotomy (lap'ār-ō-kēl-I-fōt'ō-mī) ['' + *kelyphos*, eggshell, + *tomē*, incision]. 1. Removal of an extrauterine fetus by laparotomy. 2. Suprapubic cystotomy. SYN: *laparocystotomy*.

laparomyitis (lap'ār-ō-mī-l'itis) [G. *lapara*, loin, + *mys*, muscle, + *-itis*, inflammation]. Inflammation of muscular portion of abdominal wall.

laparomyectomy (lap'ar-o-mī-o-mek'tō-mī) ['' + *ōma*, tumor, + *ektomē*, excision]. Abdominal excision of a muscular tumor.

Preparation same as for cesarean operation, minus the obstetrical appliances. POSITION: *Dorsal*.

laparonephrectomy (lap'ar-o-ne-frek'tō-mī) ['' + *nephros*, kidney, + *ektomē*, excision]. Renal excision abdominally.

laparorrhaphy (lap'ar-or-rā-fl) ['' + *raphē*, suture]. Abdominal wall suture. SYN: *celiorrhaphy*.

laparosalingectomy (lap'ar-o-sal-pln-jek'tō-mī) ['' + *salpīgē*, tube, + *ektomē*, excision]. Abdominal excision of a fallopian tube.

laparosalingo-oophorectomy (lap'ār-ō-sāl-pln'gō-ō'fō-rek'tō-mī) ['' + *ōon*, ovum, + *phoros*, bearer, + *ektomē*, excision]. Removal of fallopian tubes and ovaries through abdominal incision. SYN: *celiosalpingo-oophorectomy*.

laparosalingotomy (lap'ār-ō-sāl-pln-got'ō-mī) ['' + *tomē*, incision]. Incision of oviduct through abdominal wall. SYN: *celiosalpingotomy*.

laparoscopy (lap'ār-ōs'kō-pī) ['' + *skopein*, to examine]. Abdominal exploration employing instruments. SYN: *celioscopy*.

laparosplenectomy (lap'ar-o-splen-ek'tō-mī) ['' + *splēn*, spleen, + *ektomē*, excision]. Abdominal excision of the spleen.

laparosplenotomy (lap'ār-ō-splēn-ōt'ō-mī) ['' + *tomē*, incision]. Incision of the spleen through abdominal wall.

laparotomy (lap-ar-ot'o-mī) ['' + *tomē*, incision]. The surgical opening of the abdomen; an abdominal operation.

PREPARATION: *General*. Except in emergency cases, the preparatory treatment should be begun three days before operation, during which time the patient is strictly confined to light, nutritious diet, and receives each day a warm bath, laxative, and, in operations on uterus or vagina, a vaginal douche. Patients having stricture of the esophagus, pylorus, or intestines are not given cathartic, but with physician's permission a high enema. For pyloric or intestinal obstruction wash out the stomach. On evening before operation, previous to shaving abdomen, denude pubes with scissors and apply a potash soap poultice. After an hour remove the poultice; shave entire abdomen, pubes and genitalia, scrub with hot water and potash soap; wrap cotton on the end of probe to clean umbilicus. Wash with sterile water and scrub again, using benzine and soap; rinse with warm water; dry with gauze; sponge with alcohol, then use warm bichloride solution 1:1000 and cover field of operation with a 3-yard compress of sterile gauze, saturated with a warm

solution of bichloride, strength 1:3000 or 1:5000, oiled muslin or waxed paper pad of cotton, and enclose all in a snug abdominal bandage, held in place with perineal straps. Iodine followed by alcohol is preferred by some physicians.

Abdominal hysterectomy: The vagina should be disinfected as follows: Wrap gauze around index finger and mop with hot water and soap, then use clear water, give a douche of bichloride 1:4000 and pack cervix with a strip of iodoform gauze. One hour before operation remove gauze and give corrosive sublimate douche and mop vagina thoroughly with alcohol before repacking.

Patient should receive supper and no breakfast. Specimens of urine should be in a sterile bottle for examination. Five hours before operation give a high enema of castile suds followed by a small one of clear water to rinse bowel. Before leaving the room the patient is attired in clean clothing, including a pair of stockings, then the hair, if long, is plaited tightly in two braids.

Postoperative Nurs: In the treatment after a laparotomy the nurse should carefully observe the condition of the patient, and give timely information of the onset of serious complications, most important of which are shock, secondary hemorrhage, and peritonitis.

Patient is carefully removed from operating room without raising head or chest, to the bed, which has been previously prepared with a rubber and a draw sheet, and well supplied with hot-water bottles for armpits and lower extremities.

Cover the bottles that they may not burn the insensible patient, as much harm has been done in this way. Patient is placed in the dorsal (recumbent) position with limbs flexed to relax the abdominal muscles, and a pillow placed under the knees to support them. This position is retained for 48 hours during which patient is constantly watched. At termination of this period patient may be turned on either side.

Pulse and temperature should be immediately taken after every operation, temperature should be taken in the rectum (never take aged person's temperature in the axilla). Hypodermic syringe, brandy, strychnine, nitroglycerine, digitalis, flannel bandages and blocks to elevate the foot of bed should be kept in readiness.

No food by mouth should be given during the first 48 hours. In cases of persistent vomiting, stimulants and food are administered by rectum. After a laparotomy, mouth should be frequently sponged and lips moistened. A piece of ice wrapped in gauze and rubbed over the lips is very soothing to the patient, and in cases of extreme thirst very hot water may be given in $\frac{1}{2}$ oz doses, but as seldom as possible. Small pieces of ice in the form of ice pills are sometimes allowed.

Hot water being a stimulant, is preferred to ice, which is a sedative, another objection being the germs it contains, though it may control the nervous vomiting by rubbing across the lips. In such cases it is best to relieve the thirst by rectal or subcutaneous injections of physiologic solution, thus securing complete rest for the stomach. In absence of bad symptoms toward end of second day patient may have a little peptonized milk, chicken broth or kumiss,

varying in amount from $\frac{1}{2}$ -4 oz., according to condition of patient, increasing the quantity gradually.

Majority of laparotomy cases require a cathartic as soon as they recover from effects of operation. A teaspoonful of sulfate of magnesia dissolved in hot water and given every hour till bowels move freely is the best course to pursue in relieving the patient and guarding against peritonitis. If patient is vomiting and unable to take a cathartic, and is not relieved by an enema of equal parts (pt each) of milk and molasses heated to 100° F., give a high enema of magnesium sulfate 2 oz., glycerin 4 oz., pt of water; use rectal tube. A hot bag applied over bladder often prevents retention of urine.

If obliged to catheterize, which should not be done under 8 hours after operation, use a soft rubber catheter, see that it has been boiled and afterwards kept aseptic. **See ventrotomy.**

laparotrachelotomy (lap'ar-o-tra-kēl-ōt'ō-mī) [G. *lapara*, loin, + *trachelos*, neck, + *tomē*, incision]. Cesarean section with the incision through the lower segment of the uterus.

laparotaphy (lāp'ar-ō-tāf-ōt'ō-mī) [" + *typhlon*, cecum, + *tomē*, incision]. Incision of cerum through lateral abdominal incision.

laparouterotomy (lāp'ar-ō-ū-tēr-ōt'ō-mī) [" + *L uterus*, womb, + *G tomē*, incision]. Incision of uterus through abdominal wall. **SYN** *laparohysterotomy*.

lapis (la'pis) [L.] Stone.

laqueus (lak'we-us) [L. noose]. A noose-shaped band, fillet, or cord.

lard [L. fat]. **AV SERVING:** 15 Gm. Fat 15.0 **VITAMINS:** A — to + D — to +.

lardaceous (lar-dā'shus) [L. *lardum*, fat]. Resembling lard, waxy, fatty.

1. disease. Amyloid degeneration. The organs affected present a white waxy appearance due to the deposit of a firm translucent substance called *lardacea* or *amyloid* which when treated with iodine produces a dark mahogany-brown color.

larocaine (lar'ō-kān) Registered trademark for a medicinal preparation for topical application and for injection.

Uses: As local anesthetic.

larva (lar'vā) [L. ghost, mask]. 1 General term applied to the young of an animal which differs in form from the parent. 2 An immature stage in insect life after it has emerged from the egg and before it transforms into a pupa from which it emerges as an adult.

1. migrans. **SYN** *Creeping eruption, sandworm disease*. Caused by larvae of dog-and-cat hookworm, *Ancylostoma braziliense* but may be caused by the larvae of other nematodes or the larvae of flies.

lar'vate. Hidden, concealed. **lar'vicide.** An agent which destroys insect larvae.

laryngalgia (lār-in-gāl'jī-ā) [G. *larynx*, larynx]. Neuralgia of the larynx.

laryngeal (lar-in'je-al) [G. *larynx*, larynx]. Pert. to the larynx.

1. reflex. Cough as result of irritation of larynx or fauces.

laryngectomy (lar-in-jek'tō-mī) [" + *ek-tomē*, excision]. Excision of larynx.

PREPARATION. Similar to tracheotomy, plus additional ligatures, sponge or tampon cannula. Best done in two operations—performing tracheotomy week or two before the main operation.

laryngismal (lar-in-jis'māl) [G. *larynx*,

[larynx] Concerning or resembling affection with laryngeal spasm.

laryngismus (lar-in-jis'mus) [" + *ismos*, condition of] Spasm of the larynx

SYM Face pale—later cyanosed, eyes rolled up, body arched, thumbs turned into palm, legs extended, soles turned inward. In a few seconds the spasm relaxes.

PROG Favorable. In very young, death may result from suffocation.

TREATMENT During paroxysm cold water may be dashed on face and head or few drops of amyl nitrite or chloroform inhaled from handkerchief. In the interval search for cause—gums may need lancing or gastrointestinal tract need attention. Child should be placed under best hygienic conditions, food plain and nutritious, constitutional treatment.

1., infantile. One occurring in children less than one year old, who are poorly nourished.

1., stridulus. A condition characterized by laryngeal stridor of sudden onset, inspiratory dyspnea, temporary apnea, increasing cyanosis, and, in severe cases, unconsciousness, convulsions, and possibly death.

ETIOI. Early life (within first 2 years), male sex, and the rachitic diathesis are predisposing causes, often accompanies tetany. The discharge of motor force apparently rises in the medulla and may be excited by reflex irritation as in teething and gastrointestinal troubles.

SYM Attacks often and sudden; may occur on awakening from sleep— are characterized by a sudden arrest in breathing and tonic muscular swelling; can be detected by finger on throat. Spasm relaxes, and air is drawn in through glottis with shrill crowing sound—may occur several times a day or weeks apart.

PROG Extremely grave.

TREATMENT Correct diet, cod-liver oil, and calcium lactate to prevent attacks. During attacks, cold cloths over thyroid or hot cloths to nape of neck, a few whiffs of chloroform or ether, ipecac to induce vomiting or astringent solutions sprayed over the edematous tissues may be effective. If symptoms persist, parts may be scarified. When dyspnea persists, tracheotomy may be performed. *SYN cantus galli*.

laryngitic (lar-in-jit'ik) [G. *larynx*, larynx] 1. Resulting from laryngitis. 2. Rel to laryngitis.

laryngitis (lar-in-jit'is) [" + *-itis*, inflammation] Inflammation of larynx.

1., acute catarrhal. Acute congestive laryngitis, catarrhal inflammation of laryngeal mucosa and the vocal cords.

SYM Hoarseness and aphonia and occasionally pain on phonation and deglutition.

ETIOI. Improper use of voice, exposure to cold and wet, extension from infections in nose and throat, inhalation of irritating vapors and dust, associated with systemic diseases as whooping cough, measles, etc.

TREATMENT Complete rest of voice, promotion of elimination by catharsis, diaphoresis, liquid or soft diet, medicated steam inhalations such as compound tincture of benzoin, codeine for cough and pain. *SEE* croup.

1., atrophic. L. leading to diminished secretion and glandular atrophy of the mucous membrane.

SYM: Tickling sensation in throat,

hoarseness, cough, dyspnea when crusts are thick and accumulate on vocal cords so as to narrow the breathing aperture.

TREATMENT Iodides internally, inhalants and medicated sprays to loosen the crusts, strict attention to associated nose and throat pathology.

1., chronic. A type due to a recurrent irritation, or following the acute form. Often secondary to sinus or nasal pathology, improper use of voice, excessive smoking or drinking.

SYM Tickling in throat, amblyphonia and huskiness of voice, dysphonia.

TREATMENT Correction of preexisting nose and throat pathology, discontinuance of alcohol and tobacco, avoidance of excessive use of voice and proper vocal placement, topical application of 2-5% silver nitrate solution.

1., croupous. Diphtheritic laryngitis. *q v*

1., c. hypertrophic. Hypertrophy of tissues accompanying chronic l.

1., diphtheritic. Invasion of larynx by diphtheria bacilli, usually with formation of membrane.

1., membranous. Characterized by inflammation of larynx with the formation of a false membrane of nondiphtheritic origin.

TREATMENT Free catharsis, inhalation of medicated vapors to loosen the membrane, administration of ipecacuanha for emesis. *SEE* membranous croup.

1., phlegmonous. Inflamed larynx with purulent infiltration or abscesses.

1., syphilitic. *ETIOI.* Due to syphilis.

SYM Hoarseness, cough, simple catarrh, formation of broad condylomata, follicular hyperplasia, syphiloma, syphilitic perichondritis.

Secondary stage in form of mucous patches or tertiary in form of gumma. Secondary syphilis is a diffuse infection and one sees luetic patches spread over large areas of larynx.

In tertiary syphilis the gummatous lesion can occur in any part of larynx. There is marked redness over the infiltrated area as well as in the surrounding mucous membrane. When there is breaking down, the resultant ulceration is deep with sharp edges. Pain is usually absent and fixation of the cord is late. Cicatrization and deformity follow healing of gumma.

TREATMENT Antiluetic.

1., tuberculous. Secondary to pulmonary tuberculosis.

SYM Hoarseness, amblyphonia or aphonia, pain in swallowing, cough. Lesion located in 1. Interarytenoid area. 2. Vocal cords. 3. Epiglottis. 4. False cords. Lesions are relatively pale; ulceration occurs early.

TREATMENT Vocal hygiene, absolute rest of voice, orthoform powder sprayed in larynx. Aqueous solutions of lactic acid 20-80% applied to affected areas in applicator, galvanocautery, heliotherapy to affected areas by means of mirrors, alcoholic injection of sup. laryngeal nerve (one or both sides), resection of sup. laryngeal nerve, gastrostomy to keep patient's larynx at rest, since swallowing produces motion of larynx.

1., ulcerative. Chronic l. with ulceration of the mucous membrane.

laryngo- [G. l. Prefix Pert. to the larynx. **laryngoele** (lar-in'go-sel) [G. *larynx*, larynx, + *ele*, hernia]. 1. Dilatation of larynx. 2. Protrusion of laryngeal mucosa.

laryngocentesis (lar-in'gō-sen-tē'sis) [" +

- kentēsis**, puncture). Incision or puncture of the larynx.
- laryngofissure** (lar-ing'go-fish'ur) [' + *L. fissura*, a cleft]. The operation of opening the larynx by a median line incision through the thyroid cartilage.
- laryngograph** (lar-ing'o-grāf) [' + *graphein*, to write]. Device for making a record of laryngeal movements.
- laryngography** (lar-ing-gōg'rā-fi) [' + *graphein*, to write]. Description of larynx.
- laryngologist** (lar-ing-gō-o-jist) [' + *logos*, study]. Specialist in laryngology.
- laryngology** [' + *logos*, study]. The practice of medicine dealing with the treatment of diseases of the larynx.
- laryngometry** (lār-in-gōm'ē-trī) [G *laryx*, *larygg-*, larynx, + *metron*, measure]. Systematic measurement of larynx.
- laryngoparalysis** (lār-in-gō-par-āl'i-sis) [' + *para*, beside, + *lyein*, to loosen]. Paralysis of muscles of larynx.
- laryngopathy** (lār-in-gop'ā-thī) [' + *pathos*, disease]. Any disease of the larynx.
- laryngophantom** (lār-in-gō-fan'tōm) [' + *phantasma*, image]. Plastic model of the larynx.
- laryngopharyngeal** (lar-in'gō-far-in'jē-āl) [' + *pharygg*, pharynx]. Rel. jointly to larynx and pharynx.
- laryngopharyngectomy** (lār-in'gō-fār-in-jek'tō-mī) [' + " + *ektomē*, excision]. Removal of the larynx and pharynx.
- laryngopharyngitis** (lār-in'gō-fār-in-jī'tis) [' + " + *-itis*, inflammation]. Inflammation of the larynx and pharynx.
- laryngopharynx** (lār-in-gō-fār'inks) [' + *pharygg*, pharynx]. Lower portion of the pharynx that extends from the cornua of the hyoid bone or vestibule of the larynx to the lower border of the cricoid cartilage.
- laryngophony** (lār-in-gōf'ō-nī) [G *laryx*, *larygg-*, larynx, + *phōnē*, voice]. Voice sounds heard in auscultating the pharynx.
- laryngoplasty** (lār-in-gō-plās-tī) [' + *plastēin*, to form]. Plastic reparative surgery of larynx.
- laryngoplegia** (la-ring'go-plē'jī-ā) [' + *plēgē*, stroke]. Paralysis of laryngeal muscles.
- laryngorhinology** (lār-in'gō-rin-ōl'ō-jī) [' + *ris*, *rin-*, nose, + *logos*, study]. Science treating with diseases of the larynx and nose.
- laryngorrhagia** (lār-in-gor-rā'jī-ā) [' + *rhēgnai*, to flow forth]. Laryngeal hemorrhage.
- laryngorrhoea** (lār-in-gor-rē-ā) [' + *roia*, flow]. Excessive discharge of laryngeal mucus. Syn. *laryngorrhoea*.
- laryngosclerosis** (lār-in-gō-sklē-rō-mā) [' + *sklēros*, hard, + *ōma*, tumor]. Scleroma affecting the larynx.
- laryngoscope** (lar-in'go-skōp) [' + *skopein*, to examine]. Instrument for examining the larynx.
- l., solar**. Two mirrors, one reflecting sun rays into mouth, again reflected into larynx by laryngeal mirror. Newer modifications use an alloy of aluminum and magnesium in reflecting mirrors.
- laryngoscopic** (lar-in-gō-skōp'ik) [G. *laryx*, *larygg-*, + *skopein*, to examine]. Pert. to observation with aid of small long handled mirror for reflecting interior of larynx.
- laryngoscopy** (lar-in-gōs'kō-pī) [' + *skopein*, to examine]. Examination of interior of larynx.
- NP: Instrument should be warmed. Parts should be cocaineized.
- l., direct**. That done with laryngeal speculum or laryngoscope.
- NP: Mouth is held open with a gag.

- l., indirect**. That done with a mirror.
- NP Nurse should stand behind patient with left hand on head, holding patient's tongue with right hand to steady it.
- laryngospasm** (lār-in'gō-spazm) [' + *spasmos*, spasm]. Spasm of laryngeal muscles.
- laryngostenosis** (lar-ing'go-ste-nō'sis) [' + *stenosis*, a narrowing]. Stricture of larynx.
- l., compression**. From causes outside the larynx as result of abscesses, tumors, goiter, etc.
- l., occlusion**. Etiol. May be due to congenital bands or membranes, foreign bodies, tumors, cicatricial contraction following ulceration as in diphtheria and tertiary syphilis, penetrating wounds or corrosive fluid.
- Sym. Dyspnea, esp on inspiration and exertion. Loud breathing which becomes a stridulous choking respiration, pulse small and frequent, face anxious and cyanotic.
- Progn. Grave.
- Treatment. Depends on cause. Tracheotomy is often the temporary and almost always the final expedient.
- laryngostomy** (lār-in-gōs'tō-mī) [' + *stoma*, opening]. Establishing permanent opening through neck into larynx.
- laryngostroboscope** (lar-in'go-stro-bo-skōp) [' + *strobos*, whirl, + *skopein*, to view]. Instrument for inspection of vibration of vocal cords.
- laryngotomy** (lar-in-gōt'ō-mī) [' + *tomē*, incision]. Incision of larynx.
- laryngotracheitis** (lār-in'gō-tra-kē-i'tis). Inflamed condition of the larynx and trachea.
- laryngotracheotomy** (lar-in'go-tra-ke-ōt'ō-mī) [' + *tracheia*, windpipe, + *tomē*, incision]. Incision of larynx with section of upper tracheal rings.
- laryngoxerosis** (lār-in'gō-zēr-ō'sis) [' + *xerosis*, dryness]. Abnormal dryness of the larynx.
- larynx** (lar'inks) (*Pl. larynges*) [G *laryx*, *larygg-*]. The organ of voice, the enlarged upper end of trachea; musculo-cartilaginous structure lined with mucous membrane.

THE LARYNX

Seen in its relation to: 1. The mouth cavity. 2. Nasopharynx. 3. Glottis. 4. Esophagus.

BLOOD SUPPLY: Inf. thyroid, branch of thyroid axis and sup. thyroid, branch of ext. carotid.

STRUCTURE Consists of nine cartilages bound together by an elastic membrane and moved by muscles. Cartilages include three single ones (cricoid, thyroid, and epiglottic) and three paired ones (arytenoid, corniculate, and cuneiform). The extrinsic muscles include the omohyoid, sternohyoid, sternothyroid, and several others, intrinsic muscles include the cricothyroid, ext and int thyroarytenoid, trans and obl arytenoid, and ext and int thyroarytenoid. The cavity of the larynx contains two pairs of folds, the *ventricular folds* (false vocal cords) and *vocal folds* (true vocal cords), and is divided into three regions (*vestibule*, *ventricle*, and *int entrance to the glottis*). Opening between true vocal folds forms a narrow slit, the *rima glottidis* or *glottis*.

Nerves From int. and ext. branches of sup. laryngeal.

NP. Diseases of Patient should stay in bed and, in any event, he should avoid changes of atmosphere which may cause an attack of coughing. Room temperature should be maintained at the proper level, and drafts avoided. Movements may set up coughing, so patient should rest quietly. The voice is generally affected in abnormal conditions of the larynx, so voice also should be rested. To keep silence, however, may cause patient to become depressed. The nurse needs to entertain the patient but she should not ask the patient questions unless they may be answered by a nod of the head. The patient will need encouragement in continuing inhalations, ordered.

When possible for the patient to use the voice, instructions should be given to use the diaphragm and abdominal muscles rather than the muscles of the throat. In chronic laryngitis cold water may be applied to the neck morning and night. The nose, throat, and larynx must be kept cleaned by sprays as ordered.

In edema of the larynx sucking ice, or application of ice to the neck may be helpful. Astringent sprays and saline purges may be ordered by the doctor.

RS Bouchut's method. *cricarytenoid*, *epiglottis*, *glottis*, "laryng-" words, *prominentia laryngea*, *vestibule*, *vocal cord*.

1. foreign bodies in. **SYM** When a foreign body enters it produces violent spasmodic cough and dyspnea, fixed pain at particular spot and loss of voice.

TREATMENT If on the spot promptly raise patient by the heels and slap him on the back. Search pharynx with finger and extract object. Induce vomiting by inserting finger in throat. Feed foods such as thick gruels, mashed potatoes, bread, etc., to carry object into stomach. Use laryngoscopic mirror and extract substance with forceps—may need to resort to tracheotomy.

lasciv'ia [L. *lascivire*, to be wanton]. Abnormal sexual desire. **SYN:** *nymphomania*, *satyrinias*.

lassitude (las'i-tüd) [L. *lassitudo*, weariness]. Weariness, exhaustion.

latency (lät'en-si) [L. *latere*, to be hidden]. State of being concealed or hidden. **la'tent** [L. *latere*, to be concealed]. 1. Lying hidden. 2. Quiet; not active.

1. content. **PSY:** That part of a dream that cannot be brought into the objective

consciousness through any effort of will to remember.

1. heat. Heat that disappears during evaporation or melting.

1. period. 1. Time bet. a stimulus and its response. **SYN:** *lag phase*. 2. **PSY:** Time bet. ages of 4 to about 11 years separating infantile sexuality from onset of puberty or genital sexuality. **SYN:** *latency period*, 2. 3. Time during which a disease is supposed to be existent without manifesting itself, period of incubation.

lateral (lät'er-äd) [L. *latus*, *later-*, side, + *ad*, toward]. Toward a side or lateral aspect.

lateral (lät'er-al) [L. *latus*, *later-*, side]. Pert to the side.

1. sinus. Transverse and sigmoid portion of two cranial venous sinuses. Extends from occipital protuberance to jugular bulb.

latericeous, lateritious (lät'er-i'shūs) [L. *later*, a brick]. Resembling brick dust.

lateroflexion (lät'er-ö-flek'shun) [L. *latus*, *later-*, side, + *flectus*, from *flectere*, to bend]. Bending or curvature toward a side.

lateroprone, laterosemiprone position (lät'er-o-prön', -sēm'i-prön) Patient on left side leaning on chest, right knee and thigh drawn up, left arm back of patient. **SYN:** *Sims' position*, *q.v.*, for illustration.

lateropulsion (lät'er-o-pul'shun) [" + *pulsus*, driving] Involuntary tendency in cerebellar and labyrinthine disease to fall to one side.

lateroversion (lät'er-ö-vēr'shun) [" + *verso*, a turning] Tendency or a turning toward one side.

lathyrism (lath'ir-izm) [G. *lathyros*, vetch]. Chick-pea poisoning. **SYN:** *lupinosis*.

Nervous disorders and tremors with cramps in arms and legs.

TREATMENT Provoke vomiting, wash out stomach, stimulants.

latrine (la-trēn') [L. *latrina*]. A public privy.

Latreductus (lät'rō-dēkt'us) A genus of small black spiders belonging to the family Therididae.

L. mactans. The black widow or hourglass spider, a species widely distributed in the United States. The bite of the female produces serious symptoms and may result in death.

la'tus, la'ta, la'tum. [L. broad]. Broad, as the uterine broad ligament.

laud'able [L. *laudabilis*, praiseworthy]. Healthy, normal, said of *pus*.

laudanum (law'dan-um). Tincture of opium. **POISONING** See *morphine*.

laugh (läf) [M. E. *laughen*, to laugh]. Sound produced by laughing. **SYN:** *risus*.

1. sardonius. Spasm of facial muscles producing a grinning effect. **SYN:** *risus sardonius*.

laughing gas (la'fing) [M. E. *laughen*, to laugh]. Nitrous oxide gas.

laughter, compulsive. **SYN:** *obsessive laughter*. L without cause, occurring in certain psychoses, esp. schizophrenia.

laughter reflex (läf'tēr). Uncontrollable laughter resulting from tickling or pretense of tickling.

lavage (la-vazh') [Fr.: from L. *lavāre*, to wash]. Washing out of a cavity.

1. gastric. Washing out of the stomach. A stomach tube or catheter is used with solution of sterile water, or normal saline, or 2% boric acid, or 1-5% sodium bicarbonate.

QUANTITY OR SOLUTION: Not more than 10 oz. at a time repeated until fluid runs clear.

TEMPERATURE AND TIME 105° F. Preferably before breakfast. POSITION Semi-recumbent or low enough to prevent inhalation of returning fluid. In poisoning, save siphoned fluid for examination. If patient is unconscious use a mouth gag.

PURPOSE: To remove irritants or poisons, to relieve nausea or vomiting, to cleanse the stomach preoperatively or postoperatively. In latter case to prevent nausea. SEE bladder irrigation, colonic irrigation.

law [A. S. laga, law] In the scientific sense, a statement which is found to hold true uniformly for a whole class of natural occurrences.

1., all-or-nothing. The weakest stimulus capable of producing a response produces the maximum response contraction in cardiac and skeletal muscles and nerve.

1., Avogadro's. If temperature and ext. pressure are the same, all gases contain same number of molecules in equal volumes.

1., Behring's. Blood and serum of an immunized subject confers immunity when injected into another.

1., Bell's. Ant. spinal nerve roots are motor, and post. roots are sensory.

1's., Berthollet's. 1. When two salts react because of a solvent, if a new salt can be produced. 2. When dry heat is applied to "two salts, if a new salt can be produced more volatile, this salt will be produced."

1., biogenetic. SYN recapitulation theory. Ontogeny recapitulates phylogeny, i.e., an individual in its development recapitulates stages in its racial development.

1., Boyle's. The volume occupied by a fixed quantity of every gas is inversely proportional, and density directly proportional, to pressure applied to the gas.

1., Brewster's. For any substance the polarizing angle is equal to that angle of incidence at which the portion of light that is reflected is at right angles to the portion refracted.

1., Charles'. When pressure is constant, volume of a gas varies as the absolute temperature.

1., Courvoisier's. When the common bile duct is obstructed by a calculus, dilatation of gallbladder is rare, when otherwise obstructed, dilatation is common.

1., of definite proportions. Two or more elements when united to form a new substance do so in a constant and fixed proportion by weight.

1., DuBois-Reymond. Excitation is the function of the differential coefficient of current (c) with respect to time (t) dc/dt , that is, sudden variations in energy potential are more effective as stimuli than gradual variations, the more rapid the change, the greater the excitant effect.

1., Fechner's. The intensity of sensation is proportional to the logarithm of the strength of the stimulus.

1., Graham's. The rate at which a gas diffuses through a porous membrane is inversely proportional to the square root of the density of the gas.

1., Haeckel's. SEE law, biogenetic.
1., of the heart [Starling's]. Other things being equal, the stroke volume of the heart varies as the extent of diastolic filling; or, the energy of contraction is a function of the initial length of the muscle fibers.

1., Hilton's. A nerve trunk supplying any joint supplies the muscles which move the joint and skin over insertion of such muscles.

1., of the intestine. Moderate distention of the intestine at a point causes relaxation below (aborally to the point) and contraction above.

1., Koch's, Koch's postulate. To prove an organism to be the cause of a given disease or lesion. 1st, the microorganism in question must appear in the lesion at all times. 2nd, pure cultures must be obtained from it. 3rd, cultures must reproduce the disease in animals and pure cultures must be again obtained from these lesions.

1., of Magendie. Same as 1 of Bell.

1., Marey's. Heart rate varies inversely to arterial blood pressure, that is, a rise or fall in arterial blood pressure brings about, respectively, a slowing or speeding up of heart rate.

1., Mariotte's. Boyle's law, q. t.

1., of mass action. In chemical reactions the amount of change taking place is proportional to action mass of the reacting substance.

1., Mendel's. A number of principles of heredity established by Mendel (1822-1884) which laid the foundation for the modern science of genetics. Includes the principles of unit characters, dominance, segregation, and independent assortment.

1., of molecular weights. The weight of a molecule is the sum of the weights of its atoms and the relative molecular weight of a compound is equal to sum of the atomic weights of its components divided by two.

1., Müller's. SEE law of specificity of nervous energy.

1., of multiple proportions. When two substances unite to form a series of chemical compounds the proportions in which they unite are simple multiples of one another or of one common proportion.

1., Nysten's. Rigor mortis travels progressively from muscles of mastication, through the face, neck, trunk and arms, reaching the legs and feet last.

1., periodic. The physical and chemical properties of chemical elements are periodic functions of their at. wt.

Natural classification of elements according to their at. wt. when arranged in order of their at. wt. or atomic numbers, elements show regular variations in most of their physical and chemical properties.

1., of reciprocal proportions. In chemistry, the 1. that the proportions in which two elementary bodies unite with a third one are simple multiples or simple fractions of the proportions in which these two bodies unite with each other.

1., Rubner's. 1. L. of constant energy consumption. Rapidity of growth is proportional to intensity of the metabolic processes. 2. L. of constant growth quotient. The same proportional part, or growth quotient, of total energy is utilized for growth.

1., of specificity of nervous energy. SYN: Muller's law. Excitation of a receptor always gives rise to the same sensation regardless of the nature of the stimulus.

1., Waller's, of degeneration. If a spinal nerve is completely divided, the peripheral portion undergoes fatty de-

generation, while the proximal part preserves its original character

l., Weber's. When a stimulus is continually increased the smallest increase of sensation which we can appreciate remains the same, if the proportion of the increase of stimulus to the whole stimulus remains the same

l., Wolff's. Changes in form and function of bones result in definite changes in their internal structure

lax (laks) [L *laxus*, slack] Without tension

laxative (lak'sā-tiv) [L *laxāre*, to loosen] A mildly purgative medicine, an aperient or mild cathartic producing one or two evacuations without pain or tenesmus

l., diet. One promoting free intestinal elimination, fresh fruits, lemonade, stewed raisins, prunes, asparagus, cauliflower, spinach, tomatoes, figs, buttermilk, sweet potatoes, sweet corn, pea and bean puree, carrots, greens, nuts, whole grains, yeasts Vitamin B essential for good elimination

layer (lā'eri) [ME *layer*] A stratum, a thin sheetlike structure of more or less uniform thickness

l., bacillary. Rod and cone layer of retina

l., basal. The *basalis*, outermost layer of uterine endometrium lying next to the myometrium

l., choriocapillary. SEE *lamina choriocapillaris*

l., claustral. Layer of gray matter between external capsule and insula

l., compact. The compact surface layer of the uterine endometrium

l., cuticular, of epithelium. A striated layer secreted by and covering free surface of an epithelial sheet, esp that on surface of columnar epithelium of the intestine

l., ependymal. Inner layer of cells of embryonic neural tube

l., ganglionic. 1 Fifth layer of cerebral cortex, consisting of large- and medium-sized pyramids 2 An inner layer of ganglion cells in the retina whose axons form the fibers of the optic nerve

l., germ. One of the three primary layers of the developing embryo from which the various organ systems develop SEE *ectoderm*, *mesoderm*, *entoderm*

l., germinative. SYN *malpighian layer* Stratum germinativum, the innermost layer of the epidermis, consisting of basal layer of cells and a layer of prickle cells (stratum spinosum)

l., granular ext. Second layer of cerebellar cortex, lying within molecular layer and separated from it by a single row of Purkinje cells Consists principally of granule cells

l., granular int. The fourth layer of the cerebral cortex, consisting principally of closely packed stellate cells

l., Henle's. A layer of clear cells forming outermost layer of the inner epithelial root sheath of a hair

l., horny. The stratum corneum, outermost layer of the skin, consisting of clear, dead, scalelike cells, those of the surface layer being constantly desquamated

l., Huxley's. The middle layer of inner epithelial root sheath of a hair

l., Langhans'. Cytotrophoblast, *qv* SEE *Langhans' layer*

l., malpighian. SEE *l. germinative.*

l., molecular. 1 Outermost layer of

cerebral or cerebellar cortex 2 Inner or outer plexiform layer of the retina **l., osteogenic.** Innermost or bone-forming layer of the periosteum

l., outer-nuclear. A layer of the retina containing the nuclei of the visual cells (rods and cones)

l., papillary. Superficial layer of the corium lying immediately under the epidermis into which it extends, forming *dermal papillae*

l., pigment. Outermost layer of the retina Cells contain a pigment called *melanin*

l., Purkinje. A single row of large flash-shaped cells (Purkinje cells) lying between molecular and granular layers of the cerebellar cortex

l., of pyramidal cells. The ext pyramidal layer, third layer of cerebral cortex, consisting principally of well-developed pyramids

l., reticular. The inner layer of the corium lying beneath the papillary layer

l., somatic. In the embryo, a layer of extra-embryonic mesoderm which forms a part of the somatopleure, the outer wall of the coelom

l., splanchic. A layer of extra-embryonic mesoderm, which with the endoderm forms the *splanchnopleure*

l., spongy. The stratum spongiosum, the middle layer of the uterine endometrium Contains dilated portions of uterine glands

l., subendocardial. Layer of loose connective tissue immediately under the endocardium which binds it to the myocardium Contains fibers of the conducting system of the heart

l., subendothelial. Layer of fine fibers and fibroblasts lying immediately under the endothelium of the tunica intima of larger arteries and veins

laxare'to [It *lazzaro*, a leper]. 1 A quarantine station 2 Hospital for treatment of contagious diseases SYN *pesthouse*

leaching (lē'ching) [AS *leccan*, to wet]. Extraction of a substance from a mixture by washing the mixture with a solvent in which only the desired substance is soluble SYN *lixivation*

lead (lēd) SYMB *Pb* A metallic element [plumbum]. At wt 206.9 Its compounds are poisonous

l., acetate. USP Sugar of lead. ACTION AND USES An astringent, saturated alcoholic solution, is used as a lotion in ivy poisoning Seldom used internally

DOSAGE. AV Internally, 1 gr. (0.6 Gm.).

l., colic. That due to lead poisoning

l., encephalopathy. Disease of brain caused by lead poisoning.

l., line. Bluish line on gums in lead poisoning.

l., pipe contraction. Cataleptic condition during which limbs remain in any position in which placed

l., poisoning, acute. Eriol From large overdosage SYN Metallic taste in mouth, burns in throat and gullet Later abdominal cramps and prostration F A TREATMENT Wash out stomach Adm. of magnesium sulfate (epsom salts) or sodium sulfate which precipitates the lead and helps remove the lead by purging.

l., p., chronic. Eriol. Exceedingly common Exposure in the industries; from food when lead vessels are used in its preparation, from cosmetics; or in children from nipple shields, chewing lead toys or objects covered with lead paints.

SYM Anorexia, nausea, vomiting, salivation, anemia, the lead line on the

gums, purging, abdominal pains, muscle cramps and pains in the joints. One of the most typical findings is the abdominal pain known as *lead colic*. There may be impairment of any part of the nervous system, often leading to muscle atrophy and the characteristic foot or wrist drop. Various blood changes may be found, especially the "stippling" of the red cells.

lead (léd) [A.S. *lǣdan*, to guide]. An electrocardiograph record.

The three common leads are lead I, right arm to left arm, lead II, right arm to left leg, lead III, left arm to left leg. These are known as *standard leads*. *bipolar limb leads* or *indirect leads*.

I., precordial. Record taken when one lead is placed over the precordium, the other over an indifferent region.

I., unipolar. Record made when one lead is placed on chest wall overlying the heart, where potential changes are of considerable magnitude and the other (distant or indifferent electrode) placed where potential changes are of small magnitude.

leaf (láf) [A.S.]. A plant organ usually shooting out from the side of a stem or branch, somewhat flattened and oval in shape, and green in color. Ex. *Beladonna*, *hyoscyamus*, *digitalis*.

lean (lén) [A.S. *hlāene*, without flesh]. Without flesh, emaciated.

Diet for. Diet as for tuberculosis or neurasthenia. Milk, 2 pints with or bet. meals, 2 eggs; meat, 6-8 oz., bread, 12 oz.; potatoes, 4 oz.; milk puddings, 4 oz.; thick soup, 5 oz.; butter or other fat, 2 oz.; sugar, 4 oz. in any form, plenty of liquids with meals, tea, coffee, cocoa, water, cod-liver oil. See *macies*.

Leber's disease (lá'bér). Macular atrophy of the optic nerve that is inherited.

L's plexus. Plexus of venules in eye bet. Schlemm's canal and Fontana's spaces [the urethra].

Lecat's gulf (lá-káts'). Bulbous portion of *lechery* (lech'er-í) [Fr. *lecher*, to lick]. Lewdness, sensualism.

lechopyra (lek-o-pí'ra) [G. *lecho*, parturient woman, + *pyr*, fever]. Puerperal fever.

lecithin (les'ith-in) [G. *lekithos*, egg yolk]. A fatty substance, of the group called phospholipins, found in blood, bile, brain, egg yolk, nerves, and other animal tissues, and yielding stearic acid, glycerol, phosphoric acid, and choline on hydrolysis. They are all derivatives of glycerin.

Uses. In cases of poor nutrition, rickets, anemia, diabetes, tuberculosis.

lec'ithin'ase. An enzyme that catalyzes the decomposition of lecithin.

cobra l. An enzyme present in snake venom which brings about the removal of a molecule of fatty acid from lecithin resulting in production of *lysolecithin*, *q.v.*

lectual (lekt'ù-ál) [L. *lectus*, bed]. Pert. to a bed or couch.

l. disease. Bed-confining disease.

Lederer's anemia (léd'ér-ers). Acute hemolytic anemia.

leech (lêch) [A.S. *læce*]. A blood-sucking water worm, belonging to the phylum Annelida, class Hirudinea. It is parasitic on man and other animals, producing a condition known as *hirudiniasis*, *q.v.* Leeches were at one time used as a means of blood-letting, a practice common up to the middle of the 19th century, but which now has been almost completely abandoned. They are a source of *hirudin*, an anti-

coagulating principle secreted by their buccal glands. See: *Hirudo*.

l., artificial. Cup and exhaust pump or syringe for drawing blood.

Lee's ganglion (le) Cervical uterine ganglion formed from 3rd and 4th sacral nerves and hypogastric and ovarian plexuses.

left, SYN: sinistral. The opposite of right.

left-hand'edness. Condition of being more adept in use of left hand. SYN. *sinistrality*.

left lateral recumbent position. The English or obstetrical position. Patient on left side, right knee and thigh drawn up. Used in rectal operations and obstetrics.

leg (lég) [M.E.]. One of the 2 lower extremities, including the femur, tibia, fibula, and patella, spec. the part between the knee and ankle.

RS. *acnemia*, *acragnosis*, *anxielas tibiarius*, *Barbadoes*, *bayonet*, *bouleug*, *Buerger's disease*, *cali*, *crural*, *crus*, *saphena*, *sura*, *systemma*, *tibia*.

l., Anglesey. A form of jointed artificial leg.

l., badger. Inequality in the length of the legs.

l., baker. Genu valgum, or knock-knee.

l., bandy. Same as bowleg.

l., Barbadoes. Elephantiasis of the legs.

l., bayonet. Uncorrected backward displacement of the knee bones, followed by ankylosis at the joint.

l., bird. Reduction in size of the leg from atrophy of the muscles.

l., boomerang. A disease of the leg bones occurring among Australian natives, causing a curvature of the leg resembling a boomerang.

l., bow. *Genu varum*: an outward curving of the legs at the knees.

l., lawn tennis. Rupture of plantar fascicula accompanied by excruciating disabling pain in the posterior region of the knee.

l., milk. Phlebitis of the femoral vein occasionally following parturition and typhoid fever. It is characterized by swelling of the leg, usually without redness. Called also white leg. SYN. *phlegmasia alba dolens*.

l., scissor. Cross leg deformity, a result of double hip disease, in which the patient walks with the legs crossed.

l., type. Inherited progressive muscular atrophy.

l., white. See: *milk leg*.

leggings (lég'gíngs) [M.E. *leg*, leg]. Sterile leg coverings used on patient while in operating room.

legitimacy (lég'itím-á-sí) [L. *legitimus*, lawful]. 1. Condition of being legal. 2. Condition of being born in wedlock.

legume (lég'güm) [L. *legumen*, pulse]. Fruit or pod of beans, peas, lentils, etc.

Comp. Nitrogen. Equal to that in meat. It is called *legumin*,* forming with water a paste resembling gluten, but easier to digest.

VITAMINS (Sprouted). A good source of vit. B and probably vit. G. Vit. A and C in small amounts.

CARBOHYDRATES. Superior to those in meat. Generally they are in the form of starch in about the same proportion as the cereals, but with more cellulose.

ASH: Twice that of meat or bread. Potash is abundant and soda is present. Alkalinity higher than that of other

LEG'S ANTERIOR MUSCLES.

LEG'S POSTERIOR MUSCLES

vegetables. Organic phosphoric acid is high, only exceeded in cheese, oatmeal, and yolk of egg. Iron is found only in the lentils, but lime and magnesium, also nuclei and lecithin, are plentiful in the others as well.

ABSORPTION. They take up large amounts of water. 10.58 oz. of dried peas make 42.38 oz. of purée, while intestinal absorption is lower than that for milk, bread, meat or rice.

EFFECT OF PREPARATION. *Soaking.* The water transforms some of the starch into amyloextrin and modifies the cellulose, assisting in their digestion and absorption.

COOKING. Soft water should be used, as the carbonate of lime in hard water forms an insoluble combination. Add baking soda to hard water. Too much water lowers the nutritive value, wastes the aromatic essences, mineral salts and diminishes digestibility. Cook in small amount of water, over a slow fire in an airtight vessel.

ACTION. About the same as cereals. The great amount of albumin in legumes may overtax gastric action. Too large quantities may overtax the alimentary canal and cause gaseous and acid fermentation. In the intestines, the albumin and starch react at once on the pancreas and the glandular system, while the cellulose reacts on the muscular system. They are heavy in nitrogen and nuclei, and should be considered as less expensive substitute for meat.

IND. *Adolescence and Childhood.* The phosphorus, lime and magnesium in legumes are very valuable in the construction of tissue, as well as in convalescence and tuberculosis. Thick soups may be used when the entire pea or bean would not be tolerated by the stomach.

CONTRA. Dyspepsia, dilatation, gastritis, anemia, neurasthenia, enterocolitis, enteritis, enteroptosis, hyperchlorhydria, gout, gravel, rheumatism, neuralgia, scleroma, Bright's disease, and cardiac affections. *Diabetes.* Slow to digest, and because rich in carbohydrates they should be limited. *Obesity.* There is a tendency to transform them into fatty substances in the liver, therefore they should be avoided. *Gastric troubles.* The hyperacidity arrests the digestion of starch, provoking putrefaction. SEE *beans, peas, lentils.*

legumelin (leg-u-mel-in) [L. *legumen*, pulse] An albumin present in many leguminous seeds, as in peas. SEE *legume, legumin.*

legu'min [L. *legumen*, pulse] A protein globulin contained in legumes, vegetable casein.

leioderma (lī-ō-dēr-mī-ā) [G. *leios*, smooth, + *derma*, skin] Skin disease characterized by abnormal glossiness and atrophy.

leiomyofibroma (lī'ō-mī'ō-fī-brō'mā) [G. *leios*, smooth, + *mys*, muscle, + *oma*, tumor] A benign tumor composed principally of smooth muscle and fibrous connective tissue.

leiomyoma (lī'ō-mī-ō'mā) [G. *leios*, smooth, + *mys*, muscle, + *oma*, tumor] Myoma consisting principally of smooth muscle tissue.

leiomyosarcoma (lī'ō-mī'ō-sār-kō'mā) [+ + + sarx, flesh, + *oma*, tumor] Combined leiomyoma and sarcoma.

leiotrichous (lī'ō'trī-kūs) Possessing smooth straight hair.

Leishmania (lēsh-mān'-ī-ā) A genus of parasitic flagellate protozoans, which occur as typical *leishmanian* forms in vertebrate hosts, but as *leptomonad* forms in invertebrate hosts or in cultures. They are transmitted by the sandfly, *Phlebotomus*.

L. braziliensis. Causative agent of American leishmaniasis.

L. donovani. Causative agent of kala azar (visceral leishmaniasis).

L. tropica. Causative agent of oriental sore (cutaneous leishmaniasis).

leishmaniasis, leishmaniosis (lēsh-mān-i-ās-is, -ī-ō-sis) Infection with a species of *Leishmania*, affecting the skin, nasal cavities and pharynx, one form causing oriental boil, another kala azar.

L., American. L. caused by *L. braziliensis* involving principally nasopharyngeal and mucocutaneous membranes. Common in Cent and South America.

L., cutaneous. SYN *oriental sore*.

Delhi ulcer. L. caused by *L. tropica*.

L., visceral. SYN *kala azar, dumtum fever.* L. caused by *L. donovani*.

le'ma. SYN *sebum palpebrae.* The dried secretion of the meibomian glands which collects in the inner canthus of the eye.

-lem'ma. Combining form meaning a membrane, covering, sheath, or envelope.

lemmocyte (lem'mō-sīt) [G. *lemma*, husk, + *kytos*, cell] A cell which becomes a neurilemma cell.

lemniscus (lem-nis'kūs) [G. *lemniskos*, a fillet] A bundle of sensory fibers (lateral or ext. and median or int.) in the medulla, and pons. SYN *fillet, laqueus*.

lem'on [Persian *limān*, lemon] Contains citric acid. AV. SERVING 100 Gm. Pro 1.00, Fat 0.7, Carbo 7.4, ASH Ca 0.036, Mg 0.007, K 0.175, Na 0.004, P 0.022, Cl 0.002, S 0.011, Fe 0.0006.

L. juice. AV. SERVING 15 Gm. Carbo 1.5, ASH Ca 0.024, Mg 0.010, K 0.127, Na 0.009, P 0.010, Cl 0.003, S 0.006.

VITAMINS. Same for both A+, B+, C+++.

A base forming fruit, alkalinity 5 cc per 100 Gm., 12 cc per 100 cal.

ACTION. Stimulating and refreshing. **IND.** May be used in place of vinegar, spices, and aromatic substances by those who cannot use the latter. *Diabetics* may use. A fine antiscorbutic, good in Barlow's disease. Six to 8 lemons per day may be used in rheumatism except as stated below.

CONTRA. As they are supposed to increase calcification of arteries and deposit of chalky matter in the tissues, avoid use in pulmonary tuberculosis and in acute articular rheumatism.

lemoparalysis (le'mo-par-al'is-īs) [G. *laimos*, gullet, + *para*, beside, + *lyein*, to loosen] Paralysis of esophagus.

lemostenosis [+ + stenosis, a narrowing]. Stricture of esophagus.

lenigallol (len-i-gal'ōl) A derivative of pyrogallol acid (triacetyl pyrogallol).

USES. In eczema, psoriasis, and other skin conditions.

DOSAGE. In 1-6% ointment, usually with zinc oxide.

lenitive (len'i-tiv) [L. *lenire*, to soothe].

1. Demulcent, soothing, slightly laxative.

2. A palliative.

lens (lēnz) (pl. *lentēs*) [L. *lentil*, lens].

1. A transparent refracting medium,

usually made of glass 2 The crystalline lens of the eye.

RS *capitis, capsulociliary, circle of diffusion, posterior chamber, vitreous chamber.*

l., achromatic. One for correction of aberration of refrangibility, or chromatic aberration.

l., bifocal. Having a double focus

l., concave spherical. Formed of prisms with their apices together, therefore, thin at the center and thick at the edge. Used in myopia

l., contact. A thin shell of glass or plastic made to fit over and lie in contact with the cornea

l., convex spherical. Formed of prisms with their bases together, therefore, thick at the center and thin at the edge. Used in hyperopia

l., crystalline. Transparent, colorless structure in eye, biconvex in shape, enclosed in a capsule and held in place just behind the pupil by the suspensory ligament. Consists principally of *lens fibers* which at the periphery are soft, forming the *cornea lentis*, and in the center of harder consistency, forming the *nucleus lentis*. Beneath the capsule on ant. surface is a thin layer of cells, the *lens epithelium*. Function is to focus rays so they form a perfect image on the retina

l., cylindrical. Segment of a cylinder parallel to its axis, used in correcting astigmatism

lenticonus (len-ti-kō-nus) [" + *conus*, cone] Conical protrusion of ant. or post. surface of lens

lenticular [L *lenticularis*, pert. to a lens] 1 Lens shaped. **SYN** *lenticiform*. 2 Pert. to a lens

l., fossa. Depression in ant. surface of vitreous for reception of the crystalline lens

l., glands. Small masses of lymphatic tissue in lamina propria of pyloric region of the stomach

l., nucleus. Mass of gray matter forming part of the corpus striatum. Consists of the putamen and globus pallidus

lenticulostriate (len-tik"ū-lō-strī"āt) [" + *striatus* "streaked"] Rel. to the lenticular nucleus and corpus striatum

lenticulothalamic. Pert. to lenticular nucleus and the thalamus

lenticiform (lent-i-form) [L *lens*, *lenticul*, lens, + *forma*, shape] Lenticul or lens shaped. **SYN** *lenticular*.

lentiginous (lën-ti"tîn-ūs) [L *lentigō*, freckle] 1 Affected by lentigo. 2 Covered with very small dots

lentigo (pl *lentiginēs*) [L freckle] Small brown macules or yellow-brown pigmented areas on skin sometimes caused by exposure to sun and weather. **SYN** *ephelis, freckle*

lentitis (lën-ti'tis) [" + *G.* -itis, inflammation] **SYN** *phakitis* Inflammation of the crystalline lens

leontiasis (lē-on-ti'ās-sis) [G *leōn*, *leont-*, lion] Lionlike expression about face, accompanying certain diseases.

l., ossea. Enlargement and distortion of facial bones, giving one the appearance of a lion. The condition is rare and not fatal. **SYN** *leontiasis*.

leotropic (lē-ō-trop'ik) [G *laos*, left, + *tropos*, a turning] Running from right to left in a spiral form. **OPP**: *deiotropic*.

leper (lē'pēr) [G *lepros*, scaly]. Person afflicted with leprosy.

lepido- [G.]. Combining form. Referring to scales.

Lepidoptera. An order of the class Insecta which includes the butterflies, moths and skippers. Characterized by scaly wings, sucking mouth parts, and complete metamorphosis

lepidosis (lēp-id-ō'sis) [" + -ōsis, intensive] Any scaly or desquamating eruption. **SYN** *lepra*, 2. *pityriasis*.

leptothrix (lep'o-thriks) [G *lepos*, scale, + *thrix*, hair]. Condition in which shaft of the hair is incased in hardened, scaly, sebaceous matter

lepra (lēp'rā) [G *lepra*, leprosy] 1. Leprosy, but commonly used only in conjunction with other words to denote types of leprosy 2. A dermatosis with desquamation

l., alba. Skin is anesthetic and white, and different forms of paralysis follow.

l., anæsthetica. Leprosy with anæsthetic areas on body

l., arabum. True or nodular leprosy

l., maculosa. Form with pigmented cutaneous areas

l., mutilans. Final stage of true leprosy, or mutilation stage.

l., nervorum. Maculo-anæsthetic leprosy, q v

leprid(e) (lēp'rēd) [G *lepra*, leprosy]. Leprous cutaneous lesion

leprology (lēp-rōl'ō-jī) [" + *logos*, study]. The study of leprosy and methods of treating it

leproma (lēp-rō'mā) [G *lepra*, leprosy, + *oma*, tumor] A cutaneous nodule or tubercle characteristic of leprosy

lepromin. A substance prepared from lepromatous nodules of leprosy

l., skin test. One in which lepromin is introduced intradermally. Reaction is positive in neural leprosy, negative in lepromatous leprosy. Of prognostic rather than diagnostic value

leprosarium. An institution for the care of lepers

leprosy (lēp'rō-sī) [G *lepra*, leprosy] **SYN** *Hansen's disease*. See *lepra*

Divided into two main types (1) *nodular* or *cutaneous* (*lepra tuberosa*), also called *lepromatous* or *L type*. (2) *maculo-anæsthetic* (*lepra nervorum*), also called *neural* or *N type*. A mixed (*L-N*) type is a combination of the two

In many respects, this infection resembles tuberculosis, and for many years was regarded as incurable, a conclusion no longer considered true

Etiol. Due to *Mycobacterium leprae*, or Hansen's bacillus. May occur at practically any age. Not easily transmissible, though considered contagious

Incubation. Anywhere from 1 to 30 years

SYM. Onset very gradual. May be malaise, headache, chilliness, mental depression, and numbness in portions of the body where disease later makes its appearance.

COMPLICATIONS. Mostly surgical amputations and treatment of deformities may be required

DIFFERENTIAL DIAG. Tuberculosis and esp. syphilis are the 2 diseases most likely to be considered.

Progn. Unfavorable; nevertheless, in recent years many cures have been reported. In other instances, the progress of the disease has been checked for prolonged periods.

TREATMENT. Isolation usually required, though the real danger of infection from ordinary contact is not great. Diamino diphenyl sulfone, usually referred to as DDS, has become the drug of choice and is given by mouth in maximum daily doses of 200 mg., or 300

mg. two or three times a week. Many cases are being cured on this regime. The hygienic surroundings of the patient are an important factor, as well as avoiding secondary infections. See *lepra*.

l., anesthetic. The peripheral nerves are invaded by the leprosy bacillus and discolored spots follow. These may have the appearance of iodine stains, sometimes with a reddish periphery. Skin and appendages atrophy, bones undergo necrosis, and phalanges drop off 1 by 1.

l., cutaneous. Nodular or lepromatous leprosy.

l., Italian. SEE *l. Lombardy*

l., lepromatous. SEE *l. cutaneous*
l., Lombardy. Deficiency disease caused by lack of vitamin B₂. SYN *pellagra*, *q v*

l., neural. Anesthetic leprosy, *q v*

l., nodular. L. with granulation of tissues. SYN *leproma*.

l., trophoneurotic. Anesthetic leprosy.

l., tubercular. Spots of erythema appear on body, become pigmented and hyperanesthetic and develop into tubercles from size of pea to walnut. Face, extremities, and genitals are the parts most commonly affected—occasionally mucous membranes, esp. of nose and throat, are invaded. Hair, eyebrows, and lashes drop out, eyes become inflamed, features distorted, voice husky. Disease may last years. Both the anesthetic and tubercular varieties are frequently seen in same patient.

l., tuberculoid. Leprosy in which a tuberculoid T type of lesion develops.

leprotic (lêp-rô'tik) [*G lepra, leper*] 1 Rel to leprosy. 2 Affected with leprosy. SYN: *leprosus*.

leptous (lêp'tūs) [*G lepra, leper*]. 1 Pert. to leprosy. 2 Affected by leprosy. SYN: *leprotic*.

leptocephala. Having an abnormally small head.

leptocephalus. An individual possessing an abnormally small head.

leptodermic (lêp-tô-dêr'mik) [*G leptos, slender, + derma, skin*] Possessing a thin skin.

leptomeninges (lêp'to-men-in-jēs) [" + *mênigz, membrane*] Pia mater and arachnoid as distinct from dura mater, because of their thinner and more delicate structure.

leptomeningitis (lêp'to-men-in-jî'tis) [" + " + *-itis, inflammation*]. Inflammation of the pia and arachnoid membranes. SEE *meningitis*.

ETIOI. Tubercle bacillus, spirochete of syphilis, and other pathologic organisms.

SYM. Acute headache, pain in back, rigidity of spine, irritability, drowsiness ending in coma.

Clinically, it cannot be distinguished from pachymeningitis, *q v*.

leptomeninx. Sing. of leptomeninges. The pia mater or the arachnoid.

leptopellic (lêp-tô-pel'ik) [" + *pellis, a bowl (pelvis)*] Having an abnormally narrow pelvis.

leptophonia (lêp-tô-fô-nî-â) [" + *phônê, voice*] Weakness or feebleness of voice.

leptoprosopia (lêp'tô-prô-sô-pî-â) Narrowness of the face.

leptorrhine, leptorrhine (lêp'tor-rîn) [" + *ris, rin-, nose*]. Having a very thin or slender nose.

leptosoma (lêp'tô-sôm) [" + *soma, body*] Person of thin, slight stature.

Leptospira (lêp-tô-spi'râ) [*G. leptos, thin, + spaira, coil*]. Genus of spirochetes, thin, spiral, and hook-ended.

L. autumnalis. Species causing pre-tibial fever, thought to be the same as autumnal fever of Japan.

L. hebdomadis. Species causing seven-day fever of Japan.

L. icterohaemorrhagiae. Species causing infectious, hemorrhagic spirochetemia, jaundice (Weil's disease).

leptospirosis (lêp'tô-spi-rô'sis) [" + *-osis, intensive*]. Condition resulting from *Leptospira* infection.

leptothricosis (lêp'tô-thri-kô'sis) [" + *thrix, hair*] Disease from *Leptothrix* infection.

Leptothrix (lêp'to-thriks) [" + *thrix, hair*]. A genus of bacteria often with long filaments. They belong to the Chlamydo bacteriales, the so-called "iron bacteria."

L. buccalis. A species commonly found in the mouth cavity. Considered non-pathogenic.

L. placoides. Species isolated from a tooth canal.

Leptotrichia buccalis. An organism inhabiting the buccal cavity normally.

Leptus autumnalis (lêp'tus) [*G leptos, slender*] Parasitic mite larva causing itch and sometimes wheals. SYN *chigger*.

lere'sis. Loquacity in old age, garrulosity.

les'bian [*G lesbios, pert to island of Lesbos*]. 1 Pert to lesbianism, or perverted sexual desire in women for those of their own sex only. 2 One who practices lesbianism.

les'bianism. Perversion in which sexual desire of women is only for one of their own sex.

Named from the Island of Lesbos wherein the practice of sapphism was reputed to have been general in ancient days. It may be expressed physically or psychically. SEE *sapphism, tribadism, winningism*.

lesion (lê'ziun) [*L laesio, a wound*] 1 Morbid change in tissue formation locally. 2 An injury or wound. 3 Single infected patch in a skin disease.

Primary lesions include macules, vesicles, blebs, or bullae, pustules, papules, tubercles, wheals, and tumors, *q v*. Secondary lesions are the result of primary lesions. They may be crusts, excoriations, fissures, pigmentations, scales, scurs, and ulcers, *q v*.

RS abscess, boil, carbuncle, Caze-nave's lupus, cerebropsychosis, chancre, chancroids, Chausser's areola, felon, gumma, moles, pimples, rash, sebaceous cysts, tumefactions, verruca, wound.

l., degenerative. L caused by or showing degeneration.

l., diffuse. L spreading over a large area.

l., discharging. 1 Brain l. discharging nervous impulses. 2 L discharging an exudate.

l., focal. L. of small definite area.

l., indiscriminate. L affecting separate systems of the body.

l., initial, of syphilis. Hard chancre.

l., irritative. L. stimulating or exciting activity in part of body where it is situated.

l., local. L. of nervous origin giving rise to local symptoms.

l., peripheral. One of nerve endings.

l., primary. First l. of a disease, esp. used in referring to chancre of syphilis.

l., structural. One causing change in tissue.

l., systematic. One confined to organs of common function.

l., toxic. One resulting from sepsis.

l., vascular. One of a blood vessel
le'thal [G *lethē*, oblivion]. Pert. to or
that which causes death

lethargic (leth-ar'jik) [G *lēthargos*,
drowsiness] 1. Affected with lethargy
2. Rel to lethargy. 3. Sluggish

lethargy (leth-ar-'ji) [G *lēthargos*, drow-
siness] 1. A condition of functional
torpor or sluggishness, stupor. 2. A
state analogous to hypnotism, or the
first stage of hypnotism

RS *carus, cataphora, coma vigil, dual*
and multiple personality, noctambulism,
somnambulism, vigilambulism.

l., African. Sleeping sickness

l., hysteric. The sleep of hypnotic
lethargy, the state in which many cases
of apparent death and resurrection are
found

l., lucid. Retention of intellect but loss
of will power with a consequent total
lack of muscular response. The subject
knows what is going on, resents it, per-
haps, but is unable to exercise sufficient
will to bring about muscular defense

Etiol Fear, fascination, shock. This
unrecognized condition may be re-
sponsible for many instances of rape,
or of yielding to such an attack

lethologica (lēth-ō-loj'ik-ā) [G *lethō*, for-
getfulness, + *logos*, word] Temporary
inability to remember a word or name,
or an intended action

lettuce [L *lactuca*, lettuce] COMP Con-
tains a small amount of an opium prin-
ciple A SERVING 50 Gm Pro 0.6,
Fat 0.2, Carbo 0.5 VITAMINS A + I,
B++ , C+++ , D+, E+, G++ The
green leaves of lettuce contain 30% more
vit A than the inner white leaves
ASIR Ca 0.043, Mg 0.017, K 0.339 Na
0.027, P 0.042, Cl 0.074, S 0.014, Fe 0.0007
A base forming food, alkalinity 74 cc
per 100 Gm, or 387 cc per 100 cal
Action Slightly soporific A mineralizer
and alkaliizer

leuc- For words beginning thus, see
leuk- words

leucine (lū'sēn) [G *leukos*, white] Al-
pha-amino-isobutyl acetic acid, CH₃
(CH)₂ CH (NH₂) COOH, an amino
acid found among the products of the
digestion of proteins. It is present in
body tissues and is indispensable in
foods being essential for normal growth
and metabolism

leucinosis (lū-sin-ō'sis) [+ -*ōsis*, in-
tensive] Excess of leucine in the body

leucinuria (lū-sin-ū'rī-ā) [+ *ouron*,
urine] Presence of leucine in urine

leucitis (lū-sī'tis) [+ -*itis*, inflamma-
tion] Inflammation of the sclera. SYN
scleritis.

leukanemia (lū-kā-ne'mī-ā) [+ *a-*, priv
+ *ama*, blood] Leukemia with marked
anemia.

leukasmus (lū-kas'mūs) [G *leukasmōs*,
growing white] Congenital absence of
pigment in hands or patches of the
skin SYN *leukoderma*.

leukemia (lū-kē'mī-ā) [G *leukasmōs*,
growing white, + *ama*, blood] A dis-
ease of unknown cause characterized
by rapid and abnormal proliferation of
leukocytes in the bone-forming organs
(bone marrow, spleen, lymph nodes)
and the presence of immature leuko-
cytes in peripheral circulation May be
acute or chronic

NP. Watch for local mouth infec-
tions, terminal septicemia, and broncho-
pneumonia as complications. Myelo-
genous forms are prone to such infec-
tions as boils, erysipelas, grippé, influ-
enza and pneumonia. Good nursing

care is very important in all forms of
this disease. Hemorrhages from nose
and mouth often require packing and
hemostatics.

l., acute. Leukemia in which onset
is sudden and progress rapid. Usually
fatal within a period of two or three
months

l., aleukemic. L in which the total
leukocyte count is normal or below
normal and in which immature cells
are absent

l., leukemic. L in which total leuko-
cyte count in peripheral blood is ele-
vated and immature cells of the series
involved are present

l., lymphatic. That in which the
lymphatic glands are the seat of hyper-
plasia, with a marked increase in
lymphocytes in blood, acute form occurs
in children and young adults, spleen is
slightly enlarged

l., monocytic. A rare form of leuke-
mia (about 5% of all cases) in which
monocytes are the predominant cells
involved. Involves the reticulo-endo-
thelial tissues of blood-forming organs.
Also called *reticulosis* or *reticulo-endo-
theliosis*

l., myelogenous. L involving the
hematopoietic bone marrow, esp that
of the ribs, sternum, and vertebrae.
Bone marrow which is normally red in
color, becomes gray and assumes a
gelatinous consistency. Myeloid ele-
ments increase in blood stream

SYM General manifestations of ane-
mia—enlargement of spleen, liver or
lymphatic glands. Febrile paroxysms
(101°-103° F.), hemorrhage from mu-
cous membranes, digestive disturbances,
dimness of vision. There is marked in-
crease in the leukocytes proportion to
red corpuscles may be 1-50 or even 1-10.
This leukocytosis results from an in-
crease in all forms of leukocytes, with
a concomitant decrease in red blood
cells

PROG Occasional recovery. More fatal
in adults than children, death usu-
ally resulting in 3-4 years

l., plasma cell. L in which plasma
cells are numerous in the blood

l., subleukemic. Aleukemic leukemia,
q.v.

leukemic (lū-kēm'ik) [G. *leukos*, white, +
ama, blood] 1. Rel to leukemia 2.
Affected with leukemia

leukemoid (lū-kē'moid) [G *leukos* white,
+ *ama*, blood, + *cidos*, form] Having
symptoms of leukemia, but due to other
conditions

leu'ko, leuk- [G.] Combining forms sig-
nifying deficiency of color.

leukoblast [G *leukos*, white, + *blastos*,
germ] General term applied to a cell
that gives rise to a leukocyte

leukoblasto'sis. Proliferation of excessive
numbers of immature leukocytes

leukocidin (lū-kō-sid'in) [+ L *cidos*,
from *caedere*, to kill]. An exotoxin that
attacks leukocytes. SYN. *leukotoxin*, q.v.

leukocytal (lū-kō-sī'tāl) [+ *kytos*, cell].
Rel to leukocytes.

leukocyte (lū'kō-sīt) [G *leukos*, white,
+ *kytos*, cell] White blood corpuscle
There are two types: (1) *granulocytes*
(those possessing granules in their cy-
toplasm) and (2) *agranulocytes* (those
lacking granules) Granulocytes in-
clude (a) *neutrophils* (65%), *basophils*
(0.5%), and *eosinophils* (2-4%) Agran-
ulocytes include *lymphocytes*, large and
small (25%) and *monocytes* (5%)

The leukocytes act as scavengers and
resist infection. They have an amoeboid
power of movement. They are able to

penetrate tissue and then return to the blood stream. When invading bacteria overcome them, the dead bodies of the white blood corpuscles collect in the form of pus, causing an abscess if a ready outlet is not found. Different types combat various kinds of infection. One cu mm of blood contains 5000-10,000 colorless corpuscles normally.

FUNCTIONS. Leukocytes, esp the granular forms, are markedly phagocytic, i.e., have the power to ingest particulate substances. Neutrophils ingest bacteria and small particles, other cells such as the monocytes and histiocytes.

Their presence is always indicative of disease.

In a smear of blood, all of the white cells are not alike, they vary in size, in shape, in appearance, and in color which they assume when stained. Some of the cells contain minute granules, and these cells are called granulocytes, the cytoplasm of others is granular. It is seen that the granules in some cells stain bright red, and the cells are called eosinophils, in others, deep blue, and these are called basophils. In most of the cells, however, the granules take a neutral purplish color, and these are

Tabular Summary of Leukocytes

Cells	Nucleus	Cytoplasmic Granules	Per Cent	
			Range	Ave.
Granulocytes (Polymorphonuclear)				
Neutrophils	Polymorphic	Fine Neutral stain	55-70	65
Eosinophils	Polymorphic	Coarse Stain with acid dye	2-4	3
Basophils	Polymorphic	Coarse Stain with basic dye	0.3-1	0.5
Agranulocytes				
Lymphocytes, small and large	Spherical (slightly indented)	None	20-30	26.5
Monocytes	Kidney shaped	None	3-8	5 100

in the tissues ingest larger particles. The function of the eosinophils and basophils is unknown. Eosinophils increase in number in certain conditions, such as asthma and infestations of animal parasites. Lymphocytes are not phagocytic. They are thought to be a source of serum globulin and possibly certain immune bodies. They may aid in tissue repair.

A greatly diminished number of erythrocytes is found in the anemias, and a greatly increased number of leukocytes (leukocytosis) is indicative of the presence of inflammatory products. A leukocyte count is usually a pre-operative routine if infection is suspected, such as in appendicitis. A count may also be taken following an operation to be sure that no infection from a wound is present.

How to Recognize. White blood cells are round, edges occasionally broken, nucleated, granular, having a grayish color, sometimes clumped, and can be stained as polynuclears from other places.

MICROSCOPIC EXAMINATION. They are usually in pieces of mucus and can be stained by ordinary blood stains.

Decrease below normal (5000) is called *leukopenia*, increase above normal (10,000) is called *leukocytosis*.

Two determinations are usually made regarding the leukocytes: their total number (total count), and the percentage of each type (differential count). Decrease below the normal is called *leukopenia*. Relative increase or decrease of any particular type is denoted by adding the suffix "philia" (denoting increase) or "penia" (denoting decrease), as neutrophilia, granulocytopenia, neutropenia, eosinophilia, etc.

Sometimes immature white cells are discharged into the blood stream and may be observed in blood smears, myelocytes, myeloblasts, or lymphoblasts.

called neutrophils. There are 2 types of nongranular cells, the lymphocytes and the monocytes.

Not all leukocytes are formed in the same place, nor in the same manner. Granulocytes are formed in the bone marrow, arising from large cells called megakaryocytes. Lymphocytes are formed in the lymph nodes, monocytes from the cells lining the capillaries in various organs, perhaps principally in the spleen and bone marrow.

L., acidophil. An eosinophil 1, q r.

L., alpha. One of those disintegrating during coagulation of the blood.

L., basophil. L with cytoplasmic granules which stain with basic dyes. Stain a deep purple with Wright's stain. Comprise 0.3-1.0% of white cell count.

L., beta. One of those which do not disintegrate during coagulation.

L., eosinophil. L with cytoplasmic granules which stain with acid dyes. Appear reddish when stained with Wright's stain. Comprise 2-4% of white cell count.

L., granular. SYN granulocyte. L containing granules in cytoplasm.

L., heterophilic. Neutrophil 1 of certain animals whose granules stain with an acid stain.

L., neutrophil. L with fine cytoplasmic granules which do not stain with acid or basic stains but have an affinity for neutral stains.

L., nongranular. An agranulocyte, a lymphocyte or monocyte.

L., polymorphonuclear. L with a nucleus consisting of several lobes. One of the granulocytes (neutrophil, eosinophil, basophil).

leukocythemia (lû-kô-sî-the'mî-â) [G leukos, white, + kytos, cell, + aima, blood]. Blood disease characterized by excess of white blood corpuscles and enlargement of spleen, lymphatic glands and bone marrow. SYN leukemia, q.v.

leukocytic (lû-kô-sî'tîk) [lû + kytos, cell]. Pert. to leukocytes.

leukocytoblast (lū-kō-sit'ō-blast) [+ + " + *blastos*, germ] Leukocyte mother cell.

leukocyto-genesis (lū'kō-sit'ō-jen'ē-sis) [G *leukos*, white, + *kytos*, cell, + *genesis*, formation] Leukocyte formation. **SYN** leukopoiesis.

leukocytoid (lū'kō-si-toid) [+ + " + *eidōs*, form] Resembling a leukocyte.

leu'kocytol'sin. A lysin which destroys leukocytes. **SYN** leukocidin.

leukocytolysis (lū-kō-si-tol'i-sis) [+ + " + *lysis*, dissolution]. Destruction of leukocytes.

leukocytoma (lū-kō-si-tō'mā) [+ + " + *ōma*, tumor] 1 Tumor composed of cells resembling leukocytes. 2 Tumor-like mass of leukocytes.

leukocytometer (lū'kō-si-tōm'et-er) [+ + " + *metron*, measure] Device for counting white blood corpuscles.

leukocytopenia (lū'kō-sit'ō-pe'nī-ā) [+ + " + *penia*, want] Subnormal number of leukocytes in peripheral blood. **SYN** leukopenia.

leukocytopenia (lū'kō-sit'ō-plā-nī-ā) [+ + " + *plane*, wandering] Wandering of leukocytes through blood vessel walls. **SYN** leukopedesis.

leukocytopeniosis (lū-kō-si-poy'tē-sis) Formation of white blood cells.

leukocytosis (lū'kō-si-tō'sis) [G *leukos*, white, + *kytos*, cell, + *ōsis*] Increase in the number of leukocytes (above 10,000 per cu mm) in the blood generally caused by presence of infection. It may also accompany or occur after the following conditions: hemorrhage, extensive operations, coronary occlusion, malignant growths, pregnancy, certain intoxications, and toxemias. Eosinophilic leukocytosis occurs in certain allergies, infestation with animal parasites, and Hodgkin's disease.

Leukemias, however, release immature leukocytes due to abnormal condition of blood forming organs. Leukocytosis is present in all infections excepting influenza, leprosy, malaria, measles, mumps, typhoid, and uncomplicated tuberculosis.

Fifteen thousand to thirty thousand is the usual count in leukocytosis, sometimes 50,000 or 75,000, in leukemias 500,000-1,000,000 per cu mm. Leukocytosis is early and marked in severe infections when the patient's resistance is good, if infection and resistance are less marked it obtains later and in a lesser degree and disappears more quickly. No leukocytosis may occur in unusually virulent infection, such as diphtheria, pneumonia, sepsis, etc.

leukocyturia (lū'kō-si-tū'rī-ā) [+ + " + *ouron*, urine] Leukocytes in the urine.

leukoderma (lū-kō-der'mā) [+ + *derma*, skin] Deficiency of pigmentation of the skin, esp in patches. **SYN** leukopathia. Classified as congenital, acquired and syphilitic.

leukodiagnosis (lū-kō-dī-ag-nō'sis) [+ + *dia*, through, + *gnōsis*, knowledge]. Diagnosis by observance of number, variety, or reaction of leukocytes.

leukoencephalitis (lū-kō-ēn-sēf-ā-lī'tis) Inflammation of the white matter of the brain.

leukokeratosis (lū'kō-kēr-ā-tō'sis) [+ + *keras*, horn, + *ōsis*] White patch formation on the surface of mucosa of tongue, cheek and gums. **SYN** leukoplakia.

leukolysin (lū-kō-l'i-sin) [+ + *lysis*, dissolution]. Serum constituent destructive to leukocytes.

leukolysis (lū-kol'i-sis) [+ + *lysis*, dissolution] Destruction of leukocytes. **SYN** leukocytolysis.

leuko'ma [+ + *ōma*, tumor]. A white, opaque corneal opacity.

l. adherens. Corneal scar with incarcerated iris tissue.

leukomaine (lū-kō-mā-ēn, -ma-in) [G *leukoma*, whiteness]. Nitrogenous alkaloid developed in living tissue as distinguished from one in dead tissue, or one of vegetable origin.

These alkaloids represent 2 groups, the uric acid and the creatinine group. **SEE** *antiscorbutine*.

leukomainemia (lū-kō-mā-in-ē'mī-nī) [+ + *aima*, blood] 1 Excess of leukomaines in blood. 2 Retention of excretory products in the blood.

leukomatous (lū-kōm-ā-tūs) [+ + *ōma*, tumor] 1 Pert to leukoma. 2 Suffering from leukoma.

leukomyelitis (lū'kō-mī-ē-lī'tis) [G *leukos*, white, + *myelos*, marrow, + *-itis*, inflammation] Inflammation of the white matter of the spinal cord.

leukomyelopathy (lū'kō-mī-ēl-ōp-āth-ī) [+ + " + *pathos*, disease] Disease involving white matter of spinal cord or myelon.

leukonecrosis (lū-kō-nē-krō'sis) [+ + *nekrosis*, deadness] Dry, light colored or white gangrene.

leukonychia (lū-kō-nīk'ī-ā) [+ + *onyx*, *onych-*, nail] "Gift spots," white spots or streaks on the nails, due probably to air in interstitial corneal spaces, with local trauma as cause of production.

leukopathia (lū-kō-pāth'ī-ā) [+ + *pathos*, disease] 1 Absence of pigment in skin. **SYN** leukoderma. 2 Disease involving leukocytes.

leukopedesis (lū-kō-ped-ē'sis) [+ + *pēdan* to leap] Passage of leukocytes through walls of blood vessels. **SYN** leukocytopenia.

leukopenia (lū-kō-pe'nī-ā) [+ + *penia*, lack] Abnormal decrease of white blood corpuscles usually below 5000 per cu mm.

l., malignant. An acute infection with extreme leukopenia. **SYN** agranulocytosis.

leukophlegmasia (lū-kō-flēg-mā'zī-ā) [+ + *phlegmasia*, inflammation, fever] Dropsical tendency with general edema and pale, flabby skin.

leukoplakia (lū-kō-plā-kī-ā) [G *leukos* white, + *plax*, plate]. Formation of white spots or patches on the mucous membrane of the tongue or cheek.

They are smooth, irregular in size and shape, and hard and occasionally fissure. May become malignant. **SYN** leukoma, *psoriasis buccalis*, *smoker's tongue*.

l. buccalis. L of the mucosa of the cheek.

l. lingualis. L of the tongue.

l. vulvae. L. of the vulva. **SEE** *kraurosis vulvae*.

leukoplasia (lū-kō-plā'zī-ā) [+ + *plax*, plate]. White patch formation on buccal mucosa. **SYN** leukoplakia, *q.r.*

leukopoiesis (lū'kō-poi-ē'sis) [G *leukos*, white, + *poiesis*, formation] Leukocyte production. **SYN** leukocyto-genesis.

leukopoletic (lū'kō-poi-et'ik) [+ + *poietn*, to make]. Forming leukocytes.

leukoprotease (lū-kō-pro'te-ās) [+ + *prōtos*, first, + *ase*, enzyme]. An enzyme in polynuclear leukocytes that digests protein.

leukopsin. Visual purple, a substance formed in the rods of the retina from

rhodopsin under the influence of light and heat.

leukorrhagia (lū-kō-ra'ji-ā) [⁺ + *rēgnat*, to flow forth]. Profuse white vaginal discharge. SYN *leukorrhea*, *g.v.*

leukorrhea (lū-kōr'e-ā) [⁺ + *rouē*, flow]. An abnormal, white or yellowish mucous discharge from the cervical canal or the vagina.

There is frequently a normal physiological leukorrhea which is present just preceding and following menstruation. Leukorrhea may be abnormal because of increase in amount, changes in color, variations in consistency, odors, types of bacterial content, and the appearance of blood.

ETIOI. Pathological states of the endocervix and vagina. Infection by *Trichomonas vaginalis*.

SYM Usually indications of acute inflammation, pain, heat, redness of parts involved, which may subside as discharge increases. Pain in groins, hypogastrium, sacral regions and small of back. Urethra often implicated, causing painful micturition. Symptoms which may occur in connection with chronic leukorrhea are innumerable. Reaction of discharge is acid, may be any consistency thin and watery or viscous and tenacious.

TREATMENT Remove the etiological factor. Constitutional. Improve genital health, outdoor exercise, regular habits, plain, nutritious diet. Injections of hot, sterile water (95°-100° F). Mild antiseptic douches.

SYN *biennelytria*.

1., uterine. May affect mucous surface of cervix only, or fundus.

SYM Pain, weight and dragging sensation in back and bearing down pains. Discharge at first serous and bloody, soon becomes thick yellowish or greenish,ropy, fluid or purulent. After drying, leaves yellow or greenish stain on linen and stiffens it. Afterward discharge becomes whiter, milky. May become chronic—discharge is alkaline in reaction.

Examined through speculum, cervix is found swollen, edematous, and red, and from the os pours forth a clear albuminous looking fluid, mucopus or long, tenacious shreds of cervical mucus.

PROG Favorable in both though cure is often tedious.

TREATMENT Same as vaginal form. Find and remove any special etiological factor.

SYN *uterine catarrh*.

leukosarcoma (lū-kō-sar-kō'nā) [G *leukos*, white, + *sarx*, flesh, + *ōma*, tumor]. An unpigmented sarcoma.

leukosis (lū-kō'sis) [⁺ + *-ōsis*, intensive] 1 Unnatural pallor 2 Excessive proliferation of leukocyte-producing tissue. On the basis of type of cell involved, leukosis may be *lymphoid*, *myeloblastic*, or *myelocytic*. SEE *leukemia* 3 Increase in leukocyte forming tissue.

leu'kotac'lic. Possessing the power of attracting leukocytes.

leu'kotax'ine. A nitrogenous substance present in tissues in which inflammatory processes are taking place. It increases capillary permeability and is positively leukotactic.

leu'kotax'is. Possessing the power of attracting (positive 1) or repelling (negative 1) leukocytes.

leukotoxic (lū-kō-tōks'ik) [⁺ + *toxikon*, poison]. Destroying leukocytes.

leukotrichia (lū-kō-trik'i-ā) [⁺ + *thriz*,

trich-, hair]. Whiteness of the hair. SYN: *canities*.

leukous (lū'kūs) [G *leukos*, white]. White, esp. rel. to the skin.

levator (le-va'tor) [L *lifter*] 1. A muscle that raises a part, opposed to *depressor*. 2. An instrument which lifts depressed portions.

1. ani. A broad muscle helping to form the floor of the pelvis.

1. palpebrae superioris. A muscle which elevates the upper eyelid.

level of activities. Connector neurons are grouped into "levels" corresponding to different stages of development (a) spinal cord level, (b) medullary level, (c) midbrain level, (d) basal ganglia level, (e) cortical level. Each level is responsible for certain activities but yet controlled by the one above it. SEE *III*, p. L-24.

lev'er. Rigid bar used to modify direction, force, and motion. SEE *III*, p. L-25.

1., Davy's. A rigid rod for compressing the common iliac artery.

lev'ita'tion. The subjective sensation of rising in the air or moving through the air unsupported. Occurs in dreams and certain mental disorders.

levocardiogram (lev-ō-kar'di-ō-grām) [L *laevus*, left, + G *kardia*, heart, + *gramma*, a writing]. Part of cardiogram representing effect or action of left ventricle.

levoduction (lev-ō-dū'k'shun) [⁺ + *ducere*, to lead]. Movement or drawing toward the left, esp. of an eye.

levogyrous (lev-ō-jī'rus) [⁺ + *gyrāre* to turn]. Causing to turn toward the left, applied esp. to substances that turn polarized light rays to the left. SYN *levorotatory*.

levophobia (lev-ō-fō'bi-ā) [⁺ + G *phobos*, fear]. Morbid dread of objects on the left side of the body.

levorotation (lev-ō-rō-tā'shūn) [⁺ + *rotāre*, to turn]. Twisting or turning to the left.

levorotatory (lev-ō-rō'tā-tō-rī) [⁺ + *rotāre*, to turn]. Causing to turn toward the left, applied esp. to substances that turn polarized light rays to the left.

levorotation (lev-ō-tōr'shūn) [L *laevus*, left, + *torsio*, a twisting]. A twisting to the left. SYN *levorotation*.

levoverision (lev-ō-vēi'shun) [⁺ + *versio*, a turning]. A turning to the left. SYN *levorotation*, *levorotation*.

lev'ulose [L *laevus*, left]. Fructose, or fruit sugar, a monosaccharide and a hexose, having the same empirical formula as dextrose, C₆H₁₂O₆.

It is an example of the carbohydrates, *q.v.* One of the 3 simple sugars. It is formed in the body by the digestion of sucrose. It is found in plants and fruits, in honey, corn syrup and syrup resulting from the inversion of sucrose.

Dosage. 1-2 oz (30.0-60.0 Gm).

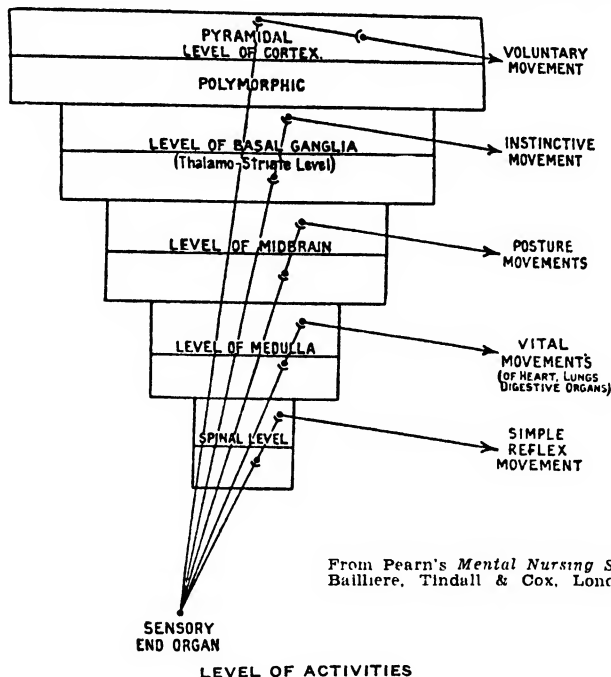

levulosemia (lev-ū-lō-sē'mī-ā) [⁺ + G *aima*, blood]. Presence of levulose in the blood.

levulosuria (lev-ū-lō-sū'rī-ā) [⁺ + G *ouron*, urine]. Presence of levulose in the urine, usually in a form of diabetes.

Leyden jar (lī'den) A glass jar coated partially, inside and out, with metal or tinfoil, or coated outside with metal and having salt solution inside, it is used as a capacitor.

Leydig's cells (lī'djī). Interstitial tissue cells in the testicles, believed to be responsible for internal secretion of the testicles.

Li. Symbol for *lithium*.

From Pearn's *Mental Nursing Simplified*,
Bailliere, Tindall & Cox, London, Eng.

liberomotor (līb'ēr-ō-mō'tōr) [L *liber*, free, + *motor*, mover] 1 Pert to voluntary movement 2 Free from motor energy.

libidinous (līb'id'i-nūs) [L. *libidinōsus* pert to desire] Characterized by lust or lewdness. *Syn* *lascivious*, *salacious*

libido (līb'idō, bē'dō) [L *desire*] 1 The sexual drive, conscious or unconscious 2 In *psychoanalysis*, the energy or force or affect which is the driving force of human behavior Various identified as the sex urge, desire to live, desire for pleasure or satisfaction. *See freudian object choice*

lichen (lī'ken) [G *leichen*, lichen]. Any form of papular skin disease, usually noting *l. planus*.

l. acuminatus. A form of *l. ruber* with papulosquamous type of eruption.

l. agrius. Eczema of acute papular type.

l. disseminatus. Form in which the eruption is placed unevenly

l. pilaris. Form affecting hair follicles. *Syn*: *keratosis pilaris*.

l. planus. Inflammatory skin disease of many varieties

Sym. Begins with pinhead size papules, reddish or violaceous, glistening, then coalescing, forming rough, scaly patches, acute, subacute, or chronic itching situated on extremities According to type of lesion the disease may be *Lichen planus atrophicus*, *erythematotus*, *hypertrophicus*, *linearis*, *ruber montiformis*, etc.

Etiol: Unknown. Nervous exhaustion

a contributory factor. Probably systemic

Prog Exceedingly chronic but favorable

Treatment. Hygienic regimen. Mercury, arsenic, and iron internally. Locally, soothing antipruritic ointment.

l. ruber. Form with red, papular lesions and constitutional symptoms Extremely rare. Most common in poorly nourished, middle aged males

Sym Small, red, glazed, acuminated papules. No tendency to coalesce—associated with itching and failure of general health.

Prog Chronic course May prove fatal through exhaustion.

l. scrofulosus. Form with red papules occurring chiefly in children of strumous diathesis.

Sym Small, pale red, or salmon colored, scaly papules, most frequent on trunk. Itching absent

Prog Chronic course.

Treatment: In all forms, good nourishing diet, good hygiene, constitutional remedies in each individual case.

l. spinulosus. Form with spine developing in each follicle. *Syn* *keratosis pilaris*, *q.v.*

l. tropicus. Form with redness and inflammatory reaction of the skin. *Syn*: *miliaria rubra*, *prickly heat*.

lichenification (lī-ken'fī-kā'shun) [G. *leichen*, lichen]. 1. Cutaneous thickening and hardening from continued irritation. 2. Changing of an eruption into resemblance to lichen.

LEVERS IN THE HUMAN BODY

I When the arm is held above the head, extension of the elbow involves the ulna as a first-class lever II Rising on the ball of the foot involves the calcaneus and other bones of the foot as a second-class lever III When the arm is held at the side, flexion of the elbow involves the ulna as a third-class lever.

lichenoid (lī'ken-oid) [G. *leichen*, lichen, + *eidos*, form] Resembling lichen

licorice (lik'ō-ris). A dried root of *Glycyrrhiza glabra* and allied species used as demulcent, laxative, and expectorant
SYN *glycyrrhiza*

lid. An eyelid

L. reflex. Closure of eyelids resulting from direct corneal irritation

Lieber's test (lē'bēn). A test for acetone in the urine by caustic and iodine

Yellow phosphate precipitates and iodoform indicates presence of acetone

Lieberkuhn crypts. (lī'ber-kūn) SYN: glands of Lieberkuhn, intestinal glands, Lieberkuhn's follicles Simple tubular glands present in the intestinal mucosa In their epithelium are found goblet cells, serozymogenic cells of Paneth and argentaffine cells The glands form minute invaginations opening between the bases of the villi They lie in the lamina propria, their blind ends extending to the muscularis mucosa In the large intestine, they are longer, contain more goblet cells and are arranged vertically with much regularity

Liebig's extract (lē'bīg). Variety of beef extract.

lie detector. An instrument for determining such minor but definite physical changes under the stress of lying (or any other emotion) as variations in respiratory rhythm, pulse rate, blood pressure and sweating of the hands Increased perspiration lessens resistance to passage of electrical current

lien (lī'en) [L. *spleen*]. The spleen.

l. accessorius. Accessory spleen

lienal (lī'en-āl) [L. *lien*, spleen]. Rel. to the spleen. SYN: *splenic*.

lienitis (lī-en-ī'tis) [L. *lien*, spleen, + G

-*itis* inflammation] Inflammation of the spleen SYN *splenitis*

lienocèle (lī-en'ō-sēl) [L. + G. *kēlē*, hernia] Splenic hernia SYN *splenocèle*

lienomalacia (lī'en-o-mal-a'sī-ā) [L. + G. *malakia*, softening] Softening of the spleen

lienomedullary (lī'en-ō-med'ū-la-rī) [L. + *medulla*, marrow]. Rel. to both spleen and bone marrow

lienomyelogenous (lī'en-ō-mī-ēl-ōj'ē-nūs) [L. + G. *myelos*, marrow, + *gennan*, to produce] Derived from both the spleen and bone marrow

lienomyelomalacia (lī'en-ō-mī-el-o-mā-lā-sī-ā) [L. + " + *malakia*, softening] Softening of the spleen and bone marrow.

lienopancreatic (lī'en-ō-pān-kre-at'ik) [L. + G. *pankreas*, pancreas] Rel. to the spleen and pancreas

lienopathy (lī-en-op'ā-thī) [L. + G. *patos*, a disease] Any disorder of the spleen SYN: *splenopathy*.

lienorenal (lī'en-ō-rē-nāl) [L. + *rēnalis*, pert. to a kidney]. Rel. to the spleen and kidney.

lienotoxin (lī'en-ō-tōks'īn) [L. + G. *toxikon*, poison]. Cytotoxin having specific action on splenic cells. SYN: *splenotoxin*.

lienteric (lī-en-ter'ik) [G. *leienteria*, smooth intestine]. 1. Pert. to diarrhea with stools containing undigested food. 2 Affected with lientery.

lientery (lī'en-ter-ī) [G. *leienteria*, smooth intestine] Diarrhea with undigested foods in the stools.

life (līf) [A.S.]. 1. State of being alive; quality manifested by metabolism, growth, reproduction, and internal

adaptation to environment; state in which the organs of an animal or plant are capable of performing all or any of their functions. 2. Time bet birth and death. 3. The sum total of those properties which distinguish living things (animals or plants) from nonliving or dead organic matter.

RS *anima, antihistosis, antibiotic, apothanasia, archebiosis, "bio-" words, vital, vitality.*

l., change of. SEE *menopause*

l., expectancy. Expectation of life, the average number of years, that a person of a given age may be expected to live as determined by mortality tables.

Ligament (lig'ă-měnt) [*L. ligamentum, a band*]. 1. A band or sheet of strong, fibrous connective tissue connecting the articular ends of bones serving to bind them together and to facilitate or limit motion. 2. A thickened portion or fold of peritoneum or mesentery which supports a visceral organ. 3. A band of fibrous connective tissue connecting bones, cartilages, and other structures and serving for support or for attachment of fascia or muscles. 4. A cord-like structure representing the vestigial remains of a fetal blood vessel.

l., accessory. A l. which supplements another one, esp. one on lateral surface of a joint. One outside of and independent of the capsule of a joint.

l., acromioclavicular. One extending from clavicle to the acromial process of the scapula.

l., alar. SYN *check l.*: odontoid l. 1. L. connecting odontoid process of atlas to occipital bone. 2. Lateral fold of synovial membrane of the knee joint.

l., annular. A circular l., esp. (1) l. enclosing head of radius, and (2) l. holding footplate of stapes in fenestra vestibuli.

l., apical. A single median l. extending from odontoid process to occipital bone. Also called *apical odontoid l., suspensory l.*

l., arcuate, lateral and medial. SYN *ext arcuate lig.* L's from 12th rib to transverse process of 1st lumbar vertebra to which diaphragm is attached.

l., arcuate popliteal. L. on posterolateral side of knee, extending from head of fibula to joint capsule.

l.'s, auricular. The ant., post., and sup. auricular l.'s uniting external ear to the temporal bone.

l., broad, of the liver. A wide, sickle-shaped fold of peritoneum, attached to lower surface of diaphragm and internal surface of right rectus abdominis muscle, and to the convex surface of liver.

l., broad, of uterus. Folds of peritoneum attached to lateral borders of uterus from insertion of fallopian tube above to the pelvic wall. It consists of 2 leaves between which are found the remnants of the wolffian ducts, cellular tissues, and the major blood vessels of the pelvis.

l.'s, capsular. Heavy fibrous structures, lined with synovial membrane, surrounding articulations.

l.'s, carpal. Those uniting carpal bones.

l., caudal. Bundles of fibrous tissue uniting dorsal surfaces of the 2 lower coccygeal vertebrae and superjacent skin.

l., check. One that restrains motion of a joint, esp. the lateral odontoid l.'s.

l., conoid. Post. portion of coracoclavicular l.

l., coracoacromial. Broad triangular one attached to the outer edge of coracoid process of the scapula, and to tip of acromion.

l., coracoclavicular. One uniting clavicle and the coracoid process of the scapula.

l., coracohumeral. Broad l. connecting coracoid process of scapula to greater tubercle of the humerus.

l., cornicopharyngeal. L. extending from corniculate cartilage of larynx caudally and attaching to mucosa of the pharynx.

l., coronary, of liver. A fold of peritoneum extending from post. edge of liver to diaphragm.

l., costocolic. One attaching splenic flexure of colon to diaphragm.

l., costocoracoid. One joining first rib and coracoid process of the scapula.

l.'s, costotransverse. One uniting ribs with transverse processes of vertebrae.

l., costotransverse, middle. One consisting of parallel fibers extending bet. a vertebra and its adjacent rib.

l.'s, costovertebral. Those uniting the ribs and vertebrae.

l., cricopharyngeal. A ligamentous bundle bet. upper and post. border of cricoid cartilage and ant. wall of pharynx.

l.'s, cricothyroid. Ones uniting cricoid and thyroid cartilages.

l., cricotracheal. The ligamentous structure uniting upper ring of trachea and the cricoid cartilage.

l., cruciate. 1. L. of the ankle passing transversely across dorsum of foot which holds tendons of the anterior muscle group in place. 2. A cross-shaped ligament of the atlas consisting of the transverse ligament and sup. and inf. bands, the former passing upwards and attaching to margin of foramen magnum, the latter passing downwards and attaching to the body of the atlas. 3. Two l.'s of the knee (*ant. and post.*), the former passing from tibia to medial aspect of lateral condyle of femur, the latter from tibia to lateral aspect of medial condyle.

l., cruciform. A structure consisting of one l. crossing another.

l., crural. Poupart's l.

l., deltoid. Int. lateral l. of ankle.

l., dentate. Processes of pia mater extending across the subdural space on either side of spinal cord.

l., falciform, of the liver. A wide, sickle-shaped fold of peritoneum, attached to lower surface of diaphragm and internal surface of right rectus abdominis muscle, and to the convex surface of liver.

l., fundiform, of the penis. L. extending from lower portion of the linea alba and Scarpa's fascia to dorsum of penis. Also called *superficial suspensory l.*

l., gastrophrenic. A fold of peritoneum bet. esophageal end of stomach and the diaphragm.

l., Gimbernat's. Triangular flat expansion of aponeurosis of abdominal ext. oblique muscle. Forming medial boundary of femoral ring. Also called *lacunar l.*

l., glenohumeral. Fibers of the coracohumeral l. passing into the joint, and inserted into inner and upper part of bicipital groove.

l., glenoid. One which extends bet. palmar surfaces of phalanges and corresponding metacarpal bone.

l., hepaticoduodenal. A fold of peritoneum from transverse fissure of liver

to vicinity of the duodenum and right flexure of colon, forming ant. boundary of foramen of Winslow.

l., ileopectineal. A portion of the pelvic fascia attached to the ileopectineal line and to capsular l of hip joint.

l., iliofemoral. Bundle of fibers forming the upper and ant. portion of the capsular l of the hip joint. L that extends from ilium to intertrochanteric line.

l., ilio lumbar. L extending from 4th and 5th lumbar vertebrae to iliac crest.

l., infundibulopelvic. The upper free edge of the broad l. in which the ovarian artery is found.

l., inguinal. SYN: *Poupart's l* L extending from ant sup iliac spine to pubic tubercle. Forms lower margin of aponeurosis of ext oblique muscle.

l., interclavicular. Bundle of fibers bet. sternal ends of the clavicles, attached to interclavicular notch of sternum.

l.'s, interspinal, interspinous. Those extending from sup. margin of a spinous process of one vertebra to lower margin of one above.

l., ischio capsular. L extending from ischium to ischial border of acetabulum.

l., lacunar. Gimbernat's l. q.v.

l.'s, lateral, of the liver. Folds of peritoneum extending from lower surface of diaphragm to adjacent borders of right and left lobes of the liver Also called rt and l triangular l's

l., lateral occipitoatlantal. A ligament on each side bet transverse processes of atlas and jugular process of the occipital bone

l.'s, lateral odontoid. Strong l's extending bet. sides of odontoid process of the axis and inner sides of condyles of the occipital bone.

l., palpebral. Two ligaments, *medial* and *lateral*, extending from tarsal plates of the eyelids to the frontal process of maxilla and the zygomatic bone respectively

l., Poupart's. Inguinal l. q.v.

l., pterygomaxillary. Band of fiber extending bet apex of internal pterygoid plate of sphenoid bone and the post. extremity of internal oblique line of inferior maxilla.

l., pubic. Those connecting the pubic bones at the symphysis pubis. Include ant. and sup. pubic l's and the arcuate (inf.) ligament.

l., rhomboid. SYN: *costoclavicular l.* A strong structure extending from tuberosity of clavicle to outer surface of the cartilage of the first rib.

l., round, of the liver. SYN: *l. teres hepatis.* Fibrous cord extending upward from the umbilicus and enclosed in lower margin of the falciform ligament. Represents obliterated left umbilical vein of the fetus.

l., round, of uterus. SYN: *l. teres uteri.* L attached to uterus immediately below entrance of uterine tube. Each extends laterally in the broad ligament to the pelvic wall where it passes through inguinal ring, terminating in the labium majus.

l., sacro iliac. Two ligaments, the ant. and post., which connect sacrum and ilium.

l., sacrospinous. L extending from spine of ischium to sacrum and coccyx. Also called *lesser sciatic l.*

l., sacrotuberous. L extending from tuberosity of the ischium to posterior sup. and inf. iliac spines and to lower part of sacrum and coccyx. Also called *greater sciatic l.*

l., sphenomandibular. L attached superiorly to spine of sphenoid and inferiorly to lingula of mandible.

l., spiral. The thickened periosteum of the peripheral wall of the osseous cochlear canal. The basilar membrane is attached to its inner surface.

l.'s, stomach. The lesser omentum and the *phrenicogastric l.*

l., stylohyoid. A thin fibroelastic cord bet. lesser cornu of hyoid bone and apex of styloid process of the temporal bone.

l., stylomandibular. A thin fibrous band of tissue extending bet. styloid process of temporal bone and lower part of post border of ramus of the mandible

l., stylomaxillary, stylomylod. A broad fibrous band of tissue extending bet. styloid process of temporal bone and lower part of post border of ramus of the inferior maxilla.

l., suprascapular. A thin fibrous band of tissue extending from base of coracoid process of scapula to inner margin of suprascapular notch

l., supraspinal, supraspinous. One uniting apices of spinous processes of vertebrae.

l., suspensory. One suspending an organ.

l., suspensory, of lens. The zonula ciliaris (ciliary zonule); the fibers holding the crystalline lens in position.

l., suspensory, of ovary. SYN *infundibulopelvic l* L extending from tubal end of ovary laterally to pelvic wall. It lies in layers of the broad ligament

l., suspensory, of the penis. A triangular bundle of fibrous tissue extending from ant. surface of the symphysis pubis and adjacent structures to dorsum of the penis.

l.'s, suspensory, of the uterus. The broad l's, the round ones, and the recto-uterine folds of the uterus.

l.'s, sutural. Thin, fibrous layers interposed bet articulating surfaces of bones united by suture.

l., transverse, of atlas. A strong l passing over odontoid process of the axis.

l., transverse crural. L lying on ant. surface of leg just above the ankle.

l., transverse, of hip joint. A ligamentous band extending across cotyloid notch of the acetabulum.

l., transverse, of knee joint. A fibrous band extending from ant. margin of external semilunar fibrocartilage of knee to extremity of the internal semilunar fibrocartilage.

l., trapezoid. Ant. ext. portion of the coracoclavicular l.

l., triangular, of liver. Two ligaments, right and left, which connect post aspects of right and left lobes with corresponding portions of the diaphragm

l., umbilical, lateral. Fibrous cord extending from bladder to umbilicus. Represents obliterated int. iliac artery of fetus.

l., umbilical, median. Fibrous cord extending from apex of bladder to umbilicus. Represents the remains of the urachus of fetus.

l., uterorectosacral. Arises from the sides of the cervix and passes upwards and backwards, passing around the rectum, to the second sacral vertebra. They are enclosed within the recto-uterine folds which demarcate borders of the recto-uterine pouch.

l., ventricular, of larynx. SYN: *vestibular ligament.* The lateral free mar-

gin of the quadrangular membrane. It is enclosed within and supports the ventricular fold.

l., vocal, of larynx. The thickened free edges of the elastic cone extending from thyroid angle to vocal processes of arytenoid cartilages. They support the vocal fold, *q v*

l., yellow. SYN. *ligamenta flava* L. connecting lamina of adjacent vertebrae

ligamentopexis (lig-ā-mēn'tō-peks'is) [L. *ligamentum*, band, + G *pēxis*, fixation]. Suspension of uterus on the round ligaments

ligamentous (lig-ā-men'tūs) [L. *ligamentum*, band] 1 Rel to a ligament. 2 Like a ligament

ligamentum (lig-a-men'tum) (pl *ligamenta*) [L a band] Ligament

l. arteriosum. A fibrous cord, from pulmonary artery to arch of aorta, the remains of the ductus arteriosus of the fetus

l. dentatum, denticulatum. A delicate band of connective tissue on each side of the myelon

l. flavum. SYN. *ligament yellow*

l. nuchae. The upward continuation of the supraspinous ligament, extending from seventh cervical vertebra to occipital bone

l. palpebrale. Ligamentous band, external and internal, bet outer margin of the orbit and tissues of eyelids

l. patellae. A strong, flat band securing the patella to the tibia

l. teres femoris. A flat band extending from acetabular fossa to head of femur

l. teres hepatis. SEE **l. round, of liver**

l. teres uteri. SEE **l. round of uterus**

l. venosum. A solid fibrous cord representing obliterated ductus venosus of the fetus

ligate (līg'gāt) [L. *ligāre*, to bind]. To apply a ligature

ligation (lī-gā'shun) [L. *ligāre*, to bind] The application of a ligature SYN *circoadesis*

ligature (līg'a-tūr) [L. *ligatūra*, a binding] 1 Process of binding or tying. 2 A band or bandage 3 A ligament 4 A thread or wire for tying blood vessels

The cord or material used in tying or binding, as an artery, catgut, kangaroo gut, silk, either the plaited silk or the Chinese twisted silk. In some cases dentists' floss silk as it does not slip easily. SEE *catgut*.

light (lit) [A. S. *līhtan*, to shine]. The sensation produced by electromagnetic radiation which falls on the retina

The radiation itself is also called light over the range of wavelengths which produces sensation, and regarding this range it is also called infrared and ultraviolet light. Radiant energy producing a sensation of luminosity on the retina limited to a wavelength of from 4000 to 7000 angstroms.* SEE *rays*.

l. adaptation. Changes which occur in a dark-adapted eye in order for vision to occur in moderate or bright light. Principle changes are contraction of pupil and bleaching of visual purple in the rods

l., axial. L. with rays parallel to each other and to optic axis.

l. difference. Abbr. L D The difference with respect to sensitiveness to intensity of light between the two eyes.

l., diffused. Rays broken by refraction.

l., Finsen. L rays given off by a Finsen lamp, consisting principally of violet and ultraviolet rays

l., polarized. L. in which waves vibrate in one direction only

l., reflected. Light rays which are thrown back by an illuminated object such as a mirror

l. reflex. Constriction of the pupil when light is flashed into the eye

l., refracted. Rays bent from original course

l. therapy. Phototherapy; the use of light rays in the treatment of disease Includes use of ultraviolet and infrared radiations SEE *heliotherapy, lamp*

l., transmitted. That which passes through an object.

l. unit. A foot candle. This is the amt. of light measured one foot from a standard candle. The light intensity of the average room is from 3 to 10 foot candles, whereas 25-100 would be better. At noon, on a clear day, the sun gives 10,000 candle ft. of light, under a tree we get 1,000, on a porch, 500, on a fairly cloudy day, 200. The term foot candle takes the place of "candle power"

light, words perf. to: astatic, "actin-" words, anacampsis, Blondlot rays, catadioptric, circumpolarization, etiolate, "fluor-" words, Fraunhofer's lines, Grotthuss' law, half-value thickness, "phot-" words, "radi-" words, ray, reflection, reflector, refraction, spectrum

light (lit) [A. S. *lēhte*, not heavy]. 1. Not heavy 2. Pale

l. diet. All foods allowed in soft diet* plus whole grained cereals, easily digested raw fruits and vegetables. Foods not pureed or ground

lightening [A. S. *lēhte*, not heavy] Uterine descent into pelvis during primary stage of labor

ligula (līg'u-lā) [L. a strap] Strip of white substance on the margin of the fourth ventricle

limb (lm) [A. S. *līm*] 1 An arm or leg 2 An extremity 3 A limblike extension of a structure

RS *acampsis*, *acroagnosis*, *anisomelia*, *appendicular*, *artificial*, *cineplastics*, *extremity*, *macrocolia*, *melagra*, *melibagra*, *member*.

l., ant., of internal capsule. The lenticulo-caudate portion which lies between lenticular and caudate nuclei

l., ascending, of renal tubule. Portion between the bend in Henle's loop, and the distal convoluted portion

l., descending, of renal tubule. Portion between proximal convoluted portion and the bend in Henle's loop

l., pelvic. The lower extremity

l., thoracic. The upper extremity

limbic (līm'bik) [L. *limbus*, a border]. Pert to a limbus or border. SYN. *marginal*.

limbus (līm'būs) [L. border]. The edge or border of a part.

l. alveolaris. 1. The upper free edge of the alveolar process of the mandible. 2 The lower free edge of the alveolar process of the maxilla

l. conjunctivae. The edge of conjunctiva overlapping the cornea

l. corneoscleral. The edge of the cornea where it unites with the sclera.

l. fossa ovalis. The thickened margin of the fossa ovalis, esp the rim of the septum secundum bounding the fossa

l. lamina spiralis. Thickening of the periosteum of the osseus spiral lamina of cochlea to which the tectorial membrane is attached.

- l. palpebralis, ant.** The ant. margin of the free edge of the eyelid from which the cilia or eyelashes grow
- l. palpebralis, post.** The post margin of the free edge of the eyelid; the region of transition of skin to conjunctival mucous membrane
- l. sphenoidalis.** Ridge on ant portion of upper surface of sphenoid bone
- lime (līm) [A S hīm, glue]** CaO (calcium oxide) A substance obtained from limestone **See calcium**
- l., chlorinated.** Substance resulting from chlorination of lime, consisting chiefly of calcium chloride and calcium hypochlorite Used principally as a disinfectant
- l. water.** Solution of calcium hydroxide, Ca(OH)₂ in water, a weak base and used as an antacid
- lime (fr līmō)** Fruit of *Citrus auranti-folia* Its juice is antiscorbutic and refrigerant **AV SERVING** 40 Gm **PRO** 0.3, Fat trace, Carbo 4.9 **VITAMINS** A+, B+, C++ Lemons have a much higher antiscorbutic value **ASH CONST** Ca 0.055, Mg 0.014, K 0.350, Na 0.062, P 0.036, Cl 0.039, S 0.010-0.003.
- l. juice.** **AV SERVING** 15 Gm **PRO** 0.1, Carbo 1.2. **VITAMINS** A+, B+, C++ Fe 0.003.
- limen (līm'ēn) [L. threshold]** Edge, threshold.
- limes death.** The least amount of toxin which when mixed with one unit of antitoxin and injected into a guinea pig weighing 250 gm will bring its death within five days **SYMS** L
- limes zero.** The greatest amount of toxin which when mixed with one unit of antitoxin and injected into a guinea pig weighing 250 gm will cause no local edema **SYMS** L.
- liminal (līm'i-nāl) [L. limen, limin-, threshold]** Hardly perceptible, rel to a threshold as of consciousness
- limitans (līm'i-tāns) [L. limitāre, to limit]** 1 Used in conjunction with other words to denote limiting 2 Used synonymously to indicate membrane limitans
- limo'sis [G. limos hunger]** Abnormal hunger, depraved appetite
- limothery (līm-ō-ther-ā-pl) [L. + therapia, treatment]** Treatment by restriction of diet, or fasting
- lincture (līnk'tūr), lincus (-lūs) [L. linctus, a licking].** Medicine to be taken by licking
- line (līn) [L. lineal]** 1 Any long, relatively narrow mark 2 A boundary or an outline 3 A wrinkle
- l., abdominal.** Line indicating abdominal muscle boundaries
- l., alveobasilar.** One from nasion to alveolar point
- l., alveolonasal.** From alveolar point to nasion
- l., auriculobregmatic.** From auricular point to bregma
- l., axillary (ant., post. and mid-).** Downward from axilla
- l., base.** From infraorbital ridge through middle of external auditory meatus to midline of occiput.
- l., basibregmatic.** From basion to bregma.
- l., Baudelocque's.** Ext. conjugate diameter of pelvis
- l.'s, Beau's.** Transverse lines on the fingernails.
- l., blauricular.** From one auditory meatus over vertex to other
- l., blue.** One on gums in chronic lead poisoning.
- l., costoclavicular.** From sternoclavicular joint to point on 11th rib.
- l., costoclavicular.** Line midway bet. nipple and sternum border
- l. of demarcation.** Division bet. healthy and diseased tissue
- l. of femur, internal supracondylar.** Inner of 2 ridges into which linea aspera of femur divides
- l. of fibula, oblique.** Prominent ridge on int surface of shaft of fibula
- l. of fixation.** Imaginary l drawn from subject viewed to the fovea centralis
- l., gingival.** 1 Line of junction of cementum and enamel of a tooth 2 One on neck of tooth where gum is attached.
- l.'s., gluteal.** Three lines, *ant post.* and *inf.* on ext surface of ilium
- l., iliopectineal.** Bony ridge marking brim of pelvis
- l. of ilium, intermediate.** Ridge upon crest of ilium bet inner and outer lip
- l. of inferior maxilla, internal oblique.** Ridge on int surface of lower jaw
- l., interauricular.** One joining the 2 auricular points
- l., intercondylar, intercondylean.** Transverse ridge joining condyles of femur above the intercondyloid fossa
- l., intertrochanteric.** Ridge upon post surface of femur ext bet greater and lesser trochanters
- l., isciatuberal.** One joining inner borders of ischial tuberosities below small sciatic notch
- l., mammary.** From one nipple to other
- l., mammillary.** Vertical line through center of nipple
- l., median.** One joining any 2 points in the periphery of the median plane of the body, or one of its parts
- l., milk.** The mammary ridge, an ectodermal thickening in embryo ext between bases of limb buds
- l., nasobasilar.** Through basion and nasion.
- l., nuchal,** sup and inf Two curved ridges on occipital bone extending laterally from ext occipital crest
- l., oblique, of fibula.** The medial crest or posteromedial border, a line extending from med side of head and terminating distally at interosseous crest
- l., oblique, of radius.** Pant ridge on ant surface passing downward and laterally from radial tuberosity
- l., parasternal.** Line midway bet nipple and sternum border
- l., pectineal.** L on post surface of femur extending downward from lesser trochanter That portion of iliopectineal l formed by the os pubis
- l., popliteal.** L of post surface of tibia, extending obliquely downward from fibular facet on lateral condyle to medial border about middle of bone
- l., scapular.** Downward from lower angle of scapula
- l., semilunar.** Curved tendinous condensation of aponeurosis of obliquus abdominis externus.
- l., sight.** From center of pupil to viewed object, imaginary.
- l., sternal.** Median line of sternum.
- l., sternomastoid.** From bet heads of sternomastoid muscle to mastoid process.
- l., supracondylar, medial and lateral.** Two ridges on post surface of distal end of femur, formed by diverging lips of the linea aspera
- l., supraorbital.** Across forehead above root of ext. angular process of frontal bone
- l., temporal, sup and inf** Two curved l's on lateral surface of skull, passing

upwards and backwards from zygomatic process of frontal bone and terminating posteriorly at supramastoid crest

l.'s, test. Those for detecting fracture or shortening of neck of femur.

l., umbilicopubic. That portion of median l extending from umbilicus to symphysis pubis

l., visual. One that extends from object to macula lutea passing through the nodal point.

linea (lin'e-ä) (pl *lineae*) [L. line] An anatomical line

l. alba. The white line of connective tissue in middle of abdomen from sternum to the pubis

l. albicans. L on abdomen in advanced pregnancy, in dropsy or tumor

l. aspera. A longitudinal ridge on post surface of middle third of the femur

l. costoclavicularis. A line bet the sternoclavicular articulation and point of the 11th rib

l. n'gra. Black line or discoloration of the abdomen seen in pregnant women during latter part of term It runs from above the umbilicus to the pubes

l. splendens. A thickening of the pia mater extending along ant median surface of the spinal cord It ensheaths the ant spinal artery

l. sternalis. Median line of the sternum.

l. terminalis. BNA Bony ridge on inner surface of ilium continued on to pubis which divides true and false pelvis

l. transversae ossis sacralis. Ridges formed by lines of union of the 5th sacral vertebrae

linear (lin'e-ar) [L. *linea*, line] Pert to, or resembling, a line

l. measure. Measure of length

Linear Measure

12 inches (in)	= 1 foot (ft)
3 feet	= 1 yard (yd)
165 feet	= 1 rod (rd)
320 rods	= 1 mile (mi)
1760 yards	= 1 mile
5280 feet	= 1 mile

lingism (ling'izm) Exercise cure or treatment, esp without the aid of apparatus SYN *kinesiotherapy*.

Ling's cure, L.'s system (ling). Treatment by movements

lingua (ling'gwä) [L. tongue] Tongue, or tongue-like structure

l. fraenata. A tongue with a very short frenum, resulting in tongue-tie

l. nigra. Black tongue, q v

l. pilicata. A fissured tongue

lingual (ling'gwäl) [L. *lingua*, tongue] 1 Pert. to the tongue 2. Tongue-shaped

lingula (lin'gü-lä) [L. little tongue] Tongue-shaped process, esp lingula cerebelli

l. cerebelli. Tongue of cerebellum prolonged forward on upper surface of sup medullary velum.

l. of lung. Projection of lung which separates cardiac notch from inf margin of left lung

l. of mandible. Projection of bone forming medial boundary of mandibular foramen

l. sphenoid. Ridge between the body and ala magna of the sphenoid.

l. Wrisbergi. Connecting fibers of motor and sensory roots of the trifacial nerve.

liniment [L. *linimentum*, smearing substance]. A liquid containing a medicament and oil, alcohol or water for use externally, applied by friction method.

linimentum (lin-im-en'tum) [L. smearing substance]. Liquid preparation for external use and usually applied with rubbing. Four are official

lin'in [L. *linum*, flax]. An achromatic, threadlike substance which forms the nuclear network of a cell, the nucleoplasm is found in its reticulum, in the form of granules.

lin'itis (lin-i'tis) [G. *linon*, web, + -itis, inflammation]. Inflamed condition of gastric cellular tissue

l., plastic. L. with hypertrophy of connective tissue about the stomach

linkage. In genetics, condition in which two or more genes present in the same chromosome tend to remain together and not assort independently in the formation of gametes

l., sex. Condition in which a character is due to a factor located on the X-chromosomes

linseed [AS *linsäed*] SYN *flaxseed*

Seeds of the common flax, *Linum usitatissimum* It is the source of linseed oil Linseed is used as a demulcent and emollient, and sometimes as a laxative

l. poultice. One made from crushed linseed which is heated. Test for heat with hand before applying

l. tea. A soothing demulcent drink for colds. Add 1 tablespoonful of linseed to 1 pint of water The juice of a lemon may be added and sugar. Some use $\frac{1}{2}$ oz of liquorice and $\frac{1}{2}$ oz of candy It is then simmered in a saucepan for half an hour, strained, and served hot

lin't (lint) [L. *linteum*, made of linen]. 1. Linen scraped until soft and woolly for dressing wounds. 2. Cotton fiber.

lintin (lin'tin) [L. *linteum*, made of flax]. Prepared absorbent cotton, fabric used in dressings

liomyofibroma (li-ö-mi-ö-fi-brö'mä) [G. *leios*, smooth, + *mys*, myo-, muscle, + *L fibra*, fiber, + *G öma*, tumor]. Tumor in which lioma, myoma, and fibroma are characterized.

lip [AS *lippa*]. 1. Soft structure around the oral cavity, externally 2. One of the lips of the pudendum (*labium majus* or *minus*). 3. A liplike structure forming border of an opening or groove Diagnostic examination incomplete unless lips are everted to expose buccal surfaces Conditions affecting lip are *Chancre* It is not unusual to have the initial lesion of syphilis appear upon the lip as an indurated base, with a thin secretion, accompanied by enlargement of the submaxillary glands. Innocent extragenital syphilitic infection may take place on the lips *Condyloma latum*. This appears as a mucous patch, flattened, coated with gray exudate, with strictly delimited area, usually at the angle of the mouth. *Ecema* Dry fissures, often covered with a crust, bleeding easily, and occurring on both lips. *Epithelioma* May be confused with chancre Seldom appears before the age of 40, but there are exceptions. It may appear as a common cold sore, a painless fissure or other break of the lower lip. Less than 5% occur on upper lip. A crust or scab covers the lesion, leaving a raw surface if removed. Pain does not appear until well advanced. *Herpes* Appears on the lips in malaria, pneumonia, typhoid, acute coryza, and other febrile diseases. *Tuberculous ulcer*: At

inner portion of lip close to angle of mouth. Pathological examination necessary for verification

RS: *buccal, cheilitis*, "chul-" words, *labia, labium, labrum*.

l., bluish or purplish. May appear in the aged, in those exposed to great cold, and in carbon monoxide poisoning.

l., cleft. Harelip, *q v*

l., dry. May be seen in fevers, or be caused by drugs such as atropine, by thirst, or exhaustion.

l., fissured. May occur after exposure to cold, in certain forms of indigestion, and in children in congenital syphilis. The dribbling of saliva, and a toothless condition may cause fissures in the corners of the mouth

l., glenoid. Thickened fibrocartilaginous structure surmounting margin of acetabulum

l., hare. Harelip, *q r*

l., oral. Upper and lower lips which surround mouth opening, and form ant wall of buccal cavity

l., pale. May be seen in anemia and wasting diseases, in prolonged fever, and after a hemorrhage.

l., rashes. These may be manifestations of typhoid fever, meningitis, or pneumonia. In secondary syphilis, chancre, cancer, and epithelioma, mucous patches may appear

l., reading. Catching meaning of a speaker by watching movements of his lips without hearing his words

l., reflex. Reflex movement of lips when angle of mouth is suddenly and lightly tapped during sleep

l., tympanic. Lower border of the sulcus spiralis internus of the cochlea

l., vestibule. Upper border of the sulcus spiralis internus of the cochlea

lipacidemia (lip-'ā-si-dē'mi-ā) [G. *lipos*, fat, + *L. acidus*, acid, + *G. aima*, blood]. Fatty acid in the blood

lipaciduria (lip-'ā-si-dū'ri-ā) [" + " + *G. ouron*, urine]. Fatty acids in the urine

liparocoele (lip-'ā-ro-sēl) [" + *kēlē*, hernia] 1. Scrotal hernia containing fat 2. A fatty tumor

liparomphalus (lip-'ā-rom-'fā-lū-si) [" + *omphalos*, navel]. Fatty tumor located at, or involving, the umbilical cord

liparous (lip-'ār-ūs) [G. *lipos*, fat] Obese fat

lipase (lī'pās, lī'pās) [G. *lipos*, fat, + *ase*, enzyme]. A lipolytic or fat splitting enzyme found in the blood, pancreatic secretion and tissues. See *enzyme, digestive*

Emulsified fats of cream and egg yolk are changed in the stomach to fatty acids and glycerol by gastric lipase

l., pancreatic. Steapsin, *q v*

lipasuria (līp-'ās-u'ri-ā) [" + " + *G. ouron*, urine]. Lipase in the urine

lipectomy (lī-'pek'to-mī) [" + *ektomē*, excision]. Excision of fatty tissues

lipemia (lī-'pē'mi-ā) [" + *aima*, blood] Fat in the blood

l., retinalis. Condition in which retinal vessels appear reddish white, or white, found in cases of lipemia

lipifanogens (lī-'fān-'ō-jēns) Substances producing visible fat or lipid substances in blood serum, which, when in a free state, are converted by living cells into visible fat

l., anti-. Substance in blood serum which regulates or reduces or prevents deposition of fat in atherosclerosis. It in part may combine with lipifanogens to form a complex not converted into visible fat

lipid(e) (līp'id) [G. *lipos*, fat]. Any one of a group of fats or fatlike substances, characterized by their insolubility in water. Includes (a) *true fats* (esters of fatty acids and glycerol), (b) *lipoids* (phospholipids, cerebrospins, waxes), (c) *sterols* (cholesterol, ergosterol), and (d) *hydrocarbons* (squalene, carotene), also called *lipin*. See *fat*. SYN *lipin, lipid*

lipidosis. Amautotic family idiocy (Tay-Sachs disease)

lipin (līp'in) [G. *lipos*, fat]. See *lipid*

lipiodol (līp-'iō-dōl) [" + " + *L. oleum*, oil]. An iodized oil obtained by fixation of iodine in poppyseed oil

It contains 40% of pure iodine by weight. It is opaque to x-rays and used for radiological diagnosis. It is introduced into cavities by a catheter, into the trachea for outlining the bronchial tree by x-ray, and spinally to locate tumors. It is eliminated completely and does not cause iodism

l., infection. May be cisternal, lumbar, or both depending upon whether the suspected block is near the cisterna magna or below it. Two cubic centimeters are injected into spinal canal. There are 2 forms of lipiodol: *ascending* and *descending*. If tumor is near the cisterna, descending lipiodol is given. Intraspinaly, its position is uncertain or halfway bet. cisterna and lumbar region, both forms are given. If there is a block in the canal, the picture shows a dark mass through which the lipiodol has not passed, and a light streak where the lipiodol is present.

lipo-, lip- [G.]. Combining forms pert to fat

lipoarthritis (līp-'ō-ar-thi-'rītis) [G. *lipos*, fat, + *arthron*, joint, + *-itis*, inflammation]. Inflammation of fatty tissues of joints

lipoblast (līp-'ō-blast) [" + *blastos*, germ]. Immature fat cell

lipoblastoma (līp-'ō-blast-'ō-mā) [" + " + *-ōma*, tumor]. Tumor of fatty tissue. SYN *adipoma, lipoma*.

lipocardiac (līp-'ō-kar'di-'āk) [" + *kardia*, heart] 1. Pert to fatty heart degeneration 2. Sufferer from fatty degeneration of heart.

lipocoele (līp-'ō-sēl) [" + *kēlē*, hernia]. Presence of fatty tissue in a hernial sac. SYN *adipocoele, liparocoele*.

lipocere (līp-'ō-sēr) [" + *L. cera*, wax]. Waxy substance resulting from exposure of fleshy tissue to moisture with the exclusion of air. SYN *adipocere*

lipochondrodystrophy (līp-'ō-kōn-drō-'dīs-'trō-fī) SYN *Hurley's disease*. Congenital abnormality in the skeletal bones and cartilage, with lipodystrophy, kyphosis and other deformity, possible mental deficiency and cloudy cornea

lipochondroma (līp-'ō-kōn-drō-'mā) [G. *lipos*, fat, + *chondros*, cartilage, + *-ōma*, tumor]. Tumor both fatty and cartilaginous

lipochrome (līp-'ō-krōm). Colored substance of fatty nature.

Ex *Carotin*, the fat-soluble yellow pigment found in carrots, sweet potatoes, egg yolk, butter, body fat and corpus luteum. See *carotene*.

lipoclasis (līp-'ōk'lās-'sīs) [" + *klastis*, breaking]. Splitting up of fat. SYN *lipolysis, lipodieresis*.

lipoclastic (līp-'ō-klas'tik) [" + *klastikos*, broken]. Fat splitting. SYN *lipolytic*.

lipocyte (līp-'ō-sīt) [" + *kytos*, cell]. Fat cell.

lipodieresis (līp-'ō-dī-er-'ē-sīs) [" + *dia*, apart, + *airein*, to take]. Splitting or destruction of fat. SYN *lipoclasis*.

lipodystrophy (lip-ō-dis'trō-fī) [" + *dys*, bad, + *trophē*, nourishment]. Disturbance or defectiveness of fat metabolism.

1. **insulin**. Atrophy of subcutaneous fat at site of injection of insulin.

2. **intestinal**. Disease characterized principally by fat deposits in intestinal and mesenteric lymphatic tissue and by fatty diarrhea, loss of weight and strength, and arthritis.

lipoforous (lip-ōf'ēr-ūs) [" + *pherein*, to carry] Causing or carrying fat.

lipofibroma (lip-ō-fī-brō'mā) [G. *lipos*, fat, + L. *fibra*, fiber, + G. *-ōma*, tumor] Tumor indicating lipoma and fibroma. A fibrolipoma, *q.v.*

lipogenesis (lip-ō-jén'ē-sis) [" + *genesis*, formation] Fat formation.

lipogenetic (lip-ō-jén-ēt'ik) [" + *gennan*, to produce] Fat producing. SYN: *lipogenetic*, *lipogenous*.

lipogenic (lip-ō-jén'ik) [" + *gennan*, to produce] Fat producing. SYN: *lipogenetic*, *lipogenous*.

lipogenous (lip-ō-jén'ūs) [" + *gennan*, to produce] Producing fat. SYN: *lipogenetic*, *lipogenic*.

lipogranuloma (lip-ō-gran-ū-lo'mā) [" + L. *granulum*, granule, + G. *-ōma*, tumor] Inflammation of fatty tissue with granulation and development of oily cysts.

lipoid (lip'oid) [" + *eidos*, form] 1 Substance resembling fats in appearance and solubility, but containing other groups than the glycerol and fatty acids which make up the true fats.

Ex. cholesterol, cephalin and lecithin, *q.v.* SYN: *lipid*.

2. Similar to fat.

lipidemia (lip-oi-dē'mī-ā) [" + " + *aima*, blood] Lipoids in the blood.

lipoidosis (lip-oi-dō'sis) [G. *lipos*, fat, + *eidos*, form, + *-osis*] Condition in which lipids accumulate in excessive quantities in body tissues. SEE *Xanthomatosis*.

1. **arterial**. Arteriosclerosis, *q.v.*

2. **cerebroside**. Disease Gaucher's disease. A familial disease characterized by deposition of keratin, a cerebroside, in cells of the reticuloendothelial system.

3. **primary**. L of unknown etiology in which (a) serum lipids are abnormal in quantity or in quality, or (b) serum lipids are normal but lipids accumulate intracellularly.

lipoiduria (lip-oi-dū'ri-ā) [G. *lipos*, fat, + *eidos*, like, + *ouron*, urine] Lipoids in the urine.

lipolipoidosis (lip-ō-lip-oi-dō'sis) [" + *lipos*, fat, + *eidos*, form, + *-osis*] Infiltration of fats and lipoids into a tissue.

lipolysis (lip-ol'is-is) [" + *lysis*, dissolution] The decomposition of fat.

lipolytic (lip-ō-lī'tik) [" + *lysis*, dissolution] Having ability to hydrolyze fats.

1. **digestion**. The conversion of neutral fats by hydrolysis into fatty acids and glycerol, fat splitting.

2. **enzyme**. Fat splitting ferment. SYN: *lipase*. SEE *enzymes*.

lipoma (li-po'mā) [" + *-ōma*, tumor] A fatty tumor. SEE *chondrolipoma*.

They are frequently multiple, but not metastatic.

1. **arborescens**. Excrescence of fatty tissue within a tendon sheath.

2. **colloides**. A myxolipoma.

3. **cystic**. One containing cysts.

4. **diffuse**. One not definitely circumscribed.

5. **diffusum renis**. Condition in which fat displaces parenchyma of the kidney.

6. **durum**. One in which there is marked hypertrophy of the fibrous stroma and capsule.

7. **hernial**. A lipoceole.

8. **myxomatodes**. A lipomyxoma.

9. **nasal**. A fibrous growth of the subcutaneous tissue of the nostrils.

10. **osseous**. One in which the connective tissue has undergone calcareous degeneration.

11. **telangiectodes**. A rare form containing a large number of blood vessels.

lipomatosis (lip-ō-mā-to'sis) [G. *lipos*, fat, + *-ōma*, tumor, + *-ōsis*, intensive] Excessive deposit of fat in the tissues. SYN: *liposis*, *obesity*.

1. **renis**. Fatty infiltration of renal parenchyma. SYN: *lipoma diffusum renis*.

lipomatous (lip-ō-mā-tūs) [" + *-ōma*, tumor] 1. Of the nature of lipoma. 2. Affected with lipoma.

lipometabolic (lip-ō-met-ā-bol'ik) [" + *metabolē*, change] Rel. to metabolism of fat.

lipometabolism (lip-ō-mē-tab'ol-izm) [" + " + *ismos*, state of] Fat metabolism.

lipomyoma. A myoma containing fatty tissue.

lipomyxoma (lip-ō-miks-ō'mā) [" + *myxa*, mucus, + *-ōma*, tumor] Tumor indicating lipoma and myxoma.

lipopectic (lip-ō-pek'tik) [" + *pēxis*, fixation] Characterized by lipopexia.

lipopexia (lip-ō-pek'sī-ā) [" + *pēxis*, fixation] Accumulation of fat in the body. SYN: *adipopezia*.

lipophagy (lip-ō-fāj) [" + *phagein*, to eat] Cell absorbing fat.

lipophagic (lip-ō-fā'jik) [" + *phagein*, to eat] Consuming, destroying, or absorbing fat. SYN: *lipolytic*.

lipophil (lip-ō-fil) [G. *lipos*, fat, + *philēin*, to love] 1 Having an affinity for fat. 2 Absorbing fat.

lipophrenia (lip-ō-frē'nī-ā) [" + *phrēn*, mind] Mental failure or collapse.

lipoprotein. A conjugated protein consisting of a simple protein combined with a lipid.

liposarcoma (lip-ō-sar-kō'mā) [" + *sarx*, flesh, + *-ōma*, tumor] Sarcoma with fatty elements.

liposis [" + *-ōsis*, intensive] Accumulation of fat in a part.

lipostomy. Congenital absence or extreme smallness of the mouth.

lipothymia (li-po-thī'mī-ā) [G. *leipein*, to leave, + *thymos*, mind] Faintness; syncope.

lipotropic (lip-ō-trōp'ik) [G. *lipos*, fat, + *trope*, a turning] Having an affinity for lipids, said of certain dyes such as Sudan III which stains fat readily.

lipoxeny (lip-oks'ē-nī) [G. *leipein*, to leave, + *zenos*, host] Desertion of host by parasitic organism after completion of its development.

lipuria (li-pu'ri-ā) [G. *lipos*, fat, + *ouron*, urine] Fat in the urine.

liquefacient (lik-we-fa'shent) [L. *liquere*, to flow, + *facere*, to make] 1 Agent which produces a conversion into liquid. 2 Converting into liquid.

liquefaction (lik-we-fak'shun) [L. *liquere*, to flow, + *facere*, to make] 1 The conversion of a solid into a liquid. 2 Conversion of solid tissues to a fluid or semifluid state.

liquefcent (lik-we'shent) [L. *liquecere*, to become liquid] Becoming liquid. SYN: *deliquescent*.

liqueur (li-ker') [Fr.]. Alcoholic spirit.

Aromatically flavored, often colored, and sweetened. A cordial.
liquid (lĭk'wĭd) [L. *liquidus*, flowing] 1. Flowing easily. 2. Substance which flows without being melted. See *emulsion*, *liquefacent*, *liquefaction*.
l. air therapy. Therapeutic application of low temperatures. See *refrigeration*.
l. measure. Measure of liquid capacity.

Liquid Measure

4 gills (gi.)	= 1 pint (pt.)
2 pints	= 1 quart (qt.)
4 quarts	= 1 gallon (gal.)
63 gallons	= 1 hogshead
2 hogsheads	= 1 pipe
2 pipes	= 1 tun

liquid diet. Coffee with hot milk, tea, water, albumin water, milk in all forms, milk and cream mixtures, cocoa, cream soups strained, fruit juices, meat juices, beef tea, clear broths, gruels, meat soups strained, eggnogs. See *fluid diet*.

l. d., full. Restricted liquid diet plus gruels, strained fruit juice, tomato juice, strained cream soups, milk and cream beverages, albumins, plain gelatin, custard, plain ice cream, junket, coffee, tea.

l. d., high caloric. Full liquid diet reinforced with lactose, glucose, dextrimaltose, ice cream, ices, coffee, tea, etc.

l. d., or fluid, without milk. Cereal water, strained fruit and strained vegetable juices, albumins, plain gelatin, water ices, ginger ale, clear fat-free broth, beef juice, coffee, tea, etc.

l. d., restricted. Fat-free broth, tea (no cream), ginger ale, bland fruit juice, such as pear, white cherry, or peach juice.

l. d., surgical. Strained fruit juices, ginger ale, fat-free broth, strained cream soup, milk and cream beverages, albuminized fruit juices, tea, coffee, gelatin beverage if ordered.

liquor (lĭk'ər) [L. a liquid] 1. Any liquid or fluid. 2. An alcoholic beverage. 3. **PHARM**. Solution of medicinal substance in water.

l. amnii. The amniotic fluid, a clear, watery fluid which surrounds the fetus in the amniotic sac.

l. folliculi. The fluid contained in the graafian follicle.

l. puris. Liquid portion of pus.

l. sanguinis. Blood serum or plasma.

l. solutions. Aqueous solutions of nonvolatile substances presenting the greatest variety in strength, character, and method of preparation. They are usually very active medicinal preparations. There are 21 official solutions.

lisencephalous. Condition in which the brain is smooth owing to failure of development of cerebral gyri.

lisp (lĭsp'ing) [A.S. *lǣsp*, stammering or lisp]. Substitution of sounds due to defect in speech, as of *th* sound for *s* and *z*.

lisotrichy (lĭs-sot'ri-kĭ) [G. *lissos*, smooth, + *thrix*, *trich-*, hair]. Condition of having straight hair.

liter (lĕ'tər) [Fr. *litre*, from G. *litra*, a pound]. Metric fluid measure; 1000 cc., 270 fl. drams, 61 cu. in., 33.8 fl. oz., 1.056 qt. The volume occupied by one kilogram of water at 4° C. and 760 mm pressure. See: *metric system*.

lithagogue (lĭth-ā-gōg) [G. *lithos*, stone, + *agōgos*, leading]. 1. Agent which expels calculi. 2. Expelling calculi.

lithectasy (lĭth-ek'ta-sĭ) [' + *ektasis*, dilatation]. Removal of a stone from bladder by dilation of the urethra.

lithemia (lĭth-e-mĭ-ā) [' + *aima*, blood]. Excess of lithic or uric acid in the blood due to imperfect metabolism of the nitrogenous substances. **SYN** *uricemia*. See *oxypathy*.

lithiasis (lĭth-i-āsĭs) [G. *lithos*, stone]. 1. Formation of calculi and concretions. 2. Uric acid diathesis.

l. billaris. Gallstones.

l. nephritica. Stone formation in the kidneys. **SYN** *nephrolithiasis*.

l. renalis. Kidney stones.

lithic acid (lĭth'ik) [G. *lithos*, stone]. Acid found in urine. **SYN** *uric acid*.

lithicosis. Stone-cutters silicosis, pneumoconiosis.

litho-, lith- [G.]. Prefixes. Pert to stone or calculus.

lithococcosis (lĭth-ō-sĕn-ō'sĭs) [G. *lithos*, stone, + *leno's*, evacuation]. Removal of crushed fragments of calculi. **SYN** *litholapaxy*, *lithotripsy*.

lithoclast (lĭth-ō-klāst) [' + *klan*, to crush]. Foreman for breaking up large calculi. **SYN** *lithotripsy*.

lithoclasty (lĭth-ō-klās-tĭ) [' + *klan*, to crush]. The crushing of a stone into fragments that it may pass through natural channels.

lithoclysis (lĭth-ō-klĭs-mā) [' + *klysis*, a (clyster). Injection of calculary solvents into urinary bladder.

lithocystotomy (lĭth-ō-sĭs-tof-ō-mĭ) [G. *lithos*, stone, + *kystis*, bladder, + *tomē*, incision]. Incision of bladder to remove calculus.

lithodialysis (lĭth-ō-dĭ-al'i-sĭs) [' + *dialysis*, a breaking up]. Fragmentation or solution of calculi. **SYN** *litholysis*.

lithogenesis (lĭth-ō-jen-ē-sĭs) [' + *genesis*, formation]. Formation of concretions.

lithokonion (lĭth-ō-kōn'ĭ-on) [' + *konian*, to pulverize]. Instrument for pulverizing vesical calculi.

litholapaxy (lĭth-ō-l'apaks-l) [' + *lapaxis*, removal]. The operation of crushing a stone in the bladder followed by immediate washing out of the crushed fragments through a catheter.

lithology (lĭth-ō-l'jĭ) [' + *logos*, science]. The science dealing with calculi.

litholysis (lĭth-ō-l'i-sĭs) [' + *lysis*, dissolution]. Dissolving of calculi. **SYN** *lithodialysis*.

lithometer (lĭth-om-ē-tēr) [' + *metron*, measure]. Instrument for estimating size of calculi.

lithometra (lĭth-ō-me'trā) [' + *mētra*, uterus]. Uterine tissue ossification.

lithomyi (lĭth-ō-mĭ) [G. *lithos*, stone, + *mylē*, mill]. Instrument for crushing a vesical stone. **SYN** *lithokonion*.

lithonephrotomy (lĭth-ō-nē-frot-ō-mĭ) [' + *nephros*, kidney, + *tomē*, excision]. Incision of kidney for removal of renal calculus.

lithontriplic (lĭth-ōn-trĭp'lĭk) [' + *tribein*, to crush]. An agent that tends to dissolve calculi.

Ex *Lithium citrate*, *potassium citrate*, and *ammonium benzoate*.

lithopedion (lĭth-ō-pe'dĭ-ōn) [' + *paidion*, child]. A fetus which has died and become calcified.

lithophone (lĭth-ō-fōn) [' + *phōne*, sound]. Instrument for determining by sound the presence of calculi in the bladder.

lithoscope (lĭth-ō-skōp) [' + *skopein*, to examine]. Instrument for examining stone in bladder.

lithotome (lith-o-tōm) [l' + *tomē*, incision] Instrument for performing lithotomy.

lithotomy (lith-ot'o-mī) [l' + *tomē*, incision] Incision into bladder for removing a stone

NP See that retention catheter is kept draining at all times Watch intake and output of urine

l., bilateral. Incision across perineum.

l., high. Suprapubic incision

l., lateral. Front of rectum to one side of raphe

l., median. In median line in front of anus

l., position. Upon the back with thighs flexed upon abdomen and legs upon thighs, which are abducted SYN: *dorsosacral.*

l., rectal. Through the rectum

l., vaginal. Through vaginal wall

lithotomy (lith-ot'o-nī) [l' + *tonos*, a stretching] Removal of a calculus through small incision instrumentally dilated

lithotresis (lith-ō-trēs'is) [G *lithos*, stone, + *trēsis*, boring] Drilling or boring of holes in a calculus to facilitate crushing

lithotripsy (lith-ō-trīp-sī) [l' + *tripsis*, a rubbing] Crushing of a calculus in bladder or urethra

lithotriptic (lith-o-trīp'tik) [l' + *tripsis*, a rubbing] 1 An agent that dissolves calculi 2 Pert to lithotripsy SYN *lithotriptic.*

lithotrite (lith-o-trīt) [l' + *L tritus*, a rubbing] Instrument for crushing stone in the bladder SEE *lithotripsy.*

lithotrity (lith-ot'ri-tī) [l' + *L tritus*, a rubbing] Crushing of a stone to small fragments in the bladder SEE *lithotripsy.*

lithous (lith'ūs) [G *lithos*, stone] Rel to a calculus or stone SYN *calculus*

lithoxiduria (lith'oks-i-dū'ri-ā) [l' + *oxide* + G *ouron*, urine] Presence of xanthic oxide in the urine.

lithuresis (lith-u-re'sis) [l' + *ouressis*, urination] Passage of calculus through the urethra during urination.

lithureteria (lith'ū-re-tē'ri-ā) [l' + *ourētēr*, ureter] Disease of the ureter due to presence of calculi

lithuria (lith-u'ri-ā) [l' + *ouron*, urine] Excess of uric acid and urates in the urine

litmus (lit'mus) [ON *litr*, lichen dye, + *mosi*, moss] A blue dyestuff made by

fermenting certain coarsely powdered lichens.

l., paper. Chemically prepared blue paper which is turned red by acids, and remains blue in alkali solutions, used as test for acid in urine SEE *indicator.*

litter (lit'ter) [Fr *litère*, from *lit*, a bed] A stretcher for carrying the wounded or the sick

Little's disease (lit'tls) Congenital spastic paralysis on both sides (diplegia), although it may be *paraplegic* or *hemiplegic* in form Cerebral spastic paralysis

Etiol. Possible birth injury

SYM Child dribbles, is feeble-minded, possibly an idiot Stiff, awkward movements, legs crossed and pressed together, arm adducted, forearm flexed, hand pronated, scissors gait

livedo (liv-é-dō) [L. a dark spot] Patchy or general dark discoloration of the skin SYN *lividity.*

liver (liv'er) [AS *lifer*] Large gland in the body, 30x15x8 cm., 1500 to 1800 Gm in wt., situated on right side beneath the diaphragm; right hypochondriac, epigastric, and part of left hypochondriac regions, level with bottom of sternum, undersurface, concave, covers stomach, duodenum, hepatic flexure of colon, right kidney and suprarenal capsule, secretes bile and aids metabolism

The liver, the largest organ of the body, is completely covered by a tough fibrous sheath, Glisson's capsule, which is thickest at the transverse fissure At this point, the capsule carries the blood vessels and hepatic duct which enter the organ at the hilus Strands of connective tissue originating from the capsule enter the liver parenchyma and form the supporting network of the organ and separate the functional units of the liver, the hepatic lobules.

The many intrahepatic bile passages converge and anastomose, finally leading into the hepatic duct, the excretory channel of the liver This structure receives the cystic duct on the end of which is situated the gallbladder The union of the cystic and the hepatic ducts forms the common bile duct or the ductus choledochus, which enters the duodenum at the papilla of Vater A ring of smooth muscle at the terminal portion of the choledochus, the sphincter of Oddi, permits the passage of bile into the duodenum by relaxing Briefly

LITHOTOMY OR DORSOSACRAL POSITION.

stated, the bile leaving the liver enters the gallbladder where it undergoes concentration principally through loss of fluids by absorption by the gallbladder mucosa. When bile is needed in the small intestine for digestive purposes, the gallbladder contracts and the sphincter relaxes, thus permitting escape of the viscid gallbladder bile. Ordinarily, the sphincter of Oddi is contracted, shutting off the duodenal entrance and forcing the bile to enter the gallbladder after leaving the liver.

Within the sinusoids of the liver and attached to their walls are found the cells of Kupffer, which are highly phagocytic. They remove cellular detritus, bacteria, and other foreign particulate substances from the blood stream.

Has 5 lobes, 5 ligaments, 5 fissures, 5 sets of vessels, secretes 600 to 1200 cc. of bile in 24 hours

BLOOD SUPPLY From the hepatic artery, a branch of the celiac art and the hepatic portal vein, which drains the intestine

FUNCTIONS The liver receives blood from the portal vein and thus is the first organ to receive blood from the intestines where the blood has absorbed the final products of digestion and decomposition products. From this blood the liver removes glucose from which it synthesizes glycogen which it stores. It deaminizes amino acids with the resultant formation of ammonia which is converted into urea. Hippuric acid and uric acid are synthesized in the liver and it is thought that amino-acid synthesis may occur. The liver acts to detoxify such substances as indole and skatole which may be absorbed into the blood from the intestine.

The liver excretes bile pigments, *bilirubin* and *biliverdin*, formed in the cells of the reticuloendothelial system in various parts of the body from hemoglobin derived from effete red corpuscles. The liver synthesizes *fibrinogen* and *prothrombin*, blood constituents essential for clotting. It is the source of *heparin*, and anticoagulant. It is the source of red blood cells in the fetus and is the main site for the pro-

duction of plasma proteins. It produces a *vasodepressor material* (VDM), a factor in shock. Reticuloendothelial cells (Kupffer cells), present in the linings of the sinusoids, act to filter out and destroy bacteria present in the blood stream.

The liver also performs these additional functions. It is a storage place for vitamins A, D, K, and B, and is concerned with the formation of vitamin A from carotene. It also stores the *antianemic* or *hematinic factor* (erythroblastic-maturation factor) essential for the development of red blood cells. It plays a role in the regulation of blood volume and is one of the main sources of body heat.

NERVE SUPPLY Parasympathetic fibers from the vagi and sympathetic fibers from celiac plexus via hepatic artery.

DISEASES OF

1., abscess of. Temperature up in evening, low in morning, sweats and chills, liver enlarged, painful, tender, may be bulging and fluctuation. Pus may be detected by aspirating needle.

ETIOI. Pathogenic bacteria, esp pyogenic organisms such as *Streptococcus*, *Staphylococcus*, and *Pneumococcus*, traumatism, infection by *Entamoeba histolytica*.

PROG. Embolic (multiple) abscesses generally fatal. Traumatic abscesses, or those due to an anebic dysentery may terminate favorably after spontaneous or induced evacuation.

1., acute yellow atrophy of. A rare and grave disease, characterized anatomically by a rapid destruction of the liver tissues, and manifested by jaundice and hemorrhages, a reduction in size of liver and marked cerebral phenomena. **SYM:** (1) Malaria, slight fever, coated tongue, nausea, vomiting and jaundice. (2) Nervous symptoms follow, as severe headache, delirium, convulsions and coma, these sometimes precede the jaundice. (3) Urine is scanty, contains albumin, blood, tube casts and crystals of leucine and tyrosine. (4) Hemorrhages are common, the skin may be covered with ecchymoses and bleeding from the mucous membranes may occur. (5) Hepatic dullness diminished, splenic, increased. **PROG:** Generally fatal. **TREATMENT** Constitutional and palliative. Hot applications. Single abscesses, invoke surgical aid.

1., amyloid. An enlargement of liver, due to the deposition of an albuminoid substance. **SYM:** Failure of general health with anemia. Liver is enlarged, smooth, firm and painless. Spleen and kidneys share in the degeneration so the spleen enlarged and urine albuminous. **PROG:** Unfavorable. **TREATMENT** Remedies must be directed to the causal disease, usually prolonged suppuration, syphilis, tuberculosis or chronic malaria. Nutrition or tonics indicated.

1., cancer of. Male sex, heredity and traumatism predisposing factors. **SYM:** (1) Severe pain and tenderness; (2) cachexia, i. e., loss of flesh and strength with pallor; (3) pressure symptoms, jaundice common, but ascites rare; (4) liver enlarged, surface is nodular and

INFERIOR SURFACE OF LIVER

1. Left lobe. 2. Right lobe. 3. Quadrate lobe. 4. Round ligament. 5. Caudate lobe. 6. Hepatic artery. 7. Portal vein. 8. Fossa for ductus venosus. 9. Gallbladder. 10. Cystic duct. 11. Hepatic duct. 12. Fossa for vena cava. 13. Vena cava. 14. Right inferior phrenic vein. 15. Hepatic vein. 16. Right renal vein. 17. Left renal vein.

the central depression or umbilications can often be detected; (5) symptoms of the primary growth which is usually in the stomach. Fever generally absent, but secondary perihepatitis or suppuration of cancerous nodules may reduce it. **Proc.** Fatal, duration from few months to year. **Treatment.** Palliative, constitutional in first stage.

1. cirrhosis of, atrophic. A chronic disease characterized anatomically by a hyperplasia of the connective tissue and destruction of the secreting cells shown chiefly by symptoms of portal obstruction. In advanced stage, liver small, firm, gray color and covered with numerous granulations ("hobnails") **Sym.** Coated tongue, anorexia, fullness and distress after eating, vomiting of frothy mucus, flatulence, constipation and dark urine. As obstruction becomes greater, portal blood finds new channels, and the superficial abdominal veins enlarge, notably about the umbilicus, forming the so-called "caput medusae", hemorrhoids result from the same cause. **Proc.** Unfavorable except in first stages.

1. c. of, hypertrophic. In which the connective tissue hyperplasia starts from the periphery of the capillary bile ducts instead of from ramifications of portal vein as in atrophic form. **Sym.** Jaundice, marked, liver large, yellow and surface smooth or finely granular, spleen swollen. Disease may last 1 or 2 years, but abrupt termination may occur at any time in convulsions and coma. **Treatment.** Constitutional.

1. cysts of. May be (a) simple cysts, usually small and single, (b) hydatid cysts (*Ser. hydatid*, *Echinococcus granulosus*), or (c) cysts associated with cystic disease of the liver, a rare condition usually associated with congenital cystic kidneys.

1. fatty. Infiltration of the liver with fat. Is one of two types *infiltrative* or *degenerative*. The infiltrative type may result from general obesity in which fat accumulates in the liver in common with other parts, impairment in oxidative powers of the body as in anemia or pulmonary tuberculosis, or from infections. The degenerative type may result from poisoning as from phosphorus, arsenic, or alcohol, nutritional disturbances, esp lack of vitamin B, or lack of lipotropic substances.

1. hobnail. That of atrophic cirrhosis, *q.v.*

1. hyperemia of, active. Liver enlarged and filled with blood. Commonly due to dietetic indiscretions (biliousness), may result from overindulgence in alcohol—hot climates. **Sym.** Coated tongue, fetid breath, anorexia, pain and tenderness in epigastric and hypogastric regions, nausea, vomiting, sick headache and sometimes slight jaundice, liver may be enlarged.

1. inflammation of. **Sym.** (1) Symptoms of gastroduodenal catarrh usually precede, i. e., coated tongue, anorexia, fetid breath, epigastric distress, vomiting and perhaps diarrhea; (2) obstructive jaundice indicated by yellow skin and conjunctivae, light stools and dark urine; (3) in acute cases slight fever and swelling of the liver, which is tender to touch. **Proc.** Favorable; duration, few days to several weeks. **Treatment.** Rest, liquid diet, constitutional remedies. **Syn:** *hepatitis*.

1. nutmeg. That of amyloid and heart disease, and fatty infiltrations. It has

a peculiar mottled appearance and dilatation of capillaries.

1. waxy. Amyloid liver, *q.v.*

liver, words pert. to: anhepatia; anhepatic, anhepatogenic, anticholagogue, arginase, azorubin S, bile, -acids, -calculi, -colic, -pigments; "bili-" words, capsule, Gilsen's, cardiohepatic, chloasma; chloresis, cirrhosis, facies hepatica; flexure, "glyco-" words, "hepa-" words, jaundice, perihepatitis.

liv'er (as food). **Calves:** Contains 1 to 16% glycogen, lecithin and phosphorus, fats and nuclein.

Av. Searing 115 Gm. **Pro.** 27.6, **Fat** 9.8 **VITAMINS** A++ to +++, B+++, C++, D+ to ++, G+++.

The liver stores more Vit. A and G than other parts of the animal, 10 times more of Vit. G, and 200 to 400 times more of Vit. A, depending upon the animal's food.

Liver may be assumed to contain about 15 mg. of iron for every 100 Gm. of protein, and 4.1 mg. of copper per kilo of fresh calf liver.

Action. Liver supplies some protective substance necessary for the stroma of red cells but not for the formation of hemoglobin. It does not affect gastric secretion.

IND In anemias (½ lb or more per day) and diseases of the bone marrow, neurasthenia, and phthysical persons. Recommended for adolescents and convalescents. Easily digested. One hundred and forty degrees Fahrenheit coagulates the albumin and destroys its useful ferments.

liver extract. *Syn extractum hepatis* A dry, brown powder obtained from mammalian livers which contains the hematinic factor (antianemic factor) which stimulates erythropoiesis. Used in treatment of pernicious anemia.

liver fluke, human. *Clonorchis sinensis*, common in Far East. Adults infest biliary and pancreatic ducts. Eggs pass out with feces and continue development in snails of the subfamily *Bulininae* (Family *Hydrobiidae*). Cercariae emerge and infest numerous species of freshwater fishes in which they encyst. Infestation results from eating raw fish containing encysted metacercariae.

liver spots. Yellowish-brown spots on skin following some digestive disturbances. **Syn** *Chloasma hepaticum*.

livid (liv'ld) [L. *lividus*, dark in color].

1. Ashen, cyanotic. 2. Discolored. **lividity** (liv-id'i-ti) [L. *lividus*, dark in color]. 1. Skin discoloration, as from a bruise or venous congestion. 2. State of being livid.

Livierato's reflex (liv-yär-ä'tō). Reduction of area of cardiac dullness resulting from manual friction of precordial and epigastric areas.

livor (liv'vor) [L. a dark spot]. 1. Lividity, *q.v.* 2. Cutaneous dark spot on dependent portion of a cadaver.

lixivation (liks'iv-fä-shün) [L. *lixivia*, lye]. Separation of soluble from insoluble substances by washing and filtration.

Loa loa (lō'ā lō'ā). The African eye-worm, a species of filarial worm which infests the subcutaneous tissues and conjunctiva of man. Its migration causes itching and a creeping sensation. Sometimes causes itchy edematous swellings known as "Calabar swellings". It is transmitted by certain species of *Chrysops*.

lobar (lô'bar) [G. *lobos*, lobe]. Pert. to a lobe

l. pneumonia. Inflammation of 1 or more lobes of the lungs. **Syn** *pneumonia, lobar.*

lobate (lô'bât) [L. *lobatus*, lobed]. 1. Pert to a lobe 2. Having a deeply undulated border. 3. Producing lobes.

lobe (lôb) [G. *lobos*]. A globular part of an organ separated by boundaries.

l., anterior, of hypophysis. Ant portion of the hypophysis or pituitary gland, consisting of the pars distalis, and pars tuberalis

l., caudate. The spigelian lobe, a lobe on post surface of liver

l., central. Island of Reil, which forms floor of lateral cerebral fossa

l.'s of the cerebrum. Frontal, parietal, occipital, and temporal lobes and the insula or island of Reil (central lobe)

l. of the ear. Lower portion of auricle having no cartilage.

l., flocculonodular. A lobe of the cerebellum consisting of the flocculi, nodulus and their connecting peduncles

l., frontal. That part of a cerebral hemisphere in front of central and sylvian fissures.

l., Home's. Pedunculated median lobe of prostate gland, frequently hypertrophied in old age

l., insular. **SEE** central l.

l.'s, lateral, of the prostate. The portions on each side of the urethra.

l.'s, lateral, of thyroid gland. The 2 main portions, 1 on each side of trachea, united below by thyroid isthmus

l., limbic. Marginal section of cerebral hemisphere on medial aspect **Syn** *gyrus fornicatus*

l. of the lungs. Large divisions of the lungs **sup** and **inf** lobes of the left lung, **sup**, **mid**, and **inf** lobes of the right lung

l. of the mamma. The 15-20 divisions of the glandular tissue separated by connective tissue and each possessing a duct (lobar duct) opening on the nipple

l., occipital. Caudal region of either hemiserebrum.

l., olfactory. A series of convolutions below horizontal portion of the intraparietal fissure of cerebrum, containing olfactory bulb The rhinencephalon, **q**

l.'s, orbital. The convolutions above the orbit

l.'s of the pancreas. Roundish aggregations of glandular tissue separated by connective tissue

l., parietal. Upper and lateral portion of hemisphere of cerebrum.

l. of the parotid, accessory. A small lobe, variable in size, on ant surface of parotid gland superior to exit of parotid duct

l., posterior, of hypophysis. The posterior portion of the pituitary gland, consisting of the *pars intermedia* and the *processus infundibuli* (*pars nervosa*)

l.'s of the prostate. The lateral l.'s and the middle l. of the gland

l., pyramidal, of thyroid. A portion of the thyroid gland extending upward from the isthmus. It is extremely variable in size.

l., quadrate, of liver. An oblong elevation on lower surface of liver.

l., spigelian. **Syn:** *caudate lobe.* Irregular quadrangular portion of liver behind fissure for portal vein and bet.

fissures for vena cava and ductus venosus

l., temporal. The portion of cerebral hemisphere lying below lateral fissure of Sylvius It is continuous posteriorly with the occipital lobe.

lobectomy (lô-bêk'tô-mî) [G. *lobos*, lobe, + *ektomê*, excision]. Surgical removal of a lobe of any organ or gland.

lobotomy (lôb-ô'tô-mî). A bilateral small trephination in the plane of the coronal suture through which the white matter of the brain is sectioned, disconnecting the diencephalon, esp the hypothalamic area from the prefrontal cortex by section of the white fiber connecting pathways subcortically in a plane that passes adjacent to ant tip of lateral ventricle and post margin of sphenoid wing for relief of mental disturbances

lob'ular [G *lobulus*, small lobe] Composed of small lobes

lobulate, lobulated (lôb'û-lât, -lât-ed) [L *lobulus*, small lobe]. 1. Consisting of lobes or lobules 2 Pert. to lobes or lobules 3 Resembling lobes **Syn** *lobular.* [small lobe]

lobule (lôb'ûl) [L. *lobulus*, small lobe] A

l., central, of the cerebellum. A small lobe at ant part of sup vermiform process

l. of the epididymis. Conelike divisions of the head of the epididymis formed by the much coiled distal ends of the efferent ducts of the testis

l. of kidney. Subdivision of a renal cortex consisting of a medullary ray and surrounding glandular tissue

l. of the liver. Structural unit consisting of hepatic cells arranged in irregular, branching and interconnected groups and anastomosing blood channels (sinusoids) surrounding a central vein Polyhedral in shape with branches of portal vein, hepatic artery, and interlobular bile ducts at its periphery

l. of the lung. Physiological unit of the lung consisting of a respiratory bronchiole and its branches (alveolar ducts, alveolar sacs, and alveoli)

l., paracentral. Sup convolution of ascending frontal and parietal convolutions forming a union of both **[lobule.**

l., parietal. One of two subdivisions of the parietal lobe. The *sup parietal lobule* comprises posterior part of the upper portion, the *inf parietal lobule* comprises a lateral area continuous with temporal and occipital lobes

l. of the testis. One of the pyramidal divisions separated from each other by incomplete partitions called septulae Each consists of one to three much coiled seminiferous tubules

l. of the thymus. Subdivisions of a lobe each consisting of a cortex and medulla

lobulus (lôb'û-lûs) [L.]. A lobule **Syn:** **l. centralis vermis superior.** A small lobe at ant. part of sup. vermiform process

l. epididymidis. Segments into which the epididymis is divided by transverse septa from its tunica albuginea.

l., parietalis. One of 2 portions of the parietal lobe.

l., testicul. Conical lobules, from 250 to 400, which make up glandular structure of the testicle.

lobus (lôb'ûs) [L., from G. *lobos*]. Lobe **l. cerebelli anteriores.** The lobes forming ant. and sup. portion of hemisphere of the cerebellum.

l. pulmonales. Lobes of the lung.
1. reniculi. Lobes in fetal kidney, later forming malpighian pyramids
local (lō'kāl) [L *locus*, place] Limited to one place or part
localization (lō-kāl-i-zā'shun) [L *locus*, place] 1 Limitation to a definite area. 2 Determination of the seat of an infection. 3 Relation of a sensation to its point of origin.
l., cerebral. Determination of centers of various faculties in particular parts of the brain [ited region]
localized (lō-kāl-īzd). Restricted to a limited localizer. Apparatus used for locating solid opaque bodies in the eye by roentgenographic examination
lochia (lō'ki-ā) [G *lochia*, pert to childbirth] The discharge from the uterus of blood, mucus and tissue, during the puerperal period.
Sym The first 6 days it is distinctly blood-tinged and is known as *lochia rubra* or *cruenta* the following 3 or 4 days the discharge becomes brownish and is known as *lochia serosa* after this it becomes yellowish, turning to white and is known as *lochia alba*
It is diminished or suppressed in high fever if offensive it is result of contamination with saprophytic organisms
Position should favor drainage
lochial (lō ki-āl) Pert to the lochia
lochiocolpos (lō ki-ō-kōl'pōs) [G *lochia*, pert to childbirth, + *kolpos*, vagina] Retention of lochia in the vagina
lochiometra (lō'ki-ō-mē'trā) [" + *mētra*, uterus] Retention of lochia in the uterus
lochiometritis (lō'ki-ō-mē-trī'tis) [" + " + *-itis*, inflammation] Puerperal inflammation of the uterus
lochiopyra (lō-ki-op'ir-ā) [" + *pyr*, fever] Puerperal fever
lochiorrhagia (lō-ki-or-ra'jī-ā) [" + *regnum*, to break forth] Excessive flow of lochia
lochiorrhoea (lō'ki-or-rē-ā) [" + *roia*, flow] Abnormal flow of lochia
lochiosthesis (lō-ki-ōs'thē-sis) [" + *sthesi*, retention] Retention or suppression of the lochia
lochometritis (lō'kō-mē-trī'tis) [G *lochos*, childbirth, + *mētra*, uterus, + *-itis*, inflammation] Puerperal inflammation of uterus [See *tetanus*, *trismus*]
lockjaw. Tonic spasm of muscles of jaw
locomotion (lō-kō-mō'shun) [L *locus*, place, + *motus*, moving] Movement of a body from one place to another
locomotor (lō-kō-mō'tor) [" + *motor*, mover] Pert to locomotion
l. ataxia. A sclerosis affecting the post columns of the spinal cord **Syn** *tubes dorsalis* See *ataxia*, *Charcot's arthropathy*.
locular (lōk'ū-lār) [L *loculus*, a small place] Divided into small cavities
located (lōk'ū-lāt-ād) [L *loculus*, a small place] Containing or divided into loculi **Syn** *locular*
loculus (pl *loculi*) [L] 1 A cell. 2 A small cavity
locum tenens [L *locus*, place, + *tener*, to hold]. A substitute Physician who substitutes for another temporarily.
locus [L a place] 1. A spot or place 2 In genetics the position of a gene on a chromosome
l. caeruleus, l. cinereus, l. ferrugineus. A dark-colored depressor in floor of 4th ventricle at its upper part
l. niger. Gray matter separating the crura cerebri. **Syn:** *substantia nigra*.

Loeffer's bacillus (lōf'lēr) **Syn** *Klebs-Loeffer bacillus* The bacillus of diphtheria, *Corynebacterium diphtheriae*
logadectomy. Excision of a portion of the conjunctiva
logaditis (lō-gā-dī'tis) [G *logades*, conjunctivae, + *-itis*, inflammation] Inflammation of the sclerotic coat of the eye. **Syn** *scleritis*
logagnosia (lōg-āg-nō'si-ā) [G *logos*, word, + *a-*, priv + *gnōsis*, knowledge] Word blindness **Syn** *aphasia*.
logagraphia (lōg-ā-grā'fī-ā) [" + " + *graphein*, to write] Loss of ability to express ideas in writing **Syn** *agraphia*.
logamnesia (lōg-ām-nē'zī-ā) [" + *amnesia*, forgetfulness] Aphasia of a sensory character Inability to recognize spoken or written words
logaphasia. Motor aphasia, *q r*
logokoposis. Inability to understand spoken language, word deafness
logomania (lōg-ō-mā'nī-ā) [" + *mania*, madness] Repetitious, continuous and excessive flow of speech seen in monomania
logoneurosis (lōg'ō-nū-rō'sis) [G *logos*, word, + *neuron*, nerve, + *-osis*] Any neurosis marked by speech disorders
logopathia (lōg-ō-pāthī-ā) [" + *pathos*, disorder] Any disorder of speech
logopedia (lōg-ō-pē'dī-ā) [" + *paid*, child] Science dealing with speech defects, and their correction
logoplegia (lōg-ō-plē'jī-ā) [" + *plēgē*, stroke] Paralysis of the speech organs
logorrhoea (lōg-or-ē-ā) [" + *roia*, flow] Unusual loquacity seen in insanity **Syn** *garrulosity*, *logomania*.
logospasm (lōg'ō-spazm) [" + *spasmos*, spasm] Spasmodic word enunciation
-logy [G] Suffix meaning *discourse science or study of*.
loiasis (lō-i-as'is) Infestation with *Loa loa* *q*
loimic (lō'imfk) [G *loimos*, plague] Pert to pestilence or plague
loimology (lōi-mōl'ō-jī) [" + *logos*, science] Science concerned with contagious diseases, esp plague
loin (lōyn) [O Fr *loigne*, long part] Lower part of back and sides bet the ribs and pelvis
lo'ism. Poisoning by the seeds of *Lolium temulentum* (darnel ryegrass)
long [L.] Prefix meaning *long*
longevity (lōn-jēv'itī) [L *longaeus*, aged] 1 Length of life 2 Unusual length of life Age was reckoned by the Romans in six stages: *pueritia*, childhood, to 5 years, *adolescencia*, youth, to 18 years, *iuventus*, young man, to 25 years, *maiores*, man, 25 to 50 years, *senectus* old man, 50 to 60 years, *crepita aetas*, decrepit, 60 years to death
long flame arc lamp. According to distance bet electrodes, carbon arc lamps are either short or long flame
longsightedness (lōng-sī'tēd-nēs) [L *longus*, long, + *AS gesiht*, sight] Farsightedness **Syn** *hyperopia*, *q r*.
Lophotrichia (lō-fō-trīk'ē-ā) [G. *lophos*, tuft, + *thrix*, *trich-*, hair] Microorganisms possessing flagella in tufts
lophotrichous (lō-fō'trīk'ūs) [" + *thrix*, *trich-*, hair] Having bunches of flagella at one end
lordoma (lōr-dō'mā) [G. *lordōma*, a bending]. Forward incurvation of the spine. **Syn** *lordosis*.
lordoscoliosis (lōr'dō-skō-lī-dō'sis) [G. *lordō*, to bend, + *skoliosis*, curvation]. Lordosis and scoliosis combined.
lordosis (lōr-dō'sis) [G. *lordō*, to bend]. Abnormal ant convexity of the spine.

lotion (lō'shun) [L. *lotio*]. Liquid medicinal preparation for local bathing of a part.

loupe (lūp) [Fr.]. A magnifying lens.

louse (lows) [AS *lūs*]. A small wingless insect which lives as an ectoparasite on birds and mammals. Sucking lice belong to the order *Anoplura*; biting or chewing lice belong to the order *Mallophaga*.

Human lice are the primary transmitters of epidemic typhus, trench fever, and relapsing fever. They may also be the mechanical transmitters of other diseases such as plague.

l. body. *Pediculus humanus corporis*. Lives principally in or on clothing.

l. crab. *Phthirus pubis*. Lives principally in hair in pubic region, but also found in beard, eyebrows, and eyelashes.

l. head. *Pediculus humanus capitis*. Lives in hair of the head.

lousiness [AS *lus*]. *SYN* *pediculosis*, *q v*. State of being infested with lice.

Loven's reflex (lō'ven). Vasodilation with corresponding increase in size of organ resulting from stimulation of afferent nerve of organ.

Lowman balance board. Tilted board for walking with feet inverted to restore proper muscle balance and to correct static faults.

low protein diet. Breakfast, 413 calories, lunch, 695, supper, 704. Total daily, 1812. No salt except what is used in cooking, which will equal 3 or 4 Gm per day.

Breakfast. Fruit, cereal with cream and sugar or milk (2 oz.), toast, plenty of butter, jelly or jam, cocoa or milk (1 cup), and 1 egg.

Lunch. Cream soup or 1 cup milk, 1 potato, 1 serving of vegetable, large serving salad with mayonnaise, 1 thin slice bread, liberal amt butter, custard, gelatin, cake, ice cream or blanc mange, 1 serving. One egg may be substituted for cream soup or milk.

Supper. One serving cereal or 1 large serving of potatoes, 3 oz of cream or milk, sugar and butter as desired, large serving salad, fruit and vegetable, 1 cup cocoa, 1 egg or 1 glass milk.

CONTRA. No meat, fish, chicken, meat gravies, soups or broth. Peas and dried beans only 2 or 3 times per week.

loxarthron (lōks-ā'rthron) [G. *loxos*, slanting, + *arthron*, joint]. Oblique deformity of a joint without dislocation.

loxia (lōks-i-ā) [G. *loxia*, slanting]. Wry neck. *SYN* *torticollis*.

loxotic (lōks-ōt'ik) [G. *loxos*, slanting]. Distorted in an awry manner.

loxotomy (lōks-ōt'ō-mī) [“ + *tomē*, a cutting]. Amputation by oblique section.

lozenge (lōz'ēn) [Fr. diamond-shaped]. Small, dry, medicinal solid to be held in mouth until it dissolves. *SYN* *troche*.

LSD. Abbr for *lysergic acid diethylamide*, a derivative of an alkaloid in ergot. It is made from a fungus growing on wet grass and grain and is giving remarkable results in the cure of schizophrenia.

lubb (lūb) [imitative origin]. Word denoting 1st cardiac sound in auscultation. Caused by closure of the atrioventricular valves, the impact of blood rushing into the aorta and pulmonary artery and the contraction of the ventricular muscle. It is pitched low and slightly longer than the 2nd sound. *SEE* *dupp*; *heart, auscultation of*.

lubb-dupp (lūb-dūp) [imitative origin].

The 2 sounds heard in auscultation marking a complete cycle of the heart.

Pause following the cycle is slightly longer than that bet the 2 sounds.

lubricant (lūb'rī-kānt) [L. *lubricans*, making smooth]. Agent which makes smooth.

lubricating enema. One given to soften feces and lubricate anal canal after hemorrhoidectomy, or to soften fecal impaction. *SEE* *enema*.

Lucas-Championniere disease (lū-kā'-shawn-pō-ōn-yair'). Pseudomembranous affection of the bronchi.

L.-C. method. Early massage and mobilization in treating fractures.

lucid (lū'sid) [L. *lucidus*, clear]. Clear, esp applied to clarity of the mind.

l. interval. Period of normal mentality bet psychiatric attacks.

lucidity (lū-sid-i-tī) [L. *lucidus*, clear]. Quality of clearness or brightness, most especially with regard to mental conditions. *SEE* *lucid*.

luciotherapy (lū-kō-ther-ā-pī) [L. *lux*, light, + *G* *therapeia*, treatment]. Therapeutic use of light rays. *SYN* *phototherapy*.

Ludwig's angina (lūd'wig). A suppurative inflammation of subcutaneous connective tissue adjacent to a submaxillary gland. *SEE* *angina*.

Luer's syringe. One made of glass for intravenous and hypodermic use.

lues (lū'ēs) [L. pestilence]. Any pestilential disease, the plague, esp syphilis.

l. venerea. Syphilis.

luetic (lū-et'ik) [L. *lues*, pestilence]. 1. Pert to syphilis. 2. Affected with syphilis. *SYN* *syphilitic*.

luetin (lū-et-in) [L. *lues*, pestilence]. A killed culture of *Treponema pallidum* for the Noguchi skin test for syphilis.

Lugol's caustic (lū'gol). Aqueous solution of 25% each of iodine and potassium iodide.

L's solution. Iodine, 5%; potassium iodide, 10%, and water to make 100 cc. Dosage 3 m (0.2 cc).

INCOMPATIBILITIES. Codeine.

lumbago (lūm-bā'gō) [L. *lumbus*, loin]. Dull, aching pain across loins due to sudden cooling of overheated lumbar muscles, or turning body or rising from sitting posture causes an exacerbation which is sometimes so severe patient cries out.

TREATMENT. Affected muscles should be put at rest. A large piece of adhesive plaster may be applied from the floating ribs to the iliac crests. acupuncture occasionally gives brilliant results—also the continued current. Internal medication.

lumbar (lūm'bār) [L. *lumbus*, loin]. Pert to the loins. *SEE* *lumbago*.

l. nerves. Five pairs, corresponding with the lumbar vertebrae.

l. puncture. One made into the subarachnoid space of the spinal cord bet the 2nd and 5th lumbar vertebrae (or more approximately in the 4th lumbar interspace, the middle of the line connecting the iliac crests).

PURPOSE. For the removal of spinal fluid for diagnostic or other purposes, and for the injection of an anesthetic solution.

Fluid is often removed to reduce intracranial pressure. Medication (dissolved in fluid previously removed) or anesthetics for cord blocking, etc., may be cautiously introduced.

The part is cleaned and painted with iodine. A sterile puncture needle is

then readily passed directly in the midline, to and through the dura. On removing the stylet, spinal fluid will escape and can be collected in 2 or 3 tubes for examination.

NP Patient should be turned on side near edge of bed with back to operator. Thighs flexed on trunk. Nurse holds patient in this position. Articles needed. Sterilized lumbar puncture needles, gloves for physician, iodine, sterilized gauze and sponge, alcohol, 0.5% solution, 5 cc. Two sterile test tubes, colodion, cotton. **See cerebrospinal fluid, cisternal puncture, spinal puncture.**

l. reflex. Irritation of the skin over the erector spinal muscles causing contraction of muscles of the back.

l. region. Each side of umbilical region above the iliac, below the hypochondriac.

l. vertebrae. Five bones of spinal column between sacrum and thoracic vertebrae.

lumbarization (lūm-bār-i-zā'shūn) [L. *lumbus*, loin] Coalescence of the 1st sacral vertebra with the last lumbar vertebra.

lumbo- [L.] Combining form pert. to the loins.

lumbocolostomy (lūm'bō-kō-lost'ō-mī) [L. *lumbus*, loin, + G. *kolon*, colon, + *stoma*, opening] Colostomy by lumbar incision.

lumbocolotomy (lūm-bō-kō-lot'ō-mī) [L. + *tomē*, incision] Incision into the colon through lumbar region.

lumbocostal (lūm-bō-kōst'āl) [L. + *costa*, rib]. Rel. to the loins and ribs.

lumbodynia (lūm-bō-dīn'ī-ā) [L. + G. *odynē*, pain] Pain and rigidity in the loins. **Syn** *lumbago*.

lumbosacral. Pert. to the lumbar vertebrae and the sacrum.

l. plexus. Nerve plexus formed by union of lumbar, sacral, and coccygeal nerves.

lumbrical (lūm'brī-kāl) [L. *lumbricus*, earthworm] Like a worm. **Syn** *vermiform*.

lumbricā'lis [L. *lumbricus*, earthworm] One of the muscles of the hand or foot which are wormlike in shape.

lumen (lū'mēn) (pl. *lumina*) [L. light]. 1. The space within an artery, vein, intestine or tube. 2. Unit of light, the amt. of light emitted in a unit solid angle by a uniform point source of 1 international candle.

luminal (lū'mī-nāl) [L. *lumen*, lumin-, light] Rel. to lumen of tubular structure, such as a blood vessel.

luminal (lū'mīn-āl). A brand of phenobarbital.

DOSAGE 1/2 gr. (0.03 Gm.).

l. sodium. A brand of soluble phenobarbital.

lunacy (lū'nā-sī) [L. *luna*, moon. Insanity was formerly thought to be affected by the moon] Mental derangement. **Syn:** *insanity, psychosis*.

lunar [L. *luna*, moon]. Pert. to the moon, a month, or silver.

l. caustic. Silver nitrate.

lunate. **Syn:** *semilunar bone*. A bone in the proximal row of the carpus.

lunatic (lū'nā-tīk) [L. *luna*, moon]. 1. An insane person. 2. Insane, mad.

lunet, lunette (lū-nēt') [Fr. *lunette*, from L. *luna*, moon]. A concavo-convex lens for spectacles.

lung (lung) [A.S. *lungen*]. **ANAT:** One of 2 cone-shaped, spongy organs of respiration contained within the pleural cavity of the thorax.

Connected with the pharynx through the trachea and larynx. The base rests on diaphragm and apex rises to an inch above the collarbone, supported by its attachment to the hilum or root structures.

Right lung has 3 lobes, left one 2. Weight, 1280 Gm., contains 78,000,000 air cells. Averages 18 respirations per minute in adult. Respiration surface, 870 sq. ft. Capacity, 20 cu. in. of air each respiration, 300 cu. ft. every 24 hours.

The left lung has an indentation for the normal place of the heart, which is called the *cardiac depression*. Behind this is the *hilum* through which the blood vessels and bronchi enter and leave the lung.

Each *primary bronchus*, on entering the lung, divides into smaller bronchi which give rise to smaller *bronchioles* of several orders. These divide into *terminal bronchioles*, each continuing as one or two *respiratory bronchioles* each of which leads to a group of air spaces called *atria* which communicate with *alveolar (air) sacs*, walls of which contain rounded out-pocketings: the *alveoli*. The respiratory bronchiole with its terminal air-sacs together with their blood vessels, lymphatics, and nerves constitutes a *pulmonary lobule*, the unit of lung structure.

ANTERIOR ASPECT OF LUNGS

A. Right lung. B. Left lung. 1. Middle lobe. 2. Oblique fissure. 3. Lower lobe. 4. Upper lobe. 5. Groove for innominate vein. 6. Groove for subclavian artery. 7. Cardiac notch.

NERVE SUPPLY Parasympathetic fibers via vagus nerve and sympathetic fibers from ant and post. pulmonary plexuses.

BLOOD VESSELS Bronchial, pulmonary arteries, and pulmonary veins. Blood passing through lungs gives off carbon dioxide and receives oxygen. The lungs include the lobes, lobules, bronchi, bronchioles, infundibula, and alveoli or air cells. The capacity of the lungs is 230 cu. in.

l. abscess. Circumscribed, suppuration of lung. **Sym:** High and irregular fever, rigors, sweats and pallor. Dyspnea, cough and purulent expectoration. May be bubbling râles and later cavernous breathing and pectoriloquy.

Prog: Fair, except in embolic abscesses.

TREATMENT: Nutritious food. Remedies called for by general condition. Abscess should be opened and drained.

1., collapse of. Atelectasis. Condition resulting from a lowering of intrapulmonic pressure or an increase in intrathoracic pressure. It may be *focal*, involving only a few lobules, or *massive*, in which an entire lobe or the complete lung is involved. It may result from obstruction of the bronchial tubes (*obstructive atelectasis*) or pressure upon the lung by air or fluid in the pleural cavity, an intrathoracic tumor, or a greatly enlarged heart (*compressive atelectasis*). Air may be introduced artificially into the pleural cavity (artificial pneumothorax) or it may be derived from emphysematous lesions. Collapse may occur in the newborn as a result of blockage of bronchioles by mucus or from failure of the lung to distend because of weak inspiratory movements.

SYM. In a sudden collapse, there are pronounced dyspnea and circulatory collapse. When collapse occurs gradually, symptoms are less pronounced or may not occur at all.

PROG. Depends upon extent of collapse and gravity of preexisting disease.

TREATMENT. In congenital form apply alternately hot and cold sponges to spine, keep up external temperature. If these measures fail, gently inflate lung with a catheter. In acquired varieties direct remedies to the original disease. **SEE** auscultation of lungs, chest, emphysema, tuberculosis.

1. congestion, active. This results from increased afflux of blood to the lungs.

SYM. Flushed face, dyspnea, short, dry cough, followed by tenacious, blood-streaked expectoration, full, rapid pulse. Slight dullness, crepitant râles and brouchovesicular breathing.

TREATMENT. Rest, liquid diet, and internal remedies as indicated.

1. c., hypostatic. Congestion of dependent portions of the lungs occurring in asthenic diseases which necessitate a protracted recumbent position.

SYM. Dyspnea, cough, scanty expectoration. Slight dullness, subcrepitant râles, and feeble bronchial breathing.

TREATMENT. Development should be prevented by frequent change in position and timely use of cardiac stimulants. Internal remedies.

1. c., passive. Results from obstruction to the flow of blood from the lungs to the heart.

SYM. Dyspnea, hard cough, mucous expectoration containing pigmented cells and râles. Slight dullness, feeble breathing.

1., edema of. Effusion of serous fluid into air vesicles and into interstitial tissue of lungs.

SYM. Extreme dyspnea; rapid, labored breathing, cough with frothy, blood-stained expectoration, cyanosis, cold extremities.

PROG. Grave. Often a final symptom of some pulmonary disease.

TREATMENT. When much cyanosis is present, hot fomentations should be applied to the chest. Hydragogue cathartics indicated. Cardiac stimulants may be given hypodermically.

1. fluke. *Paragonimus westermani*.

1., gangrene of. A putrefactive necrosis of lung. Secondary condition to some inflammatory disease of the lung. It is excited by the entrance of bacteria of putrefaction—but unless system is considerably reduced in vitality the tissues, even though diseased, show won-

derful resistance and escape putrefaction.

SYM. Are associated with original disease—cough, dyspnea, moderate fever and great prostration generally present. Expectoration is characteristic, is profuse, and has penetrating offensive odor. When allowed to stand in a glass vessel separates into 3 layers. A frothy layer on top, serous in middle, through which hang strings of pus, and at bottom layer of reddish green purulent material.

TREATMENT. Nutritious food. Remedies, inhalations. Surgical interference if strength will permit.

lung-heart disease. Cor pulmonale. A serious respiratory and heart condition caused by pollution of air by soot, gasoline vapor, sulfur dioxide, or unburned droplets of such air. It can cause fatal heart failure. It interferes with flow of blood, especially through the right side of the heart which fails. There are more cases than coronary artery disease and hypertension combined. 4000 deaths resulted in England within a five-week period.

1., hemorrhage from. Hemoptysis.

1. inflammation. Pneumonia.

1., iron. Device for inducing respiration artificially.

Patient is placed in airtight compartment except for his head and neck, and then atmospheric pressure inside is raised and lowered by a pulmotor. **SEE** Drinker respirator.

1. motor. An apparatus designed for forcing air or a mixture of air and oxygen into the lungs.

lung, words pert. to: aeropleura, air, air vesicle, aluminosis, alveobronchitis, alveolar, alveolus, alveolus pulmoneus, anthracosis, anthrax, anthroptoxin, apicitis, artificial pneumothorax, asbestosis, atelectasis, atmiatrics, atmocausis, atrium, auscultation of, "bronch-" words, byssinosis, byssophthisis, calcicosis, cardiopulmonary, chest, emphysema, hilum, pectoriloquy, "pleur-" words, "pneum-" words, pulmonary, râles, siderosis, silicosis, tuberculosis, vesicular resonance, vomica.

lunula (lu'nu-lă) [L. little moon] The semilunar white arch of area near the root of the nail.

1. of valves of heart. **SYN** 1 *valvulae semilunaris*. One of two narrow portions on the free edges of the semilunar valves on each side of the nodulus.

lupiform (lu'pi-form) [L. *lupus*, wolf, + *forma*, shape] Resembling lupus.

lupoma (lu-pō-mă) [L. + G. -ōma, swelling] Nodule of lupus, esp a primary one.

lupous (lu'pūs) [L. *lupus*, wolf]. 1 Pert to lupus. 2 Affected with lupus.

lupus (lū'pūs) [L. wolf]. Tuberculous skin disease, acute or subacute.

ETIOL. Unknown. Circulatory disorders and trauma predispose.

SYM. Reddish-brown, soft patches, circumscribed (discoid) or disseminated with raised edges and depressed centers which are white and scarlike when scales drop off. In disseminated type there may be mucous membrane involvement. Sebaceous glands are dilated and often filled with sebum.

Disease spreads slowly, shows no tendency to ulceration and rarely excites subjective symptoms. Middle life, female sex are predisposing factors.

PROG. Favorable under prolonged treatment.

TREATMENT Hygienic regimen. Locally, soothing lotions, cautiously followed by stimulating agents. Surgical diathermy, curettage, carbon dioxide snow, x-rays, radium.

1., disseminated follicular. L. of face with small and large papules.

1., erythematous disseminated. A chronic and usually fatal disease characterized by pathologic changes in the vascular system, esp. the collagen which serves as a binding substance for capillaries and small blood vessels. A skin rash is usually present, the erythema spreading across bridge of nose and face in a butterfly pattern. Marked constitutional symptoms are manifested. Etiology is unknown. Incidence highest in females between puberty and menopause.

1., hypertrophicus. L. with vegetations.

1., maculosus. L. with maculae.

1., nonexedens. L. without ulcerations.

1., pernic. Sarcoidosis (Boeck's sarcoid).

1., serpiginosus. L. spreading with creeping ulcerations.

1., tu midus. L. with edematous infiltrations.

1., verrucosus. Lesion consisting of an elevated plaque with indolent inflammatory base and a warty papillary surface.

1., vulgaris. Patches on skin which break down and ulcerate, leaving scars on healing. Most common form of lupus.

Lust's reflex (lúst) Dorsal flexion and abduction of foot resulting from percussion of ext. branch of sciatic nerve.

luteal [L. *luteus*, yellow] Pert. to the corpus luteum, its cells, or its hormone.

1., hormone. Progesterone, *q.v.* Secreted by the corpus luteum. SEE *endocrine hormone, ovary, corpus luteum, estrogen*.

lutein (lú-té-in) [L. *luteus*, yellow] 1. Yellow pigment derived from corpus luteum, egg yolk, and fat cells or lipochromes. 2. A proprietary substance prepared from corpora lutea from the ovaries of sows.

1., cells. Ovarian cells which contain a yellow pigment and are involved in the formation of the corpus luteum. They are of two types: *granulosa lutein cells* of follicular origin and *theca lutein cells* from the theca interna.

luteinization (lú-tin-i-zá-shún) Process of development of the corpus within a ruptured graafian follicle.

luteinizing hormone. Hormone secreted by ant. lobe of hypophysis which stimulates development of the corpus luteum. Abbr. LH. Also called *interstitial-cell stimulating hormone* (ICSH).

luteoma (lú-té-ó-má) [L. *luteus*, yellow, + G. -oma tumor] An ovarian tumor containing lutein cells.

luteotrophia (lú-té-ó-tró-fí-á) SYN *prolactin lactogenic hormone*. Hormone of ant. lobe of hypophysis which maintains mature corpora lutea and stimulates secretion of their hormone, progesterone. It also stimulates the secretion of milk by the mammary gland.

luteum (lú-té-úm) [L.]. Yellow.

1., corpus. Yellow cellular mass which forms in position of ruptured graafian follicles in ovary. It persists and enlarges in pregnancy.

lutin (lú-tín). Hormone of corpus luteum which aids in preparation of endometrium for fertilized ovum. SYN: *progestin*.

luxation (lúks-á-shún) [L. *luxare*, to dis-

locate]. Displacement of organs or articular surfaces; dislocation of a joint.

luxus [L. excess] Excess of anything.

Luy's body. SYN *centromedian nucleus*. Small mass of gray matter lying on dorsal surface of peduncle dorsolateral to substantia nigra. *Luy's nucleus* located in the posterior portion of the thalamus.

lycanthropy (lí-kan'thró-pí) [G. *lykos*, wolf, + *anthrōpos*, man]. Mania in which patient believes himself a wild beast, esp. a wolf. SYN: *lycomania*.

lycomania (lí-kó-má-ní-á) [“ + *mania*, madness] Delusion of being a wild animal, esp. a wolf. SYN: *lycanthropy*.

lycopodium (lí-kó-pó'di-úm) A yellow powder formed from spores of *Lycopodium claratum*, a club moss. Used as a dusting powder, and as a desiccant and absorbent.

lye (lí) [AS *leah*] 1. Liquid from leaching of wood ashes. 2. Any strong alkaline solution, esp. sodium or potassium hydroxide. SEE *alkalis*, *NaOH*.

1., burns. Treat with hydrosulfosol* which is safe for use around eyes, nose, and mouth. Spray with h solution every hr first 24 hr.

ly'ing-in. 1. The puerperal state. 2. Being in confinement.

lymph (límf) [L. *lymphā*]. The lymph is a body alkaline fluid found in the lymphatic vessels and the cisterna chyli. Lymph is usually a clear, transparent, colorless fluid, however, in vessels draining the intestines it may appear milky owing to presence of absorbed fats. It differs from blood in that red blood corpuscles are absent and its protein content lower. Osmotic pressure and alkaline reserve are slightly higher than in blood plasma, viscosity, slightly less. Sp. Gr. 1.016-1.023.

Lymph may vary considerably in composition in different parts of the body. In peripheral vessels it is similar to blood plasma except that the protein content is usually much lower. Lymph contains proteins (serum albumin, serum globulin, serum fibrinogen), salts, organic substances (urea, creatinine, neutral fats, glucose), and water. Cells present are principally lymphocytes, formed in lymph nodes and other lymphatic organs. Lymph from the intestine (called chyle) contains fats and other substances absorbed from the intestine.

The lymph is formed in tissue spaces all over the body and is gathered into small vessels which carry it centrally. All lymph eventually enters into either the *thoracic duct* or *right lymph duct* each terminating at the junction of the internal jugular and subclavian veins where the lymph reenters the blood stream. The thoracic duct commences in the abdomen as a dilated sac, the *cisterna (receptaculum) chyli*, which receives lymph vessels from the lower limbs and pelvis and from the intestines and digestive organs. It continues upward through the thorax receiving intercostal vessels and near its termination it receives the *left subclavian trunk*, draining left upper extremity, and the *left jugular trunk*, draining 1 side of head and neck. The rt. lymph duct drains the right sides of the thorax, head, and neck.

Lymph in passing from any region of the body to the main lymph ducts must pass through lymph vessels which pass through regional *lymph nodes*. These filter the lymph, freeing it of foreign particulate matter, esp. bacteria.

The absorption of fatty matter chiefly takes place through the *epithelial cells* of the intestines, and those of the villi. These cells carry it to the lacteals when the particles break up into fat and protein matter.

Absorption is most active in the alimentary canal, the digested material passing into the blood stream through the vessels of the portal circulation and into the lacteals.

l., animal. Vaccine *l* from an animal.

l. cell or corpuscle. A lymphocyte.

l. channel. A lymph sinus, *q v*

l. follicle. Old term for lymph node

l., inflammatory. Exudate due to inflammation.

l., intercellular. Tissue fluid

l. node. A lymph node is a rounded body consisting of accumulations of lymphatic tissue found at intervals in the course of lymphatic vessels. *L* nodes vary in size from a pinhead to an olive; may occur singly or in groups. One side bears an indentation, the *hilum*, from which blood vessels enter and leave and *effluent vessels* leave. *Afferent vessels* enter on side opposite from hilum.

The node is enclosed in a *capsule*, from which *trabeculae* project inwardly, dividing node into compartments called *ampullae* or *alveoli*. Outer compact region comprises the *cortex*, the inner diffuse portion, the medulla. The cortex is tightly packed with *lymph nodules*, which are separated from capsule by the *cortical sinus*. The lymphatic tissue of the medulla is arranged in the form of *medullary cords*. Irregular tortuous spaces, called *lymph sinuses*, are present throughout the node. The nodes are aggregated in regions, the principal ones of which are in the neck (*cervical*), in the armpit (*axillary*), in the groin (*inguinal*). Lymph nodes as well as vessels are divided into *superficial* and *deep* groups. Among the deep groups are those draining lymph from the visceral organs of the thorax and abdomen.

FUNCTIONS Lymph nodes produce lymphocytes and monocytes. They act as filters keeping particulate matter, esp bacteria, from gaining entrance to the blood stream. They may stop cancer cells but in turn may be the seat of cancer.

l. nodule. A small compact, densely staining mass of cells, each containing a lighter staining central area in which lymphocytes are formed. They comprise the structural unit of lymphatic tissue. May occur singly, in groups as in Peyer's patches, or in encapsulated organs as lymph nodes.

l. scrotum. Scrotal lymphatic dilatation occurring esp in elephantiasis.

l. sinuses. Irregular tortuous vessels found in lymphatic organs. Lined with cells belonging to the reticuloendothelial system.

l. spaces. Those esp. in connective tissue filled with lymph.

lymphadenectasis (līm'f'ā-den-ēkt'ā-sīs) [*L. lymphā, lymph, + G. aden, gland, + ektasis, dilatation*]. Dilatation or distention of a lymph node.

lymphadenia [' + *G. aden, gland*]. Hyperplasia affecting lymphatic tissue.

l. ossea. Bone marrow hyperplasia accompanied by Bence-Jones protein in urine.

Sym. Neuralgic pains, followed by painful swellings on ribs and skull, and possible occurrence of spontaneous fractures. **Syn.** *multiple myeloma*.

lymphadenitis (līm'f'ad-en-'ītis) [' + + -itis, inflammation]. Inflammation of a lymphatic gland.

Etiol. Drainage of bacteria or toxic matter into lymph nodes. May be specific, as by the organisms of typhoid, syphilis, or tuberculosis, or non-specific, in which causative organism is not identified.

Sym. Marked increase of tissue, possible suppuration. Swelling, pain, tenderness. Usually accompanies lymphangitis.*

Treatment Hot, moist dressings, incision and drainage if abscesses occur. Similar to other severe infections.

l., tuberculous. Etiol. Infection.

Sym. Possible loss of weight and strength; gradual onset and enlargement of lymph nodes, may become adherent, necrotic, and discharge pus through skin.

Treatment Elimination of foci, exposure of area to sunlight, deep x-ray in some cases. Surgical removal.

NP If tuberculosis is cause, same as in that condition. Otherwise, same as in lymphangitis, *q.v.*

lymphadenoma (līm'f'ā-den-ō'mā) [' + + -ōma, tumor] Hyperplasia of the lymph nodes. **Syn.** *lymphoma*.

lymphadenopathy. Disease of the lymph nodes.

lymphagogue (līm'f'ā-gōg) [*L. lymphā, lymph, + G. agōgos, leading*]. An agent which stimulates the production or flow of lymph.

lymphangiectasis (līm'f'ān-'ji-ekt'ā-sīs) [' + *G. aggeion, vessel, + ektasis, dilatation*]. Dilatation of lymphatic vessels. **Syn.** *lymphectasia*.

lymphangi endothelioma (līm'f'ān-'ji-ō-en-'dō-thēl-i-ō'mā) [' + + *endon, within, + thēlē, nipple, + -ōma, tumor*]. Endothelioma originating from lymph vessels. **Syn.** *lymph endothelioma*.

lymphangiobroma (līm'f'ān-'ji-ō-fi-brō'mā) [' + + *L. fiber, fiber, + G. -ōma, tumor*]. Fibroma and lymphangioma combined.

lymphangioma (līm'f'ān-'ji-ō'mā) [' + + -ōma, tumor] Tumor composed of lymphatic vessels.

lymphangiophlebitis (līm'f'ān-'ji-ō-flē-bī-'ītis) [' + + *phleps, vein, + -itis, inflammation*]. Inflammation of lymphatic vessels and veins.

lymphangioplasty (līm'f'ān-'ji-ō-plās-tī) [*L. lymphā, lymph, + G. aggeion, vessel, + plassein, to form*]. Formation of artificial lymphatics.

lymphangiosarcoma (līm'f'ān-'ji-ō-sār-kō'mā) [' + + *sarx, flesh, + -ōma, tumor*]. Lymphangioma and sarcoma combined.

lymphangiectomy (līm'f'ān-'ji-ōt-ō-mī) [' + + *tomē, a cutting*]. 1 Dissection of the lymphatics. 2. Anatomy of the lymphatics. **Syn.** *lymphotomy*.

lymphangitis (līm'f'ān-'jītis) [' + + -itis, inflammation]. Inflammation of the lymphatics.

Etiol. Streptococcus infection.

Sym. Onset chill and high fever, moderate swelling and pain. Deep general flush with raised border on affected area if infection is in deep layers of skin.

NP. Applications of heat in the form of baths or fomentations may be ordered. Adm. plenty of fluids. Keep bowels open. Light diet and rest are important. General care given in febrile and painful conditions.

lymphatic (līm-fat'ik) [*L. lymphaticus,*

pert. to lymph]. 1. Of or pert. to lymph.

2. A lymph vessel. A lymph vessel conveys toward the heart; contains valves like the veins. The intestinal parts of the lymphatics which take up some of the products of digestion are called *lacteals*.

After the *chyle* enters the lacteals it is known as *lymph*. The lymphatics, or lacteals, carry the food material in the form of lymph, which has not hitherto been taken directly into the blood vessels of the alimentary canal, into the blood stream.

Fluids exuded from the blood vessels into the tissues are gathered up and carried back again to the blood by the lymphatics, so that they serve 2 purposes. They appear like small veins with thin walls, and they are provided with valves. They commence as lymph capillaries, microscopic in size, and empty into 2 trunks which open into the large veins near the heart.

Unlike the blood, the fluid contained in the lymphatics flows only in 1 direction from the small capillaries to the main trunk (the thoracic duct and a

smaller duct on the right side) and then to the large veins. When the lymph enters the blood it becomes part of its constituents.

PRINCIPAL GROUPS OF LYMPHATICS: (a) Right internal jugular vein, (b) right subclavian vein; (c) lymphatics of upper extremities, (d) receptaculum chyli, (e) lymphatics of lower extremities; (f) thoracic duct, (g) right subclavian vein, (h) lacteals, (i) lymphatics of lower extremities.

RS *angioleukasia*, *angioleukitis*, *angiolymphitis*, *angiolymphoma*, *angiosis*, *bubo*, *chylangioma*, *leukosis*, *varix*, "ras-" words.

l., afferent. Any of the small vessels carrying lymph to a lymph node.

l. blockade. Local defense mechanism in which minute bits of material, such as fibrous exudate from injured tissue, enter local lymphatic vessels, tending to obstruct them and thus preventing foreign substances, esp bacteria, from passing to other parts of the body.

l. capillary. The smallest lymph vessels. Minute tubes consisting of a single layer of endothelium ending blindly in swollen or rounded ends. Tissue fluid enters the lymphatic system through the lymph capillaries. In intestinal villi they are called *lacteals*.

l., efferent. Any of the small vessels carrying lymph from a lymph node.

l. organ. A structure composed principally of lymphatic tissue. Includes lymph nodes, spleen, tonsil, thymus.

l. system. That system including all structures involved in the conveyance of lymph from the tissues to the blood stream. It includes the *lymph capillaries*, *lacteals*, *lymph nodes*, *lymph vessels*, *main lymph ducts* (thoracic and its lymphatic duct) for the circulation of lymph, see *lymph*.

l. vessels. Thin-walled vessels conveying lymph from the tissues. They resemble veins in structure, possessing three layers, the intima, media, and adventitia. They possess valves always occurring in pairs.

lymphaticostomy (limf'ăt-i-kos'tō-mi) ['' + G *stoma*, opening]. Making of a permanent aperture into a lymphatic duct.

lymphatism (limf'ă-tizm) [L. *lymphā*, lymph, + G *ismos*, state of] 1. The lymphatic temperament. 2. Sluggishness in the vital processes. 3. Pathologic state in which there is excessive growth of lymphatic tissues. SYN: *status lymphaticus*, *q.v.*

lymphatitis (limf-i-ti'tis) [L. *lymphā*, lymph, + G *-itis*, inflammation]. SYN: *lymphangitis*. Inflammation of lymphatic vessel or tissue.

lymphatolysis (limf-ă-tōl'i-sis) [L. *lymphā*, lymph, + G *lysis*, dissolution]. Destruction of lymphatic vessels or tissue.

lymphatolytic (lim-fat-ō-lit'ik) ['' + G *lysis*, dissolution]. Destructive to lymphatics.

lymphectasia (limf-ĕk-tă'zī-ă) ['' + G *ektasis*, dilatation]. Dilatation of the lymphatics. SYN: *lymphangiectasis*.

lymphedema (limf-ĕ-dē'mă) ['' + G. *oidema*, swelling]. Edema due to obstruction of lymphatics. SYN: *serous edema*.

lymphemia (limf-e'mi-a) [L. *lymphā*, lymph, + *aima*, blood]. Presence of an abnormal number of lymphocytes in the blood.

lymphendothelioma (limf-ĕn'đō-thēl-i-ō'mă) ['' + G. *endon*, within, + *thēlē*,

LYMPHATICS

nipple, + *-ōma*, tumor]. Tumor from proliferation and dilatation of lymphatics with overgrowth of myxomatous tissue.

lymphenteritis (līm-f'én-tēr-i'tīs) [l' + G. *enteron*, intestine, + *-itis*, inflammation] Serous infiltration accompanying inflammation of bowels

lymphnoditis (lĭmf-nōd-ĭ'tis) [" + *nodus*, knot, + *G. -itis*, inflammation]. Inflamed condition of a lymph node.

lymphadenoma (lĭmf"ō-ad-en-ō'mă) [" +

G aden, gland, + -oma, tumor] 1 A tumor of lymphoid tissue 2 Hyperplastic condition of the lymphatics Syn lymphadenoma.

lymphoblast (limf'ō-blāst) [L *lymph*
lymph, + G *blastos*, germ]. A cell
which gives rise to a lymphocyte

lymphoblastoma (limf-ō-blast-ō'mă) [" +
" + -ōma, tumor]. Tumor composed of
lymphocytes. SYN *lymphosarcoma*.

lymphoblasto'sis [$l' + b' + -\text{ōsis}$, intensive] Excessive number of lymphoblasts in the blood.

lymphocele (lĭmf'ō-sēl) [" + G *kēlē*, her-
nal] Tumor containing lymph SYN
lymphocyst.

lymphocyst (līm'fō-sist) [*l* + *G* *kystis*, cyst]. Tumor containing lymph **SYN** *lymphocele*.

lymphocyte (līm'fō-sīt) [“ + G *kytos*, cell] Lymph cell or white blood corpuscle without cytoplasmic granules.

They normally number from 25-30% of total white cells. May increase to 90% in lymphatic leukemia.

1., large. SYN *macrolymphocyte*. Lymphocytes averaging 10-12 microns in diameter. Resemble small lymphocytes except that nucleus is slightly larger and there is greater amount of cytoplasm which may contain a few "azure granules."

Characterized by deeply staining, compact nucleus taking a dark blue. The nucleus occupies all or most of the cell, either in center or at one side. The cytoplasm is clear blue. Sometimes a few small azure granules may be present, esp. in the nuclear indentation. Measures six to eight microns in diameter.

lymphocyt^hemia (līm'fō-sī-the'mī-ā) [^h +
" + *aima*, blood]. Excess of lymph cells
in the blood

lymphocytopenia (līm'f'ō-sīt'ō-pē'nī-ă) | + " + *penia*, lack|. Less than normal number of lymphocytes in the blood

lymphocytopoiesis (līm'f'ō-sīt'ō-poi-ē'sis, [l' + " + *poiesis*, production] Lymphocyte production.

lymphocyto'sis | " + " + -ōsis, intensive |
Excess of lymph cells. SYN *lymphocy-*
themia.

lymphocytotoxin (līm'f"o-sīt"ō-toks'in) [**l** + " + **toxikon**, poison]. A toxin destructive to lymphocytes

lymphodermia (līm-f-ō-dēr'mī-ă) [L. *lymphā*, lymph, + G. *derma*, skin]. Disease of cutaneous lymphatics

lympho''epithelio'ma. A tumor composed of epithelium and lymphatic tissue which develops usually in the nasal cavity or pharynx

lymphogenous (līm'f-ōj'en-ūs) [" + G.
gennan, to produce] Forming lymph
lymphogonia (līm'f-ō-go'nī-ă) [" + G.

lymphocytes (limf' o-sigh' tih) [*limf' o-sigh' tih*, *gonos*, offspring] Large lymphocytes with large nuclei appearing in lymphatic leukemia.

lymphogranulomatosis (lím'f'ō-grăn-ū-lō'-mă-tō'sis) [l' + " + G -ōma, tumor, + -ōsis]. 1. Infectious granuloma of the lymphatics. 2. Hodgkin's disease

lymphogranuloma venereum. SYN: *l. in-*
quinale, *lymphopathia venereum*, *clim-*
aticum bubo, *fourth venereal disease* A
venereal disease characterized by a
small primary lesion, usually on gen-
italis, inflammation of regional lymph
nodes, and constitutional symptoms. It
is caused by a virus and readily trans-
mitted by sexual contact

lymphoidectomy (līm-f-oid-ek'tō-in) [*L. lymphā, lymph, + G. eidos, form, + ektomē, excision*]. Surgical removal of lymphoid tissue.

lymphoidocyte (līmf-oid'ō-sīt) [l' + " + *kytos* cell] A hemocytoblast, *qv*
lymphology (līmf-ol'ō-jī) [l' + G *logos*,

lymphoma (limf-o'ma) [L *lymph*a, lymph, G -oma tumor] A lymphoid tissue

tumor. May be of the *sclerosing type* (Hodgkin's disease) in which nodules become hard, *lymphocytic type*, which may give rise to lymphocytic leukemia or aleukemic leukemia, *lymphoblastic type* or lymphosarcoma, and *follicular type* in which multiple nodules develop within lymph nodes.

l. granulomatosum. Small, white lymphatic nodule in liver in Hodgkin's disease

lymphomatosis (līm'f'ō-mā-tō'sis) [" + " + -osis, intensive] General lymphatic engorgement, general deposition of lymphomata throughout the body

lymphomatous (limf-ō'mā-tus) | - + G
-ōma, tumor| 1 Pert to a lymphoma.
2 Affected with lymphoma.

lymphopath'ia venereum [" | pathos disease] Venereal disease marked by ulceration and enlargement of lymph node, in inguinal area. Syn. *lymphogranuloma inguinale*.

lymphopathy (lĭmf-op'ă-thĭ) [*l* + *G pa-*
thos, disease] Any lymphatic disease

lymphopenia (lĭmf-ô-pĕ'nĭ-ă) | + G
penia, a lack| Deficiency of lympho-
cytes in the blood

lymphopoiesis (limf-ō-pol-ē'sis) [*l* + *G*
poiesis production] Formation of
lymphocytes

lymphopoietic (līm-fō-poi-et'ik) [*l'* + *G*
poietin, to produce] Forming lympho-
cytes

lymphoprotease. Protein-splitting enzyme secured from a suspension of lymphatic tissue

lymphorrhagia (līm-f-or-rā'jī-ā) [L *lymphā*, lymph, + G *rēgnunai*, to burst forth] Flow of lymph from ruptured lymph vessels. SYN *lymphorrhea*.

lymphorrhea (līm-f-or-rē'ā) [*l'* + *G. roia*, flow] Internal or external discharge of lymph through a wound. Syn: *lymphorrhagia*.

lymphosarcoma (limf-ō-sar-kō'mă) [*l' + G sarx, flesh, + -ōma, tumor*] Sarcoma of lymph

lymphosarcomatosis. Condition characterized by the development of lymphosarcoma.

lymphostasis (lĭmf-os'tă-sĭs) [*"* + *G sta-*
sĭs, a stoppage]. Stoppage of flow of
lymph.

lymphotome (lĭmf'ō-tōm) [*"* + G. *tomē*, incision]. Instrument for removing glandular growths from tonsils.

lymphotrophy (līm-f-ot'rō-fī) [*"* + *G. trophē*, nourishment], Lymph nourishment of cells in regions devoid of blood vessels

lymphuria (līm-f-ŭ'rī-ă) [*"* + *G* *ouron*,
urine] Lymph in the urine.

lymphovascular (līm-f-vas'kū-lar) [" + *vasculus*, a little vessel]. Rel to the lymphatic vessels.

lyo- Combining form meaning *dissolved, loose*

lyochrome. *Flavin, q v*

lyogel. A gel containing much water

lyophilization. Process of rapidly freezing a substance at an extremely low temperature and then dehydrating in a high vacuum

lyophobic, lyophobic. Tending not to go into solution, applied to colloidal systems in which there is a strong affinity between dispersed phase and dispersion medium

lyotrope. A substance which goes into solution readily

lyra (lī'rā) [G *lyra, lyre*] Triangular space on ventral surface of corpus callosum bet. post. columns of the fornix

lysimeter (lī-sim'ē-ter) ["" + *metron, measure*] Apparatus for determining solubilities

lysin (lī'sin) [G *lysis, dissolution*] A specific antibody acting destructively upon cells and tissues **SEE** *immune body*

lysine (lī'sen) [G *lysis, dissolution*] An amino acid which is a hydrolytic cleavage product of protein through digestion

It is essential for growth and repair

lysis (lī'sis) [G. *dissolution*]. 1 The gradual decline of a fever or disease "the opp. of *crisis*." 2 Destruction of blood cells, etc. by a lysin, as when rabbit's red corpuscles are dissolved by dog's serum 3 Combining form meaning dissolution, decomposition (ex *hydrolysis*), or in medicine, reduction or relief (ex *paralysis*) **SEE** *crisis, hemolysis*

lyso-genesis (lī-sō-jen'ē-sis) [G *lysis* dissol., + *genesis, production*] The production of cell-dissolving substance known as lysin.

lysogenic (lī-sō-jen'ik) ["" + G. *gennan, to produce*] Producing lysins

lysol (lī'sōl) A mixture of cresols made soluble in water by sodium hydroxide Used as an antiseptic

POISONING. When swallowed it causes corrosion, edema of the lungs, immobility of pupils, and collapse Vomiting may occur, death sometimes after symptoms have abated

TREATMENT: Prompt use of stomach-pump

lysolecithin. A substance obtained from lecithin through the action of an enzyme present in cobra venom Exerts a powerful hemolytic action

lysozyme (lī'sō-zim) ["" + *zymē, leaven*] A bacteria-destructive substance present in tears, and other body secretions, and tissues

lyssa (līs'sā) [G *lyssa, frenzy*] An acute infectious disease, transferable by inoculation, which particularly attacks the nervous system **SYN** *hydrophobia, rabies*

lyssin (līs'sin) [G. *lyssa, frenzy*]. Virus of lyssa **SYN** *hydrophobin*.

lyssodexis (līs-sō-deks'is) ["" + *dēxis, a bite*]. Inoculation or infection with lyssin

lyssoid (līs'soid) ["" + *eidos, resemblance*] Resembling lyssa or rabies

lyssophobia (līs-sō-fō-bi-ā) ["" + *phobos, fear*] 1 Hysteria resembling rabies 2 Fear of rabies

lyterian (lī-tēr'i-an) [G *lyein, to dissolve*] Indicative of lysis

lytic (lī'tik) [G *lyein, to dissolve*] Rel. to lysis or a lysin

lyze (līz) [G *lysis, from lyein, to dissolve*] To bring about lysis

M

M. Abbr. for *mille*, a thousand; *misc*, *mix*.

m. Abbr. for *meter* and *minum*, in chemistry, for *meta*.

M. A. Abbr. for *meter angle*.

MA. Mental age.

Ma. Chem. symbol for *masurium*.

ma. Abbr. for *millampere*.

M + Am. Abbr. for *compound myopic astigmatism*.

macaroni [It.] Av. SERVING 75 Gm Pro 10 1, Fat 0 7, Carbo 55 6 Ash Ca 0 022, Mg 0 037, K 0 130, Na 0 008, P 0 144, Cl 0 073, S 0 172, Fe 0 00012

Macdowell's frenum (măk-dow'el) Part of post. layer of pectoralis major which extends into muscular substance.

mace (mās) [L. *mācis*]. A spice from the nutmeg tree, employed as flavoring similarly to nutmeg.

maceration (mās-ēr-a'shūn) [L. *macerāre*, to make soft] 1 Process of softening a solid by steeping in a fluid.

Mache unit (ma'kē) The unit of measurement of concentration of radium emanation. Abbr. *M. u.*, or German, *M. E.* See *unit*.

machonnement (mash-shōn-mon') [Fr.]

Movement of jaws resembling chewing.

macies (mā'shi-ēz) [L. *wasting*] Atrophy, wasting, emaciation.

macrencephalia, macrencephaly (mak-i-en-sē-fā'li-ā -sē'fā-li) [G. *makros*, long, + *ekkephalos*, brain] Abnormal size of brain. SYN *macrocephalia*.

macro-, macr- [G.] Combining forms meaning *large, long*.

macrobiosis (măk'rō-bi-ō'sis) [G. *makros*, large, + *biosis*, life] State of surpassing normal span, longevity.

mac-ro-bleph'aria. Abnormal largeness of eyelid.

macrobrachia (măk'rō-brā'-ki-ā) Abnormal largeness of the arm.

macrocephalia (măk'rō-sē-fā'li-ā) [G. *makros*, large, + *kephalē*, brain] Abnormal largeness of head SYN *macrencephalia*.

Etiol Found in acromegaly, hydrocephalus, rickets, osteitis deformans, leontiasis osseæ, myxedema, sporadic cretinism, idiocy, leprosy and hemiatrophy; also in pituitary disturbances.

macrocephalous (măk'rō-sē-fā'lūs) [L. + *kephalē*, brain] Pert. to or having an excessively large head.

macrocephaly (măk'rō-sē-fā'li) [L. + *kephalē*, brain] Abnormal size of head. SYN *macrocephalia*.

macrocheilia (mak-rō-ki'li-ā) [G. *makros*, large, + *cheilos*, lip] Abnormal size of lip caused by permanently dilated lymphatic spaces, as in cavernous lymphangioma of the lip SYN *macrolabia*.

Etiol Hereditary, as in certain negroid races, enlargement of lymphatic spaces occurring in lymphangioma; hypertrophy of mucous glands.

macrocheiria (mak-rō-ki'ri-ā) [L. + *cheir*, hand]. Excessive size of the hands. SYN: *macrochiria*.

macrocornea (măk'rō-kor'ne-ā) [G. *makros*, large, + L. *cornu*, horn] Abnormal size or projection of the cornea. SYN: *keratoglobus*, *megaloecornia*.

macrocyte [G. *makros*, large, + *kytos*,

cell] Erythrocyte larger than normal, exceeding 10 microns in diameter.

macrocythemia (măk'ru-si-thē'mi-ā) [L. + L. + *aima*, blood] Abnormal number of macrocytes in the blood.

macrocytosis (măk'ru-si-tō'sis) [L. + L. + *-osis*, intensive] Development of macrocytes, esp. in greater numbers than normal.

macroactylia (mak'rō-dak-til'i-ā) [L. + *daktylos*, finger]. Excessive size of 1 or more of the digits.

macrodont (mak'rō-dont) [L. + *odont-*, tooth] Having abnormally large teeth. SYN *megadont*.

macroesthesia (mak'rō-ēs-thē'zi-ā) [G. *makros*, large, + *aisthēsis*, sensation]. A state in which objects seen or felt appear to be greatly magnified.

macrogam'ete. A large, immobile reproductive cell formed in certain protozoa and simple plants. Corresponds to the ovum in higher forms.

macrogametocyte. A large nonmotile reproductive cell developing from the merozoite of certain protozoans, the female gametocyte. SYN *Plasmodium*.

macrogenitosomia (mak'rō-jen'i-tō-sō-mi-ā) [L. + L. *genitātis*, genital, + G. *sōma*, body] Precocious body development in general, with unusually large genitalia.

macroglia (mak-rōg'li-ā) [G. *makros*, large, + *glia*, glue] A type of neuroglia whose cells are called astrocytes, q. t.

See *neuroglia*, *glia* cell, *spider cell*.

macroglō'sia [L. + *glossa*, tongue] Hypertrophied condition of the tongue.

Etiol Usually congenital. May be due to inflammation of the lymphatics, glossitis. Ludwig's angina, acromegaly, myxedema, gumma, carcinoma, trauma, hoof and mouth disease.

macrognathia (mak-rō-nā'thi-ā) [L. + *gnathos*, jaw] Abnormal size of jaw.

macrogy'ria. Excessively large size of convolutions (gyri) of cerebral hemispheres.

macrolabia (măk'rō-lā'bi-ā) [L. + L. *labium*, lip] Abnormal size of lip. SYN: *macrocheilia*.

macrolymphocyte (mak'rō-limf'ō-sit) [L. + L. *lymphā*, lymph, + G. *kytos*, cell]. A large lymphocyte.

macromastia (măk'rō-mas'ti-ā) [L. + *mastos*, breast]. Abnormal size of the breasts.

macromazia (măk'rō-mā'zi-ā) [L. + *mazos*, breast]. Abnormal development of breasts. SYN *macromastia*.

macrom'e'lia. Excessive size of an organ or a part, esp. an extremity.

macrom'e'lus. An individual possessing limbs of excessive size.

macromere (măk'rō-mēr) [L. + *meros*, a part] Blastomere of large size.

mac'ronor'moblast (G. *makros*, large, + L. *norma*, rule, + G. *blastos*, germ). Large, nucleated normoblast.

macrophage, macrophagus (măk'rō-fā,-roi'n-gus) [G. *makros*, large, + *phagēin*, to eat] SYN *clasmatocyte*, resting wandering cell, *adventitial cell*. A cell of the reticuloendothelial system having the ability to phagocytose particulate substances and to store

vital dyes and other colloidal substances. They are found in loose connective tissues and various organs of the body. They include *Kupffer cells* of the liver, *splenocytes* of the spleen, *dust cells* of the lung, *microglia* of spinal cord and brain, and *histiocytes* of loose connective tissue.

m., fixed. A nonmotile macrophage **m., free.** SYN *wandering m.* A wandering or ameboid macrophage. Found esp in areas where inflammatory processes are in progress.

macrophallus (măk"rô-făl'ûs) [" + *phallos*, penis]. Abnormally large penis.

macropodia (niăk-rô-pô'di-ă) [" + *pous*, pod-, foot]. Abnormally large feet.

macroprosopia (măk"rô-prô-sô'pi-ă) [" + *prosôpon*, face]. Large facial features.

macropsia (mak-rop'si-ă) [" + *opsis*, vision]. Condition in which objects look larger than they really are.

macrorhinia (mak-rô-rin'i-ă) [" + *rhin*, nose]. Excessive size of the nose, either congenital or pathological.

macroscelia (mak-rô-sêli-ă) [" + *skelos*, leg]. Abnormal size of the legs.

macroscopic (mak-rô-skop'ik) [" + *skopein*, to examine]. Large enough to be seen by the naked eye. OPP *microscopic*. SYN *megascopic*.

macroscopy (mak-ros'kô-pli) [" + *skopein*, to examine]. Examination of an object with the naked eye.

macrosmatia (mak"rô-sô-mă'shi-ă) [" + *soma*, body]. Abnormally large size of body. SYN *macrosonia*.

macrosonia (măk-rô-sô'mi-ă) [" + *sôma*, body]. Abnormal size of body. SYN: *macrosmatia*.

macrostomia (măk-rô-stô'mi-ă) [" + *stoma*, mouth]. Excessively large mouth.

macrotia (mak-ro'shi-ă) [G *makrotis*, large, + *ous*, *ot-*, ear]. Abnormal size of ears.

macula (mak'û-lă) [pl *maculae*] [L *spot*]. SYN *macule*. A small spot or colored area. SEE *roseola*, *vibices*.

m. acusticae. Oval thickened areas in sacculi and utricle in which fibers of vestibular branch of acoustic nerve terminate. They are sensory receptors containing hair cells which respond to movement of the endolymph. They include *m. sacculi* and *m. utriculi*.

m. alba. White mark found on liver in some contagious diseases. SYN *tache blanche*.

m. atrophica. Glistening white spot on skin following a circumscribed hemorrhage.

m. caerulea. Steel gray or blue stain of epidermis, without elevation, which does not disappear on pressure, occurring esp. with pediculosis pubis or bites from fleas.

m., cerebral. Reddened line, becoming deeper and persisting for some time, esp. in tubercular meningitis, by drawing the fingernail across the skin *tache cérébrale*, *q v*.

m. corneae. Opaque spot in cornea.

m. cribrosa. One of the tiny foramina in wall of vestibule of bony labyrinth of the ear through which pass filaments of the acoustic nerve.

m. flava. A small yellow spot at ventral end of each vocal fold formed by a small mass of elastic tissue or sometimes cartilage.

m. gonorrhoeica. Red spot at orifice of vulvovaginal gland. Seen in gonorrheal vulvitis.

m. lutea. The yellow spot on the retina, about 1/12 in. (2.08 mm.) to outer side of the optic nerve's exit, the

exact center of the retina. Contains a pit, the *fovea centralis*, where retina is reduced to a layer of closely packed cones, which functions as the area of most acute vision (central vision).

m. sacculi. SEE *m. acusticae*.

m. utriculi. SEE *m. acusticae*.

macular (măk'û-lar) [L *macula*, spot]. 1. Rel. to macules. 2. Having macules.

maculate (d (măk'û-lăt, -lăt-əd) [L *macula*, spot]. Spotted, as with macules.

maculation (măk'û-lă'shun) [L *macula*, spot]. Process of becoming maculate. Development of macules.

macule (mak'ûl) [L *macula*, spot]. Discolored spot or patch on the skin, neither elevated nor depressed, of various colors, sizes and shapes.

They consist of *hyperemia*, *roseola*, *erythema*, *telangiectasis*, *nevi vasculosi*, *areola*, *achromia*, *chloasma*, *purpura*, *petechiae*, *ecchymosis*, *vibices*, *albinism*, *vitiligo*, *lentiginos*, *nevi pigmentosi*, *nevi spili*, *discolorations*, *q v*.

Macules occur in *pellagra*, *pityriasis rosea*, *pediculosis corporis*, *rubella*, *scurvy*, *serum sickness*, *pelliosis*, *anemia*, *leukemia*, *cancer*, *Bright's disease*, *infectious diseases*, *poisoning*, *erysipelas*, *acne rosacea*, *nevus pigmentosus*, *vitiligo*, *leprosy*, *morphea*, *facial hemiatrophy*, etc. SYN *macula*, *q v*.

maculopapular. Consisting of or pertaining to macules and papules.

mad. SYN *insane*, *rabid*. 1. Not rational. 2. Angry. 3. Rash, foolish, frantic. 4. Suffering from infection with rabies.

madarosis (mad-ă-ro'sis) [G *madaros*, bald]. Loss of cilia or eyelashes and eyebrows.

madescant (mad-es'ent) [L *madescere*, to become moist]. Slightly moist, or becoming so.

madidans (mad'id-ăns) [L *madidus*, wet]. Exuding, moist, as in some skin lesions.

Madu'ra foot. Fungous disease of the foot. SYN *mycetoma maduromycosis*, *q v*.

maduromycosis (măd-û-rô-mi-kô'sis) Chronic infection of the foot or hand characterized by marked swelling and development of nodules, vesicles, and sinuses.

ETIOL. A variety of fungi, esp *Monosporium apiospermum* and various species of *Nocardia*. Infections by the latter are usually designated *mycetomas*, *q v*.

Magendie's foramen (mă-zhan-de'). The median of 3 openings in the roof of the 4th ventricle which is in front of the cerebellum and behind the *pons varoli*, connecting the ventricle with the subarachnoid space.

magenstrasse (mag'en-stres'se). A groove along lesser curvature of stomach from cardia to pylorus. Frequently the seat of gastric ulcer.

mag'got (origin uncertain). Larva of an insect, esp. the soft-bodied, footless larva of flies (order *Diptera*). Many are parasitic giving rise to *myiasis*, *q v*.

m. treatment. A method of treating septic wounds. Meat maggots, introduced into a sloughing septic wound, ingest the necrotic material, leaving the wound with a clean granulating surface. The maggots are then removed and destroyed. SEE *osteomyelitis*.

magistry (maj'is-tēr-i) [L *magister*, master]. 1. Specially compounded remedy. 2. A precipitate.

magistral (maj'is-trăl) [L *magister*, master]. Concerning medicines prescribed

by a physician for a particular case.
See *official*.

magma (mag'mă) [G. *magma*, from *massein*, to knead] 1. Mass left after extraction of principle 2 Salve 3 A pulpy mass or paste

magnesia (măg-nē'zī-ă) [G. *magnēs*, a magnet] Magnesium oxide MgO

m., milk of. An aperient composed of magnesium hydroxide and water

magnesium [L] Syms *Mg.* At wt 24.32. Sp gr. 1.74 A white mineral element found in soft tissue, muscles, bones, and to some extent in the body fluids.

The entire body contains 0.05% Mg. 70% of which is contained in the bones. The muscles contain less of it than they do calcium. Concentration of Mg in the blood plasma averages 2.5 (1.8—3.6) mg per cent. in erythrocytes 6.6 (5.4—7.8) mg per cent.

Daily minimum requirement, 0.22 Gm

FUNCTIONS Salts of magnesium and potassium, and other minerals are necessary to maintain osmotic pressure. Magnesium is needed for the ion balance, the activation of enzymes, for muscular activity, nerve stability, and bone structure. It also has a laxative effect.

DEFICIENCY SYM Convulsions, nervous conditions, retarded growth, digestive disturbances, spasticity of muscles and nerves, accelerated heart beat, arrhythmia, and vasodilation.

SOURCES It is obtained in sufficient quantities in meat, milk, fruits and vegetables to make special dietary planning to include it unnecessary. From 0.14 to 0.67 Gm have been found in the food for a single day. Indeed, Mg, added to a mixed diet, may cause a loss of calcium. Most foods contain almost as much of it as they do of calcium.

m. carbonate ($MgCO_3 \cdot 3H_2O$). USP. A bulky, white, odorless powder.

ACTION AND USES Internally, to neutralize acid in stomach, also a laxative. Dosage As antacid, 10 gr (0.6 Gm.), as a laxative, 2 drams (8 Gm.)

m. citrate solution. USP. A solution containing an amount of magnesium citrate corresponding to approximately 16% magnesium oxide.

ACTION AND USES Purgative. Dosage 12 fl. oz. (350 cc.).

m. oxide (MgO). USP. Calcined magnesia. Light magnesia. A white, very bulky, fine powder.

ACTION AND USES Antacid, laxative. Dosage As an antacid, 4 gr (0.25 Gm.); as a laxative, 45 gr (3 Gm.)

Heavy. USP. *magnesi oxidum ponderosum*

ACTION AND USES Same as magnesium, light.

DOSAGE Same as magnesium, light.

m. phosphate tribasic. A white, odorless powder.

USES As an antacid and laxative. Dosage 15-75 gr. (1.0-5.0 Gm.).

m. sulfate (epsom salt) ($Mg \cdot SO_4 \cdot 7H_2O$). USP. Small, colorless crystals. Saline bitter taste.

ACTION AND USES Refrigerant, hydragogue, cathartic, in tetanus and eclamptic conditions.

DOSAGE As cathartic, ½ oz (15 Gm.).

INCOMPATIBILITIES Ammonium chloride, soapuds enema, gummine, ferric chloride, sulfanilamide.

mag'net [G. *magnes*] Any body which has the property of attracting iron, spec a mass of iron or steel which has

this property given to it artificially. A piece of iron may be magnetized by passage of an electric current through and insulated wire wound about it.

m., horseshoe. One in shape of a horseshoe.

m. operation. Removal of metal particles with a magnet.

magnetic [G. *magnēs*]. Pert. to a magnet or having magnetism

m. field. The space permeated by the magnetic lines of force surrounding a permanent magnet or coil of wire carrying electric current.

m. induction. The production of magnetic properties in iron or other magnetic metals by the influence of a magnetic field or of a magnet.

m. lines of force. The lines indicating the direction of the magnetic force in the space surrounding a magnet or constituting a magnetic field.

magnetism (măg'nē-tizm) [“ + -ismos condition] The property of repulsion and attraction of certain substances

magnetotherapy (mag'nēt-ō-ther'ā-pi) [“ + *therapeia*, treatment]. Application of magnets or magnetism in treating diseases

magnification (mag-nī-fi-kā'shun) [L. *magnus*, great, + *facere*, to make] Process of increasing apparent size of an object, esp under microscope

mag'num [L. large] 1 Large (ex foramen magnum) 2 Old term for capitate bone (os magnum) the largest of the carpals.

maidenhead (măd'en-hēd). Thin, crescentic fold partly closing vaginal opening and once considered a sign of virginity. SYN *hymen*.

maieusiomania (mī-ū-sī-ō-mă'nī-ă) [G. *maieusis*, childbirth, + *mania*, madness] Insanity following childbirth.

maieusiophobia (mī-ū-sī-ō-fō'bī-ă) [L. *magnus*, great, + *phobos*, fear] Extreme fear of childbirth

maieutics (mī-ū'tiks) [G. *maieusis*, childbirth]. Obstetrics

maim (mām) [ME *maymen* to cripple] 1 To injure seriously, to disable 2 To deprive of the use of a part, such as an arm or leg

main (mān) [Fr.] Hand

m. en griffe (ahn-grēf') Flexion and atrophy of the hand in a claw shape

m. succulente (sūk-kū-lahnt'). Edema of a hand

Majocchi's disease (mah-yok'ē) Ring-form, purplish eruption of lower limbs, *purpura annularis telangiectodes*, q.v.

make. In elect., to complete an electric circuit. Opp of *break*

m. twitch. In physiol., the contraction of a muscle which occurs upon closure of the primary circuit

makro- [G.] For words beginning thus, see under *macro-*.

mal (mah) [Fr. from L. *malum*, an evil]

An evil, a sickness or a disorder

m. de Cayenne. Elephantiasis

m. de la rosa. Pellagra

m. de mer. Seasickness

m., grand. A major epileptic attack with convulsions

mal- Combining form meaning ill, bad, poor

m., petit. A minor attack of epilepsy without convulsions

mala (mal'ă) [L.] 1. The cheek 2 The cheekbone.

malachite green (mal'ă-kīt) [G. *malachē*, a mallow (with green leaves)]. Dye sometimes used in treating trypanosomiasis and as an indicator. Also used as a bacteriological stain

malacia (māl-ā'sī-ā) [G. *malakia*, softening]. 1. Softening of tissues of an organ, or of a part of them. 2. A morbid appetite for some specific food, esp. condiments.

m. cordis. Softening following infarction of the myocardium

malacoma (māl-ā-kō-mā) [G. *malakia*, softening]. Softening of an organ or part of the body. SYN *malacia*, *malacosis*.

malacoplakia (mal-ā-kō-plā'kī-ā) [" + *plak-, plak-*, plaque]. Existence of soft patches in mucous membrane of a hollow organ

m., vesical. Soft, funguslike patches on mucosa of the bladder

malacosarcosis (māl-ā-kō-sar-kō'sis) [" + *sarz*, flesh, + *-ōsis*]. Softness of tissue, especially muscular

malacosis (māl-ā-kō'sis) [" + *-ōsis*, intensive]. Softening of an organ or part of the body, abnormally. SYN *malacia*, *malacoma*.

malacosteon (mal-ā-kōstē-ōn) [G. *malakia*, softening, + *osteon*, bone]. Softening of the bones. SYN *ostromalacia*.

malacotic (mal-ā-kōt'ik) [G. *malakia*, softening]. 1. Soft. 2. Affected with malacia. 3. Rel to malacia

m. teeth. Those of soft texture easily affected by caries

malacotomy (māl-ā-kōt'ō-mī) [" + *tomē*, incision]. Incision of soft areas of the body, esp. of the abdominal wall

mal'adjusted. Poorly adjusted, unhappy or unsuccessful because of inability or failure to adjust one's desires or needs to one's environment or station in life

malady (mal'ā-dī) [Fr. *maladie* illness, from L. *malum*, an evil]. A condition of ill health. SYN *disease*

malaise (mā-lāz') [Fr.]. Discomfort, uneasiness, indisposition, often indicative of infection

malar (mā'lar) [L. *mala*, cheek]. Pert. to cheekbones.

m. bone. A 4-pointed bone on each side of the face, uniting the frontal and sup maxillary bones with the zygomatic process of the temporal. The zygomatic or cheek bone. SEE *zygoma*

malaria (mā-lā'ri-ā) [It. *malaria*, bad air]. An acute and sometimes chronic infectious disease due to the presence of protozoan parasites within red blood cells. The parasites undergo an asexual cycle in man and a sexual cycle in the mosquito. Sporozoites injected by the bite of a mosquito go through an exoerythrocytic cycle in tissue cells such as liver cells where they undergo schizogony. After an interval of 7-10 days, they invade erythrocytes in which they undergo several divisions (schizogony), forming many merozoites. These break free and invade other corpuscles. The destruction of corpuscles with liberation of pigment and waste products brings on the characteristic paroxysms of chills and fever. This occurs at 48-hr intervals in tertian and 72-hr intervals in quartan malaria. After several generations of schizonts, some merozoites develop into micro- and macrogametocytes which when sucked up by a mosquito undergo further development. The microgametocytes produce several "flagellated bodies" which unite with a macrogamete to form a zygote, which elongates forming a vermiform or ookinete, which penetrates the stomach wall of the mosquito forming an oocyst in which sporozoites develop. When mature the oocyst bursts liberating sporozoites into body cavity through

which the sporozoites make their way to salivary glands. They are discharged through salivary ducts when the mosquito bites a person

Etiol. Four species of a sporozoan, *Plasmodium* (*P. vivax*, *P. falciparum*, *P. malariae*, *P. ovale*). The causative organism is transmitted through bites of infected mosquitos of the genus *Anopheles*

Sym. Various derangements of the digestive and nervous systems. Characterized by periodicity, chills, fever and sweats, in the order mentioned, having pathologic manifestations of progressive anemia, splenic enlargement, and deposition in various organs of a melanin, resulting from the biologic activity of the plasmodia

Treatment. Prophylactics. Patients living in malarial districts should avoid the night and early morning air—should sleep in upstairs room. Absolute rest. Light diet. Quinine has long been a popular remedy. Atabrine and plasmochin also used

m., algid. Cold malaria characterized by coldness of skin. See *m., estivoautumnal*

m., cephalgic. Unusually severe headache, nausea, vomiting, etc. **DIFFERENTIAL DIAG**. Meningitis and intracranial lesions

m., cerebral. Falciparum malaria in which brain is affected due to tendency of corpuscles to agglutinate, resulting in clogging of capillaries which in the brain lead to coma or sometimes sudden death.

m., delirious. Delusions, hallucinations, maniacal excitement

m., eclamptic. Chill, fever, severe headache, sometimes nausea and vomiting. Convulsions resembling eclampsia. More common in children

m., estivoautumnal. Indistinct chill, usually only a chilly sensation. Intense headache, profound weakness, marked muscular aching. Marked mental depression. Coated tongue, feeble and accelerated pulse, rapid respiration. Febrile stages may be 36 hours long. SEE *m., falciparum*

m., falciparum. M. caused by *Plasmodium falciparum*. More prevalent in tropics, also called malignant tertian, subtertian, estivoautumnal malaria. Symptoms more severe than in other types, but runs a shorter course without relapses

m., latent. Parasites exist within blood stream, but give rise to no recognizable symptoms. Individuals having this form constitute portion of carriers

m., pernicious. Onset may be sudden, resembling apoplexy; coma usually comes, however, after obvious, severe, and intense symptoms. Hot skin; petechiae, contracted pupils. Cheyne-Stokes respiration, coated tongue; loss of sphincter control, rapid, irregular, weak pulse, elevated temperature. A remission may occur with profuse perspiration, but other paroxysms follow if treatment is inadequate. **Etiol.** *Plasmodium vivax*. **Progn.** In spite of heroic administrations, death sometimes occurs. Often general collapse, with death in cases where no treatment is instituted

m., pleuritic and pulmonic. Fever, thoracic pain, cough, dyspnea, sometimes hemoptysis, rales. Periodicity of symptoms may aid diagnosis. Blood findings are conclusive

m., quartan. Short and less severe

paroxysms. Sporulation occurs each 72 hours, causing seizures with that interval. Caused by *Plasmodium malariae*.

m., quotidian estivoautumnal. Paroxysms occur with daily periodicity due to 24-hour sporulation. Abrupt rise and fall of temperature. Due to multiple infections with the same organism.

m., sudoriferous. Sweating is excessive and leads to collapse.

m., tertian. Sporulation each 48 hours. Symptoms more common during the day. Paroxysms divided into chill, fever and sweating stages. Cold stage is usually 10-15 minutes, but may last an hour or more. Febrile stage varies from 4-6 hours.

m., t., benign. Caused by *Plasmodium vivax*, malignant tertian by *Plasmodium falciparum*.

m., vivax. SYN: Benign tertian. Malaria caused by *Plasmodium vivax*.

malarial (mā-lar'ī-āl) [It. *malaria*, bad air]. 1. Affected with malaria. 2. Causing malaria. 3. Resembling malaria. 4. Pert. to malaria. SYN: *malarious*.

malariology (mā-lar'ī-ol'ō-jī) [“ + G. *logos*, study]. The scientific study of malaria.

malariotherapy (mā-lar'ī-ō-ther'ā-pī) [“ + G. *therapeia*, treatment]. Method of treating paresis and parasymphilitic conditions by injecting malarial organisms into the body.

malarious (ma-lar'ī-ūs) [It. *malaria*, bad air]. Of the nature of, or afflicted with malaria.

Malasse'zia. A genus of fungi.

malassimilation (mal'ās-sim-i-lā'shūn) [L. *malus*, ill, + *assimilare*, to make like]. Defective, incomplete, or faulty assimilation, esp. of nutritive material.

malaxation (mal-aks-a'shun) [L. *malaxare*, to soften]. Kneading movement used in massage.

male (māl). 1. Masculine. 2. One of the sex that fertilizes; one potentially capable of producing sperm.

RS: *female*, *organs*, *male generative*, *virile*, *virulence*, *virilism*.

m. sex hormone. SYN: *androsterone*. 1. Hormone found in urine and secreted by the testicles, which regulates development at puberty of male char-

acteristics. 2. An *androgen*. One of a group of steroids which stimulate the development of secondary sex characters and accessory sex organs in the male. They are produced principally by the interstitial cells of the testes, although the adrenal cortex and the ovaries also produce androgenic compounds. They are also found in urine. Principal androgenic hormone is testosterone ($C_{19}H_{28}O$). Other androgenic substances include adrenosterone, androsterone, and isoandrosterone.

malemission (mal-ē-mīs'shūn) [L. *malus*, weak, + *ē*, out, + *mittere*, to send]. Failure of semen to be ejaculated from the urethra during coitus.

malformation (māl-for-mā'shūn) [L. *malus*, bad, + *formatio*, a shaping]. Deformity, abnormal shape or structure.

malic (ma'lik) [L. *malum*, apple]. Pert. to apples.

m. acid. An acid found in some fruits, such as apples. SEE: *acid*.

malign (mā-lin') [L. *malignus*, of bad kind]. Malignant. Tending to injure or harm.

malignancy (mā-līg'nān-sī) [L. *malignus*, of bad kind]. 1. Opposition to treatment. 2. Severe form of occurrence, tending to grow worse. SYN: *virulence*.

malignant (mā-līg'nānt) [L. *malignus*, of bad kind]. Virulent. Growing worse, resisting treatment, said of cancerous growths. Tending or threatening to produce death, harmful.

maling (mā-ling'er) [Fr. *malingre*, weak, sickly]. To feign illness, usually to arouse sympathy.

malingering (mā-ling'ger-er) [Fr. *malingre*, sickly, weak]. 1. One who pretends to be ill or to be suffering from a non-existent disorder to arouse sympathy. 2. One who pretends slow recuperation from a disease once suffered in order to continue to receive benefits of sick insurance.

malleation (māl-lē-ā'shūn) [L. *malleare*, to hammer]. Spasmodic action of the hands in which they seem drawn to strike any near object, as spasmodic rapping against thighs, furniture, etc. SEE: *tic*.

malleoincudal (māl'lē-ō-in'kū-dāl) [L. *malleus*, hammer, + *incus*, anvil]. Con-

HUMAN CYCLE OF TERTIAN MALARIA.

In the circles A, B, C, D, and A', B', C', and D', which represent red blood corpuscles, malarial parasites are shown growing from the little spore in A and A' to the adult in C and C' and sporulating in D and D'. Above is a temperature curve, the figures on the left indicating the temperature of the patient (given in the Centigrade scale) the vertical lines indicating days. The temperature is highest—i.e., there is a paroxysm—each time the parasite reaches the stage of sporulation, D and D'.

cerning or pert. to the malleus and incus.

malleolar (māl-le'ō-lar) [L. *malleolus*, little hammer]. Concerning the malleolus.

malleolus (māl-le'ō-lus) (pl. *malleoli*) [L. little hammer]. The protuberance on both sides of the ankle joint, the lower extremity of the fibula being known as the lateral *m.*, and the lower end of the tibia as the medial *malleolus*.

m., ext., lateral, outer. Process on outer edge of fibula at lower end.

m., int., inner, medial. Round process on inner edge of tibia at lower end.

mallet finger (mal'let) [L. *malleus*, hammer]. Loss of power of extension in a finger, causing permanent flexion. *SYN drop-finger.*

m. toe. Abnormal flexion or loss of power of extension of a toe. *SYN hammer toe.*

malleus (mal'e-ūs) (pl. *mallei*) [L. hammer] 1 The largest of the 3 auditory ossicles in the middle ear, attached to the eardrum, and articulating with the incus 2. Glands, an acute febrile disease with suppuration and necrosis of cartilage and bone

RS. ear, incus, stapes.

Mallophaga. An order of insects which includes the biting lice

malnutrition (mal-nū-ti'shun) [L. *malus*, bad, + *nutrire*, to nourish]. Lack of necessary food substances in the body or improper absorption and distribution of them.

MALNUTRITION

PHYSICAL SIGNS OF DEFICIENCY STATE*

Infants and Children

- 1 Lack of subcutaneous fat
- 2 Wrinkling of skin on light stroking
- 3 Poor muscle tone
- 4 Pallor
- 5 Rough skin (toad skin)
- 6 Hemorrhage of newborn (K)
- 7 Bad posture
- 8 Nasal blackheads and whiteheads
- 9 Sores at angles of mouth, cheilosis
- 10 Rapid heart
- 11 Red tongue
- 12 Square head, wrists enlarged, rib beading
- 13 Vincent's angina, thrush
- 14 Serious dental abnormalities
- 15 Corneal and conjunctival changes—slit lamp

Adolescents and Adults

- 1 Nasolabial sebaceous plugs
- 2 Sores at corners of mouth, cheilosis
- 3 Vincent's angina
- 4 Minimal changes in tongue color or texture
- 5 Red swollen lingual papillae
- 6 Glossitis
- 7 Papillary atrophy of tongue
- 8 Stomatitis
- 9 Spongy, bleeding gums
- 10 Muscle tenderness, extremities
- 11 Poor muscle tone
- 12 Loss of vibratory sensation
- 13 Increase or decrease of tendon reflexes
- 14 Hyperesthesia of skin
- 15 Bilateral symmetrical dermatitis
- 16 Purpura
- 17 Dermatitis; facial butterfly, Casal necklace, perineal, scrotal, vulval
- 18 Thickening and pigmentation of skin over bony prominences
- 19 Nonspecific vaginitis
- 20 Follicular hyperkeratosis of extensor surfaces of extremities
- 21 Rachitic chest deformity
- 22 Anemia not responding to iron

23. Fatigue of accommodation

24. Vascularization of cornea

25. Conjunctival changes

* Committee on Medical Nutrition, National Research Council

mal'occlusion. Imperfect occlusion of the teeth. May be due to imperfect development, loss of teeth, abnormal growth of jaws

malpighian (māl-plq'ī-ān) Concerning or described by Marcello Malpighi

m. body. 1 A malpighian corpuscle, *q.v.* 2 A splenic nodule, a spherical, ovoid body found in the white pulp of the spleen. Similar in structure to a lymphatic nodule

m. corpuscle. *SYN renal corpuscle.* A spherical body found in cortex of kidney consisting of a glomerulus and Bowman's capsule

m. layer. *SYN stratum germinativum, stratum mucosum, stratum Malpighi.* The innermost layer of the epidermis.

m. pyramid. A renal pyramid

malposition (māl-pō-zī'shun) [L. *malus*, bad, + *positus*, from *ponere*, to place]. Faulty or abnormal position or placement, esp. of the body or one of its parts

malpractice (māl-prak'tīs) [' + G *praxis*, an action]. Wrong or injurious treatment, esp. applied to performing illegal abortions

malpresentation (mal-prē-zen-tā'shun) [' + *praesentatio*, a presenting]. Abnormal position of fetus rendering natural delivery difficult or impossible.

malt (mawlt) [A.S. *mealt*]. Germinated grain, usually barley, used in manufacture of ale and beer. Contains carbohydrates (dextrin, maltose), a diastase, and proteins and is used as a food, esp. in wasting diseases

m. extract. A viscous, light brown fluid obtained from wort (malt steeped in water)

m. sugar. Maltose, *q.v.*

Malta fever. *SYN Mediterranean fever, Neapolitan fever, Gibraltar fever.* An infectious disease caused by one of three species of *Brucella* (*Br. melitensis* from goats, *Br. suis* from swine, and *Br. abortus* from cattle). Transmitted principally from animals to man. May occur in acute or chronic form

SYM. Swelling of the joints and spleen, excessive perspiration, weakness and anemia, and recurrent febrile attacks. Organisms tend to localize in tissues of the reticuloendothelial system, esp. spleen, liver, bone marrow, and lymph nodes.

maltase (mawlt'ās) [A.S. *mealt*, grain]. A salivary and pancreatic enzyme which acts on maltose converting it by hydrolysis to glucose. *SEE enzyme and digestion*

maltose (mawlt'ōs) [A.S. *mealt*, grain]. Malt sugar ($C_{12}H_{22}O_{11}$). A disaccharide present in malt, malt products, and sprouting seeds. It is formed by the hydrolysis of starch and is converted into glucose by the enzyme *maltase*, *q.v.* *SEE carbohydrates and disaccharose.*

malto'suria. Presence of maltose in urine.

mal'turn'ed. Abnormally turned, said of a tooth turned on its long axis.

malum (ma'lūm) [L. an evil]. A disease.

m. coxae senilis. Hip disease in the aged, esp. osteoarthritis

m. perforans pedis. Ulcer of the foot of perforating type. It begins with thickening of the epidermis.

m. pilare. Trichinosis.

m. venereum. Syphilis.

malunion (māl-ūn'yūn) [L. *malus*, bad, +

unité, oneness]. Growth of the fragments of a fractured bone in a faulty position, forming an imperfect union.

mamelonation (mam-el-ô-nâ'shun) [Fr. *mamelles*, from *L. mamma*, breast]. Nipplelike prominences on a part or organ.

mamma (mâm'â) (pl. *mammæ*) [L. breast]. One of 2 glands and structures in the female secreting milk; situated between the 3rd and 6th ribs when not pendulous. **SYN:** *breast, mammary gland*

mammalgia (mam-al'ji-â) [' + G. *algos*, pain]. Pain in the breast. **SYN:** *mastalgia*.

mammary (mam'â-ri) [L. *mamma*, breast]. Pert. to the breast.

m. glands. Two compound glands of the female breast secreting milk. They are made up of lobes and lobules bound together by areolar tissue

The main ducts are 15 to 20 in number and are known as *lactiferous* ducts, each one discharging through a separate orifice upon the surface of the nipple. The dilatations of the ducts form reservoirs for the milk during lactation. The pink, or dark colored, skin around the nipple is called the *areola*. **SYN:** *mammæ*.

RS breast, b., caked, galactagogue; gynecomastia, mammeotomy, mastectomy, mastopathy, nipple.

mammectomy (mâm-mek'to-mi) [' + G. *ektomê*, excision] Removal of the breast **SYN** *mastectomy*.

mammilla (mâm-îl'î) [L. nipple] 1 Nipple 2 Any structure resembling a nipple.

mammillary (mam'ti-lar-i) [L. *mammilla*, nipple] Like or concerning a nipple

mammillated (mam'mil-lâ-têd) [L. *mammilla*, nipple]. Having protuberances like a nipple

mammillation (mâm-îl-lâ'shûn) [L. *mammilla*, nipple] 1. Condition of having a granulated appearance or nipplelike projections 2 A nipplelike protuberance.

mammilliform (mam-mil'i-form) [' + *forma*, shape]. Shaped like a nipple

mammillipasty (mâm-mil'i-plâs-ti) [' + G. *plassein*, to form] Plastic operation on a nipple. **SYN** *thelyplasty*.

mammillitis (mâm-mil-'itis) [' + G. *-itis*, inflammation] Inflammation of a nipple **SYN** *thelitis*.

mammitis (mâm-'itis) [L. *mamma*, breast, + G. *-itis*, inflammation] Inflamed condition of the breast **SYN** *mastitis*.

mammose (mam'ôs) [L. *mamma*, breast]. 1. Having unusually large breasts. 2. Shaped like a breast.

mammotomy (mâm-ot'ô-mi) [' + G. *tomê*, incision] Surgery of a breast. **SYN:** *mastotomy*.

mammotropin (mâm-ôt'rô-pin) Name of lactogenic principle of the ant. pituitary lobe. **SYN:** *prolactin*.

man (mân) [AS. *mann*]. 1. Member of the human race, a human being. 2. Male member of the species 3. The human race, collectively; mankind. **SEE:** "anthrop-" words

manicnism (man'sin-izm) [L. *mancus*, crippled]. State of being left-handed.

mandelic acid (man-del'ik). A crystalline compound derived from benzaldehyde.

Uses: In the treatment of urinary infections, esp. pyelitis and cystitis.

It is necessary that the acidity of the urine be controlled, that the bactericidal effect be received. An additional acidifying agent, as ammonium chloride, is usually required, when the sodium salt is used.

It is advised, because of renal irritation, that the drug be used not longer than 12-14 days.

INCOMPATIBILITIES Fluids.

mandible (man'di-bl) [L. *mandibulum*, jaw]. A jawbone, esp. the lower one. The inferior maxilla.

THE MANDIBLE.

A, Condyle, B, Coronoid process, C, Mandibular notch, D, Ramus, E, Angle, F, Mental protuberance

mandibular (mân-dib'û-lar) [L. *mandibulum*, jaw]. Rel. to the lower jaw.

m. reflex. Clonic movement resulting from percussing or stroking lower jaw.

m. and m. enema. One given because its ingredients form gases and distend the bowel, thus causing frequent and copious bowel movements **SEE** *enema*.

mandrin (man'drin) [Fr.] A guide for a flexible catheter

manducation (mân-dû-ka'shûn) [L. *manducare*, to chew]. The chewing of food **SYN** *mastication*.

maneuver (mân-ôô'ver) [Fr. *manoeuvre*, from *L. manu operari*, to work by hand] Obs Manipulation of the fetus and placenta to aid in delivery **SEE** *labor*.

m., Crede's. Method of expressing the placenta first described by Crede, in which the hand is placed on the fundus of the uterus with the thumb on the ant wall and the fingers on the post wall, the placenta being pushed out by pressure in the direction of the birth canal

m., Leopold's. Method of abdominal palpation for the diagnosis of presentation and position of the fetus in utero

m., Mauriceau - Smelle - Velt. Method employed to deliver the aftercoming head in breech presentation Straddling the baby over the right arm, the index finger of that hand is introduced into the mouth of the child and applied over the maxilla. 2 fingers of the other hand are then hooked over the neck, grasping the shoulders Downward traction is made until the occiput appears under the symphysis pubis The body of the child is now raised up toward the mother's abdomen and the mouth, nose, brow and occiput are successively brought over the perineum.

m., Muller's. Similar in import and method to that of Munro Kerr.

m., Munro Kerr. A method for determining the presence of disproportion bet. the fetal head and the maternal pelvis The fetal head is pushed into the pelvis with the right hand on the abdomen, while with 2 fingers of the left hand in the vagina the possibilities of engagement of the head are noted. At the same time the thumb of the left hand feels over the brim of the pelvis to determine the degrees of overlapping.

m., Pinard's. Fingers behind knee and push it toward and past the body, causing flexion of knee. Foot is then grasped and brought down in breech presentation.

m., Prague. A method for the delivery of the aftercoming head in a breech delivery when the occiput is post.

m., Scanzoni. Double application of forceps in post position of the occiput.

manganese (man'gā-nēz) [L. *mangane-sium*] SYMS Mn Ar. Wt 54.93. Sp. Gr. 7.2 A metal element found in many foods, and in some plants, and in the tissues of the higher animals

FUNCTIONS Its significance in the diet is not clear. It is believed to supplement copper in aiding in the formation of hemoglobin, although some think it has a nutritional function of its own. It is known to activate certain enzymes, for example, some of the phosphatases, and in experimental animals is essential for normal growth and reproductive activity.

DEFICIENCY SYM Subnormal growth and deficient tissue respiration

SOURCES *Er* Bananas, bran, beans, beets, blueberries, chard, chocolate, peas *Good* Leafy vegetables and whole grains

POISONING A rather uncommon industrial poison found usually after prolonged exposure

SYM Muscular weakness, peculiar gait, tremors, central nervous system disturbances, salivation

F A TREATMENT. Removal from source of exposure

mania (mā'nī-ā) [G. *mania*, madness] 1 Madness, characterized by excessive excitement 2 A form of psychosis characterized by exalted feelings, delusions of grandeur, elevation of mood, psychomotor overactivity, and overproduction of ideas *SEE* *psychosis*, *manic-depressive*

m. à pōtu. Delirium tremens
m., Bell's. Pericencephalitis in acute form

m., puerperal. A form of mental derangement occurring occasionally during the puerperium

m., religious. Mania resulting from excessive religious fervor

m., transitory. Short attacks of frenzy

m., unproductive. Behavior characteristic of mania by lack of spontaneity in speech or muteness sometimes seen in manic-depressive psychosis. *SEE* *alcoholism*.

maniac (mā'nī-āk) [G. *mania*, madness]. A person with mental disease, usually one disturbed or excited

maniacal (mā'nī-āk-āl) [G. *mania*, madness] 1. Like a maniac 2 Afflicted with mania

manic-depressive psychosis. Cyclic or circular affective psychosis in which there are alternating moods of depression and mania *SEE* *psychosis*, *manic-depressive*.

man'ikin [D. *manneken*, little man] 1. A model of the human body or its parts 2 A dwarf

manipulation (mān'ip-ū-lā'shūn) [L. *manipulāre*, to handle]. Any treatment or procedure involving use of the hands

RS: *massage*, *osteopathy*, *spondylotherapy*, *Swedish movements*.

manipulative surgery. Use of manipulation in surgery, bonesetting, etc.

Man'aberg's symptom. Accent of 2nd pulmonic sound in diseases of the abdomen.

man'nerism. Acts which are in keeping

with the personality. A peculiar modification of an ordinary movement

Mann'kopf's sign. Pulse acceleration exhibited on pressing a painful point, seen in neurasthenia.

manometer (mān-om'et-er) [G. *manos*, thin, + *metron*, measure] Device for determining liquid or gaseous pressure.

mantle (man'tl) [A.S. *mentel*, a garment]. The cerebral cortex. *SYN* *brain mantle*, *pallium*.

manual (man'ū-al) [L. *manus*, hand]. 1. Pert. to the hands. 2. Performed by or with the hands

manubrium (man-u'bri-um) [L. *handle*]. 1. The upper bone of the sternum articulating with the clavicle and first pair of costal cartilages. 2 That portion of the malleus* resembling a handle *SEE* *umbo*.

m. sternal. Same as *manubrium*, 1.
manus (ma'nus) [L.]. The hand.

manustupration (man'u-su-pra'shun) [L. *manustupratio*, defilement by hand]. Masturbation.

marantic (mā-rān'tik) [G. *marainein*, to waste]. 1. Pert. to *marasmus*. 2. Wasting away.

marasmic (mā-raz'mik) [G. *marainein*, to waste]. Affected with *marasmus*; wasting away. *SYN* *marantic*.

marasmus (mar-az'mus) [G. *marasmos*, wasting]. Emaciation, wasting Infantile atrophy which occurs almost wholly as a sequel to acute diseases, esp. diarrhetic diseases of infancy

Most common from 6-18 months of age. Extreme wasting, child becoming a mere living skeleton.

SYM. May be vomiting and diarrhea, sleep restless, child uncomfortable and in pain, constantly hungry, frets, worries, suffers abdominal pain and headache Feet edematous, urine scanty, anus and nates chafed and sore from urinal acidity and alkalinity or acidity of evacuations Prostration becomes extreme, heart weak, abdomen distended, and mesenteric glands enlarged

Proc Fair, but recovery is slow

TREATMENT Often change of climate or simply from city to country is of great benefit. Keep in fresh air as much as possible Oil baths

Dier. Blandest kind of nourishment, as free from starch as possible Different foods must be tried till one is found to suit the case. Constitutional treatment.

marble bones. Abnormally calcified bones with spotted appearance in a roentgenogram *SYN* *Albers-Schonberg disease*, *osteosclerosis* fragilis generalisata*, *osteopetrosis*

mareo (mar-ā'ō) [Sp. from L. *mare*, sea]. Seasickness [ness.]

m. de la Cordillera. Mountain sickness

marginal (mar'jin-āl) [L. *margō*, margin-, edge]. Concerning a margin or border.

margination (mar-jl-nā'shūn) [L. *margō*, margin-, edge]. Cleavage of leukocytes to walls of blood vessel in first stages of inflammation.

marginoplasty [' + G. *plassein*, to form]. Plastic surgery of a border, as of an eyelid.

margo (mar'go) [L.]. A border.

m. acutus. A sharp margin of the heart extending from apex to the right.

m. obtusus. Portion of a line extending from apex to root of pulmonary artery which lies along rounded left side of left ventricle.

Marie's disease (mā-rē'). Chronic condition of enlargement of bones and soft

tissues of hands, feet and face. **SYN:** *acromegaly, hypertrophic pulmonary osteoarthropathy*

Marie's sign. Hand tremor seen in exophthalmic goiter.

marihuana (ma-ré-whan'á). A Mexican name for a poisonous plant. Used in cigarette form, it is a dangerous habit-forming substance. **SYN** *Indian hemp; Maria-Juana*

Mariotte's law (mar-é-ot'). Boyle's* law.

M.'s spot. The blind spot of the eye. **SYN** *optic papilla*

mark [A.S. *mearc*]. A nevus, bruise, cut or spot on the surface of a body

m., birth-. Blemish on the skin at birth. A nevus

m., port-wine. A congenital hemangioma or nevus vascularis, *q.v.*

Marmos method (mar'mòz) (Seratino Marmo, contemporary Italian obstetrician) (artificial respiration) A manner of performing artificial respiration in asphyxiated infants. The accoucheur places his hands in the infant's axillae and thereby raises the subject up in the air and suddenly releases his hands. A sudden drop of a foot or two will cause inspiration to occur, with expiration being effected by pressure of the accoucheur's hands against the chest wall

marriage (mar'rj) [L. *maritäre*, to marry]. State of being united to one of the opposite sex as husband and wife, wedlock **SEE** *misogamy, polyandry, polygamy*

mar'row [A.S. *meaeh*] The soft tissue occupying the medullary cavities of long bones, some haversian canals, and spaces between trabeculae of cancellous or spongy bone. Of two types, *red* and *yellow, q.v.*

In adult bone there are red and fat, or yellow, *m.* The yellow *m.* is found esp. in medullary cavity of long bones, and the red in spongy bones.

It consists of both fat and red marrow; from 20-80% fat marrow, to 100% red marrow. The marrow may be as high as 5% of body weight in an adult.

The liver seems to have something to do with the production of the red blood cell marrow. These cells may produce many times their volume of mature red blood cells within 2 weeks. The rate of red marrow to fat marrow fluctuates constantly.

RS: *giant cell, leukomyelitis.*

m., gelatinous. Yellow marrow of old or emaciated persons, almost devoid of fat and having a gelatinous consistency.

m., red. That in cancellous tissue of bone. Concerned with the production, maintenance and disposal of red blood cells and hemoglobin.

m., spinal. Spinal cord.

m., yellow. That in the medullary canal of long bones. Consists principally of fat cells.

marsh fever. Malarial fever.

m. gas. Methane, *q.v.*

Marsh's test. A test to detect the presence of arsenic.

marsupialization (mar-sü'pí-al-i-za'shun) [L. *marsupium*, pouch]. Process of raising the borders of an evacuated tumor sac to the edges of the abdominal wound, and stitching them there to form a pouch.

The interior of the sac suppurates and gradually closes by granulation.

Martin's bandage. Rubber bandage for varicose veins, ulcers and other similar conditions.

maschaladenitis (mas-kal-ä-den-'itís) [G.

maschalē, armpit, + *adēn*, gland, + *-itis*, inflammation]. Inflammation of axillary glands

maschaliatry (mas-kal-i-at'rí) [" + *iatreia*, healing]. Treatment by axillary incunations.

masculation (mäs-kü-lä'shün) [L. *masculus*, a male] Male sex characteristics formation.

masculine (mäs'kü-lin) [L. *masculus*, a male]. Having male characteristics

masculino''voblasto'ma. A benign ovarian tumor which resembles microscopically an adrenal adenoma or normal adrenal cortical tissue. Usually results in virilism.

mask [Fr. *masque*] 1. A covering for the face, as the gauze mask of a surgeon or nurse 2. The countenance or appearance of the face such as appears in certain pathologic conditions.

m., death. A copy of the face molded in plaster of Paris soon after death

m., ecchymotic. Cyanotic faces accompanying traumatic asphyxia

m., Fontana's. Fold transversely on a nerve trunk when it has been severed.

m., Hutchinson's. A feeling of compression over face as though one is wearing a mask. A symptom of tabes dorsalis

m., luetic. Blotchy brown pigmentation of cheeks, forehead and temples, seen in tertiary syphilis

m., Parkinson's. Immobile facial appearance as a result of paralysis agitans (Parkinson's disease). The face is devoid of expression, the skin smooth and without a wrinkle

m. of pregnancy. Pigmented spots on the face seen in some pregnant women.

m., uterine. Mask of pregnancy or uterine disease.

masked (mäs'kd) [Fr. *masque*]. Covered from view.

masochism (mas'o-kízm) [named after Sacher-Masoch of Germany]. A psychopathic condition due to weakness and glandular insufficiency, esp. of the gonads and adrenals, which condition demands the stimulation of pain (generally whipping), before the subject is able to react to the sexual stimulus

The subject thus expects to dominate indirectly his sexual partner through his own weakness. Masochism demands torture of one's self, or the opp. of sadism, *q.v.* A psychopathic state in males, but also a physiological phenomenon in women, such as an inclination to subordination to man. It is rare in women. **SEE** *algolagnia, flagellation.*

masochist (mas'ò-kíst). A person addicted to masochism

mass (mäs) [L. *massa*, mass] Soft, solid preparation for internal use, and of such consistency that it may be molded into pills. It is frequently prescribed alone or with other agents, and may be given in pill form or put into capsules. Two masses are official

m., cell. An aggregation of cells which serves as the primordium (anlage) of a future organ or part.

m., epithelial. Inner portion of a developing gonad enclosed within the germinal epithelium

m., inner cell. Mass of cells within the blastocyst from which the embryo, yolk sac, and amnion develop

m., intermediate cell. A plate of unsegmented mesoderm lying lateral to the segments (somites) and connecting them to the unsegmented lateral mesoderm. Also called *nephrotome*.

mas'sa [L.]. Mass, *q.v.*

m. intermedia. The middle commissure, an inconstant mass of gray matter extending across third ventricle and connecting adjacent surfaces of the thalami.

massage (mas-sāzh') [G. *massein*, to knead]. Manipulation, methodical pressure, friction and kneading of the body. Must always be applied upon the bare skin.

RS *anatripsis, effleurage, flagellation, friction, frolement, fustigation, kneading, malaxation, masseur, pétrissage, Swedish movements, tapotement, vibration.*

m., auditory. Massage of the eardrum membrane.

m., cardiac. Manual manipulation of the heart to restore heart beat after heart has stopped beating. Accomplished through a "buttonhole" incision made below xiphoid process.

m., douche. Massage resulting from the application of a douche.

m., electrovibratory. Massage by means of an electric vibrator.

m., general. Consists of centripetal stroking in connection with some muscular kneading from the toes upward. Principally used for nervousness, being an important part of the well known "rest cure." Useful in connection with certain baths, duration 30-40 minutes. As soon as a part is massaged, it should be given a few passive rotary movements and afterwards covered up.

m., hydropneumatic. Massage by means of air forced through a tube at the end of which is a chamber containing water, the water chamber being applied to the part massaged.

m., introductory. Consists of centripetal strokings around the affected part; as in an affection of the knee joint, where introductory massage should be used on lower part of thigh and somewhat below the knee. Very useful in cases where it is impossible for operator to apply treatment directly to diseased parts.

m., local. Consists in treatment confined to particular parts.

m., tremolo. A variety of mechanic massage.

m., vapor. A treatment of a cavity by a medicated and nebulized vapor under interrupted pressure.

m., vibratory. Massage by rapidly repeated light percussion with a vibrating hammer or sound.

masseur (mas-sē'tēr) [G. *masētēr*, chewer]. The muscle which closes the mouth and is the principal muscle in mastication.

masseur (ma-su'r) [Fr.]. 1. A man who gives massages. 2. An instrument for massaging.

masseuse (ma-suz') [Fr.]. A woman who gives massages.

massive (mās'siv) [Fr. *massif*]. Bulky; consisting of a large mass, huge.

m. collapse of the lung. Dyspnea and pain in chest, esp. in patients who have suffered severe shock and collapse after abdominal operation or thyroidectomy.

Patient's condition resembles that of postoperative pneumonia, but the collapsed lung expands in 3-3 days. The condition is a dangerous one.

TREATMENT: That used for general collapse, Fowler's position, heat to affected side; inhalations of oxygen and carbon dioxide. **See:** lung.

massotherapy (mās-ō-ther'ā-pl) (G. *ma-*

sein, to knead, + *therapeia*, treatment). Use of massage in treatment of disease.

mastadenitis (māst-ā-den-i'tis) [G. *mas-tos*, breast, + *adēn*, gland, + *-itis*, inflammation]. A mammary gland inflammation.

mast'adeno'ma. A tumor of the breast. **mastalgia** (mast-al'jī-ā) [' + *algos*, pain]. Pain in the breast. **SYN** *mastodynia*.

mastatrophia (mast-ā-trōfī-ā) [' + *a-*, priv + *trophē*, nourishment]. Atrophy of breasts. **SYN:** *mastatrophy*.

mastatrophy (mast-at'rōfī) [' + " + *trophē*, nourishment]. Atrophy of breasts. **SYN:** *mastatrophia*.

mastauxe (mas-tawk'se) [' + *auxē*, increase]. Excessive size of the breast.

mast cells. Large round or ovoid cells found in loose connective tissue. Possess small pale-staining nuclei and coarse cytoplasmic granules which stain with basic dyes. Called *histogenous mast cells* to distinguish them from basophilic leukocytes (*hematogenous mast cells*).

mastecchymosis (mās-tēk'-i-mō'sis). Ecchymosis of the breast.

mastectomy (mast-ēk'tō-mī) [G. *mas-tos*, breast, + *ektomē*, excision]. Excision of the breast.

NP Patient's gown is removed, care being taken not to chill the patient by exposure. The side arm rest should be attached to table. The patient's arm is extended on the rest. The entire area of operation is then painted with 3 1/2% iodine, extending from wrist to umbilicus and from opposite nipple line, across and around body to middle line of back, with particular attention to axilla. The patient is rolled over on unaffected side, and a sterile sheet slipped underneath painted area and extending over the arm rest. The patient is then rolled back and extended hand is wrapped in a towel. A second towel is wrapped around arm and entire arm covered with sterile sheet. The sterile sheet is laid over patient from umbilicus to feet. A second sheet extends from neck up over anesthetizing screen. The so-called "thyroid sheet," one which is split part way so as to form 2 "tails" which may be folded under neck and shoulders of patient, is often used. The main part of sheet is brought up over the face. A sheet is placed on unaffected side of patient and extends over midline of body. The sheets should all be clipped into place with towel clips. Four towels are now placed, 2 crosswise and 2 lengthwise, and are clipped into place. The area exposed between towels should extend from midbody line to the axillary line, and from 2 inches above umbilicus to just below clavicle. Thus the axilla and the area of the pectoralis muscles are exposed. Further procedure is routine. Have hot salt water solution ready, as hot wet pads may be needed. A good many ligatures will be used and should be ready. Silkworm gut is used for tension sutures when the skin flaps are approximated. Metal clips (skin clips), silk or interrupted sutures of silkworm gut are used for suture of incision line.

DRAINAGE AND DRESSING: A heavy absorbent dressing is used. The arm is brought across the chest and dressing finished with either a breast bandage or a Velveau bandage. Strips of iodoform gauze, 3 and 8 inches wide; folded gutta percha tissue for surface drainage; 2 fenestrated tubes, large and medium; borosilicic acid powder, 4:1; 3 yards

gauze; large pad of cotton; 2 aseptic gauze bandages, 7 inches wide, 5 yards long; 8 gauze compresses; gauze sponges; 12 safety pins, 12 towels; 3 sheets; colloidion in an aseptic glass, and camel's hair brush. Hot and cold physiologic salt solution Corrosive sublimate, 1:1000. Support the operated side on a pillow covered with a rubber pillow case. *SYN: mammectomy.*

masthelicosis (mās-thēl-kō'sis) [*G. mastos*, breast, + *elkōsis*, ulceration]. Ulcerated condition of breast

mastication (mās-ti-kā'shūn) [*L. masticare*, to chew]. Chewing. The comminution and insalivation of the food in the mouth is the first stage of digestion. Certain muscles close the mouth, raise and lower the mandible, tense the cheeks, and accomplish the highly coordinated movements of the tongue.

The smell and taste of food stimulate sensory nerves, which reflexly elicit both motor and secretory activity in various digestive organs. Thus the salivary glands begin to secrete at once, and both the glands and the musculature of the stomach gradually become active. The saliva dissolves some substances, dilutes materials too concentrated for the stomach, hydrolyzes (due to the salivary enzyme, ptyalin) some of the starch to maltose, and lubricates material to be swallowed.

RS. absorption, amasesis, enzyme, gastric and salivary digestion.

masticatory (mās'tik-ā-tō-rī) [*L. masticare*, to chew]. 1. Pert to mastication. 2. Any substance chewed to facilitate secretion of saliva.

Mastigophora (mās-ti-gō'fō-rā) A class of protozoa characterized by the possession of one or more flagella. Includes both free-living and parasitic forms

mastitis (mās-ti'tis) [*G. mastos*, breast, + *-itis*, inflammation]. Inflammation of the breast.

Most common in women during lactation, but it may occur at any age.

Etiol. May be due to entry of disease producing germs through the nipple. In most cases there is a crack or abrasion of the nipple. Infection begins in 1 lobe but may extend.

Sym. The earliest sign is a triangular flush generally underneath the breast. There may be a high temperature and pulse rate, and the patient may become very ill from septic absorption.

Treatment. If seen early enough, complete weaning of the baby for 48 hours, support, painting nipple with protargol, 10%, and the whole breast with 10% ichthylol in glycerin will clear up the condition. Otherwise, some authorities advise weaning from the affected breast only, and treatment with antiphlogistine or hot fomentations until inflammation subsides or an abscess forms and is incised. Occasionally the mastitis is secondary to generalized puerperal sepsis.

Testosterone propionate has been giving promising results, but care must be taken not to administer too large a dose.

m., cystic. M. resulting in formation of cysts which give the breast a nodular feeling upon palpation

m., interstitial. Inflammation of connective tissue of the breast

m., parenchymatous. Inflammation of the glandular substance of the breast.

m., puerperal. M. in later portion of

puerperium and often accompanied by suppuration. Breast may become indurated owing to retention of milk.

m., stagnation. Caked breast.

mastocarcinoma (māst'ō-kār-sin-ō'mā) [*G. mastos*, breast, + *karkinos*, crab cancer, + *-ōma*, tumor]. Carcinoma of the breast

mastochondroma (māst'ō-kon-drō'mā) [*' + chondros*, cartilage, + *-ōma*, tumor]. Cartilaginous breast tumor.

mastodynia (māst-ō-din'ī-ā) [*' + odyne*, pain]. Pain in the breast

mastoid (māst'oid) [*' + eidos*, form]. 1. Pert to mastoid process of the temporal bone. 2. The mastoid process of temporal bone. 3. Formed like a nipple.

m. antrum. Small chamber by which the mastoid cells communicate with the tympanic cavity

m. bone. Mastoid process of temporal bone.

m. cells. Mastoid sinuses.

m. disease. Inflammation of mastoid.

m. operation. Outward drainage of mastoid cells.

m. portion of temporal bone. Portion of temporal bone lying behind external opening of ear and below temporal line. Contains *mastoid cells* and *antrum* and its inner surface bears a deep curved sigmoid groove which transmits a part of the transverse sinus

m. process. Nipple-shaped process of mastoid portion of temporal bone extending downward and forward behind external auditory meatus. Serves for attachment of sternocleidomastoid, splenius capitis, and longissimus capitis muscles

mastoidal (mās-toi'dāl) [*' + eidos*, form]. Rel to mastoid process.

mastoidale [*' + eidos*, form]. The mastoid process' lowest point.

mastoidalgia (mas-toi-dal'jī-ā) [*' + algos*, pain] Pain in the mastoid.

mastoidec'tomy [*' + + ektome*, excision]. Excision of mastoid cells. Rarely indicated since advent of antibiotics. May be simple, involving extirpation of the air cells of the mastoid process alone, or *radical*, involving the middle ear

NP. Patient in dorsal position with small sand bag under shoulders. The area of operation is painted with iodine (3½%). Two sterile towels placed lengthwise under head and shoulders. One is brought up around head and is kept in place with towel clips. The other covers end of table. A laparotomy sheet is placed over patient, with opening over area of operation.

mastoideocentesis (mās-toi-dē-ō-sen-tē-sis) [*G. mastos*, breast, + *eidos*, form, + *kentesis*, puncture]. Surgical puncture of the mastoid process.

mastoiditis (mās-toi-dī'tis) [*G. mastos*, breast, + *eidos*, form, + *-itis*, inflammation]. Inflammation of the air cells of the mastoid process

Complications. Perisinus abscess, periphlebitis, sinus thrombosis. Involvement is metastatic through blood vessels without erosion of sinus plate or extension of suppuration directly through sinus plate into the sinus.

Sym. Fever, chills, tenderness over emissary vein, leukocytosis, sepsis.

Treatment: Surgical.

m., Bezold's. Abscess underneath insertion of sternocleidomastoid muscle due to pus breaking through the tip cell.

m., externa. Inflammation of the periosteum of the mastoid process.

m., sclerosing. M. in which there is thickening and hardening of trabeculae between mastoid cells

mastoidotomy (mas-toid-ot-ō-mī) [“ + “ + *tomē*, incision]. Incision into mastoid process

mastology (mast-ol-ō-jī) [“ + *logos*, study] Science or study of the breasts.

mastomenia (mas-to-me-nī-ā) [“ + *mēnēs*, menses] Vicarious menstruation from the mammary glands.

mastomus (mas-ton-kūs) [“ + *ogkos*, tumor]. Any tumor of the breast

mastoocephalitis (mas-tō-ok-sēp-tālītis) [G. *mastos*, breast, + L. *ocephalitis*, pert. to occiput]. Rel. to mastoid process and occipital bone.

mastopathy (mās-top-ā-thī) [“ + *pathos*, disease]. A disease of the mammary glands

mastopexy (mas-tō-pēks-i) [“ + *pēxis*, fixation]. Surgical correction of a pendulous breast by fixation. **SYN** *mastopexy*.

mastoplasia (mās-tō-plā-zī-ā) [“ + *plassein*, to form] Hyperplasia of mammary gland tissue. **SYN** *mastoplasia*.

mastorrhagia (mās-tōr-ā-jī-ā) [G. *mastos*, breast, + *rrhgunai*, to burst forth]. Hemorrhage from the breast.

mastoscirrhus (mās-tō-skīr-ūs) [“ + *skirros*, hardness]. A hard cancer of breast.

mastosfomy. Incision into the breast.

mastotomy (mās-tōt-ō-mī) [“ + *tomē*, incision] Surgical incision of a breast.

masturbate (mas-ter-bāt) [L. *masturbāri*, to pollute one's self]. To arouse self-excitement through titillation of the genital organs

masturbation (mās-ter-bā-shūn) [L. *masturbāri*, to pollute one's self]. Self-production of an orgasm by titillating the genitals either by hand or some mechanical means

It is considered morbid or pathological if practiced excessively or as a substitute for normal sexual relations. It is common among the psychopaths. Its harmful effect is due more to a sense of guilt and secrecy than to physical causes and may induce a neurosis or a psychosis

RS *manustupration, onanism, self-abuse*

m., psychic. When the orgasm ensues through psychic processes such as phantasy and without physical contacts

masurium. Former name of the element *technetium*.

match'es. Lucifer matches are usually made of phosphorus, q.v., and potassium chlorate and may be lit by friction
“Safety” matches contain antimony, sulfide and potassium chlorate and must be lit by striking on the box which is covered with red phosphorus.

Poisoning SYM Gastrointestinal irritation with blood changes.

F. A. Treatment. Wash out stomach with water or very dilute potassium permanganate. Repeated catharsis
maté (mā'tā) [Sp. *maté*, vessel for preparing leaves]. Paraguay tea made from the leaves of *Ilex paraguayensis*.

Said to contain caffeine and tannin
Uses: Diaphoretic, diuretic, and for headaches.

materia alba. White cheese-like deposit along gum line about the necks of teeth, consisting of mucus, epithelial cells, food particles, leukocytes, and microorganisms

materia medica (mā-tē-rī-ā mēd'ī-kā) [L. medical matter]. That branch of science dealing with all drugs used in

treatment of diseases, their source, preparation, dosage and use

RS. *active principles, drug action, drug administration, medical preparations, pharmacognosy, pharmacology.*

maternal [L. *maternus*, pert. to a mother].

1. Rel. to the mother 2. From a mother.

maternity (mā-ter-nī-tī) [L. *mater*, mother]. 1. The condition of motherhood 2. Lying-in hospital. **SEE** *accouchée*.

maternology (ma-ter-nol-ō-jī) [“ + G. *logos*, study] The scientific study of motherhood

matrix (mā'trīks) (pl. *matricēs*) [L. mother, womb]. 1. The womb. 2. The formative portion of a tooth or nail 3. The intercellular substance of a tissue. 4. Mold for casting.

m. ungvis. Nail bed.

matrititis (mā-trīks-ītīs) [“ + G. *-itis*, inflammation]. Inflammation of the bed of a nail **SYN** *onychitis*.

matter. 1. Anything that occupies space. May be gaseous, liquid, or solid 2. Pus, principally

m., gray. **SYN** *substantia grisea*
The gray substance of the spinal cord and brain, consisting principally of nerve-cell bodies, dendrites, and portions of axons. Also found in peripheral ganglia and retina of eye

m., white. **SYN** *substantia alba*
The white substance of spinal cord and brain, consisting principally of nerve fibers (myelinated and unmyelinated)

matfold (mat'old) [L. *matius*, drunken, + G. *eidos*, form] Person not in full control of mental faculties, but not to extent of insanity

mature (ma'tūr-ā) [L. *maturus*, ripe] 1. To ripen, to mature 2. To suppurate **SYN** *suppurate*.

maturation (māt-ū-rā-shūn) [L. *maturus*, ripe] 1. Maturing, ripening, as a *graafian follicle* 2. Suppuration 3. The process in the development of germ cells (spermatozoa and ova) occurring in spermatogenesis or oogenesis in which the number of chromosomes is reduced from the diploid number to the haploid number (one half of diploid). Includes two cell divisions, the first qualitative (meiosis), the second quantitative **SEE** *oogenesis, spermatogenesis*

mature (ma-tūr') [L. *maturus*, ripe]. Fully developed or ripened

maturity [L. *maturus*, ripe] State of being mature or fully developed, time when a person becomes capable of reproducing

matutinal (ma-tū'tī-nāl) [L. *matutinus*, morning]. Occurring early in the day, as *morning sickness*. In the morning

mattoon (māt-zūn') [Armenian]. Milk with a ferment containing lactic acid, bacilli and other organisms

maxilla (pl. *maxillae*) [L. jawbone] **BNA.** A jawbone, esp. the upper one, the superior maxilla **SEE** *skeleton*.

m., inferior. The lower jawbone, or mandible.

m., superior. Upper jawbone.

maxillary (māk'sī-lā-rī) [L. *maxillaris*, pert. to the maxilla]. Pert. to the jaw, esp. the upper.

m. bones. Maxilla sup. and inf., upper and lower jawbones.

m. sinus. The atrium of Highmore; air cavity in sup. maxilla opening into middle meatus of nose.

maxillitis (māks'ī-lītīs) [L. *maxilla*, jawbone, + G. *-itis*, inflammation]. 1. Inflammation of maxilla. 2. Inflamma-

tion of the submaxillary (submandibular) gland.

maxillofacial. Pert. to the lower half of the face.

maximal (maks'i-mal) [L. *maximus*, greatest]. Greatest possible; highest.

maximum (maks'i-mum) [L. *greatest*]. 1. The greatest quantity. 2. Height of a disease.

Mayo enema. One which causes gas to form in the intestine, inflating the bowel and producing bowel action. **See enema.**

Mayo-Robson's point. A point just above and to right of the umbilicus, where pressure causes tenderness in pancreatic disease.

mastopexy (mă'zō-pēks-i) [G. *mazos*, breast, + *pēxis*, fixation] Correction of a pendulous breast by surgical fixation. **SYN.** *mastopexy*.

mastoplasia (mă-zō-plă'zī-ă) [" + *plasma*, to form]. Hyperplasia of mammary gland tissue. **SYN.** *mastoplasia*.

McBurney's incision. Abdominal incision employed in appendectomy.

An incision is made parallel to the path of external oblique muscle, about 1-2 inches away from ant sup. spine of right ilium, cutting through the external oblique to the internal oblique and transversalis, separating their fibers.

McB.'s point. Point of tenderness in acute appendicitis, situated on a line bet. the umbilicus and the right ant.

mean (mēn) [L. *medius*, in middle]. In statistics, a number derived from a series of other numbers by a prescribed method of computation. **See:** *median*.

Thus the *arithmetic mean* (commonly called the average) of a series of *n* numbers is obtained by adding all the numbers and dividing the sum by *n*. The *geometric mean* is obtained by multiplying all the numbers and taking the *n*th root of the product.

m. deviation. In statistics, a number representing the degree of variation found in a series of observations. The mean is first found; next, by subtraction, the differences bet. the mean and each observation, then the sum of all the differences, treated as positive; then the quotient of this sum by the total number of observations. Thus the mean deviation of the series 5, 6, 7 is $(1+0+1)/3 = 0.67$; the mean deviation for the series 4, 6, 8 is $(2+0+2)/3 = 1.33$.

measles (mē'zls) [Dutch *maselen*]. A highly contagious disease characterized by catarrhal symptoms and the presence of maculopapular eruption.

ETIO. Believed to be caused by a filtrable virus because of its analogies to other known virus diseases, but the specific virus has not yet been isolated. Measles is the commonest of all so-called contagious diseases. After the age of 4 months, natural immunity may be regarded as practically nonexistent.

MEASLES

sup. iliac spine, about 1 or 2 inches above the latter.

McCarthy's reflex. Contraction of orbicularis palpebrarum with closure of lids resulting from percussion above supra-orbital nerve.

McCormac's reflex. Adduction of 1 leg resulting from percussion of patella tendon of opposite leg.

meal (mēl) [A.S. *mæel*, measure, meal]. Portion of food eaten at a particular time to satisfy the appetite. **See:** *test m.*, *Von Leube motor test m.*, *-test m.*

One attack almost invariably confers immunity, though second occurrences have been recorded.

Protection against measles is afforded by injection of normal or convalescent serum, placental extracts, or concentrated gamma globulin from pooled plasma.

INCUBATION: Eight to 14 days—rarely longer.

SYM: Onset gradual; coryza, rhinitis, drowsiness, loss of appetite, gradual elevation of temperature for first 2 days,

when fever may rise from 101-103° F. Photophobia and cough soon develop, although some recession in the temperature may occur.

About 4th day, fever usually reaches a higher elevation than previously, at times as high as 104-106° F., and with this recurrence the rash appears.

Eruption first appears on face, being seen early as small maculopapular lesions which rapidly increase in size and coalesce in places, often causing a swollen, mottled appearance. The rash extends to the body and extremities, and in some areas may assume a deviousness suggestive of scarlet fever.

A cough, present at this time, is due to the bronchitis produced by the inflammatory condition of the mucous membranes that undoubtedly corresponds to the rash seen on the skin. Ordinarily, the rash lasts from 4-5 days and, as it subsides, the temperature declines. Consequently, by the end of 5 days from appearance of rash, temperature should be normal, or approximately normal in uncomplicated cases. Prior to appearance of the eruption, a leukocytosis may be noted. Following presence of rash, a leukopenia may always be expected.

COMPLICATIONS. Bronchopneumonia, the most frequent and most serious complication of measles, and the usual explanation for the fatal case. An otitis media, followed by a mastoiditis, a brain abscess, or even meningitis, are not rare. Cervical adenitis with marked cellulitis sometimes leads to fatal consequences. Encephalitis is comparatively rare. Tracheitis and laryngeal stenosis, due to edema of glottis, are sometimes seen in the course of measles.

Eye Complications: Frequently feared by parents. Not common in measles, although a marked conjunctivitis may occur.

DIFFERENTIAL DIAG. Scarlet fever, German measles, the prodromal rash of smallpox, or even cases of confluent smallpox may have to be considered. If the measles patient is observed prior to appearance of rash, or sometimes even after rash has developed, a definite decision may be based on the presence of Koplik's spots, *q v*.

Hemorrhagic spots are also seen on the hard palate and mucous membranes many times before rash is evident on the skin. These spots probably correspond to the typical maculopapular eruption of the disease.

PROG. While usually favorable in the well-nourished child, the seriousness of the possible complications of measles should not be minimized.

TREATMENT AND NP. Patient isolated in a well-ventilated room, since, when a respiratory infection is being dealt with, good ventilation is of utmost importance. Though a room is frequently darkened, this is not a necessary requirement if strong light does not shine in patient's face.

The average measles patient does not care to eat during first few days of illness. Aside from providing plenty of fluids, no unusual effort should be made to force food upon him. Plenty of water, fruit juices and milk, however, are desirable. With fading of rash and reduction of temperature, patient will soon regain his appetite under normal circumstances.

The eyes should receive careful attention, being cleansed with a saturated solution of boric acid, perhaps followed by a few drops of one of the less irritating silver salts.

The cough may be controlled to some extent by any of the drugs ordinarily used for this purpose, or amidopyrine in doses of 1 gr. per year up to 5 years of age may be given 3 to 4 times daily. This remedy appears to lessen cough, and reduce temperature, and to reduce markedly the complications of this disease.

QUARANTINE. It is customary in many states to quarantine until rash has disappeared and temperature has been normal for from 24-48 hours. In the uncomplicated cases, this usually means that the duration of the quarantine will be approximately 10 days from the date of onset. Measles is much more contagious before eruption than it is after eruption has appeared. Consequently, it is not at all likely that the quarantine of measles patients exerts any influence on the control of a measles epidemic. On the other hand, quarantine of susceptible contacts is plainly beneficial in limiting exposures and preventing the spread of infection.

See: Koplik's spots, roetheln, rubella, rubcola.

m., black. A serious form of measles characterized by hemorrhagic areas in the skin and marked constitutional symptoms.

m., German. Rubella, *q v*.

m., hemorrhagic. Black measles, *q v*. **measure** (mē'zhur) [Fr *mesure*, from *L mensura*, a measuring] 1 A determined extent or quantity 2 To determine the extent or amount of an area or substance

meat. 1 The edible portion of anything 2 The flesh of animals, including poultry, which is used for food

Meat is an important source of vitamins, esp those of the B complex (thiamine, riboflavin, niacin). Pork is especially rich in thiamine. Liver has an unusually high vitamin content, esp of vitamin A. The glandular organs such as liver and kidney contain a considerably higher percentage of certain mineral elements and vitamins than are found in other forms of meat.

Nitrogenous extractives, purines and mineral salts give flavor to meat. Lean meat contains about 1% of mineral ash. Clear fat has almost none. The amount of mineral elements in lean meat is proportional to the amount of protein it contains. It is rich in phosphorus, potassium, iron, and it has a good percentage of other minerals, but is deficient in calcium. The ash constituents differ somewhat in the different groups (beef, pork, etc.), and in the same animals at different ages, but in all meats the acid-forming elements are decidedly in excess of the base-forming.

Meat has been assailed for several reasons: "It forms acids in the body"; "it is hard on the kidneys"; "it is conducive to 'autointoxication,'" all of which have been proved unwarranted, and objection to purines as precursors of uric acid has been withdrawn.

DIGESTIBILITY OF MEATS: (1) Mutton quicker than beef. (2) Beef quicker than pork. (3) Pork. (4) Lean meat quicker than fat meat. (5) Fat meat. (6) Young animal quicker than old animal. (7) Old animal. **See:** flesh, examination of animal.

meatal (mê-â'tâl) [L. *meatus*, passage]. Pert. to a meatus or passage.

meatometer (mê-â-tom'êt-ër) [" + G. *metron*, measure]. Device for measuring a passage or opening

meat poisoning. Poisoning from eating diseased or putrified animal flesh.

Sym. The symptoms depend upon the cause, but (a) cramps, (b) nausea, (c) vomiting, and (d) diarrhea within 24 hours after the ingestion of questionable food are symptoms in common to all forms of food poisoning except *botulism*.* In addition to these symptoms, meat poisoning creates thirst; muscular weakness; pain in the chest or bet the shoulders, fever, dark, offensive stools; leg and arm cramps; muscular twitching, prickling or numbness of the hands, drowsiness, disturbed vision, yellow skin, hallucinations, and often vertigo and anorexia. Pinched features, blueness of fingers, toes and sunken eyes precede death

meatorrhaphy (mê-ât-or'af-l) [L. *meatus*, passage, + G. *raphê*, a sewing]. Suture of the severed end of a meatus, usually the *meatus urinarius*.

meatotomy (mê-ât-ôs'kô-pi) [" + G. *skopein*, to examine] Instrumental examination of a meatus

meatotome (mê-ât-ô-tôm) [" + G. *tomê*, incision] Knife with probe or guarded point for enlarging meatus by direct incision

meatotomy (mê-ât-tot'ô-mi) [" + G. *tomê*, incision] Incision of urinary meatus to enlarge the opening **Syn** *porotomy*.

meatus (mê-ât'ûs) (pl. *meatus*) [L. *meatus*, opening] A passage or opening
m. acusticus externus. [BNA] External auditory canal from tympanum to pinna

m. acusticus internus. [BNA] Canal in the petrous portion of temporal bone, containing facial and auditory nerves and vessels

m. auditorius. **See** *m. acusticus, ext and int*

m. nasi communis. Common nasal cavity on either side of septum

m. nasi inferior. Space beneath inf. turbinate

m. nasi medius. Space beneath middle turbinate or concha

m. nasi superior. Space beneath sup. turbinate or concha

m. nasopharyngeus. Posterior portion of nasal cavity which communicates with the nasopharynx

m. urinarius. External opening of the urethra; usually said of the male

mechanical rectifier. A device which, by changing contacts at the proper moment in a cycle, changes alternating current into pulsating direct current

mechanics (mê-kân'tiks) [G. *mêchanê*, machine]. Science of force and matter

mechanism. **Psy** Combination of mental processes by which a result is obtained
m. mental. **Psy** Method of utilizing energy from instinctive drives with their accompanying emotions to deal with internal and external pressures upon the personality.

mechanology (mêk-ân-ôl'ô-jî) [" + *logos*, study]. Study of force and matter.

mechanotherapy (mêk'an-ô-thêr'â-pi) [G. *mêchanê*, machine, + *therapeia*, treatment]. Use of various types of mechanical apparatus to perform passive movements and to exercise various parts of the body. **Ex:** MacKenzie and Zander apparatus.

meckeleotomy (mek-el-ek'tô-mi) [G. *ek-tomê*, excision]. Excision of Meckel's ganglion.

Meckel's cartilage. A cartilaginous bar about which the mandible develops

M.'s diverticulum. A congenital sac or blind pouch sometimes found in lower portion of the ileum. Representing the persistent proximal end of the yolk stalk. Sometimes is continued to the umbilicus as a cord, or as a tube forming a fistulous opening at the umbilicus. Strangulation may cause intestinal obstruction **See:** *diverticulum, diverticulitis*

M.'s ganglion. G located in the sphenomaxillary fossa giving off nerves to eyes, nose and palate. **Syn** *sphenopalatine g* [the gasserian ganglion].

M.'s space. Area in dura holding **mecometer** (mê-kom'êt-ër) [G. *mekos*, length, + *metron*, measure] Device for measuring an infant's length

meconism (mek'ô-nizm) [G. *mêkôn*, poppy, + *ismos*, condition of] 1 Opium poisoning 2 The opium habit.

meconium (mê-kôn'ium) [G. *mêkônion*, poppy juice] 1 Opium, poppy juice 2 First feces of a newborn infant, made up of salts, liquor amnii, mucus, bile and epithelial cells, greenish black to light brown, almost odorless and of a tarry consistency

Evacuated by 3rd or 4th day after birth. Its disappearance should not be hastened, as it is a preventive of early bowel infection. Buttocks should be greased with petrolatum to prevent meconium from drying on the skin

mecystasis (mê-cis'tâ-sis) Process in which a muscle maintains its original degree of tension although its length is increased

medi- [L] Prefix The middle.

media (mê-di-â) [L middle] 1 Middle or muscular coat of an artery. **Syn** *tunica media* 2 Plural of *medium*.

med'ial [L *medius*, middle] 1 Pert to middle 2 Nearer the medial plane

med'ian [L *medius*, middle] 1 Middle, central 2 In statistics, a number obtained by arranging the given series in order of size and taking the middle number; one then has as many greater as there are less. Thus, in the series 5, 7, 8, 9, 10 the median is 8 **See** *mean*.

m. artery. A branch of the volar interosseous artery

m. line. An imaginary line extending longitudinally on the ant or post surface of the body marking the edges of the median plane **q v**

m. nerve. One of motion and sensation having its origin in the brachial plexus

m. plane. The midsagittal plane; a vertical plane through the trunk and head dividing the body into right and left halves

mediastinal (mê-di-âs-tî-nâl) [L. *mediastinus*, in middle] Rel. to the mediastinum.

mediastinitis (mê-di-âs-tî-nî'tis) [" + G. *-itis*, inflammation]. Inflammation of tissue of the mediastinum

mediastinopericarditis (mê-di-âs'tî-nô-pêr'i-kâr-di'tis) [" + G. *peri*, around, + *kardia*, heart, + *-itis*, inflammation]. Inflammatory condition of mediastinum and pericardium.

mediastinum (mê-di-âs-tî-nûm) [L. in the middle]. 1. A septum or cavity bet. 2 principal portions of an organ. 2. The folds of the pleura and intervening space bet. right and left lung. The in-

terpleural space. It contains the thoracic viscera. SEE *chylomediastinum*.

m. testis. SYN. *corpus Highmori*, or *body of Highmore*. The thickened portion of the tunica albuginea on post. surface of testis

m., thoracic. The space between the pleural cavities which encloses the heart and pericardium, large vessels entering and leaving heart, thoracic duct, vagus and phrenic nerves, trachea, esophagus, and thymus. Extends from sternum to vertebral column. Divided into superior, middle, inferior, anterior, and posterior portions

mediate (mē'di-āt) [L. *mediatus*, in the middle] 1. Accomplished by indirect means 2 Intermediate

medicable (med'i-kā-bl) [L. *medicāri*, to heal] Amenable to cure

medical (mēd'i-kal) [L. *medicāri*, to heal]. Pert. to medicine

m. jurisprudence. Principles of medicine in their application to questions of law.

m. preparations. SOLID SUBSTANCES: Capsule or *capsula*, cachet, confection or *confectio*, cerate or *ceratum*, extract or *extractum*, lozenge or *trochiscus*; *lamella**, ointment or *unguentum*, plaster or *emplastrum*, powder or *pulvis*, pill or *pilula*, paper or *charta*, sterile* or *sterila*, suppository or *suppositorium*, tablet or *tabella*, vesicette*

FLUIDS: Fluidextract, or *fluidextractum*, tincture or *tinctura*, infusion or *infusum*, decoction or *decoctum*, wine or *vinum*, oleo-resin or *oleoresina*.

SUSPENSIONS: Mixture or *mixture*; emulsion or *emulsum*.

SOLUTIONS. Water or *aqua*, mucilage or *mucilago*, solution or *liquor*, elixir or *elixir*, syrup or *syrupus*, spirit or *spiritus*, glycerite or *glyceritum*, vinegar or *acetum* [or *oleatum*.

Misc Liniment or *linimentum*, oleate RS alkaloid, active principle, names of preparations, drugs with two names, antidote, dosage, drug action, drugs and their administration, names of individual drugs in alphabetical order; names of poisons poison, poisoning, preparations usually given by rectum; prescription writing [cine or remedy.

medicament [L. *medicamentum*]. A medicinal RS epispastic, errhine, escharotic, evacuant medical preparations, rubefacient, saponum, sedative, specific, vesicant, vesicatory

medicate (mēd'i-kāt) [L. *medicari*, to heal]. 1. To treat a disease with drugs. 2. To impregnate with medicinal substances.

medication (mēd-i-kā'shūn) [L. *medicāri*, to heal]. 1. Treatment with remedies. 2. Impregnation with medicine

m., hypodermic. Treatment by injection of remedies beneath the skin.

m., ionic. Introduction of ions of drugs into the body by cataphoresis.

m., substitutive. Medical therapy to cause a nonspecific inflammation to counteract a specific one.

ROUTES OF MEDICATION

m. r., inhalation. By use of masks, atomizers, vaporizers, or friable ampules.

m. r., intra-arterial. Introduction of medicaments or blood into an artery, usually the ulnar artery

m. r., intracardiac. Introduction of a drug into heart muscle or one of the heart chambers

m. r., intracutaneous (intradermal, endermic). Injection of drug between layers of skin.

m. r., intramedullary. Introduction of fluids into bone marrow, esp. that of sternum.

m. r., intramuscular. Introduction of drug muscles. Usual sites are deltoid or triceps muscles, or gluteus maximus
ABBR IM

m. r., intranasal. Introduction of nose drops or jellies for antiseptic, antihistaminic, or vasoconstrictive effect.

m. r., intrathecal. Introduction into subdural space of spinal cord. Spinal fluid is withdrawn equal to that introduced

m. r., intravenous. Injection of fluids into a vein, usually the basilic or median cubital vein. ABBR IV

m. r., iontophoresis (ion transfer) Introduction of drugs into deeper layers of the skin by a galvanic electric current

m. r., oral. Introduction by mouth. Not available for drugs destroyed by digestion, or those incapable of absorption, or drugs that are irritating to mucous membranes

m. r., rectal. Drugs may be given in form of liquids or suppositories

In diseases of the rectum and adjacent parts, medication is often applied by way of the anus, esp if medication cannot be adm by mouth, as in persistent nausea or emesis, during unconsciousness or delirium, or on account of the bad taste of the medication.

Almost any drug other than those of a corrosive nature may be adm. through the rectum

The medication should be given in as small an amount of solution as possible, in order to prevent irritation and expulsion. The preparation should be given in a small, well-greased catheter (with a funnel) into an empty rectum and colon. The colon should be cleansed at least 1 hour previous to giving the enema

A purgative enema may be used for this purpose. The time elapsing bet the 2 enemas should be an hour, as there must be no peristaltic action when the medication is introduced. Of course, there must be no fecal content to absorb the medicated solution.

Four points must be kept in mind: (1) The rectum must be free of fecal material.

(2) The medicinal substance must be readily soluble.

(3) The solution must have the consistency of thin starch, with a temperature of 100° F.

(4) The enema must be given slowly and not be too hot but at body temperature so as not to stimulate peristalsis. A wad of cotton should be held against the anal region to aid retention. The patient should lie on the left side while the injection is being given, in order to allow the solution to reach the ascending colon more easily.

A normal salt solution of 4 oz. with 5% of glucose is a common medicated enema. Gelatin or some astringent, such as alum solution, may be given.

SEE: enema

m. r., subcutaneous. Injection of drugs or implantation of pellets under the skin

m. r., sublingual. Absorption of drugs by the sublingual mucosa

m. r., vaginal. Drugs may be given in liquid form by douche or in the form of suppository, powder, or paint.

medicinal (mēd'i-sin-āl) [L. *medicina*, medicine]. Pert. to medicine.

m. enema. One to which some drug

or medication has been added, for retention or absorption, particularly in cases where medication cannot be adm. by mouth. **See:** *enema*.

medicine (mēd'ī-sin) [L. *medicina*]. 1. A drug. 2. The art of preventing, caring for, and assisting in the cure of disease, and the care of the injured. 3. Treatment of disease medically as distinguished from surgery.

m., aviation. A branch of medicine which deals with pathologic, physiologic, and emotional conditions induced by flying.

m., clinical. Observation and treatment at the bedside.

m., domestic. The treatment of disease or injuries in the home, usually by a layman under the direction or advice of a physician.

m., experimental. The scientific study of disease or pathologic conditions by experimentation upon laboratory animals, or through clinical research.

m., forensic. Application of medical knowledge to legal affairs.

m., group. (a) The practice of medicine by a group of physicians, usually consisting of specialists in various fields who pool their services and share jointly laboratory and x-ray facilities. Such a group is commonly called a clinic. (b) The securing of medical services by a group of individuals who, upon paying definite sums of money, are entitled to certain medical services or hospitalization in accordance to prearranged rules and regulations.

m., internal. 1. Treatment of diseases involving the internal structures. 2. Treatment of diseases nonsurgical in nature.

m., legal. Forensic medicine.

m., patent. A medicine for which a patent has been granted. **See:** *patent medicine*.

m., physical. **SYN:** *physiotherapy, physical therapy*. Treatment of disease by physical agents such as heat, cold, light, electricity, manipulation, or the use of mechanical devices.

m., preventive. The practice of preventing disease.

m., proprietary. Medicine in which proprietary interests have been secured by patent, copyright of labels, or secrecy of composition. **See:** *proprietary medicine*.

m., psychosomatic. Treatment of disease of mental and physical origin, esp the study of the emotional or psychic conditions as a cause or factor in bodily disorders. **See:** *psychosomatic*.

m., socialized. Practice of medicine under control and direction of the State.

m., state. **SYN:** *public medicine*. Branch of medical science which is concerned with collection of vital statistics, public health, esp control of contagious diseases, food and drug control, etc.

m., tropical. Branch of medical science which deals principally with diseases common in tropical or subtropical regions.

m., veterinary. That which deals with the diagnosis and treatment of diseases of animals.

medicineria (mēd'ī-sin-ē-rē-a) [L. *medius*, middle, + *cinerea*, ashen]. Internal gray matter of the claustrum and lenticle of the brain.

medicochirurgical (mēd'ī-kō-kī-rur'jī-kāl) [L. *medicus*, medical, + G. *cheir*, hand, + *ergon*, work]. Concerning both medicine and surgery.

medicolegal (mēd'ī-kō-lē-gāl) [“ + *legalis*, legal] **Rel.** to medical jurisprudence or forensic medicine.

medicus [L.]. A physician.

medinal (mēd'ī-nal). Soluble barbitol, barbitol sodium.

Uses: Sedative and hypnotic.

Dosage: 5-15 gr. (0.3-1.0 Gm.)

Medina worm. *Dracunculus medinensis*, *q v*.

medio- [L.]. Prefix meaning the middle.

mediopontine (mē'dī-ō-pon'tin) [L. *medius*, middle, + *pons*, *pont-*, bridge]. **Rel.** to center of the pons Varoli.

mediotarsal (mē'dī-ō-tar'sāl) [“ + G. *tarsos*, tarsus]. **Rel.** to the middle of the tarsus.

Mediterranean anemia. *Thalassemia* (Cooley's anemia) Also called *M disease*.

M. fever. Brucellosis, *q v*, undulant fever.

medium (mēd'ī-ūm) (pl. *media*) [L. middle] 1. An agent through which an effect is obtained. 2. Substance used for the cultivation of microorganisms. **SYN:** *culture medium*. 3. Substance through which impulses are transmitted.

medulla (mē-dul'ā) [L. marrow] 1. The marrow. 2. Inner or central portion of an organ, in contrast to the outer portion or cortex. 3. Medulla oblongata.

m., adrenal. Inner portion of the adrenal gland composed of chromaffin tissue. **Secretes:** epinephrine. **See:** *adrenal*.

m. of hair. Central axis of a hair.

m. of kidneys. Renal pyramids.

m. nephrica. Pyramids of kidneys.

m. oblongata. Enlarged portion of spinal cord in cranium after it enters the foramen magnum of the occipital bone; the lower portion of the brain stem.

m. ossium. Marrow in bone.

m. of ovary. Central portion of the ovary composed of loose connective tissue, blood vessels, lymphatics, and nerves.

m. spinalis. Spinal cord.

medullary (mēd'ū-lar'ī) [L. *medullaris*, pert. to marrow] Concerning marrow, or any medulla.

medulated (mēd'ū-lāt-ēd) [L. *medulla*, marrow] Covered by or containing marrow or medulla.

m. nerve fiber. A nerve fiber possessing a myelin or medullary sheath; a myelinated nerve fiber.

medullation. Acquiring of a myelin sheath.

medullitis (mēd'ū-lī'tis) [“ + G. *-itis*, inflammation] Inflammation of marrow. **SYN:** *myelitis*.

medullization (mēd'ū-lī-zā'shūn) [L. *medulla*, marrow]. Conversion to marrow abnormally.

medullocarthritis (mēd'ū-lō-ar-thrī'tis) [“ + G. *arthron*, joint, + *-itis*, inflammation]. Inflammation of marrow elements of bone ends.

medulloblastoma (mēd'ū-lō-blas-tō'mā) [L. *medulla*, marrow, + G. *blastos*, germ, + *-ōma*, tumor]. A malignant, soft, infiltrating tumor of the roof of the 4th ventricle and cerebellum. Often invades the meninges.

medullocell (mēd'ū-lō-sēl) [“ + *cellula*, little box]. Marrow cell. **SYN:** *myelocyte*.

medulloepithelioma (mēd'ū-lō-ep'ī-thēlī-ō'mā) [“ + G. *epi*, upon, + *thēlē*, nipple, + *-ōma*, tumor]. Tumor composed of retina epithelium and of neuroepithelium. **SYN:** *neuroepithelioma*, *glioma*.

mega-, meg- [G.]. Combining forms meaning *great, large*.

megabladder (még'-ă-blăd-ēr) [" + A.S. *blædre*]. Permanent abnormal distention of the urinary bladder. SYN: *megaloecystis*.

megacalyx (még'-ă-sēf'al'k) [" + *kephalē*, head]. Having an abnormally large head. SYN: *macrocephalous*.

megacoccus (még'-ă-kok'ūs) [" + *kokkos*, berry]. A large size coccus. SYN: *macrococcus*.

megacolon (még'-ă-ko'lon) [" + *kōlon*, colon]. Extremely dilated colon.

Usually congenital, and occurs also in infancy or childhood. In congenital cases, acetylcholine is used as a diagnostic test. SEE *Hirschsprung's disease*.

megacoly (még'-ă-kol'i) [" + *kōlon*, colon]. Dilatation of the colon.

megadont (még'-ă-dont) [G. *megas*, large, + *odont*, tooth]. Possessing very large teeth. SYN: *macrodon*.

megadyne (még'-ă-din) [" + *dynamis*, power]. A unit equal to one million dynes.*

megakaryocyte (még'-ă-kar'i-ō-sīt) [" + *karyon*, nucleus, + *kytos*, cell]. Large bone marrow cell with large or multiple nuclei. SYN: *megaloblast*, *myeloplax*.

megakakria (még'-ă-lak'ri-ă) [" + *akros*, extremity]. Trophic disorder marked by progressive enlargement of head, hands, feet, and thorax. SYN: *acromegaly*.

megakaryoblast (még'-ă-kar'i-ō-blăst). An immature megakaryocyte.

megalencephaly (még'-ă-l-ēn-sēf'ă-lī). Abnormally large size of the brain, usually accompanied by mental deficiency.

megalgia (még'-ă-lī-ă) [" + *algos*, pain]. Very severe pain.

megalo- [G.]. Combining form meaning *large, great*.

megaloblast (még'-ă-lō-blăst) [G. *megas*, large, + *blastos*, germ]. A large size nucleated red blood corpuscle, from 11-20 microns in diameter, oval and slightly irregular. Found in the blood in cases of pernicious anemia. SYN: *macroblast*.

megaloecardia (még'-ă-lō-kar'di-ă) [" + *kardia*, heart]. Cardiac hypertrophy. SYN: *cardiomegaly*.

megalocephalic (még'-ă-lō-sēf'al'k) [" + *kephalē*, head]. Having an abnormally large skull. SYN: *megacephalic*, *macrocephalic*.

megalocephaly (még'-ă-lō-sēf'ă-lī). [G. *megas*, large, + *kephalē*, head]. SYN: *macrocephaly*. 1. Abnormal size of the head. 2. *Leontiasis ossea*, a rare disease characterized by hyperostosis of bones of the skull.

megaloecornea (még'-ă-lō-kor'nē-ă) [G. *megas*, large, + L. *cornū*, horn]. An enlarged cornea.

megaloecystis (még'-ă-lō-sīs'tis) [" + *kystis*, bladder]. Abnormal, permanent enlargement of the bladder. SYN: *megabladder*.

megalocyte (még'-ă-lō-sīt) [" + *kytos*, cell]. Red blood corpuscle larger than average.

megalodactylous (még'-ă-lō-dak'til'ūs) [" + *daktylos*, finger]. Having very large digits.

megalodontia (még'-ă-lō-don'shl-ă) [G. *megas*, large, + *odont*, tooth]. Abnormal size of teeth.

megaloenteron (még'-ă-lō-ēn'tēr-on) [" + *enteron*, intestine]. Excessive size of the intestine. SYN: *enteromegaly*.

megalogastria (még'-ă-lō-gas'tri-ă) [" + *gastēr*, belly]. Excessive size of stomach. SYN: *gastromegaly*.

megaloglossia (még'-ă-lō-glos'si-ă) [" +

glōssa, tongue]. Enlargement of the tongue. SYN: *macroglossia*.

megalohepatia (még'-ă-lō-hē-pat'i-ă) [" + *ēpar*, *ēpat*, liver]. Abnormal enlargement of the liver. SYN: *hepatomegaly*.

megalokaryocyte (még'-ă-lō-kar'i-ō-sīt) [" + *karyon*, nucleus, + *kytos*, cell]. A large bone marrow cell with multiple nuclei. SYN: *megakaryocyte*.

megalomania (még'-ă-lō-mā-ni-ă) [G. *megas*, large, + *mania*, madness]. A psychosis characterized by ideas of personal exaltation and delusions of grandeur.

megalomelia (még'-ă-lō-mēl'i-ă) [" + *melos*, limb]. Abnormally large size of the limbs. SYN: *macromelia*.

megalonichosis (még'-ă-lō-nī-kō'sis) [" + *onyx*, *onych*, nail, + *-osis*]. Hypertrophy of the nails.

megaloecis (még'-ă-lō-pē'nīs) [" + L. *penis*, penis]. Abnormally large penis. SYN: *macrohallus*.

megaloophthalmos (még'-ă-lōf-thal'mus) [" + *ophthalmos*, eye]. Abnormally large eyes.

megaloecis (meg-a-lōp'si-ă) [" + *opsis*, vision]. An affection of the eyes in which objects appear enlarged. SYN: *macroscopia*.

megaloscopy (meg-a-lō-skōp) [" + *skopein*, to examine]. A speculum that magnifies.

megaloecis (még'-ă-lō-splēn'i-ă) [" + *splēn*, spleen]. Hypertrophy of the spleen. SYN: *splenomegaly*.

megalosyndactyly (még'-ă-lō-sin-dak'til'i) [" + *syn*, with, + *daktylos*, finger]. A condition of large and webbed digits.

megaloecis (még'-ă-lō-ūr'ē-tēr) [G. *megas*, large, + *ourētēr*, ureter]. Increase in diameter of the ureter.

megaloecis (még'-ă-prōs'ō-pūs). Possessing a large face.

megarectum (még'-ă-rek'tum) [" + L. *rectum*, straight]. Excessive dilatation of the rectum.

megase (még'-ă-sēm) [" + *sēma*, sign]. 1. Having an orbital aperture with an index exceeding 89, said of a skull. 2. A megase skull.

megophthalmos (még'-of-thal'mūs) [" + *ophthalmos*, eye]. Abnormally large eyes. SYN: *buphthalmos*, *megaloophthalmos*.

megrim (mē'grīm) [O.F. *migraine*]. Sick headache. SYN: *migraine*, *q.v.*

melibomia cyst (mī-bō'mi-ăn). Small tumor on eyelid, the result of inflammation of a m. gland. SYN: *chalazion*.*

m. gland. SYN: *tarsal gland*. One of the sebaceous glands between the tarsi and conjunctiva of eyelids.

Meinicke reaction or test (mī'nīk-e). Tests for syphilis. 1. Floccular reaction. 2. Turbidity reaction. 3. Clearing reaction.

melocardia (mī'ō-kar'di-ă) [G. *meion*, less, + *kardia*, heart]. Systole; heart contraction.

Meissner's corpuscles (mīs'nēr). An encapsulated end organ of touch found in dermal papillae close to epidermis. Each is an ovoid body containing endings of myelinated and unmyelinated nerve fibers. Most numerous in hairless portion of skin, esp. volar surface of hands, fingers, feet, and toes; also present in lips, eyelids, tip of tongue, and nipple.

M. plexus. Small aggregations of ganglion cells located in submucosa of intestine in which parasympathetic fibers of the vagus terminate.

mel [L.]. Honey.

melaina (mel-e'na) [G. *melaina*, black,

black oil]. 1. Black vomit. 2. Tarry evacuations. SEE *melena*.

melagra (mél-'á-grá) [G. *melos*, limb, + *agra*, seizure]. Pain in the limbs. SYN. *melalgia*.

melalgia (mél-al-'jí-á) [' + *algos*, pain]. Neuralgia of the limbs. SEE. *meralgia*.

melancholia (mél-an-ko-'lí-á) [G. *melas*, melan-, black, + *cholē*, bile]. A mental disorder characterized by marked depression, physical and mental apathy, brooding, mournful and doleful notions, and inhibition of activity. Observed in depressed phase of *manic-depressive psychoses*.

Some classify it as the depressed state of mania or the excited state of *manic depressive insanity*.

m., affective. Involving or due to the emotions

m. agita'ta. M. with much motor excitement

m. attonita. Characterized by mental and physical stupor

m. climacteric. Occurring at the menopause

m., convulsive. Occurring in connection with jacksonian epilepsy

m., involuntal. Despondency, suicidal tendencies, feelings of unworthiness and mental agitation occurring between 45 and 60 years of age

m., panphobic. Characterized with dread of everything

m., parietic. Preceding paresis

m., puberty. M. with feelings of inferiority.

m., sexual. M. associated with fear of impotence, venereal disease, unsatisfied sexual desires

m. simplex. Without delusions, a mild form.

m. stuporo'sa. SEE *m. attonita*.

m., suicidal. Having impulse to commit suicide combined with melancholia

melanodema (mél-an-e-dē'mā) [G. *melas*, melan-, black, + *odema*, swelling]

Black deposit in the lungs, melanosis of the lungs. SYN. *anthracosis*

melanemia (mél-an-e'mí-á) [' + *aima*, blood]. Unnaturally dark color of blood, due to presence of melanin or free, dark pigment

Seen mainly in pernicious anemia.

melanephrosis (mél-an-éf-i-drō'sis) [' + *ephros*, sweating]. Black sweat. SYN. *melanidrosis*.

mélangeur (mā-lon-'jher') [Fr. mixer]. Apparatus for drawing and diluting blood specimens for microscopic examination

melanidrosis (mél-an-id-rō'sis) [G. *melas*, melan-, black, + *idrosis*, sweat]. Black sweat. SYN. *melanephrosis*.

melaniferous (mél-an-'í-ér-'ūs) [' + *L. ferre*, to carry]. Containing melanin or some other black pigment.

mel'anin [G. *melas*, melan-, black]. The pigment which gives color to hair, skin and the choroid of the eye, and is present in some cancers, as in *melanoma*.

Melanin can be prepared chemically

melanism (mél-'án-'izm) [' + *ismos*, state of]. Excessively black pigmentation of the organs and tissues. [darkness.]

melano- [G.]. Prefix meaning black or **melanoblast** (mél-'án-'ō-blást). A cell found in basal layers of epidermis which elaborates melanin.

melanoblastoma (mél-'á-nō-blás-tō'mā) [' + *blastos*, germ, + *-ōma*, tumor]. A tumor containing melanin

melanocarcinoma (mél-'á-nō-kar-sín-'ō'mā) [' + *karkinos*, crab cancer]. A cancer which is darkly pigmented.

melanocyte (mél-'an-'ō'sít) [G. *melas*, melan-, black, -*kytos*, cell]. SYN: *chromatophore*. A phagocyte which has ingested melanin.

melanoderma (mél-'an-'ō-der-'mā) [' + *derma*, skin]. A dark skin discoloration.

melanoeipithelioma (mél-'án-'ō-ép-i-the-'lí-'ō'mā). A malignant epithelioma containing melanin

melanogenesis (mél-'an-'ō-jén-'ē-sis) [' + *genesis*, production]. Formation of melanin

melanoglossia (mél-'án-'ō-glō'sí-'á) [G. *melas*, melan-, black, + *glossa*, tongue]. Black tongue. SYN. *glossophytia*.

melanoid (mél-'á-noid) [' + *eidos*, form]

1. Concerning or resembling melanosis.

2. Melanin which is chemically prepared.

melanoleukoderma (mél-'an-'ō-lú-kō-der-'mā) [' + *leukos*, white, + *derma*, skin]. Mottled skin

m. col'li. Mottled skin of neck sometimes seen in syphilis. SYN. *collar of Venus*, *venereal collar*.

melano'ma [' + *-ōma*, tumor]. A pigmented mole or tumor. SYN. *nevus pigmentosus*.

melanomatosis (mél-'an-'ō-mat-'ō'sis) [' + *-ōsis*, intensive]. Formation of melanomas on or beneath the skin.

melanonychia (mél-'á-nō-ník-'í-'á) [G. *melas*, melan-, black, + *onych*, onych-, nail]. Black pigmentation of the nails

melanopathy (mél-'an-'ō-pá-'thí) [' + *pathos*, disease] 1. Dark pigmentation of skin 2. Disease with dark pigmentation of the skin. SYN. *melanoderma*, *melasma*

melanophore (mél-'an-'ō-fōr) [' + *phoros*, a bearer]. Cell carrying dark pigment

melanoplakia (mél-'an-'ō-plá-'ki-'á) [' + *plax*, *plak-*, a flat plate]. Condition marked by pigmented patches on the buccal mucosa

mel'anorrhag'ia [' + *rēgnunai*, to burst forth]. Black feces. SYN. *melanorrhœa*.

melanorrhœa (mél-'an-'ō-rē-'á) [' + *roia*, flow]. Black stools. SYN. *melena*, 2

melanosarcoma (mél-'á-nō-sar-'kō'mā) [G. *melas*, melan-, black, + *sarx*, sark-, flesh, + *-ōma*, tumor]. Sarcoma containing melanin

melanosclirrhous (mél-'á-nō-sklir-'rūs) [' + *skirros*, hard]. Black pigmented cancer. SYN. *melanocarcinoma*.

melanosis (mél-'an-'ō'sis) [' + *-ōsis*, intensive]. Unusual deposit of black pigments in different parts of body.

m. lenticularis. Rare skin disease, beginning in early youth, characterized by scattered pigment discolorations, ulcers, atrophy, etc. SYN: *xeroderma pigmentosum*

melanotic [G. *melas*, melan-, black]. 1. Blackish in color. 2. Pert to melanosis

melanotrichia linguee (mél-'án-'ō-trík-'í-'á ling'gwe). Black, hairy tongue. SEE. *black tongue*

melanuria (mél-'an-'u-rí-'á) [' + *G. ouron*, urine]. Dark pigments in urine.

melasma (mél-'az-'mā) [G. a black spot]. Any discoloration of the skin. SYN. *nigredo cutis*.

m. gravidarum. Discoloration of the skin during pregnancy

m. suprarenale. Hypofunction of the suprarenals with cutaneous pigmentation and severe anemia. SYN. *Addison's disease*, *q v*.

melena (mél-'ē-nā) [G. *melaina*, black, black bile] 1. Black vomit 2. Evacuations resembling tar, due to action of intestinal juices on free blood. Common in the newly born

m. neonatorum. M. in the newborn.

melenemesis (mel-e-nem'ë-sis) [“ + *eme-sis*, vomit]. Black vomit caused by blood that has been acted upon by the gastric juice. SYN *melena*, 1.

melicera, **meliceris** (mêl-i-sêr'ä. -is) [G. *melit*, honey, + *kêros*, wax]. Cyst containing matter of honeylike consistency.

meliodosis (mê'll-o-dô'sis). An infectious disease in which granulomatous lesions develop throughout the body. Similar to glanders except primary host is the rat.

Errôt. A bacterium *Malleomyces mal-lei*.

melissoph'bia [G. *melissa*, bee, + *phobos*, fear] Insane fear of bee or wasp stings.

melitagra (mêl-i-tag'rä) [G. *melit*, *melit*, honey, + *agra*, seizure] A form of eczema with soft crusts resembling honey.

melitemia (mel-i-te'mi-ä) [“ + *ama*, blood] Sugar in the blood. SYN *glycemia*.

melitis (mêl-itis) [G. *mêlon*, cheek, + *-itis*, inflammation]. Inflammation of cheek.

melitopyalism (mêl'it-ô-ti'al-izm) [G. *melit*, *melit*, honey, + *pygalon*, saliva]. Saliva containing glucose. SYN *glycopeny*.

melituria (mel-i-tu'ri-ä) [“ + *ouren*, urine] Diabetes mellitus, excretion of sugar in urine.

melilite (mêl'it) [G. *melit*, *melit*, honey]. Any medicated preparation of honey.

meliodiotherapy (mel-iô'di-ô-ther'a-pli) [G. *melôdia*, music, + *therapeia*, treatment] Treatment by music. SYN: *musicotherapy*.

melomania (mel-iô-mä'nî-ä) [G. *melos*, song, + *mania*, madness]. Insane love for music.

melomelus (mê-lôm'êl-üs). A monster with rudimentary limb attached to normal limb.

meloncus (mêl-on'küs) [G. *mêlon*, cheek, + *ogkos*, tumor] Tumor of the cheek.

mêlon [G. *mêlon*, apple] COMP Principally water and carbohydrates, the latter nearly all in the form of sugar.

AcTION A good cleanser. Often used in semi-fasting, esp watermelon.

INT. If fully ripened dyspepsies may use in small quantities. Good in constipation and in clogged conditions of the system.

CONTRA The sugar in melons is not sufficient to prohibit for diabetics. In irritable conditions of the digestive system they should be avoided.

meloplasty (mêl'ô-plas-ti) [G. *mêlon*, cheek, + *melos*, limb, + *plassein*, to form]. Reporative surgery of a cheek or limb.

melting point. Temperature at which conversion of a solid to a liquid begins.

member [L. *membrum*]. An organ or part of the body, esp. a limb.

membrane (mem'brän) [L. *membrana*]. A thin, soft, pliable layer of tissue which lines a tube or cavity, covers an organ or structure, or separates one part from another.

m., arachnoid. Middle layer of membranes covering brain and spinal cord.

m., atlanto-occipital. One of two fibrous membranes (ant and post) extending from the arch of the atlas to borders of the foramen magnum.

m., basal. SYN: *glassy membrane*, *lamina basalis*. Innermost of three layers of the choroid membrane of the eye.

m., basement. A delicate, noncellular membrane underlying a layer of epithelial cells and serving for their support and attachment.

m., basilar. M. extending from tympanic lip of osseous spiral lamina to crest of spiral ligament in cochlea of ear. It separates scala tympani from cochlear duct and forms supporting structure for the organ of Corti.

m., bone. Bone originating in a membrane.

m., Bowman's. Thin homogeneous m. separating corneal epithelium from proper substance of the cornea.

m s., brain and spinal cord. The meninges, *pia mater*, inner m., *dura mater*, outer m., and *arachnoid*, middle m.

m., Bruch's. SEE m., basal

m., cell. Surface layer of the cytoplasm of a cell, the plasma membrane.

m., choroid. The choroid, the portion of the vascular tunic or uvea of the eye which extends posteriorly from the ora serrata.

m., costocoracoid. Dense fascia bet. the pectoralis minor and subclavius muscles.

m., cricothyroid. M. connecting thyroid and cricoid cartilages of the larynx.

m., croupous. False yellowish-white m. in the larynx during croup.

m., decidua. One of the membranes formed in the endometrium of a pregnant uterus. Includes the decidua basalis, decidua, capsularis, and decidua parietalis, q v.

m., Descemet's. Elastic m. forming lining surface of the cornea.

m., diphtheritic. Fibrinous false m. on mucous surfaces in diphtheria.

m., drum. The tympanic membrane.

m., egg. One of the protective membranes or envelopes enclosing an ovum. May be primary (formed by egg itself, Ex vitelline membrane), secondary (formed by follicle cells, Ex zona pellucida), or tertiary (formed by oviduct or uterus, Ex albumen and shell of hen's egg).

m., elastic. One formed by elastic tissue fibers, es in the coats of arteries, etc.

m., elastic, of the larynx. Consists of upper quadrangular membrane and lower elastic cone.

m., enamel. 1. Cuticula dentis. 2. Thin calcified membrane (primary enamel cuticle) on surface of newly erupted tooth.

m., epithelial. M. composed of a layer of epithellium resting on a thin layer of connective tissue. Examples are mucous and serous membranes, q v.

m., false. Fibrinous exudate on a mucous surface of a membrane, as in diphtheria.

m., fenestrated. A layer of elastic connective tissue possessing minute round or oval openings. Found in tunica intima and tunica media of medium-sized and large arteries.

m., fetal. In mammals, the chorion, amnion, and allantois and, in addition, accessory structures which include the yolk sac, umbilical cord, and placenta.

m., fibrous. M. composed entirely of connective tissue. Examples are fasciae, aponeuroses, perichondrium, periosteum, dura mater, and capsules of some organs.

m., glassy, of choroid. SEE: m., basal

m., glassy, of graafian follicle. Transparent capsule which separates membrana granulosa from the theca.

m., glassy, of hair. Internal layer of a hair follicle separating the epithelial and connective tissues.

m., glial. Extremely delicate membrane, formed of foot plates of astrocytes, which surrounds all blood vessels.

in the brain, spinal cord, and in lining of pia mater separating these vessels from nervous tissue proper. It constitutes the major component of the blood-brain barrier.

m., Henle's elastic. See: *m., fenestrated*.

m., homogeneous. A fine m. covering villi of the placenta.

m., Huxley's. See *layer, Huxley*.

m., hyaline. 1 Basement* m. 2. M. bet. outer root sheath of a hair follicle and inner fibrous layer.

m., hyaloid. One investing the vitreous humor of the eye, seen on longitudinal section.

m., hypoglossal. A transverse fibrous lamella uniting tongue to hyoid bone.

m., interosseous. 1 A fibrous m in the arm connecting ulna to radius. 2. A fibrous m in the leg connecting tibia to fibula.

m., Krause's. Dark membranous band limiting the sarcomere in striated muscle. Also called *Z* or *intermediate disk*.

m., limiting, external. 1 Outer layer of cells of the developing neural tube. 2 M. in retina of eye separating rods and cones from their cell bodies.

m., limiting, internal. 1 Inner layer of ependymal cells lining neural tube. 2 Glial membrane forming innermost layer of the retina and of the iris.

m., meconic. A m. forming a layer in rectum of the fetus.

m., medullary. Endosteum*.

m., mucous. M. lining cavities and canals communicating with the air and kept moist by secretion of mucus.

m., Nasmyth's. Epithelial m. covering enamel of teeth in the fetus, also for a short time after birth.

m., nictitating. A third eyelid present in lower vertebrates and represented in man by a fold of the conjunctiva, the *plica semilunaris*.

m., nuclear. The *karyotheca* or membrane forming surface layer of a nucleus.

m., obturator. Fibrous m. closing the obturator foramen.

m., oral. Pharyngeal m., *q v*.

m., oronasal. A double epithelial layer separating the nasal pits from the embryonic oral cavity. Same as *bucco-nasal membrane*.

m., otolithic. A layer of gelatinous substance containing otoconia or otoliths, found on the surface of maculae in inner ear.

m., peridental. Connective tissue between the root of a tooth and the alveolar bone.

m., permeable. A m. which permits the passage of water and certain substances in solution.

m., pharyngeal. m. closing embryonic gut at oral end.

m., plasma. A cell membrane, *q v*.

m., pseudoserous. M. resembling a serous membrane in structure. Ex endothelium.

m., pupillary. Transparent m. closing the fetal pupil. If it persists after birth it is known as persistent p. membrane.

m., pyogenic. Granular lining of an abscess or fistula.

m., pyophylactic. Protective lining of an abscess that prevents reabsorption.

m., quadrangular. Upper portion of the elastic membrane of the larynx, *q v*.

m., Reissner's. Syn: *membrana vestibularis*. Delicate membrane separating cochlear canal from scala vestibuli.

m., Ruysch's. Syn: *lamina chorio-capillaris*. Choroid's middle layer, composed of a close capillary network.

m., schneiderian. Mucosa of the nasal fossae. Syn: *membrana pituitosa*.

m., selectively permeable. A membrane which allows a substance like water to pass through more readily than another, like salt or sugar.

m., semipermeable. M. allowing passage of water but not substances in solution.

m., serous. M. consisting of mesothelium lying on thin layer of connective tissue which lines the closed cavities (peritoneal, pleural, and pericardial) of the body. Surface is moistened by a thin fluid similar to lymph.

m., Shrapnell's. That portion of the tympanic m. filling the notch of Rivinus.

m., synovial. M. lining a joint and secreting synovia.

m., tectorial. Thin, jellylike membrane projecting from vestibular lip of osseous spiral lamina and overlying the spiral organ of Corti.

m., theory, of nerve conduction. Theory that the nerve cell membrane and that of its axon is the seat of the electromotive force establishing the resting potential of a cell, that the breakdown of the membrane such as caused by a threshold stimulus abolishes the membrane potential and initiates a wave of depolarization which passes along the nerve fiber and is the nerve impulse.

m., thyrohyoid. One joining the hyoid bone and the thyroid cartilage.

m., tympanic. The drum membrane; membrane separating tympanic cavity from the external auditory meatus.

m., vaginal. The hymen.

m., vitelline. Membrane that forms surface layer of an ovum.

m., vitreous. Descemet's membrane.

m., yolk. A membrane surrounding the ovum, vitelline membrane or zona pellucida, *q v*.

membraniform (mem-bran'î-form) [L. *membrana*, membrane, + *forma*, shape]. Resembling or of the nature of a membrane. Syn: *membranoid*, *membranous*.

membranocartilaginous (mēm'brân-ô-kâr-tîl-aj'î-nūs) [*m* + *cartilago*, cartilage]. 1 Pert. to membrane and cartilage. 2 Derived from both membrane and cartilage.

membranoid (mēm'brā-noid) [L. *membrana*, membrane + *G eidos*, resemblance]. Resembling a membrane. Syn: *membraniform*, *membranous*.

membranous (mem-bran'us) [L. *membrana*, membrane]. 1 Rel. to a membrane. 2 Resembling a membrane. Syn: *membraniform*, *membranoid*.

membrum muliebre (mēm'brum mu-lîe-bre) [L. female member]. The clitoris.

membrum virile (mēm'brum vir-il'e) [L. male member]. The penis.

memory [L. *memoria*, memory]. The mental registration of past experience, knowledge, ideas, sensations and thoughts.

Registration of experience is favored by clear comprehension during intense consciousness, but it may occur during catatonic stupor (here stupor refers not to a clouding of consciousness, but to a type of behavior).

Retention of memory differs greatly with individuals, as well as with structural and psychological variations. Memory recall, esp its intentional recall, means the reproduction of a memory in consciousness. Clear comprehen-

sion greatly favors retention. Recall may fail because the memory has been obliterated, or functionally because the stream of ideas is that which one does not wish to remember. Various memory defects occur in many diseases.

Memory is confused or obliterated in *maniacal states*, lively in *paranoia*, abolished in *senile psychosis* and *organic brain disease*, but undisturbed in *depressions*. In dementia from senile causes there is accurate m for remote events but none for recent occurrences.

RS *anamnesic, association center, mnemonic, mnemonics, retention, r defect.*

m., anterograde. SYN *anterograde amnesia*. Ability to remember events occurring in the remote past but lacking ability to remember recent events.

m., retrograde. SYN *retrograde amnesia*. Ability to recall events of recent occurrence but lacking ability to recall knowledge with which patient had previously been familiar.

menacme (mĕn-ăk'mē) [G *mēn*, month, + *akmē*, top] The pinnacle (acme) of the menstrual life of a woman.

menarche (mĕn-ăr'kē) [G *mēn*, month, + *archē*, beginning]. Beginning of menstruation.

In a group of 100 subjects it was found that the menarche occurred:

In 8 between ages 11 and 11.99 years

In 22 between ages 12 and 12.99 years

In 32 between ages 13 and 13.99 years

In 23 between ages 14 and 14.99 years

In 11 between ages 15 and 15.99 years

In 4 between ages 16 and 16.99 years

Mendel's laws. Certain principles of heredity established by Gregor Mendel (1865). He demonstrated that traits were inherited as unit characters, each determined by a pair of determiners or genes, that when two determiners for contrasting characters were present in a single individual (a hybrid), one character would manifest itself to the exclusion of the other. This character was said to be *dominant* over the other, the recessive character. Mendel established that in the formation of gametes the pairs of determiners separated and only one was present in a gamete (the law of *segregation*), that when determiners for two pairs of characters were present, each pair segregated independently of the other (the law of *independent assortment*).

Although Mendel's principles were subsequently shown not to apply universally, his work laid the foundation for the development of modern genetics and the present chromosome theory of heredity (theory of the gene).

M.'s reflex. Dorsal flexion of 2nd to 5th toes upon percussion of the dorsum of the foot.

menhidrosis (mĕn-hī-drō'sis). Vicarious menstruation through the sweat glands. SYN: *menidrosis*.

menidrosis (mĕn-i-dro'sis) [G. *mēn*, month, + *idrōs*, sweat]. Vicarious menstruation through sweat glands. SYN: *menhidrosis*.

Ménière's disease (mā-nē-ărs'). Disturbance in labyrinth seen in great variety of conditions, as drug poisoning, circulatory disturbances, infectious diseases, as in the exanthemata, and chancre of syphilis, blood dyscrasias, neuritis of vestibular branch of 8th nerve, and tumors of cerebellopontine angle.

SYM: Sudden onset of tinnitus, deafness, nausea, vomiting and dizziness. May last from several days to months.

TREATMENT: Should be directed toward underlying cause. Symptomatic treatment is eliminative, sedative and withholding fluids on the basis of edema of labyrinth as cause of symptoms.

Relief obtained by performing Dandy's operation of severing equilibrium branch of auditory nerve.

meningeal (mĕn-in'jē-ăl) [G. *mēnigz*, *mēnigz*-, membrane]. Rel. to the meninges.

meningeorrhaphy (mĕ-nĭn-jē-or'ă-ff) [" + *raphē*, a sewing]. Suture of any membranes, esp those of brain and spinal cord.

meninges (mĕn-in'jēz) (sing *meninx*) [G. *mēnigz*, *mēnigz*-, membrane]. 1. Membranes. 2 The 3 membranes investing the spinal cord and brain, the *dura mater*, external, the *arachnoid*, middle, and *pia mater*, internal.

meningina (mĕ-nĭn-jī'nă) [G. *mēnigz*-, membrane]. The pia mater and adjacent layer of the arachnoid combined. SYN: *pia-arachnoid*.

meningitis (mĕ-nĭn-jī-nī'tis) [" + *-itis*, inflammation]. Inflammation of the pia-arachnoid membrane. SYN: *leptomeningitis*, *piarachnitis*.

meningioma (mĕ-nĭn-jī-ō'mă) [" + *-ōma*, tumor]. Tumor of the meninges.

meningism (mĕn-in'izlm) [" + *-ismos*, state of] Irritation of the brain and spinal cord with simulation of meningitis, but without actual inflammation.

meningitic (mĕ-nĭn-jī'tik) [G. *mēnigz*-, membrane]. Pert to meningitis.

meningitis (mĕn-in-jī'tis) [" + *-itis*, inflammation]. Inflammation of the membranes of spinal cord or brain.

SEE *choriomeningitis*, *Kernig's sign*, *leptomeningitis*, *pachymeningitis*.

m., acute. SYM: Moderate, irregular fever, loss of appetite, constipation, intense headache, intolerance to light and sound, contracted pupils, delirium, retraction of head, convulsions and coma.

ETIO: Caused by bacteria, viruses, or other organisms which reach the meninges from other foci in the body via blood or lymph, through trauma, or from adjacent bony structures (sinuses, mastoid cells).

PROG: Unfavorable though recovery is not impossible.

NP: The room should be dark and kept quiet. Bowels may be kept open with the aid of aperients. Retention of urine must be guarded against, as distention is apt to occur. The eyes and mouth must be kept cleansed, and pressure points upon the back should be guarded against. The foot of the bed should be raised after each injection. Headache may be relieved by an icebag or cold compresses. Special nursing technic as may be necessary. Isolation and asepsis are indicated. All discharges should be burned. The eyes should be protected from the light, and all noise and everything that might disturb the patient should be avoided.

A bed cradle may be necessary to relieve pressure and friction. Sudden excitement may cause a convulsion, so quiet is absolutely necessary. Change the patient's position frequently but avoid jarring the bed. Hypostatic pneumonia must be guarded against. A cleansing bath with an alcohol rub should be a daily procedure. All body prominences need special attention to prevent pressure sores. Mouth hygiene is also called for morning and night.

The intake and output of fluids must

be recorded. During the acute stage restraints may be necessary.

Diet. A fluid diet is necessary during the acute stage, but later as much nourishment should be given as possible, as the disease is an exhaustive one. Milk, eggs, beef tea, water, fruit juices and sugar may be given freely. A more solid diet may be given during convalescence. With stuporous patients nasal feeding is necessary. Children and some adults may have to be fed with a spoon, or a medicine dropper.

Treatment. Patient should be placed in a darkened, well-ventilated room. Ice bag to head. When robust wet cups or leeches may be applied to neck.

Constipation relieved by enemas. Remedies called for in individual case. Sulfanilamide and its derivatives are used successfully now in pneumococcal, meningococcal and beta hemolytic streptococcal meningitis.

m., acute, aseptic. Lymphocytic choriomeningitis, a nonpurulent form usually running a short benign course with recovery.

m., a., epidemic. SYN *cerebrospinal fever*.

m., basilar. Inflammation at base of brain of the meninges.

m., cerebral. Acute or chronic m. of brain membranes.

m., cerebrospinal. M. of brain and m., *chronic, epidemic.* M. of brain and m., *chronic, epidemic.* A specific infectious disease caused by invasion of meningococci, characterized anatomically by inflammation of the cerebrospinal meninges, and clinically by intense pain in head, back and limbs, convulsions, irregular fever and frequently by a petechial eruption.

SYM. Abrupt chill, vomiting and pain as mentioned, muscles of neck and back become rigid and contracted. Opisthotonos may be present, mind soon affected (delirium); nystagmus, strabismus; ptosis, irregular, sluggish pupils, partial deafness or blindness, extreme cutaneous hyperesthesia, so that slightest touch causes pain, may all be present. Temperature ranges generally between 101°-103° F. May be about normal or very high. Pulse full, rapid; urine may contain albumin and sugar. Ecthy, purpuric rash over whole body may be present. Duration, few hours to several weeks. Three forms: Fulminant, abortive, intermittent.

Progn. Guarded. Mortality varies in different epidemics from 20-80%.

Treatment. Liquid diet. Ice bags to head and along spinal column. Medication to suit the case. Sponging with cool water or cold pack.

m., influenza. A form caused by B strain of *Hemophilus influenzae*, which can be identified from smears of spinal fluid. More common in infants and children than in older individuals.

m., serosa circumscripta. M. accompanied by the formation of cystic accumulations of fluid which simulate tumors.

m., serous. Serous exudation in m. into cerebral ventricles.

m., spinal. M. of spinal cord membranes.

m., sterile. M. in which infectious organisms are absent.

m., traumatic. M. resulting from organisms following injury to the skull or spine.

m., tuberculous. An acute inflammation of the cerebral meninges excited by the tubercle bacillus.

SYM: Loss of flesh, gradual wasting of strength, evening rise of temperature, restlessness, irritability, and sleeplessness may exist for some time before acute symptoms come on. These are severe headache, occasional convulsions, delirium, vomiting, fever, optic neuritis.

meningitophobia (me-nin-jit-ō-fō-bi-ā) [G. *ménigx*, *méniggo*, membrane] 1 Meningism due to fear of brain disease. 2 Morbid fear of meningitis.

meningoarteritis (me-nin-gō-ār-tēr-i-tis) [" + *arteria*, artery, + *-itis*, inflammation] Inflammatory condition of the meningeal arteries.

meningocele (men-in-gō-sēl) [" + *kēlē*, hernia]. Congenital hernia, the meninges protruding through an opening of the skull or spinal column.

meningocerebritis (me-nin-gō-ser-e-brī-tis) [" + *L. cerebrum*, brain, + *G. -itis*, inflammation] Inflamed condition of brain and meninges. SYN *meningoencephalitis*.

meningococcemia (me-nin-gō-kōk-sē-mī-ā) [" + *kōkko*, berry, + *aima*, blood]. Meningococci in the blood.

meningococcus (men-in-gō-kok'us) (pl. *meningococci*) [G. *ménigx*, *méniggo*, membrane, + *kōkko*, berry] The microorganism responsible for cerebrospinal meningitis. SEE *coccus*, *Neisseria meningitidis*.

meningocortical (me-nin-gō-kor-ti-kal) [" + *L. cortex*, cortic-, bark] Pert. to the meninges and the cortex.

meningocephalitis (men-in-gō-en-sef-āl-i-tis) [" + *egkephalos*, brain, + *-itis*, inflammation] Inflammation of meninges and cerebral cortex of the brain.

meningocephalocoele (me-nin-gō-en-sēf-āl-ō-sēl) [" + *egkephalos*, brain, + *kēlē*, hernia]. Hernia of brain and meninges.

meningoencephalomyelitis (me-nin-gō-ēn-sēf-āl-ō-mī-ēl-i-tis) [" + " + *myelon*, marrow, + *-itis*, inflammation]. Inflammation of the brain, spinal cord, and their meninges.

meningomalacia (me-nin-gō-mā-lā'si-ā) [" + *malakia*, softening]. Softening of any membrane.

meningomyelitis (men-in-gō-mī-ēl-i-tis) [G. *ménigx*, *méniggo*, membrane, + *myelon*, marrow, + *-itis*, inflammation]. Inflammation of spinal cord and its membranes; less commonly of the dura mater, also.

meningomyelocoele (me-nin-gō-mī-ēl-ō-sēl) [" + " + *kēlē*, hernia]. Hernia of spinal cord and membranes.

meningopathy (me-nin-gō-pā-thi) [" + *pathos*, disease]. Any pathological condition of the meninges.

meningorrhachidian (me-nin-gō-rā-kid-i-an) [" + *rachis*, spine]. Concerning the spinal cord and meninges.

meningorrhagia (me-nin-gō-rā'ji-ā) [" + *rēgnunai*, to burst forth]. Meningeal hemorrhage. SYN *meningorrhhea*.

meningorrhœa (me-nin-gō-rē-ā) [" + *roia*, flow]. Meningeal hemorrhage. SYN: *meningorrhagia*.

meningotyphoid (me-nin-gō-ti'foid) [G. *ménigx*, *méniggo*, membrane, + *typhos*, stupor, + *eidos*, form]. Typhoid fever with symptoms of meningitis.

meninguria (me-nin-gū'ri-ā) [" + *ouron*, urine]. Presence of membraniform shreds in urine.

meninx (me'ninks) (pl. *meninges*) [G. *ménigx*, membrane]. Any membrane, but esp. one of the coverings of the brain or spinal cord.

meniscitis (men-is-ki'tis) [G. *méniskos*,

crenate, + *-itis*, inflammation]. Inflamed condition of an interarticular cartilage, esp the semilunar cartilages of the knee joint.

meniscocyte (men-'is-'kō-sīt) [' + *kytos*, cell]. A crescent-shaped red blood cell.

meniscocytosis (men-'is-'kō-sīt-ō'sis) [' + *-osis*, intensive]. Crescent cells in the blood, sickle cell anemia.

meniscus (men-'is-'kus) [G *mēniskos*, crescent]. 1. Concavo-convex lens. 2. Interarticular fibrocartilage of crescent shape, found in certain joints, esp the lateral and medial menisci (semilunar cartilages) of the knee joint
m. articularis. [BNA.] See *meniscus*, 2.

menocelis (men-ō-sē'lis) [G *mēn*, month, + *kēlis*, spot]. Spotted cutaneous condition sometimes seen in women failing to menstruate

menolipsis (men-ō-lip'sis) [' + *leipsis*, a falling]. Temporary absence or retention of menses

menometrorrhagia (mēn'ō-mēt-ror-rā'-jī-ā) [G *mēn*, month, + *mētra*, uterus, + *rēgnunai*, to burst forth]. Abnormal hemorrhagic condition of uterus, esp. bet. menstrual periods

Cure of this condition has been effected by correcting body weight and basal metabolic rate, and by using blood from lactating amenorrhic women.

menopause (mēn'ō-pawz) [G *mēn*, month, + *pausis*, cessation]. That period which marks the permanent cessation of menstrual activity

Ceases bet. 45 to 50 years of life. The menses may stop suddenly or there may be a decreased flow each month until there is a final cessation, or the interval bet. periods may be lengthened until complete cessation is accomplished.

Average Age of Women at Menopause	
Per Cent	Age
12	36-40
26	41-45
41	46-50
15	51-55

Six per cent had their menopause before 35 or after 55

SYM The menopause is usually accompanied by elevation of blood pressure, hot and cold flashes, feeling of weakness, and, in some cases, marked mental derangements.

In women of *plethoric* type symptoms are those of congestion—flushes of heat, rush of blood to face and head, uterine and other hemorrhages, leukorrhea, and even diarrhea. In *chlorotic* subjects, sallow complexion, semichlorotic skin, weak pulse and various other indications of debility. In *nervous* subjects, the overanxious look, the terror-stricken expression as if apprehensive of seeing some frightful object, the face bedewed with perspiration, and remarkable tendency to hysteria are symptoms often met.

The unusual development of hair on chin and lip generally coincides with final cessation of menses; so does an unusual power of generating heat, indicated by throwing off clothing and opening doors and windows. There is often rheumatism of shoulder or thigh or swelling of joints. Often nymphomania is present. May be ulcers and polypi of uterus and carcinoma of this organ and of the breasts.

Anatomically there is marked atrophy of the external pudendi, and atrophy of the uterus, tubes and ovaries; the vagina becomes conical in shape, and

the mucous membrane becomes smooth and atrophic.

NP & TREATMENT Constitutional as indicated by special symptoms of the case. An utter change of surroundings where possible. As many restful vacations as possible. Great care in diet, exercise, clothing, etc. Plain, simple food, consisting for most part of vegetables, fruits, fresh beef and mutton. All stimulating food and beverages should be avoided. Daily exercise in open air, riding or walking, clothing warm, comfortable and adapted to the season. Frequent bathing and friction of skin; absence of worry.

Estrogen in large doses, estradiol dipropionate, thyroid extract and sedatives have been used effectively in this condition. Large doses of female sex hormone may loosen painful or stiff shoulders and thighs. Ovarian therapy and the use of bromides. **SYN:** *change of life, climacteric*.

RS: *involution, menses, menstruation, sexual involution*.

m., artificial. M. occurring subsequent to surgical castration, x-ray irradiation, or radium implantation into the uterus
m. premature. M. either natural or artificial occurring before age 35

menophania (men-ō-fa'nī-ā) [G. *mēn*, month, + *phainein*, to show]. First appearance of the menses at puberty.

menoplasia (men-ō-plā'nī-ā) [' + *planē*, a wandering]. Vicarious menstruation, menstruation through other than the normal outlet, as through the nose.

menorrhagia (men-ō-ra'jī-ā) [' + *rēgnunai*, to burst forth]. Excessive bleeding at the time of a menstrual period, either in number of days or amount of blood or both.

ETIOI. *Endocrine Disturbances* Pituitary gland, thyroid and ovary. *General Systemic Diseases* Hypertension, diabetes mellitus, blood dyscrasias, chronic nephritis. *Malpositions of the Uterus* Retroversion and retroflexion. *New Growths of the Uterus* Particularly fibroids of the intramural and submucous types, adenomyosis of the uterus, fibrosis of the uterus with hyperplastic changes of the endometrium. *Conditions of the Cervix Uteri* Erosions, polypi. *Inflammations in the Pelvis:* Acute salpingitis, acute metritis, acute endometritis, chronic metritis and endometritis.

NP & TREATMENT The specific treatment of this condition depends upon the direct etiologic factor. In urgent cases place patient on hard mattress in cool room and elevate the hips. If this does not diminish the flow, apply piece of ice to mouth of uterus. This failing, bandage extremities as described under hemorrhage (postpartum) or plug vagina.

During attack all food and drink should be taken moderately cold. Avoid stimulating food and beverages. Careful constitutional treatment should be given to remove cause of the disorder. Menorrhagia can be curtailed temporarily by the use of ecbolics (fluid extract of ergot and hydrastis). In cases in which the bleeding occurs near the time of the menopause, the use of radium or the removal of the uterus by either abdominal or vaginal hysterectomy.

menorrhagia (men-or-rā'l'jī-ā) [G. *mēn*, month, + *roia*, flow, + *algos*, pain]. **SYN:** *dysmenorrhea*. Painful menstruation or pelvic pain accompanying men-

struation, sometimes a symptom of endometriosis

menorrhæa (mèn-or-è'ä) [" + *roia*, flow].

1. Normal menstruation. 2. Free or profuse menstruation. *Syn*: *menorrhagia*.

menoschesis (men-os'kè-sis) [G. *mèn*, month, + *schesis*, retention]. Suppression of menses.

menoëpsis (men-o-sep'sis) [" + *sēpsis*, putrefaction]. Septic poisoning from retained menstrual discharge.

menostasis (men-ost'ā-sis) [" + *stasis*, a halting]. Suppression of menses. *Syn*: *amenorrhæa*.

menoëstaxis (men-ō-stak'sis) [" + *staxis*, dripping]. Prolonged menstruation

menoxenia (men-ok-se'ni-ä) [" + *xenos*, strange]. Abnormal menstruation.

menses (mèn'sēz) [L. pl. of *menstris*, month]. Monthly flow of bloody fluid from the uterus, catamenial flow

menstrua (men'stru-ä) (pl. of *menstruum*) [L.]. The menses

menstrual (men'strü-äl) [L. *menstruäre*, to discharge the menses] *Pert.* to menstruation. *Syn* *catamenial*.

m. cycle. The periodically recurrent series of changes occurring in the uterus and associated sex organs (ovaries, vagina) associated with menstruation and the intermenstrual period. The human cycle averages about 28 days in length, measured from the beginning of menstruation.

The menstrual cycle is divided into four phases characterized by histological changes which take place in the uterine endometrium. They are

1. **MENSTRUATION**. Period of uterine bleeding accompanied by shedding of the endometrium. Averages 4 days in length.

2. **PERIOD OF REPAIR AND PROLIFERATION** (postmenstrual period). Uterine epithelium is restored to normal, endometrium becomes thicker and more vascular, glands elongate. During this period the ovarian follicle is maturing and secreting estrogens. Period is terminated by rupture of follicle and liberation of ovum at about 14th to 16th day of cycle. Length of period, 10-13 days.

Also called *estrogenic* or *follicular period*.

3. **PROGRAVID OR SECRETORY PHASE**: Endometrium increases in thickness, glands become more tortuous and produce an abundant secretion containing glycogen. Coiled arteries make their appearance, endometrium becomes edematous, stroma becomes compact. During this period the corpus luteum in ovary is developing and secreting progesterone. Also called *luteal phase*. Lasts 10 to 14 days.

4. **PREMENSTRUAL OR ISCHMIC PHASE**. A day or two before menstruation, coiled arteries constrict, endometrium becomes anemic and shrinks. Corpus luteum of ovary begins involution. Period lasts about two days and is terminated by opening up of constricted arteries, the breaking off of small patches of necrotic endometrium and the beginning of menstruation with the flow of menstrual fluid.

Variations in the length of the cycle are due principally to variation in the length of the period of repair and proliferation.

menstruant (men'strü-änt) [L. *menstruäre*, to discharge the menses]. 1. In the condition of menstruating. 2. One who menstruates.

menstruate (men'strü-ät) [L. *menstruäre*]. To discharge menses.

menstruation (mèn-strü-ä'shùn) [L. *menstruäre*, to discharge the menses]. The periodic discharge of a bloody fluid from the uterus occurring at more or less regular intervals during the active sexual life of a woman from age of puberty to menopause. The discharge contains altered blood, with normal, hemolyzed, and sometimes agglutinated red blood cells, disintegrated endometrial and stroma cells, and secretions of glands. Menstrual blood does not coagulate.

Menstruation is brought on by the reduction in production of ovarian hormones, esp progesterone, which results from involution of the corpus luteum following failure of the ovum to become fertilized.

DIAGRAM OF MENSTRUAL CYCLE.

a. Menstruation; graafian follicle beginning to develop. b. Endometrium growing and follicle ripening. c. Endometrium becomes thicker in rest state. Follicle ruptures and sets ovum free about fourteenth day (ovulation). d. Endometrium in premenstrual or pregravid stage. Corpus luteum developing. Ovum degenerating. e. Corpus luteum degenerating. Menstruation recurs.

Menstruation has its onset at puberty (11-15 years of age). Length of flow varies from 3 to 7 days (ave 4-5 days). It occurs on an average every 27-28 days, although time may vary from 18 to 40 days. Menstruation ceases temporarily during pregnancy and lactation; permanently with onset of menopause. Its failure to occur may result from congenital abnormalities, physical disorders (disease, obesity, malnutrition), emotional or hormonal disturbances, esp diseases involving the ovaries, hypophysis, thyroid, or adrenal glands.

Menstrual irregularities absence of flow when normally expected is called *amenorrhea*, scanty flow, *oligomenorrhea*, painful menstruation, *dysmenorrhea*. Excessive loss of blood is termed *menorrhagia*. *Metarrhagia* is the loss of blood during intermenstrual periods. Prolongation of menstrual flow is *epimenorrhea*.

m., anovulatory. Menstruation occurring in absence of discharge of ovum from ovary, consequently with lack of development of pregravid endometrium and corpus luteum.

m., regurgitant. Backflow of menstrual fluid through uterine tubes.

m., supplementary. M accompanied by flow from another site.

m., suppressed. Failure of menstruation to occur when normally expected.

m., vicarious. Menstruation from other than the uterine passage.

menstruous (men-strū-us) [L *menstruare*, to discharge the menses]. Rel to menstruation.

menstruum (men'stru-um) [L *menstrual* fluid, it was believed that this fluid had solvent qualities.] A solvent, a medium. **See** *vehicle*.

mensuration (men-sū-rā'shūn) [L *mensuratio*, a measuring] The process of measuring. **See** *chest*, *measure*.

mentagra (men-tag'ra) [L *mentum*, chin, + G *agra*, seizure]. Inflammation of the hair follicles, esp of the beard, with pustular eruptions. **SYN** *syccosis*.

mentagrophyton (men-tag-rof'i-ton) [" + *phyton*, a plant] The fungus which is the cause of syccosis.

men'tal [L *mens*, *ment-*, mind, *mentum*, chin]. 1. Rel. to the mind. 2. Rel. to the chin.

RS *acatalepsy*, *cataleptic*, *cataphrenia*, *cenopsychic*, *cerebrasthenia*, *cerebropsychosis*.

m. age. Age of a person mentally, determined by a group of mental tests. **See** *age*, *mental*, *Binet*.

m. deficiency. **SYN** *amentia*, *oligophrenia*. Feeble-mindedness, weakness of mind, condition in which capacity for mental development is limited. **See**: *imbecile*, *idiot*, *moron*.

Etiol. Primary *amentia* is that due to intrinsic, inherent or hereditary factors. Includes conditions such as mongolism, microcephaly, and cretinism. Secondary *amentia* is that due to brain damage before, during, or shortly after birth. May result from trauma, infection, epilepsy, endocrine disturbances, or tumors.

m. disease. A disorder of the mind or intellect. Mild forms are known as *psychoneuroses*, *q v*, more severe forms, *psychoses*, *q v*.

m. fog. Clouding of consciousness.

m. hygiene. Science of maintaining healthy mental and emotional responses and preventing development of psychoses.

m. illness. Any disorder which affects the mind or behavior.

mentality. Mental power or activity; keenness of breadth of mind.

men'tha [L]. Mint.

m. piperita. Peppermint.

m. pulegium. Pennyroyal.

m. viridis. Spearmint.

menthol. An alcohol (C₁₀H₁₈OH) obtained from oil of peppermint or other mint oils. May be prepared synthetically. Occurs in crystalline form.

ACTION AND USES. As a counterirritant, antiseptic, and anodyne.

mentula (men-tū-lā) [L]. The penis.

mentulagra (men-tū-lag'rā) [L *mentula*, penis, + G *agra*, seizure]. Painful involuntary erection of the penis, sometimes curved. **SYN** *chordee*, *priapism*.

mentulate (men-tū-lāt) [L *mentula*, penis]. Possessing a large penis.

mentulomania (men-tū-lō-mā'nī-ā) [L *ment-*, mind, + G *mania*, madness].

Mental state characterized by addiction to masturbation.

men'tum [L]. The chin. **SYN** *genion*.

mephitic [L *mephitis*, foul exhalation].

Noxious, foul, as a poisonous odor.

meralgia (mer-al'ji-ā) [G *mēros*, thigh, + *algos*, pain]. Neuralgia of the thigh. **See** *sciatica*.

m. paresthet'ica. Affection of nerves of the thigh causing itching, tingling, pain, burning, and sometimes numbness.

merbaphen (mēr-bāf-ēn). USP A compound of mercury of about 33% mercury.

USES. As a diuretic.

DOSAGE. From 1-2 cc of a 10% solution, intramuscularly, or intravenously. Give first a tolerance test of ½ cc.

INCOMPATIBILITIES. Acids and ferric chloride.

Mercier's bar or barrier (mer-se-ā') A curved fold at neck of bladder, forming post margin of trigonum vesicae.

mercuripurin (mēr-kū'pū-rin) [L *mercurius*, mercury, + *purum*, pure, + *uricum*, uric acid]. A proprietary diuretic.

mercurial (mer-kū'rī-āl) [L *mercurialis*, pert to mercury]. 1 Pert to mercury. 2 A substance containing mercury.

m. palsy. Paralysis induced by mercurial poisoning.

m. rash. Rash caused by application of mercurial preparations locally.

mercurialism (mer-kū'rī-āl-izm) [" + G *ismos*, state of]. Chronic poisoning by mercury seen as a result of continuous administration of mercury.

Also occurs in workmen who labor on the metal, or inhale its vapors.

SYN Soreness of gums and loosening of teeth, increased salivation; fetor of breath; griping; and diarrhea.

mercurialization (mer-kū'rī-āl-i-zā'shūn) [L *mercurius*, mercury]. Condition of influencing with mercury.

mercurialized (mēr-kū'rī-āl-īzād) [L *mercurius*, mercury]. 1 Impregnated with mercury. 2 Influenced by or treated with mercury.

mercuric (mer-kū'rīk) [L *mercurius*, mercury]. Rel to bivalent mercury.

m. chloride (HgCl₂). A common compound of mercury formerly used in the household as an antiseptic, as a douche, and to destroy household pests.

One part to 1000 of water is used to free the hands or skin from bacteria. This solution used in strength of 1:2000 or 1:4000 may be used for wound irrigation. It should be remembered that this disinfectant coagulates albumen, that it corrodes metal instruments, and causes local dermatitis. No metallic

instrument should ever be placed in contact with mercuric chloride. Since it has been put up in blue coffin-shaped tablets in a notched bottle, poisoning has been less common.

POISONING: SYM: *Acute:* Those of any severe gastrointestinal irritation, with pain, cramping, constriction of the throat, vomiting, and a metallic taste in the mouth. Stronger solution causes a white coating due to coagulation. Abdominal pain may be so severe as to cause fainting, bloody diarrhea, bloody vomitus, scanty urine, prostration, convulsions and unconsciousness.

SYM: Chronic Bad breath, loosening of teeth, fever, urinary difficulties, nausea, diarrhea, sore tongue, paralyses, weakness and death.

F. A. TREATMENT: Evacuate stomach, wash out with milk. Administration of sodium formaldehyde sulfoxylate given by mouth and intravenously reduces mercuric salts to insoluble salts of low toxicity. This process also takes place in the tissues. Given intravenously, its effects last for several hours. **SEE nephrosis.**

m. oxide (HgO). A powder, usually yellow in color. Used in ointments. When red, it is used to dress sores in syphilis.

mercurochrome (mer-kü'ro-kröm) [*L. mercurius*, mercury, + *G. chrōma*, color]. A compound containing about 23% mercury, used as a germicide in 1 to 4% solution.

mer'curoil [*L. mercurius*, mercury]. A mercuric acid compound used in infections of the genitourinary tract and the conjunctiva.

mercurous (mer-kü'rus, mer'ku-rus) [*L. mercurius*]. Rel. to monovalent mercury.

m. chloride (HgCl) (Calomel). USP. This is a heavy white powder used in small doses in medicine as a laxative.

It is used in powder form as an application in ulcers and skin rashes.

DOSAGE: Mild, as laxative, in fractional doses. 2½ gr. (0.15 gm.).

POISONING: SYM Salivation, abdominal discomfort, and diarrhea.

F. A. TREATMENT. **SEE mercuric chloride.**

INCOMPATIBILITIES: Iodoform, soluble iodides, soluble hydroxides.

mercury (mer'kü-ri) [*L. mercurius*] **SYN:** *quicksilver.* A metallic element **SYMS:** Hg: At. weight, 200.6; specific gravity, 13.55. Insoluble in ordinary solvents but soluble in hydrochloric acid upon boiling. Forms two series of salts: *mercurous* in which it has a valence of one (univalent) and *mercuric* in which it has a valence of two (bivalent). It is a silvery liquid at ordinary temperatures and is used in medicine in the form of its salts, as purgative, cholagogue, alterative, antiseptic, disinfectant, and astringent.

POISONING: SYM: In large doses, increased salivation, abdominal cramps, interference with kidney function, etc.

m., ammoniated. **SEE white precipitate.**

m. bichloride. Corrosive sublimate. **USES:** Germicide.

INCOMPATIBILITIES: Albumen, alkalies, borax, etc.

SEE mercuric chloride, nephrosis.

meridian. A line encircling a globular body at right angles to its equator and passing through the poles, or a half of such a line.

m. of the eye. A circle passing through ant. and post. poles of the eyeball.

meridrosis (mer-id-rō'sis) [*G. meros*, part, + *idrosis*, perspiration]. Local perspiration.

merinthophobia (mēr-in-thō'fō'bi-ā) [*G. mērinthos*, a cord, + *phobos*, fear]. Morbid fear of being tied.

merispore (mer-i-spōr) [*G. meros*, a part, + *sporos*, a seed]. A secondary spore resulting from the division of another spore.

mero- [*G.*]. Combining form meaning a part, the thigh.

meroblastic (mer-ō-blāst'ik) [*G. meros*, a part, the thigh, + *blastos*, germ].

Pertaining to a type of ovum containing considerable yolk or a type of cleavage in which cleavage divisions are restricted to the protoplasmic region of the animal pole. Opp. of *holoblastic*.

merocoele (mer-ō-sēl) [*G. meros*, thigh, + *kele*, hernia]. Hernia of the thigh.

merocoxalgia (mēr-ō-kōks-al'ji-ā) [" + *L. coxa*, hip, + *G. algos*, pain] Painful condition of the thigh and hip.

merocrine (mēr-ō-krin) [*G. meros*, a part, + *krinein*, to secrete]. Pertaining to a type of secretion in which the glandular cell remains intact during the process of elaborating and discharging its product. **SEE apocrine, holocrine.**

meroergasia (mēr-ō-ēr-gā'zi-ā) [*G. meros*, a part + *ergasia*, work]. Partial mental disorder with symptoms of emotional instability. **SEE. holergastic.**

merogenesis (mēr-ō-jen-ē-sis) [" + *genesis*, production] Multiplication or reproduction by segmentation.

merology (mer-ō-lō'ji) [" + *logos*, study of] Anatomy of the elementary tissues.

meromicrosomia (mēr-ō-mī'krō-sō'mī-ā) [" + *mikros*, small, + *sōma*, body]. Abnormal smallness of some part or structure of the body.

meronecrosis (mēr-ō-nēk-rō'sis) [" + *nekros*, dead]. Necrosis of cells.

meropia (mer-ō'pi-ā) [*G. meros*, part, + *ōps*, vision]. Partial blindness.

merorrhachischisis (mēr-ō-rā-kis'ki-sis) [" + *rachis*, spine, + *schisis*, fissure]. Fissure of a portion of the spinal cord.

meroscope (mēr-ō-skōp) [*G. meros*, part, + *skopein*, to examine]. Device used in performing microscopy.

meroscopy (mēr-ōs'kō-pi) [" + *skopein*, to examine]. Auscultation of the separate parts of the cardiac cycle.

merosmia (mēr-ōs'mī-ā) [" + *osmē*, odor]. Inability to detect certain odors.

merosystolic (mēr-ō-sis-toi'ik) [" + *systole*, a contraction] Rel. to a portion of the systole.

merofomy (mer-ōt-ō-mē) [" + *tomē*, incision]. Division into sections or segments.

merozoite (mer-ō-zō'it) [*G. meros*, part, + *zoon*, animal]. A body formed by segmentation or breaking up of schizont in asexual reproduction of certain sporozoans such as *Plasmodium*. Merozoites when formed are liberated and invade other corpuscles where they repeat the process of schizogony, or develop into gametocytes.

merthiolate (mer-thi'ō-lāt). An organic combination containing about 50% mercury, and less toxic than bichloride, used as a disinfectant in solutions of 1:5000 to 1:1000, aqueous, or in the form of a tincture, as an ointment, 1:2000. **For ophthalmic use, 1:5000 ointment, or 1:10,000 aqueous.**

Merullius lacrymans. A species of fungi causing dry rot in wood. Spores when

Inhaled may develop in lungs or respiratory passageways, causing a sometimes fatal disease

Méry's glands (ma-ré'). Two bulbourethral glands *Syn* Cowper's glands.

mesad (mes'ád) [G. *mesos*, middle, + L. *ad*, toward]. Toward a median point, line, or plane

mesal (mes'ál) [G. *mesos*, middle]. In a middle line or plane.

mesoarteritis (més-á-or-tí'tis) [G. *mesos*, middle, + *aortē*, aorta, + *-itis*, inflammation] Inflammation of the middle aortic coat

mesaraic, mesareic (mes-ar-á'ík, -e'ík) [' + *araia*, belly] Rel. to the mesentery. *Syn* mesenteric

mesarteritis (més-ar-tēr-tí'tis) [' + *arteria*, artery, + *-itis*, inflammation] Inflammation of the tunica media or middle coat of an artery

mesaticephalic (més-át'-sēf-al'ík) [G. *mesatos*, medium, + *kephalē*, brain]. Having a skull with a cephalic index of 75 to 79.9 degrees

mesatipellic, mesatipelvic (més-át'-pēl'-lík, -pēl'-vík) [' + *pellis*, pelvis] Having a pelvis with an index bet 90 and 95 degrees.

mescaliné (més-ká-lēn). An alkaloid, the active ingredient of the mescal cactus. It produces loss of inhibitions and causes the patient to describe past episodes in his life

mesectic (més-ek'tík) [G. *mesos*, middle, + *echein*, to have] Using up a normal amount of oxygen. *See* mionectic, pleonectic.

mesectoderm (més-ēk'tō-derm) The portion of mesenchyme derived from ectoderm, esp from neural-crest cells ant to the somites

mesencephalon (mes-en-sēf'al-on) [G. *mesos*, middle, + *ekkephalos*, brain]. The midbrain consisting of the corpora quadrigemina, the crura cerebri, and the aqueduct of Sylvius

mesenchyme (més-ēn-kím) [G. *mesos*, middle, + *egchyma*, infusion] A diffuse network of cells forming the embryonic mesoderm and giving rise to connective tissues, blood and blood vessels, the lymphatic system, and cells of the reticuloendothelial system.

mesenteric [' + *enteron*, intestine]. Pert. to the mesentery.

mesenteriolium (mes-en-ter-i-ō'lum) [L. *mesenteriolum*, little mesentery] A small mesentery, as that of a diverticulum of the intestine

mesenterioplexy (mes-en-ter-i-ō-peks-i) [G. *mesos*, middle, + *enteron*, intestine, + *pēxis*, fixation]. Fixation of a torn mesentery.

mesenteriorrhaphy (mes'en-ter-i-or-ra-fi) [' + " + *raphē*, a sewing]. Suturing of the mesentery.

mesenteriplication (més-ēn-tēr-i-pli-kā-shun) [' + " + L. *plicāre*, to fold]. Taking tucks in the mesentery surgically.

mesenteritis (més-ēn-tēr-tí'tis) [' + " + *-itis*, inflammation]. Inflamed condition of the mesentery.

mesenteron (mes-en-ter-on) [G. *mesos*, middle, + *enteron*, intestine]. Middle portion of the embryonic digestive tract.

mesentery (mes-en-ter-i) [' + *enteron*, intestine]. A peritoneal fold, connecting the intestine with the post. abdominal wall.

m., proper. That of the small intestine.

Mesocolon is the name given to that of the colon; *mesocecum*, that of the

cecum, and *mesorectum*, that of the rectum.

mesiad (mes'i-ad) [' + L. *ad*, toward]. Toward the middle line *Syn*: *mesad*.

mesial (més-i-ál) [G. *mesos*, middle]. *Syn* median. Toward the median plane of the body.

mesio- In dentistry, combining form meaning pertaining to or facing the median plane of the mouth.

mesion (mes-i-on) [G. *mesos*, middle]. The imaginary plane dividing the body into right and left symmetric halves. *Syn*: *meson*.

mesiris (mes-i-ris) [' + *iris*, iris]. Middle portion of the iris

mesmeric (mes-mer'ík). Rel to or induced by hypnotism, fascinating

mesmerism (més-mer-izm). Originally the theory of Mesmer, it now means therapeutics employing hypnotism or hypnotic suggestion

meso- Combining form meaning (1) middle, (2) in anatomy, pert to a mesentery, (3) in medicine, secondary or partial

mesoarteritis (mes'o-á-or-tí'tis) [G. *mesos*, middle, + *aortē*, artery, + *-itis*, inflammation]. Inflamed condition of aortic middle coat *Syn*. *mesoarteritis*

mesoappendicitis (mes-ō-ap-pen-di-sí'tis) [' + L. *appendix*, an appendage, + G. *-itis*, inflammation]. Inflamed condition of the mesoappendix.

mesoappendix (mes'ō-ap-pen-díks) [' + L. *appendix*, an appendage]. Mesentery of the vermiform appendix.

mesobronchitis (més-ō-bron-kí'tis) [G. *mesos*, middle, + *brogchos*, windpipe, + *-itis*, inflammation]. Inflammation of the middle layer of the bronchi.

mesocardia (mes-ō-kar'di-á) [' + *kardia*, heart]. Location of the heart in the middle line of the thorax, being a normal position in fetal stage, but a malposition in life

mesocardium (mes-ō-kar'di-ūm) [G. *mesos*, middle, + *kardia*, heart]. An embryonic mesentery supporting the heart. The dorsal *m* connects heart to the foregut, the ventral *m* connects heart to central body wall

mesocecum (mes-ō-se-kūm) [G. *mesos*, middle, + L. *caecum*, blind gut]. Mesentery attaching the cecum

mesocele (més-ō-sēl) [' + *koilia*, hollow]. Sylvian aqueduct in the brain.

mesocephalic (mes-ō-sēf-al'ík) [' + *kephalē*, head]. 1. Pert. to the midbrain. 2. Having a medium sized head.

3. Having a cranial index of 76.0-80.9.

mesocolic (mes-ō-kōl'ík) [' + *kōlon*, colon]. Concerning the mesocolon.

mesocolon (més-ō-kōl'on) [' + *kōlon*, colon]. Mesentery connecting colon with post. abdominal wall.

mesocoloplexy (més-ō-kōl'ō-peks-i) [G. *mesos*, middle, + *kōlon*, colon, + *pēxis*, fixation]. The taking of tucks in the mesocolon and then suturing it to make it shorter. *Syn*: *mesocoloplication*.

mesocord [G. *mesos*, middle, + *chordē*, cord]. A portion of umbilical cord attached to placenta.

mesoderm (més-ō-derm) [G. *mesos*, middle, + *derma*, skin]. A primary germ layer of the embryo lying between ectoderm and entoderm. From it arise all connective tissues, muscular, skeletal, circulatory, lymphatic, and urogenital systems and the linings of the body cavities. *See*: *ectoderm*, *entoderm*.

m., axial. That giving rise to notochord and prechordal plate.

m., extraembryonic. That lying peripheral to the margins of the embryo

proper. It is involved in formation of amnion, chorion, yolk sac, and body stalk.

m., intermediate. SYN: *mesomere*. M. lying between somite and lateral mesoderm. Gives rise to embryonic and definitive kidneys and their ducts. Also called *nephrotome*.

m., lateral. SYN: *hypomere*. Unsegmented m. lying lateral to the intermediate mesoderm. In it develops a cavity, the coelom, separating it into layers, the *somatic* and *splanchnic mesoderm*.

m., paraxial. SYN *epimere*. M. lying immediately lateral to neural tube and notochord, which segments forming *somites*. Differentiates into *dermatome* giving rise to the dermis, *myotome* giving rise to somatic muscles, and *sclerotome* giving rise to axial muscles and meninges.

m., somatic. Outer layer of lateral mesoderm. Becomes intimately associated with ectoderm, forming *somatopleure* from which ventral and lateral walls of embryo develop.

m., splanchnic. Inner layer of lateral mesoderm. Becomes intimately associated with endoderm forming *splanchnopleure* from which the gut and lungs and their coverings arise.

mesoduodenum (mēs-ō-du-ō-dē-nūm) [“ + L *duodeni*, twelve] Mesentery connecting duodenum to abdominal wall.

mesogastric (mēs-ō-gas’trik) [“ + *gaster*, belly] 1. Pert. to umbilical region. 2. Pert. to the mesogastrum.

mesogastrium (mēs-ō-gas’tri-ūm) [G. *mesos*, middle, + *gaster*, belly] 1. The umbilical region. The part of the mesentery of the embryo attached to the primitive stomach.

mesognathic (mēs-og-nā’tjik) [“ + *gnathos*, jaw] Having a gnathic index bet. 98 and 103.

mesognathion (mēs-og-nā’ti-on) [“ + *gnathos*, jaw] The intermaxillary or premaxillary bone.

mesohyoma (mēs-ō-hi-ō-mā) [“ + *ylē*, matter, + *-oma*, tumor] Tumor derived from the mesothelium.

mesoileum (mēs-ō-lī-ō-ūm) [“ + L *ileum*, from G. *eilein*, to twist] Mesentery of the ileum.

mesojejunum (mēs-ō-jē-jū-nūm) [“ + L *jejunum*, empty]. Mesentery of the jejunum.

mesomere. SYN: *nephrotome*. Intermediate mesoderm. Portion of mesoderm between epimere and hypomere.

mesometritis (mēs-ō-me’tri’tis) [G. *mesos*, middle, + *mētra*, uterus, + *-itis*, inflammation]. Inflammation of the uterine musculature. SYN: *myometritis*.

mesometrium (mēs-ō-me’tri-ūm) [“ + *mētra*, uterus]. 1. The uterine musculature. 2. BNA. The broad ligament below the mesovarium.

mesomorph (mēs-ō-morf) [“ + *morphē*, form]. A well-proportioned person of medium height. SEE: *hypermorph*, *hypomorph*.

mesonephric (mēs-ō-nef’rīk) [G. *mesos*, middle, + *nephros*, kidney]. Pert. to the mesonephros.

m. duct. SYN *wolffian duct*. Embryonic duct which gives rise in the male to reproductive ducts (ductus epididymidis, ductus deferens, seminal vesicle, and ejaculatory duct). In the female, it gives rise to *Gartner’s duct* of the *epoöphoron*, a rudimentary structure.

m. tubules. Embryonic tubules consisting of two groups, *cranial* and

caudal. The cranial group gives rise (a) in the male to efferent ductules of testes and appendix epididymis, (b) in the female to the epoöphoron and vesicular appendices. The caudal group gives rise in the male to the paradidymis and aberrant ductules, in the female to the paroöphoron. All structures except the efferent ductules of the testes are vestigial.

mesonephroma (mēs-ō-nē-frō’mā) A tumor derived from mesonephric cells developing in reproductive organs, esp. ovary or genital tract.

mesonephros (mēs-ō-nē-frōs). SYN *wolffian body*, *middle kidney*. A type of kidney which develops in all vertebrate embryos of classes above the Cyclostomes. It is the permanent kidney of fishes and amphibians, but, in reptiles and mammals, is replaced by the metanephros. SEE *pronephros*, *metanephros*.

mesoneuritis (me-sō-nu-rī’tis) [“ + *neuron*, nerve, + *-itis*, inflammation] Inflammation of the substance of a nerve or of its lymphatics.

mesopexy (mēs-ō-peks-ī) [“ + *pēxis*, fixation] Operation of shortening the mesentery by taking a tuck in it.

mesophilic (mēs-ō-fil’ik) [G. *mesos*, middle, + *philein*, to love] Preferring moderate temperature, as some bacteria which develop best at temperatures between 15 and 43 C.

mesophryon (mēs-ō-frī-on) [G. *mesos*, middle, + *ophrys*, eyebrow] Midpoint in smooth space bet the eyebrows. SEE *glabella*.

mesopneumon (mēs-ō-nū’môn) [“ + *pneumon*, lung] Meeting point of 2 pleural layers at hilus of the lung.

mesoporphyrin. C₁₂H₁₀N₄ (COOH)₂. An iron-free derivative of heme.

mesorchium (mēs-ōr-kī-um) [“ + *orchis*, testicle] Peritoneal fold which holds fetal testes in place.

mesorectum (mēs-ō-rēk’tūm) [“ + L *rectus*, straight] Mesentery of the rectum.

mesoropter (mēs-ō-rop’tēr) [G. *mesos*, middle, + *oros*, boundary, + *optēr*, observer] Normal eye position with muscles at rest.

mesorrhachischisis (mēs-ō-rā-kīs’kī-sīs) [“ + *rachis*, spine, + *schisis*, cleft]. Fissure of a portion of the spinal cord. SYN *merorrhachischisis*.

mesorrhaphy (mēs-ō-rā-flī) [“ + *raphē*, a sewing] Suture of the mesentery. SYN *mesenteriorrhaphy*.

mesorrhine (mēs-ō-rīn) [“ + *ris*, rim, nose] With a nasal index variously quoted to range anywhere bet 47 and 53.

mesosalpinx (mēs-ō-sal’pinks) [G. *mesos*, middle, + *salpiz*, tube] BNA. The free margin of the upper division of the broad ligament, within which lies the oviduct.

mesosome (mēs-ō-sēm) [“ + *sēma*, sign]. Possessing an orbital index bet. 83 and 90.

mesosigmoid (mēs-ō-sig’moid) [“ + *sigma*, letter S, + *eidos*, form]. Mesentery of the sigmoid flexure.

mesosternum (mēs-ō-ster’nūm) [“ + *sternon*, chest] The middle or second section of the sternum. SYN *gladiolus*.

mesothelium (mēs-ō-thē’lī-ūm) [“ + *thēlē*, nipple]. The layer of cells, derived from the mesoderm lining the primitive body cavity, in the adult it becomes the epithelium covering the serous membranes.

mesothener (mēs-ō-thē’nār) [“ + *thēnar*, palm]. The adductor pollicis muscle.

mes’otren. A subatomic particle of weight intermediate between light particles

(electrons) and heavy particles (protons) Present in cosmic rays

mesovarium (mēs-o-vā'ri-um) [" + *L. ovarium*, ovary] BNA. The portion of the peritoneal fold that connects the ant. border of the ovary to the post. layer of the broad ligament.

meta- Prefix meaning (1) *after, beyond, among, or over*, (2) *in zool. later or more highly developed*, (3) *in chem., the 1-3 position of benzene derivatives*.

metabiosis (mēt-ā-bi-ō'sis) [" + *biosis*, way of life] Dependence of an organism for its existence upon another and giving no recompense

metabolic (mēt-a-bō'l'ik) [G *metabolē*, change] Pertaining to metabolism

m. failure. Rapid failure of physical and mental functions ending in death

m. gradient. A gradient in metabolic activity which exists in certain structures such as the small intestine from duodenum to ileum or in embryos from animal to vegetal poles in which metabolic activity is highest in one region and becomes progressively lower away from this region

m. rate. See *basal metabolism*, also *metabolism*, *basal*

metabolimeter (mē-tab'ō-lim'e-tēr) [" + *metron*, measure] Device for measuring rate of basal metabolism

metabolism. [G *metabolē*, change, + *ismos*, state of] The sum of all physical and chemical changes which take place within an organism, all energy and material transformations which occur within living cells. It includes *material changes*, i. e., changes undergone by substances during all periods of life (growth, maturity, senescence) and *energy changes*, i. e., all transformations of chemical energy of foodstuffs to mechanical energy or heat. It involves two fundamental processes: (a) *anabolism* (assimilation or building up processes), and (b) *catabolism* (disintegration or tearing down processes). Anabolism is the conversion of ingested substances into the constituents of protoplasm, catabolism is the breakdown of substances into simpler substances, the end-products usually being excreted. *General metabolism* includes all the processes involved in the utilization of substances entering the body, *special metabolism* is the term applied to all the changes involved in the utilization of particular substances, such as carbohydrates, proteins, fats, minerals, or water, and referred to as carbohydrate metabolism, protein metabolism, etc.

m., basal. For an average person, this is, in terms of calories, 1500-1800 per day, in terms of body weight, 1 Cal. per kilogram per hour, in terms of body surface, 40 Cal. per sq. meter per hour

m., carbohydrate. All carbohydrates are digested to monosaccharides and absorbed as such principally in the form of hexoses of which glucose is the principal one. In the liver and muscles, glucose is converted to *glycogen* or it may be oxidized to carbon dioxide and water, the ultimate fate of all carbohydrates. Each of these reactions involves esterification with phosphates and requires the presence of insulin and other hormones (ant. pituitary, adrenal, and thyroid). In the process many intermediate compounds are formed, among them lactic acid

The basic reaction is $C_nH_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O$ which is the basis for the determination of the *respiratory quotient* (R.Q.), *q.v.*

m., constructive. Anabolism or as-

similation. The building up processes by which complex substances are synthesized

m., destructive. Catabolism; the breakdown or decomposition of substances into their simple constituents

m., fat. Fats are digested to fatty acids and glycerol. Following absorption they may be reconverted to neutral fats and stored as adipose tissue or oxidized to CO_2 and H_2O . Fats may be formed from carbohydrates or proteins. In the utilization of fats, the liver plays an important role in the desaturation of fatty acids. Complete oxidation of fats occurs only when carbohydrates and proteins are oxidized. It is also dependent on the normal functioning of the thyroid, pituitary, and hypothalamus. Fat metabolism also involves the formation and utilization of substances related to fats, such as sterols and phospholipids.

m., protein. Proteins are digested to amino acids and absorbed as such. In the body these are synthesized into body proteins which form an integral part of protoplasm, hence they are essential for normal growth and the repair of tissues. Those not utilized thus are deaminized, i. e., the amino group is removed. This results in the production of urea which is excreted, the remainder, a fatty acid residue ($COOH$), may be oxidized or converted to glucose, which may be stored as glycogen or converted to fat

m., purine. M. involving nucleic acids, present in nuclei of cells in which they are combined with proteins to form nucleoproteins. In the breakdown of nucleic acid, *uric acid*, one of the end products is formed

metabolite (mē-tab'ō-lit) [G *metabolē*, change] Any product of metabolism

metacarpal [G *meta*, beyond, + *karpōs*, wrist] Pert. to the bones of the metacarpus, or bones of the hand. See: *skeleton*.

metacarpus (mēt-ā-kar'pus) [" + *karpōs*, wrist] The 5 metacarpal bones of the palm of the hand. See *carpometa-carpal*.

metachromasia, metachromatism (mēt-ā-krō-mā'zi-ā, -krōm-ā-tizm) [G *meta*, change, + *chrōma*, color] Condition in which different substances assume different colors or hues when stained by the same dye

metachromatic (mēt-ā-krō-mat'ik) [" + *chrōma*, color] Pert. to metachromatism.

m. bodies or granules. Granules in protoplasm which stain deeply and differently from the surrounding ones; seen in various bacteria

metachromophil (mēt-a-krōm'ō-fl) [" + " + *philein*, to love]. Not reacting normally to staining

metachrosis (mēt-ā-krō'sis) [" + *chrōa*, color] Change of color in animal life.

metachysis (mē-tak'is-is) [G. *meta*, beyond, + *chysis*, effusion]. 1. Blood transfusion 2. The introduction of any substance directly into the blood stream by mechanical means

metacone. The distobuccal cusp of an upper molar tooth

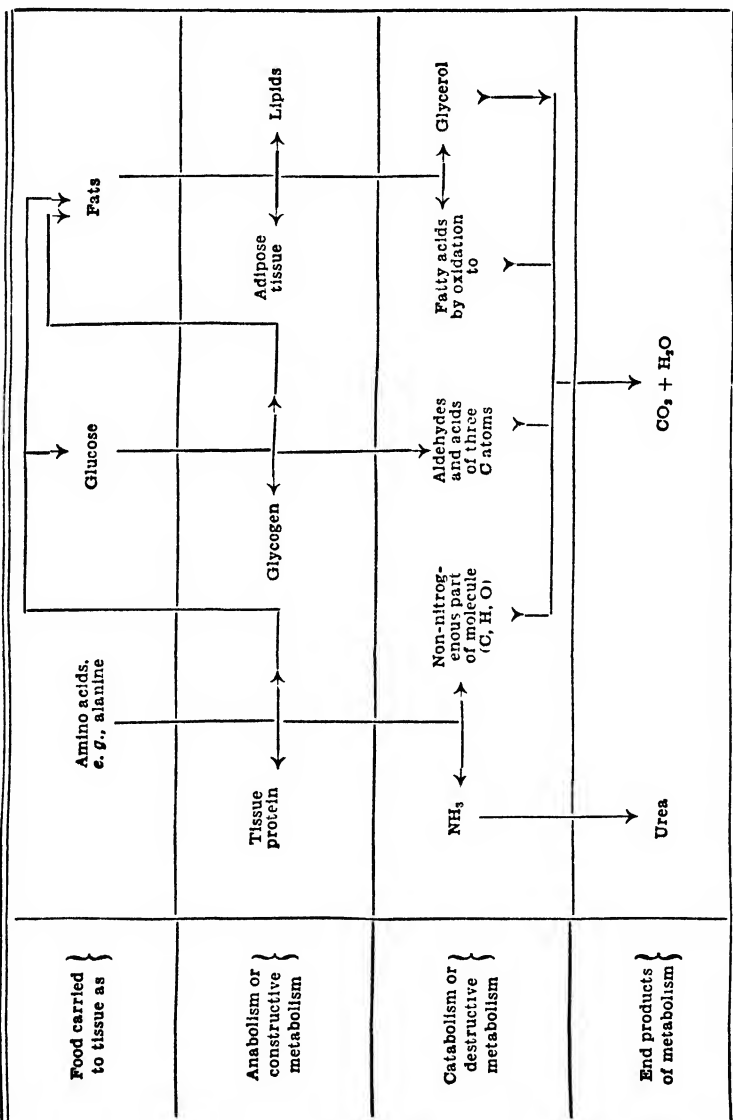

metacoenid. The mesiolingual cusp of a lower molar tooth.

metaconule. The distal intermediate cusp of an upper molar tooth

metacyesis (mēt-ā-si-ē'sis) [" + *kyesis*, pregnancy]. Extruterine gestation.

met'ae's'trus. Period of estrus cycle following estrus and preceding diestrus.

DIAGRAM OF NORMAL METABOLIC FOOD CHANGES

metagenesis [' + *genesis*, formation].

Alternation of generation

metagglutinin (met-ag-glū'tin-in) [G. *meta*, beyond, + L. *agglutināre*, to glue]. A partial agglutinin, an agglutinin present in immune serum which acts on organisms closely related to the one acting as the specific antigen.

Metagonimus. A genus of flukes belonging to the family Heterophyidae

M. yokogawai. A species of intestinal flukes common in the Middle and Far East. Normally infests the intestine of dogs, and cats, and other animals, but commonly in man. Intermediate hosts, snails and fishes, esp. a species of trout, *Plecoglossus altivelis*

metakeric (met'-ā-ik-ter'ik) [' + *iktēros*, jaundice] Occurring as a consequence of jaundice

metainfective (mēt'-ā-in-fek'tiv) [' + L. *infectio*, an infection] Occurring as a consequence of an infection

metakaryocyte (met'-ā-kar'i-ō-sit). A normoblast, *q v*

metakinesis (mēt'-ā-kin-e'sis) [G. *meta*, beyond, -*kinēsis*, motion] Transition stage in mitosis between prophase and metaphase in which chromosomes move to the equatorial plane

metal fume fever (or braziers' chills). This results from absorbing the fumes in special occupations such as welding, metal founding, torch metal cutting, and galvanizing. Zinc commonest cause of these disturbances

SYM Come on late. Chills, weakness, lassitude, profound thirst, followed after some hours by sweating and anorexia, occasionally there is mild inflammation of the eyes and respiratory tract

F. A. TREATMENT Fresh air and symptomatic treatment

metallesthesia (mēt'-al-ēs-thē'si-ā) [G. *metallon*, metal, + *aisthēsis*, sensation]. Recognition of metals by touching them

metallic (mē-tal'ik) [G. *metallon*, metal].

1. Pert to metal 2. Composed of or resembling a metal

m. tinkling. A peculiar ringing or bell-like auscultatory sound in pneumothorax over large pulmonary cavities

metallophobia (mē'tal-ō-fō'bī-ā) [' + *phobos*, fear] Psychiatric fear of metals and metallic objects and of touching them.

metalloscopy (mē-tāl-ōs'kō-pī) [' + *skopein*, to examine] Determination of the effects of applying metals to the body, and its sensitivity to them

metallotherapy (mē-tal-ō-ther'ā-pī) [' + *therapeia*, treatment]. Treatment by applying metals to the affected part.

metallurgy [' + *ergon*, work]. Study and methods of using metals

metamere. One of a series of similar segments arranged in a linear series, such as those comprising the body of an earthworm

metameric (mēt'-ā-mēr'ik) [G. *meta*, across, + *meros*, part]. Rel. to metamorphism *SYN* isomeric

metamerid (met-am'er-id) [' + *meros*, part, + *idos*, own]. A substance that is metameric

metamerism (met-am'er-izm) [G. *meta*, across, + *meros*, part, + *ismos*, state of]. 1. Isomerism, *q v* 2. Isomerism consisting of segments or metameres.

metamorphopsia (mēt'-ā-mor-fop'si-ā) [' + *morphe*, form, + *opsis*, vision]. *OPHTH*: Visual distortion of objects; found in refractive errors, esp. astigmatism, retinal disease, choroiditis, de-

tachment of retina, and tumors of retina and choroid

metamorphosis (met'-ā-mor'fō-sis) [G. *meta*, across, + *morphe*, form, + *-osis*, intensive]. 1. A change in form or structure, esp. the transition from one form to another as in complete metamorphosis of an insect (egg, larva, pupa, adult) 2. In pathology, a degenerative change

m., fatty. Fatty degeneration.

m., viscous. Collection of blood plates in thrombosis

metamyelocyte (mēt'-ā-mi-lō'sit). *SYN*. juvenile cell. A cell intermediate in development between a myelocyte and a mature granular leukocyte

metanephros (met'-ā-nēf'ros) [G. *meta*, across, + *nephros*, kidney]. The permanent kidney of amniotes (reptiles, birds, and mammals). A portion of it develops from caudal portion of intermediate cell mass or nephrotome, the remaining portion is derived from a bud of the mesonephric duct

metaneutrophil (met'-ā-nūtrō-flī) [' + L. *neuter*, neither, + G. *philein*, to love]. Not reacting normally with neutral stains.

metaphase (mēt'-ā-fāz) [G. *meta*, beyond, + *phasis*, a shining out] Stage in mitosis in which the chromosomes are arranged in an equatorial plate. Follows the prophase and precedes the anaphase in which longitudinal halves of chromosomes diverge

metaphyllin (met'-ā-flī'n). Theophylline with ethylene diamine.

USES. As a vasodilator and diuretic.

Dosage: 1½ gr. (0.1 Gm)

metaphysis (mē-taf'i-sis) [G. *meta*, after, + *physis*, nature, *SYN* epiphyseal plate. Portion of a developing long bone between diaphysis or shaft and epiphysis, the growing portion of a bone

metaplasia (met'-ā-plā-zī-ā) [' + *plasis*, a molding]. Conversion of 1 kind of tissue into another

metaplasma (met'-ā-plāzm) [' + *plasma*, a thing formed]. Reserve material present in protoplasm, esp. stored nutritive substance *SYN* cell inclusions, *paraplasma*

metaplastic (met'-ā-plas'tik) [' + *plastikos*, formed]. Pert. to or formed by metaplasia

metapneumonic (met'-ā-nū-mon'ik) [G. *meta*, beyond, + *pneumonia*, lung infection] Succeeding or as a consequence of pneumonia

metapophysis (met'-ā-pof'i-sis) [' + *apo*, from, + *physis*, growth]. Mamillary process on the superior articular processes of a vertebra.

metaprotein [' + *prōtos*, first]. Derived protein resulting from the action of acids or alkalies, in which the molecule is changed to form protein insoluble in neutral solvents but soluble in alkalies and weak acids

Group includes the acid and alkali proteins, syntonin and albuminates *SEE* protein

metapyretic (mēt'-ā-pī-rēt'ik) [G. *meta*, beyond, + *pyretos*, fever]. Performed or occurring after fever, postpyretic

metarteriole (mēt'-ar-tēr'i-ōl). A small vessel connecting an arteriole to a venule from which true capillaries are given off.

metastable (met'-ā-stā'bīl) [G. *meta*, change, + L. *stabilis*, stable]. Changing from one condition to another; unstable.

m. solutions. Those of supersatura-

tion in relation to amt. of dissolved substance.

metastasis (mē-tas'tā-sis) [' + stasis, a standing] 1. Movement of bacteria from one part of the body to another. 2. Change in location of a disease or of its manifestations or transfer from one organ or part to another.

The usual application is to the manifestation of a malignancy in a secondary growth arising from the primary growth in a new location. Spread is by the lymphatics or blood stream.

metastasis (mē-tas'tā-siz) [' + stasis, a standing] To invade by metastasis.

metastatic (mēt-ā-stat'ik) [' + statikos, standing] Pert to metastasis.

metatarsalgia (mēt-ē-tar-sāl'jī-ā) [G. *meta*, beyond, -*tarsos*, tarsus] *SYN* Morton's foot *M's neuralgia* Severe pain or cramp in ant portion of metatarsus.

metatarsectomy (mēt'ā-tar-sēk'tō-mī) [G. *meta*, beyond, + *ektomē*, excision] Removal of the metatarsus, or a metatarsal bone.

metatarsophalangeal (mēt'ā-tar'sō-fā-lan'jē-āl) [' + + phalagx, phalagx, a phalanx] Concerning the metatarsus and phalanges.

metatarsus (mēt-ā-tar'sūs) [G. *meta* beyond, + *tarsos*, tarsus] The region of foot between tarsus and phalanges. Includes the five metatarsal bones.

metathalamus (mēt-ā-thal'ā-mus) [' + thalamus, a chamber]. BNA The post part of the thalamus including the 2 geniculate bodies.

metathesis (mē-tath'ē-sis) [G. *meta*, over, + *thesis*, a placing]. 1. A changing of places. 2. Forcible transference of a disease process from one part to another where it will be more accessible for treatment. 3. Double decomposition chemically.

metatrophia (mēt-ā-tro'fī-ā) [' + *trophē*, nourishment] A condition due to disorder of nutrition.

metatrophic [' + *trophē*, nourishment] 1. Pert to metatrophia. 2. Requiring lifeless organic matter for food. *SYN* saprophytic.

metatrophism (mēt-āt'rō-fiz-m) [G. *meta*, change, + *trophē*, a turning, + *ismos*, state of] Masculine behavior in women and feminine behavior in men.

Metatropic women favor younger men whom they may dominate. They are usually dictatorial and often found among business and professional women. The metatropic men usually select a woman older than themselves, either very intellectual or very low in the social scale.

metatuberculosis (mēt'ā-tū-ber-kū-lō'sis) [' + L. *tuberculum*, a small nodule]. A condition of tuberculous reactions with nontuberculous lesions.

Metazoa. Division of the animal kingdom which includes all multicellular forms, in contrast to unicellular forms or Protozoa.

Metchnikoff's theory. Microorganisms are ingested by living cells, as by leukocytes and other phagocytes. *SYN* phagocytosis.

metencephalon (mēt'ēn-sēf'ā-lon) [G. *meta*, after, + *ēkephalos*, brain] *SYN* afterbrain, hindbrain. The ant portion of the embryonic rhombencephalon from which the cerebellum and pons arise.

meteorism (mēt'ē-rō-izm) [G. *meteōrizein*, to raise up]. Distention of gas in the abdomen. *SYN* tympanites.

me'ter [G. *metron*, a measure]. A linear standard of measurement, 39.371 inches. **me'tergasis**. Change or alteration in function.

me'testrus. Period following estrus and preceding diestrus.

methane. CH₄, marsh gas. A colorless, odorless, inflammable gas. It is produced in the intestine as a result of putrefaction and fermentation.

methemoglobin (mēt'hēm-ō-glob'in) [G. *meta*, across, + *aima*, blood, + L. *globus*, globe]. A compound closely related to oxyhemoglobin found in the blood following poisoning by certain substances.

It gives blood a chocolate-brown color and is useless as a carrier of oxygen.

methemoglobinemia (mēt'hēm-ō-glob'in-ēmī-ā) [' + + + G. *aima*, blood]. Presence of methemoglobin in the blood.

methemoglobinuria (mēt'hēm-ō-glob'in-ū-ri-ā) [' + + + G. *ouron*, urine]. Presence of methemoglobin in the urine.

methenamine (mēth'en-ā-mēn) USP Form. hexamethylene, urotropin. Colorless crystals, with sweetish taste.

ACTION AND USES Urinary antiseptic.

DOSEAGE 5 gr. (0.3 Gm.). Best results obtained by giving alternate doses of an equal amount of sodium acid phosphate.

INCOMPATIBILITIES Ammonium salts, alkalies, ferric salts.

methionine (meth-iō-nin). A sulfur-bearing compound, an essential amino acid.

methomania (meth-ō-mā'nī-ā) [G. *methē*, drunkenness, + *mania*, mania]. Psychiatric craving for intoxicating drinks. *SYN* dipsomania.

methyl (meth'il) [G. *methy*, wine, + *ylē*, substance]. In organic chemistry, the radical CH₃, seen, for instance, in the formula for methyl alcohol, CH₃OH.

m. alcohol. A colorless liquid with a peculiar alcoholic odor largely used as a solvent for paints, varnishes, etc.

POISONING *SYN* Different from those of ordinary alcoholism. Depression, weakness, nausea, headache, abdominal cramping, difficult breathing, cold sweats, coma. Well-known blindness which often follows may appear in several hours or not for several days. Sometimes the vision remains blurred, or may become totally blind.

TREATMENT Give stimulants often in form of black coffee. Sedatives may be necessary. Saline cathartic.

m. chloride. Gas obtained by distilling methyl alcohol.

It has a narcotic action and no distinctive warning features.

POISONING *SYN* Drowsiness, mental confusion, coma, nausea, vomiting and perhaps convulsions. Anuria occurs and there is an increase in temperature, pulse and respiration.

TREATMENT Inhalations of oxygen and 5-7% carbon dioxide, bromides for convulsions. Oxygen and alkalization and hospitalization.

m. ether. An anesthetic gas without color.

m. oxide. *SEE* *m. ether*.

m. parafynol. *SEE* *dormison*.

m. salicylate (sal-is'il-āt). USP. Oil of wintergreen, oil of gaultheria. Produced from distillation of leaves of sweet birch.

ACTION AND USES Antiseptic. Internally, same as salicylic acid.

DOSEAGE Internally, 12 m (0.75 cc.).

m. violet. Stain employed in histology and bacteriology. *SYN* pyoktanin.

methylene blue (meth'ī-lēn). USP. Methylthionine chloride. A dark green crystalline powder, producing a distinct blue stain.

Uses: As a urinary antiseptic, as a test for kidney function, and as an antidote for carbon monoxide and cyanide poisoning.

Dosage: Average, 2½ gr (0.15 Gm.). As an antidote, 50 cc of a 1% solution, intravenously.

metopantalgia (met'ō-pan-tral'jī-ā) [G. *metopon*, forehead, + *antron*, cavity, + *algos*, pain]. Pain in frontal sinuses.

metopantritis (met-ō-pan-trī'tis) ["" + "" + *-itis*, inflammation]. Inflamed condition of frontal sinuses.

metopic (met-op'ik) [G. *metopon*, forehead]. Rel to the forehead.

metopion (met-ō'pi-on) [G. *metopon*, forehead]. Craniometric point in forehead midway bet frontal eminences.

metopism (met-ō-plī-zm) ["" + *ismos*, condition of]. Persistence of the metopic suture in an adult.

metopodynia (met-ō-pō-dīn'ī-ā) ["" + *odynē*, pain]. Headache in frontal area of head.

metoxenous (mē-toks'ēn-ūs) [G. *meta*, across, + *renos*, host]. Denoting a parasite spending each of its 2 cycles on a different host. SYN *hetericous*.

metoxeny (me-toks'e-nī) Condition of being metoxenous, *q.v.*

metra (mē'tra) [G. *mētra*] Combining form meaning the uterus. SEE *metro-*.

metralgia (me-tral'jī-ā) [G. *mētra*, uterus, + *algos*, pain]. Pain in the uterus.

metranemia (met-rā-nē'mī-ā) ["" + *a-*, priv. + *aima*, blood]. Local uterine anemia.

metranoikter (met-rā-nō-ik'ter) ["" + *anoikēin*, to open]. Instrument for dilating cervix uteri by means of 2 or 4 spring blades when a wide, prolonged dilation is necessary.

metrapectic (met-rā-pek'tik) ["" + *apechein*, to avoid]. Denoting a disease that is transmitted by the mother, who herself is unaffected by it, for ex., hemophilia.

metratome (met'rā-tōm) ["" + *tomē*, incision]. Instrument for incising the uterus.

metratomy (mēt-rāt'ō-mī) ["" + *tomē*, a cutting]. Surgical incision of the uterus. SYN *metrotomy*.

metratonia (mē-tra-tō'nī-ā) [G. *mētra*, uterus, + *a-*, priv. + *tonos*, tone]. Uterine atony occurring after childbirth.

metratrophia (met-ra-tro'fī-ā) ["" + *atrophia*, atrophy]. Atrophy of the uterus.

metrauxe (me-traw'xe) ["" + *auxē*, increase]. Hypertrophy of the uterus.

metrazol (met'rā-zōl). Pentamethylene tetrazol, cardiazol. A white powder, chemically neutral substance.

Uses: As a circulatory and respiratory stimulant, regarded as valuable in shock, in pneumonia, and other infectious diseases, and in schizophrenia in combination with insulin and curare.

Dosage: 1½-4½ gr. (0.1-0.28 Gm.) orally or subcutaneously.

metre (mē'ter) [G. *metron*, measure]. Meter. *q.v.*

metrechoscopy (mēt-rēk-os'kō-pī) ["" + *ēchō*, sound, + *skopein*, to examine]. Mensuration and auscultation combined with inspection.

metrectasia (mēt-rēk-tā'zī-ā) [G. *mētra*, uterus, + *ektasis*, dilatation]. Uterine dilatation.

metrectomy (mē-trek'tō-mī) ["" + *ektomē*, excision]. Surgical removal of the uterus. SYN *hysterectomy*.

metrectopia (met-rek'tō'pī-ā) ["" + *ek*, out, + *topos*, place]. Displacement of the uterus.

metrelcosis (mēt-rēl-kō'sis) [G. *mētra*, uterus, + *elkōsis*, ulceration]. Uterine ulceration.

metre'mia. Congestion of the uterus.

metreurynter (met-ru-rīn'ter) ["" + *eurynein*, to stretch]. An inflatable bag which is inserted in the os uteri and distended to dilate the cervix.

metreurysis (me-tru'rī-sis) ["" + *eurynein*, to stretch]. Dilatation of cervix uteri with the metreurynter.

metric system. One based upon the meter (39.371 inches) as the unit of measurement, the gram (15.432 gr.) the unit of weight, the liter (1.056 qt. liquid, or 0.908 qt. dry measure) as the unit of volume.

CONVERSION RULES. To change grams to grains multiply by 15, or divide by 0.064. To change grains to grams divide by 15, or multiply by 0.064. To change grams to ounces divide by 30. To change ounces to grams or cc multiply by 30. SEE *avoirdupois*, *household measures*, *table in Appendix*, *Troy weight*.

metritis [G. *mētra*, uterus, + *-itis*, inflammation]. Inflammation of the uterus. Designated *endometritis* if the endometrium is involved and *myometritis* if the muscularity (myometrium) is involved.

m. chronic. Condition in which there is an increase in fibrous tissue and infiltration of lymphocytes.

metro- [G.] 1. Combining form (*metron*) meaning rel to measure or measurements. 2. From *metra*, the uterus, meaning rel to the uterus.

metrocarcinoma (mēt'rō-kār-sī-nō'mā) [G. *mētra*, uterus, + *karkinos*, crab cancer, + *-ōma*, tumor]. Uterine carcinoma.

metrocele (mēt'rō-sēl) ["" + *kēlē*, hernia]. Uterine hernia.

metroclyst (mēt'ro-klīst) ["" + *klystēr*, an injection]. Device for douching the uterus.

metrocolpocele (mēt'rō-kol'pō-sēl) ["" + *kolpos*, vagina, + *kēlē* hernia]. Protrusion of uterus into the vagina which pushes the vaginal wall downward.

metrocystosis (mēt'rō-sis-tō'sis) ["" + *kystis*, cyst, + *-ōsis*, intensive]. Formation of uterine cysts.

metrodynia (mēt-rō-dīn'ī-ā) [G. *mētra*, uterus, + *odynē*, pain]. Uterine pain.

metrobroma (me-trō-fī-brō'mā) ["" + *L. fibra*, fiber, + G. *-ōma*, tumor]. Uterine fibroma.

metromalacia. Softening of the uterus.

metromalacosis (mēt'rō-mal-ā-kō'sis) ["" + *malakia*, softening, + *-ōsis*, intensive]. Malacia or softening of uterine tissues.

metroma'nia. 1. [G. *mētra*, uterus, + *mania*, madness]. Insanity caused by uterine disease.

2. [G. *metron*, measure, + *mania*, madness]. Insanity characterized by continuous writing of verses.

metronome (mēt'ro-nōm) [G. *metron*, measure, + *nomos*, law]. Apparatus for recording intervals or periods of time.

metroparalysis (mēt'rō-pā-ral'ī-sis) [G. *mētra*, uterus, + *paralysis*, a loosening from the side]. Uterine paralysis.

metropath'ia haemorrhag'ica ["" + *pathos*, disease, + *aima*, blood, + *rēgnunai*, to burst forth]. Condition of the uterus

characterized by hemorrhage, usually accompanied by hypertrophy of the uterine mucous membranes and ovarian cystic disease. *See* *fibrosis uteri*.

metropathic (me-tro-path'ik) [" + *pathos*, disease]. Pert. to or caused by uterine disorders

metropathy (me-trop-á-thi) [G. *mētra*, uterus, + *pathos*, disease] Any uterine disease

metropéritonitis (me'trō-per-i-tō-ni'tis) [" + *peritonion*, peritoneum, + *-itis*, inflammation]. Inflamed condition of uterus and peritoneum.

metrophlebitis (me'trō-flē-bi'tis) [G. *mētra*, uterus, + *phleps*, *phleb-*, vein, + *-itis*, inflammation]. Inflamed condition of uterine veins

metroposis (met-rop-ō'sis) [" + *ptōsis*, a dropping]. Dropping of the uterus

metrorrhagia (met-ror-ra'l-ā) [" + *rhēnna*, to burst forth]. Bleeding from the uterus, esp. at any time other than during the menstrual period

This is most often caused by lesions of the cervix uteri, and its occurrence should always lead one to suspect and search for a malignancy in the genital tract

metrorrhea (met-ror-rē'ā) [" + *roia*, flow] Any morbid discharge from the uterus

metrorrhexis (met-ror-reks'is) [" + *rēxis*, a rupture] A uterine rupture

metrorrhosis (met-ror-thō'sis) [" + *orthōsis*, a straightening] Correction of uterine displacement

metrosalpingitis (met-rō-sāl-pīn-jī'tis) [G. *mētra*, uterus, + *salpīg*, *salpīg-*, tube, + *-itis*, inflammation] Inflamed condition of uterus and oviducts

metroscope (met'rō-skōp) [" + *skopein*, to examine]. Instrument for examining the uterus

metrostaxis (me-tro-stak'sis) [" + *staxis*, a dripping]. Persistent but slight hemorrhage from the uterus

metrostenosis (me-trō-stēn-ō'sis) [" + *stēnōsis*, a narrowing]. Contraction of the uterine cavity.

metrosteresis (me-trō-ster-ē'sis) [" + *sterēsis*, loss] Removal of the uterus. *Syn*: *hysterectomy*, *metrectomy*.

metrotherapy [G. *metron*, measure, + *therapeia*, treatment]. Treatment of a condition by measurement, as in restoration of joint function following injury, measuring the angle of joint motion and recording the progress, has a psychological effect on patient.

metrothome (me'trō-tōm) [G. *mētra*, uterus, + *tomē*, a cutting]. Instrument used in incising the uterus.

metrotomy (me-trot-ō-mi) [G. *mētra*, uterus, + *tomē*, incision]. Incision of the uterus. *Syn*: *hysterotomy*.

metrourethrotome (met-ro-u-re'thrō-tōm) [G. *metron*, measure, + *ourēthra*, urethra, + *tomē*, incision]. Device for incising the urethra and measuring depth to be incised.

metrhypercinesis (met'rī-per-sīn-ē'sis) [G. *mētra*, uterus, + *yper*, over, + *kinēsis*, movement]. Excessive contraction of the uterus causing abnormal labor pains.

metfeyaine (met'fī-ka'īn). A white crystalline substance formerly known as neothins.

Uses: As a local anesthetic, prompt in action as topical application, or subcutaneous injection.

Dosage: As an application to the eye,

2% solution recommended; for infiltration, use 1/2-1%.

Meynert's commissure (mī'nerts). Fibrous tract extending from subthalamic body to base of 3rd ventricle.

M. F. D. Abbr. for *minimum fatal dose*.

Mg. Symb. for *magnesium*.

mg. Symb. for *milligram*.

mgh. Milligram hour. Dosage obtained by application of 10 mg. radium for 1 hr.

miasm, **miasma** (mī'azm, mī-az'mā) [G. *miasma*, stain]. A foul emanation or odor

miasmatic (mī-az-mat'ik) [G. *miasma*, stain]. Pert. to miasm

mication (mī-ka'shun) [L. *micāre*, to glitter] 1. Rapid winking that is involuntary 2. A quick motion

micella, **micelle** (mī-sel'ā) [L. a little crumb] One of the ultramicroscopic units of protoplasm *Syn* *bioblast*, *tagma*.

micrencephalon (mīk-rēn-sef'ā-lon) [G. *mīkros*, small, + *egkephalos*, brain] 1. Cerebellum 2. Smallness of brain, cretinism

micrencephalous (mī-kren-sef'al-ūs) [G. *mīkros*, small, + *egkephalos*, brain] Possessing a small brain

micro, **micr-** [G.] Combining forms denoting small size or extent.

microaerophilic (mī'krō-a-er-ō-fī'ik) [G. *mīkros*, small, + *aēr*, air, + *philēn*, to love] Growing at low oxygen tension

microanalysis [" + *analysis*, a loosening apart] Analytical examination of tiny granules

Microbacterium. A genus of lactic acid-forming bacteria found in milk. Common species are *M. flavum* and *M. lacticum*

microbe (mī'krōb) [G. *mīkros*, small, + *bios*, life] 1. A minute one-celled form of life not distinguishable as to its vegetable or animal nature 2. Bacteria, germs producing fermentation, putrefaction and disease, microorganism.

microbian (mī'krō-bī-an) [" + *bios*, life]. Rel. to a microbe *Syn* *microbic*.

microbic (mī'krōb'ik) [" + *bios*, life]. Concerning microbes *Syn* *microbian*.

microbicidal (mī'krōb-ī-sī'dal) [" + " + *L. cidus*, from *caedere*, to kill]. Destructive to microbes

microbicide (mī'krōb-ī-sīd) [" + " + *L. cidus*, from *caedere*, to kill] An agent which is destructive to microbes.

microbiology (mī'krō-bī-ō-lō-jī) [" + " + *logos*, study]. Scientific study of microbes.

microbiophobia (mī'krō-bī-ō-fō-bī-ā) [" + " + *phobos*, fear]. An abnormal fear of microbes *Syn*: *microphobia*.

microbism (mī'krōb-īzm) [" + " + *ismos*, state of]. Infection with microbes.

microbiotic (mī'krō-bī-ōt'ik) [" + *bios*, life]. Of microbic life, or origin.

microblast (mī'krō-blāst) [G. *mīkros*, small, + *blastos*, germ]. Minute nucleated red blood corpuscle.

microblepharism, **microblephary** (mī'krō-bī-ēf'ar-īzm, -ar-ī) [" + *blepharon*, eyelid]. Condition of having abnormally small eyelids.

microcalory (mī'krō-kal'ō-rī) [" + *L. calor*, heat]. A unit of heat, the amount required to raise the temperature of 1 cc. of distilled water from 0° to 1° C.

microcardia (mī'krō-kar'dī-ā) [" + *kardia*, heart]. Unusually small heart.

microcaulia (mī'krō-kaw'ī-ā) [" + *caulus*, penis]. Unusually small size of penis.

microcentrum (mī'krō-sēn'trum) [" + *kentron*, center]. 1. Centrosome, *q. v.*

2. Motor or dynamic center of a cell.

microcephalia [G *mikros*, small, + *kephalē*, head]. Abnormal smallness of the head

microcephalic (mī-kro-sef-al'ik) [“ + *kephalē*, head]. Having or pert to a small head, one below 1350 cc. capacity.

microcephalous (mī-kro-sef-al-us) [“ + *kephalē*, head]. Having an abnormally small head

microcephalus (mī-kro-sef'a-lūs) [G. *mikros*, small, + *kephalē*, head] 1. Person with an exceptionally small head, esp. an idiot. 2. Fetus with a very small head.

microcephaly, microcephalism (mī-kro-sef'ā-lī, -līzm) [“ + *kephalē*, head]. Abnormal smallness of head often seen in idiocy, it is congenital

microcheilia (mī'krō-kī-lī-ā) Abnormal smallness of lips

microchemistry (mī-kro-kēn'is-trī) [G *mikros*, small + *chemēia*, chemistry] Chemical work in which minute quantities (a few mg or less) are utilized. Usually requires special minute apparatus or use of microscope

microchiria (mī-kro-kī'rī-ā) Abnormal smallness of the hand

Micrococcaceae (mī-kro-kōk'ā-se-e) A family of bacteria belonging to the order Eubacteriales. Contains the genera *Micrococcus*, *Gafkya*, *Methanococcus* and *Sarcina*

Micrococcus (mī'krō-kōk'ūs) [G *mikros*, small, + *kokkos* berry] A genus of gram-positive bacteria belonging to the family Micrococcaceae. Cells occur singly or in irregular groups. They may produce a yellow pigment

M. albus. SYN *Staphylococcus albus*, *q v*

M. aureus. SYN *Staphylococcus aureus q v*

M. flavus. SYN *Neisseria flava*

M. gonorrhoeae. *Neisseria gonorrhoeae*.

M. intracellularis meningitidis. SYN *Neisseria meningitidis*

M. lanceolatus. *Diplococcus pneumoniae*

M. melitensis. SYN *Brucella melitensis*, cause of undulant fever

M. meningitidis. SYN *Neisseria meningitidis*

M. pharyngis siccus. SYN *Neisseria sicca*

M. pneumoniae. SYN *Diplococcus pneumoniae*

M. tetragenus. SYN *Gafkya tetragenus*, an organism of low-grade virulence, occasionally found in blood in septicemia, in pus of abscesses, and in spinal fluid in meningitis

micro'col'on. Abnormally small colon

microcor'nea [G *mikros*, small, + *L cornū*, horn] Abnormally small cornea

microcoulomb (mī-kro-ku'lob) [G *mikros*, small, + *coulomb*]. One-millionth part of a coulomb

microcrystalline (mī-kro-kris'tal-in) [“ + *krystallos*, ice]. Composed of microscopic crystals

microcyst (mī'krō-sist) [“ + *kystis*, a cyst] A very small cyst.

microcytase (mī-kro-sī'tās) [“ + *kytos*, cell, + *ase*, enzyme] Cytase acting on bacteria and formed by leukocytes.

microcyte [G. *mikros*, small, + *kytos*, cell]. 1. A small erythrocyte or red blood corpuscle, one less than 6 microns in diameter. 2. Degenerating, small, nonnucleated, red blood corpuscle

micro'cyto'sis. Condition characterized by presence of abnormal numbers of microcytes in the blood.

microdactylia (mī'krō-dak-tīl'ī-ā) [G.

mikros, small, + *daktylos*, digit]. Abnormal smallness of the digits.

micro'determ'ina'tion. The chemical examination of extremely minute quantities of a substance

microdissection (mī'krō-dī-sēk'shūn) [G *mikros*, small, + *L dissectio*, a cutting apart] Dissection with aid of the microscope, esp by utilization of a micromanipulator

microdont (mī'krō-dont) [“ + *odous*, odont-, tooth]. Possessing very small teeth

microdontism (mī-kro-don'tizm) [“ + “ + *ismos*, state of]. Unusual smallness of the teeth.

micro'electrophore'sis. Electrophoresis of minute quantities of a solution.

microfarad (mī-kro-far'ād) [G *mikros*, small, + *farad*] One-millionth of a farad, *q v*

micro'filar'ia. The embryos of filarial worms. They are present in the blood and tissues and are of importance in the diagnosis of filarial infections. May be sheathed or unshathed

microgamete (mī-kro-gam'et) [“ + *gametes*, spouse] Male element in conjugation of protozoa

microgametocyte (mī-kro-gam-ē'tō-sīt) [“ + “ + *kytos*, cell] Mother cell of the microgamete

microgamy (mī-krog'ā-mī) Union of male and female cells, in certain lower forms

microgastria (mī-kro-gas'trī-ā) [G *mikros*, little, + *gaster*, belly]. Unusual smallness of the stomach

microgenitalism (mī'krō-jen'tī-āl-izm) [“ + *L genitalia*, genitals, + *G ismos*, state of] Abnormal smallness of the external genitals

microglia (mī-krog'ī-ā) [“ + *glia*, glue]. Neuroglia tissue probably derived from the mesoderm, forming a portion of the adventitial structure of the central nervous system

microglossia (mī'krō-glos'e-ah) [“ + *glossa*, tongue]. Abnormally small tongue

micrognathia (mī-krog-nā'thī-ā) [G. *mikros*, small, + *gnathos*, jaw]. Abnormal smallness of jaws

microgram (mī'krō-gram) [G *mikros*, small, + *gramma*, a small weight]. One-millionth part of a gram. One thousandth of a milligram. SYMS μ g or mcg

micrograph (mī'krō-graf) [“ + *graphein*, to write] Apparatus for magnifying and recording minute movements.

micrography (mī-krog'rā-fī) [“ + *graphein*, to write]. 1. Study of physical appearance and characteristics of microscopic objects 2. Very minute writing, engraving, etc

microgyria (mī-kro-jī'rī-ā) [“ + *gyros*, circle]. Smallness of cerebral convolutions

microhepatia (mī-kro-hē-pat'ī-ā) [“ + *epar*, *ēpat-*, liver]. Abnormally small size of the liver.

microhm (mī'krōm) [“ + *ohm*]. One-millionth of an ohm.

micro'incineration. Determination of presence and distribution of inorganic matter in tissues by subjecting a microscopic section of tissue to a high temperature which destroys organic matter, leaving mineral matter as ash in the form of a spodogram, *q v*

micro'injec'tion. Injection of substances into cells or minute vessels by means of a micropipette

micro'len'tia. Possessing an abnormally small crystalline lens

mī'croleukoblast [G. *mikros*, small, +

leukos, white, + *blastos*, germ] **SYN.** *myeloblast*. A small leukoblast
microliter (mi'krō-lē-ter) [" + *Fr. litre*, from *G. litra*, a pound]. One-millionth part of a liter.

microlith (mi'krō-lith) [" + *lithos*, stone]. A very tiny calculus.

microlithiasis (mi'krō-lith-i-ās-is) [" + *lithos*, stone]. The development of very minute calculi.

micrology (mi-kro'lō-jī) [*G. mikros*, small, + *logos*, study]. Science of microscopic investigations.

micromania (mi-kro-mā-nī-ā) [" + *mania*, madness]. A delusion that one has become small or infantile or insignificant.

micro'manip'ulator. Apparatus by which extremely minute pipettes or needles can be manipulated under a microscope for microinjection or microsurgery.

micromastia (mik-rō-mās-tī-ā) *Micro-mastia*, *qv*.

micromazia (mi-kro-mā-zī-ā) [" + *mazos*, breast]. Abnormally small size of the breasts.

micrometer (mi-kro-met'-er) [*G. mikros*, small, + *metron*, measure]. **SYN.** *micron*. A millionth part of a meter.

micrometer (mi-krōm'-ē-ter) Device for making microscopic measurements.

micro'micron. A millionth part of a micron.

micromillimeter (mi-kro-mil'lī-mē-ter) [*G. mikros*, small, + *L. millic*, a thousand, + *G. metron*, measure]. **SYN.** *milli-micron*. One-millionth part of a millimeter. **SYMS.** μmm .

Micro'monospora. A genus of fungi belonging to the family Streptomycesaceae, the source of an antibiotic, *microsporin*.

micromycetes (mi-kro-mī-sēs) (pl *micromycetes*) [" + *mykēs*, fungus]. Minute fungus.

micromyelial (mi-kro-mī-ē-lī-ā) [" + *myelon*, marrow]. Abnormally small size of spinal cord.

micromyeloblast (mi-kro-mī-ē-lō-blāst) [*G. mikros*, small, + *myelon*, marrow, + *blastos*, germ]. A very small myeloblast.

micron (mi'kron) [*G. mikros*, small]. **SYMS.** μ . The millionth part of a meter, the thousandth part of a millimeter, about 1/25,000 part of an inch.

microne (mi'krōn) [*G. mikros*, small]. A colloid particle that is distinguishable with the microscope.

micro'needles. Extremely minute needles used in a micromanipulator for microdissection.

micronucleus (mi-kro-nūklē-us) (pl *micronuclei*) [" + *L. nucleus*, kernel]. 1. A small nucleus. 2. The smaller of the 2 nuclei of infusoria considered as containing the inheritable germ substance.

micronychia (mi-kro-nīk'ī-ā). Possessing abnormally small nails.

microorganism (mi-kro-or-gan-izm) [" + *organon*, organ, + *ismos*, condition]. Minute living body not perceptible to the naked eye, esp. a bacterium or protozoan.

Microorganisms may be carried from 1 host to another as follows:

Animal sources Some organisms are pathogenic for animals as well as man, and may be communicated to man through direct, indirect or intermediary hosts.

By air: Pathogenic microorganisms in the respiratory tract may be discharged from the mouth or nose and settle on food, dishes, clothing and

other places. They may carry infection if they resist drying.

Contact infections: These are the result of direct transmission of bacteria from one to another, as in venereal diseases.

Food-borne: Food and water may contain pathogenic organisms acquired from infected persons handling the food or through fecal or insect contamination.

Human carriers Persons who have recovered from an infectious disease remain carriers of the organism causing the infection, and may transfer the organism to another host.

Insects They may be the physical carrier, as the housefly or as vectors *Anopheles* mosquito.

Soil-borne Spoie forming organisms in the soil may enter the body through a cut or wound. Vegetables and fruits, esp. roots, need thorough cleansing before being eaten raw.

m., pathologic. A disease-causing organism. Includes rickett-sias, bacteria, spirochetes, yeasts, molds, protozoans, and some helminths.

RS. bacteria, cataxia, Hyphomycetes, mold, Schizomyces virus, etc.

micropathology (mi'krō-path-ol'ō-jī) [*G. mikros*, small, + *pathos*, disease, + *logos*, study]. Study of microorganismal diseases and their cell and tissue changes.

microphage, microphagus (mi'krō-fāj,-krof-ag-us) [*G. mikros*, small, + *phagein*, to eat]. A small phagocyte.

RS. bacteria, bacteriolytic, leukocyte, opsonin phagocyte, trephene.

microphakia (mi'krō-fak'ī-ā) [*G. mikros*, small, + *phakos*, lens]. Abnormally small lens.

microphallus (mi-kro-fal-us) [" + *phallos*, penis]. Abnormally small size of penis. **SYN.** *microcaula*.

microphobia (mi-kro-fō-bī-ā) [" + *phobos*, fear]. Psychopathic fear of microbes. **SYN.** *microbiophobia*.

microphone (mi'krō-fōn) [" + *phōnē*, sound]. Device for augmenting sound.

phononia (mi-kro-fō-nī-ā) [*G. mikros*, small, + *phōne*, voice]. Weakness of voice.

microphonoscope (mi-kro-fō-nō-skōp) [" + *skopein*, to examine]. Form of binaural stethoscope for augmenting the sound.

microphotograph (mi'krō-fōt'ō-graf) [*G. mikros*, small, + *phos*, phot-, light, + *graphein*, to write]. A photograph of extremely small size. Term sometimes used erroneously for photomicrograph, *qv*.

microphthalmia (mi-krof-thal'mī-ā) [" + *ophthalmos*, eye]. Abnormally small size of eyes.

microphthalmus (mi-krof-thal'mus) [" + *ophthalmos*, eye]. 1. Person with unusually small eyes. 2. Condition characterized by abnormally small eyes.

microphysics (mi-kro-fiz'iks) [*G. mikros*, small, + *physis*, nature]. The branch of science dealing with the forces controlling ultimate structure of matter.

microphyte (mi'krō-fit) [" + *phyton*, plant]. Any microscopic plant, esp. if parasitic.

micropia (mi-kro-pī-ā) [" + *opsis*, vision]. A condition in which objects seem diminished in size. **SYN:** *micropsia*.

micro'pipette. An extremely small pipette used for microinjection.

micropodia (mi-kro-pō-dī-ā) [*G. mikros*,

small, + *pous*, *pod-*, feet]. Unusually small size of the feet

micro'polariscope. A polariscope used with a microscope

micro'projec'tion. Projection of images of microscopic objects upon a screen

micro'proso'pia. Abnormal smallness of the face.

micro'spia (mi-krop'si-ă) [G *mikros*, small, + *opsis*, vision]. Condition in which objects seem smaller than they usually are

Seen in paralysis of accommodation, retinitis and choroiditis. SYN *micro'opia*.

micropus (mi-kro'pus) [' + *pous*, feet]. One with unusually small feet

micro'pyle (mi-kro-pil) [' + *pylē*, gate]. The opening in the ovum for entrance of the spermatozoon

micro'rhin'ia. Abnormal smallness of the nose

micro'scel'ous. Possessing short legs

microscope (mi'kro-skōp) [' + *skopein*, to examine] Instrument which greatly magnifies very minute objects

m., binocular. M possessing two eye-pieces or oculars

m., compound. One with 2 or more lenses or lens systems for use in observing the minutest bodies

m., darkfield. M using darkfield illumination q'v An ultramicroscope

m., electron. A m which utilizes streams of electrons deflected from their course by an electrostatic or electromagnetic field for the magnification of objects The final image is viewed on a fluorescent screen or recorded on a photographic plate Because of greater resolving power, images may be magnified up to 100,000 diameters

m., fluorescent. SEE m., ultraviolet

m., phase. A compound microscope to which two elements have been added, namely, a diffraction or phase plate and a specialized condenser diaphragm Such makes visible details of objects characterized by differences in refractive index and thus delineates a change of phase such as brightness or color

m., polarization. M for examining specimens which polarize light or have birefringence, or double refraction

m., simple. One with a simple or single lens

m., ultraviolet. M utilizing ultraviolet radiations as a light source and having an optical system for transmitting them Used in observing a specimen which fluoresces, such as tissues stained with a fluorescent dye

m., x-ray. M. for utilizing x-rays to reveal structure of objects through which light cannot pass

microscopic, microscopical (mi-kro-skop'ik, -i-kal) [G *mikros*, small, + *skopein*, to examine] 1 Pert to the microscope 2 Visible only by using the microscope

microscopy (mi-kro'skōp-i) [' + *skopein*, to examine] Inspection with the microscope.

m., bright-field. M in which specimens are illuminated by light rays passing through vertical (optical) axis of the microscope

m., dark-field. M in which specimens against a dark background are illuminated by light rays striking from the side By this means, objects too small to be seen by direct illumination become visible

m., phase contrast. M involving use of a phase microscope, q'v

microseme (mi'kro-sēm) [' + *sēma*, sign]. Possessing an orbital index less than 83.

microsoma (mi-kro-so'mă) [' + *sōma*, body] Unusually small stature

microsome (mi'krō-sōm) [G *mikros*, small, + *sōma*, body] A submicroscopic or ultramicroscopic particle present in a cell

microsomia (mi-kro-so'mi-ă) [G *mikros*, small, + *sōma*, body]. Abnormally small size of body.

microspectroscope (mi-kro-spek'trō-skōp) [' + L *spectrum*, image, + *skopein*, to examine]. A combined spectroscope and microscope

microspec'trophotom'etry. Method for the histochemical study of substances present in cells such as nucleic acid, based on absorption in the ultraviolet spectrum Permits quantitative and qualitative studies of certain cellular components with a high degree of sensitivity.

microsphygmia, microsphyxia (mi-kro-sfīg'mi-ă, -sifks'i-ă) [' + *sphygmōs*, pulse, — + *sphyxis*, pulse] Smallness of the pulse

microsplenia (mi-kro-splē'nī-ă) [G *mikros*, little, + *spēn*, spleen]. Abnormal smallness of the spleen

Microspora (mik-ro'spor-on) [' + *sporos*, seed] Former name of *Microsporium*, q'v

Microsporum. A genus of fungi which causes disease of the skin, hair, and nails

M. audouinii. Causative agent of *trinea capitis* (ringworm of scalp)

M. lanosum. Causative agent of *trinea barbae* (barber's itch)

M. minutissimum. Causative agent of *erythrasma*

microstomia (mi-kro-stō'mi-ă) [' + *stoma*, mouth] Unusual smallness of the mouth

micro'sur'gery. Dissection of tissues under the microscope, usually involving the use of a micromanipulator

microtia (mi-kro'shi-ă) [' + *ous*, *ot-*, ear] Unusually small size of the auricle or external ear.

microtome (mi-kro-tōm) [G *mikros*, small, + *tomē*, incision] Instrument for preparing thin sections for microscope

microtomy (mi-krot'o-mi) [' + *tomē*, incision] The process of cutting into sections.

microvolt (mi'krō-volt) [' + *volt*]. One-millionth part of a volt

micturate (mik'tū-răt) [L *micturare*, to urinate]. To pass the urine. SYN *urinate*.

micturition (mik-tū-rī'shūn) [L *micturare*, to urinate] The voiding of urine. SYN *urination*.

mid'brain [A.S. *mid*, middle, + *braegen*, brain] The corpora quadrigemina, the crura cerebri and aqueduct of Sylvius which connect the pons and cerebellum with the hemispheres of the cerebrum. SYN *mesencephalon*, q'v.

mid'get. A very small person, an adult who has not attained full growth

midgut (mid'gut) [A.S. *mid*, middle, + *gut*, intestine] The mid-portion of the embryonic gut which opens ventrally into the yolk stalk

midriff (mid'rif) [A.S. *mid*, middle, + *hrif*, belly] The diaphragm.

mid'wife [' + *wif*, wife]. A female who practices the art of aiding in the delivery of children

midwifery (mid-wif'er-i) [' + *wif*, wife]. The art of assisting at childbirth. SYN: *obstetrics*

migraine (mi'gran) [Fr from G *ēmikrania*, half skull] Paroxysmal attacks of headache, frequently unilateral, usu-

ally accompanied by disordered vision, and gastrointestinal disturbances. Thought to be the result of vasodilation of extracerebral cranial arteries.

Etiol. Unknown. Frequently hereditary. It may be precipitated by unsuitable food, allergic hypersensitivity, worry or menstrual flow, and it is often considered anaphylactic or endocrine in origin.

Sym. As stated. It is also associated with zigzags of light and vomiting, and at times with diplopia, unilateral sweating and focal symptoms. Sharp, stabbing pains frequently in temperofrontal region. Susceptible to light and sound. Face frequently flushed.

Progn. It must be distinguished from other types of headache, but the history, the course of the disorder, and the peculiar combination of symptoms rarely permit of much uncertainty. Migraine often disappears entirely after 30 years of age.

Treatment. Rest in quiet, darkened room during attack. Good ventilation. Feet in mustard bath with cold compress to head. Ergotamine tartrate proves efficacious in most cases, with calcium gluconate and vitamin D bet attacks. Avoid overwork, alcohol, tea and coffee. Systematic exercise bet attacks with frequent bathing, then friction.

Recently, oxygen inhalation has seemed successful in overcoming and preventing attacks.

Syn. *browache, hemicrania, megrim.*

migration (mī-grā'shun) [L. *migrāre*, to move from place to place]. Passage of cells, etc., from 1 position to another; *physiological*, as the migration of an ovum from the ovary into the fallopian tube, or *pathological*, as migration of leukocytes through the wall of a blood vessel into surrounding tissues.

m., cell. A morphogenic process occurring in the embryo in which cells shift their position in the formation of organs and tissues.

m., external, of the ovum. The entrance of an ovum into the oviduct of the opposite ovary.

m., internal, of the ovum. Passage of the ovum through the uterine (fallopian) tube to the uterus.

m. of leukocytes. **Syn.** *diapedesis*. Passage of white blood corpuscles through walls of capillaries during acute inflammation.

m. of the testicle. Descent of testicle into the scrotum. **Syn.** *descensus testis*.

m. of white blood corpuscles. Passage of white blood corpuscles through walls of capillaries during acute inflammation.

migratory (mī-grā-tō-rī) [L. *migrāre*, to wander from place to place]. 1 Pert to migrate. 2 Changing or capable of changing positions.

micro- For words commencing thus, see *micro-*.

Mikulicz's disease (mīk'ū-līts). Chronic hypertrophic enlargement of lacrimal and salivary glands.

M. drain. A method for draining the abdominal cavity after operating.

M.'s law. Patients with hemoglobin below 30% must not be given a general anesthetic.

M.'s mask. Gauze-covered frame worn over nose and mouth during performance of operation.

M.'s pad. Folded gauze pad for packing off the viscera in abdominal

operations and used as a sponge in general.

M.'s syndrome. Characteristics of M.'s disease appearing as a complication of another disease.

mil'dew [A.S. *mildeāw*]. A parasitic fungus, and plant disease produced by it.

Miles' operation. One for carcinoma of the rectum.

milliaria (mī-lī-ā-rī-ā) [L. *milium*, millet].

A form of vesicles due to obstruction of the sweat glands. Acute inflammation of the sweat glands. Occurs most commonly in infants, the obese, and in those exposed to excessive heat for prolonged periods. Excessive clothing and hyperhidrosis are contributing factors. **Etiol.** Exposure to excessive heat, infancy, obesity, debility, overclothing and tendency to hyperhidrosis.*

Sym. Sudden appearance of red patches of small papules. Vesicles are discrete and accompanied by red areolae. They usually appear on the trunk and are accompanied by itching and burning, fever of short duration. They occur in hot weather, in tropical countries, in individuals sweating profusely and the papules may become eczematous if irritated.

Treatment. Mild astringent lotions with bland dusting powder.

m. crystallina. **Syn.** *Sudamina*. Form with vesicles opaque and white.

m. rubra. Same as m. crystallina with the addition of inflammation, lesions being on a slightly inflamed base.

Syn. *lichen tropicus, prickly heat*.

military (mī-lī-ā-rī) [L. *militaris*, like a millet seed]. Characterized by presence of small nodules or lesions resembling millet seed.

m. fever. An infectious disease accompanied by fever.

Sym. Fever, profuse sweating, eruption of minute red and white pimples.

m. tubercles. Small gray nodules in first stage of tuberculosis.

m. tuberculosis. Acute, generalized tuberculosis with minute tubercles in the affected part or organ.

milieu (mīl-yew') [Fr.] Environment.

m. intérieur. Internal environment of extra cellular fluids of the body.

milium (mī-lī-ūm) [L. *milium*, millet seed]. Small pink and white nodule below the epidermis, caused by clogged sebaceous glands.

Treatment: Mechanical keratolytics (pumice stone, soap or sapollo), salicylic acid and sulfur ointment, electrolysis, or incision and expression of contents.

m., colloid. Tiny papule formed beneath the epidermis due to colloid degeneration.

milk [A.S. *meolc*, milc]. A secretion of the mammary glands, density about 1.032, for feeding the young.

Comp. Milk consists of water, organic substances, and mineral salts. *Organic substances.* *Proteins.* The principal proteins are caseinogen, lactalbumin, and lactoglobulin; in the presence of calcium ions, soluble caseinogen is converted into insoluble casein by the action of acids, rennet, or pepsin. This brings about the curdling of milk.

Lactoglobulin is identical with serum globulin of blood and hence contains maternal antibodies. *Carbohydrates:* Lactose or milk sugar is the principal sugar, although small quantities of other sugars are present. *Fats:* The principal fats are glycerides of oleic, palmitic and myristic acid. Smaller quantities of stearic acid and short-

chain fatty acids with carbon chains of C₁ to C₂₂ are present. Sterols and phosphatides (lecithin and cephalin) are also present. Churning causes the fat globules to unite into a solid mass forming butter. **Mineral salts.** The principal cations are calcium, potassium, and sodium, the principal anions, phosphate, and chloride. Citrates and lactates are present in small quantities. Milk is low in iron and magnesium.

Vitamins. Vitamins A and those of the B complex (thiamine, riboflavin, niacin, and pantothenic acid) are present in adequate quantities to meet the needs of a growing child. Milk is low in vitamins C and D.

AV. SERVING 240 Gm. *Skimmed*. Pro. 8.9, Fat 0.5, Carbo 12.0. *Whole*. Pro. 7.9, Fat 9.6, Carbo 12.0

Action. Milk makes the smallest demands upon the digestive glands of any food unless it be eggs or meat, and decreases the urinary nitrogen. The absence of stimulation is its principal characteristic. A milk diet may cause a feeling of faintness, but this is not due to the lack of nutriment but to the lack of stimulant in the milk. It is a

sedative, quieting the liver, heart and blood vessels, suppresses the toxins, neutralizes vascular constriction and defective tension, and relieves the heart action. It is poor in salt, rich in lactose, and it is antitoxic, easy on the kidneys. It is a good diuretic, increasing the output of urine. *Hot milk* produces sleep. *Boiled milk* is constipating.

Milk on standing at room temperature sours as a result of the action of lactic bacilli on lactose converting it into lactic acid. When the pH reaches 5.34, coagulation occurs resulting in production of a *curd*. The remaining watery portion is called *whey*.

Milk contains antibodies which are present in the mother's blood. Milk also contains a number of enzymes (catalase, oxidase, reductase, phosphatase). As enzymes are inactivated by heat, their absence is the basis of tests used to determine effectiveness of pasteurization or boiling.

m., **acidophilus**. Milk or soy bean oil inoculated with *Lactobacillus acidophilus*.

m. agent. A carcinogenic substance

	Mother's Milk	Cow's Milk
Water	88.3%	87.3%
Mineral salts	0.2%	0.7%
Protein	1.5%	3.5%
Fat	4.0%	4.0%
Sugar (carbohydrate) ..	6.0%	4.5%
Reaction	Alkaline	Acid

A comparison of mother's milk and cow's milk by Gladys B. Caster, B.S., follows.

Mother's Milk	Cow's Milk
Clean, practically free from bacteria, correct temperature. Cheap.	May be dirty, contains bacteria causing diseases, such as tuberculosis, scarlet fever, typhoid, enteritis, diphtheria. Must be heated for use and is difficult to keep fresh. Clean milk very expensive.
Sucking of the milk provides exercise to the baby's jaw and the pleasure of nestling in to the mother, also delight to the mother. It probably assists involution of the uterus and is the proper physiological sequel to childbirth.	These pleasures are absent. Use of proper teats and correct technique of bottle feeding may replace to some extent jaw exercise.
Protects from infection by virtue of immune bodies in the mother's milk.	Bottle-fed babies have to acquire their immunity unaided, and succumb much more readily to disease.
Composition of the milk Mother's milk undergoes changes during the first few weeks, which adapt it to the needs of the baby.	These modifications cannot be imitated even by "humanizing" the milk.
Protein About two-thirds of the protein is soluble lactalbumin, one-third insoluble caseinogen. Curd flocculent and easy to digest.	About one-quarter is lactalbumin. About three-quarters is caseinogen. Curd tough and dense and difficult of digestion.
Fat. Fine emulsion, small globules, small proportion of volatile fatty acids which cause indigestion.	Coarse emulsion, large globules. Large proportion of these acids.
Sugar: Lactose similar in quality in both milks,	but greater in quantity in human milk.
Mineral salts: Lesser quantity of salts but of a type better adapted to infants' growth and metabolism.	Fewer organic compounds of salts, especially of phosphorus.

present in the milk of certain strains of mice capable of inducing the development of cancer in offspring

m., bacillary. *M* fermented by a *Lactobacillus bulgaricus*

m., blue. *M*. altered by the *B. cyanogenes*.

m., butter-. That left after removal of butter following churning.

m., casein. *M* prepared with a large quantity of casein and fat, but little sugar and salts.

m., certified. That certified by a Board of Health as pure

m., condensed. Partly evaporated and sweetened milk.

m., diabetic. *M*. with small amt. of lactose.

m. ferment. A diastatic ferment found in milk

m., fortified. *M* enriched by the addition of cream, albumin, or vitamins

m., homogenized. *M* with fats combined with the body of the milk

m., lactobacillary. *M*. with cultures of lactic acid bacteria

m. leg. Acute edema of the leg. *SYN.* *phlegmasia alba dolens*, *q. v.*

m., litmus. *M* containing litmus, an indicator Used in bacteriology

m. of magnesia. Magnesium hydroxide in permanent suspension

m., modified. *M* altered so that its composition more closely approximates that of human milk

m., mother's. That from the mammary glands of a woman The protein, fat, carbohydrate and mineral salts are exactly balanced to promote growth of the infant Average composition of mother's milk and cow's milk is shown on p M-39

m., pasteurized. *M* heated for 30 minutes at 140 to 158° F (60 to 70°C) to kill the living pathogenic bacteria *SEE* pasteurization

m., peptonized. *M* partly digested with pepsin and hydrochloric acid, or pancreatic extract and sodium bicarbonate

m. poisoning. *SYM* Headache, vertigo, thirst, vomiting, indigestion, diarrhea, frequently skin eruptions, and possible collapse are the usual symptoms

TREATMENT Purgatives, emetics and stimulants are administered

m., protein. *M* with high protein and low carbohydrate and fat content

m., red. *M* contaminated by blood, chromogenic bacteria, or plant pigments

m., ropy. That which has become viscid due to formation of vegetable gums from carbohydrates or mucinlike substances from proteins as a result of bacterial action

m. sickness. Milk poisoning resulting from ingesting milk or butter from cows affected by "trembles," a disease caused by eating a poisonous plant, white snakeroot

m., skimmed. *M* after removal of cream.

m., sour. *M* with lactic acid caused by lactic acid bacteria

m., sterilized. *M*. boiled to kill bacteria.

m., sugar of. Lactose.

m. teeth. First or deciduous teeth.

m. tumor. Retention of milk in mammary gland

m., uterine. Whitish fluid found between villi in placenta of pregnant uterus

m., uvio. *M*. sterilized by ultraviolet rays.

m., vegetable. 1. The latex of plants. 2. A synthetic milk prepared from juices expressed from various plants, such as soybean

m., vitamin D. *M* in which vitamin D content had been increased by addition of concentrates, ultraviolet irradiation, or by feeding irradiated yeast to milk-producing animals

m. witch's. *M* secreted by the breasts of the newborn

milk pox. Modified form of smallpox prevalent in South Africa Called *alastrim** in America. *SFE* *amaas*.

milli- [L.]. Prefix meaning a thousandth part.

milliammeter [*L* *mille*, thousand, + *amperere* + *G* *metron*, measure]. Ammeter registering in milliamperes. *SEE* *ammeter*.

milliampere (mil'l'-e-ahm-pair') [' + *ampere*]. P.T. One one-thousandth of an ampere

m. minute. An electrical unit of quantity, equivalent to that delivered by 1 milliamperere in 1 minute

millicurie (mil'l'-i-ku're) [' + *curie*]. P.T. One-thousandth of a curie

m.'s destroyed. A unit of the quantity of radiation furnished by a tube of radon. One millicurie in decaying gives 133.3 millicurie hours of radiation.

m. hour. A practical unit of dosage for radon. One millicurie of radon applied for 1 hour. The biologic effect depends on time, filtration, distance

milliequivalent. Weight of a substance contained in 1 milliliter of a normal solution

milligram (mil'l'-gram) [*L* *mille*, a thousand, + *G* *gramma*, a weight]. One-thousandth of a gram *ABBR* *mg*

mil'liliter. One-thousandth of a liter *ABBR* *ml* For practical purposes it is equivalent to 1 cc

millimeter (mil'l'-met-er) [' + *G* *metron*, measure]. One-thousandth of a meter.

millimicron (mil-l-i-m'i-kron). One-thousandth of a micron, one-millionth of a millimeter *SYMB* *mμ*

milphosis (mil-fō'sis) Loss of eyebrows or eyelashes

mimēsis [*G* *mimēsis*, imitation] Imitation, mimicry, term applied to a disease which exhibits symptoms of another disease or to conditions in hysteria which simulate organic disease

mimetic, mimic (uni-met'ik, mim'ik) [*G* *mimētikos*, pert. to imitation]. Imitative

m. convulsion. Facial convulsion.

m. labor. False labor

m. spasm. Spasm of facial muscles.

min. Abbr for *minim*.

mind (mind) [*A.S.* *gemynd*]. Integration of functions of the brain resulting in intelligence

No conclusive scientific definition of mind has yet been given

m. blindness. A condition in which one does not recognize what is seen due to a brain lesion. A form of aphasia.

m. deafness. Inability to comprehend what is heard A form of aphasia.

mineral (min'er-əl) [*LL* *mineralis*] 1. An inorganic element or compound occurring in nature, esp one that is solid 2. Inorganic, not of animal or plant origin. 3. Impregnated with minerals, as mineral water. 4. Pertaining to minerals

m. compounds. Compounds of mineral elements, excepting carbon, constitute the mineral constituents of the body. Minerals serve the following func-

tions (a) They are essential constituents of all cells. (b) They form the greater portion of the hard parts of the body (bone, teeth, nails). (c) They are essential components of respiratory pigments, enzymes, and enzyme systems. (d) They regulate the permeability of cell membranes and capillaries. (e) They regulate the excitability of muscular and nervous tissue. (f) They are essential for regulation of osmotic pressure equilibria. (g) They are necessary for maintenance of proper acid-base balance. (h) They are essential constituents of secretions of glands. (i) They play an important role in water metabolism and regulation of blood volume.

Approximately 20-30 Gm of mineral salts and 2000-3000 cc of water are excreted daily from the body. These must be replaced through food intake. Daily requirements for principal minerals for a normal adult are as follows: calcium, 0.8 Gm; phosphorus, 1.4 Gm; sodium, 3-6 Gm; iron, 12 mg; copper, 1-2 mg. Requirements are greater for growing children and pregnant women and in certain pathologic conditions.

Ser acid-base balance. body, names of elements, chemical elements (in the human body), buffer.

m. oil. Petroleum. Liquid petrolatum.

m. spring. A s whose water contains mineral salts thought to have a therapeutic value in certain diseases, esp. arthritis. *Ser spa*.

m. water. W charged with inorganic salts.

minim (min'im) [L *minimum*, least] *SYN.* drop. *Abbr min*. One sixtieth part of a fluidram.

minimal (min'i-mal) [L *minimum*, least]. *Least*.

m. dose. Smallest dose producing an effect.

minimum (min'im-mum) [L *least*]. *Least quantity or lowest limit. Ser threshold.*

m. lethal dose. Smallest quantity of a substance producing death.

m. wave length. The shortest wave length in a roentgen ray or gamma ray spectrum. It is definitely related to the maximum voltage applied to the roentgen ray tube in accordance with the Planck-Einstein quantum equation.

Minin light (min'in) A lamp for the administration of violet and ultraviolet light, producing local anesthesia.

Minot-Murphy diet (mi'nöt) Diet for pernicious anemia containing large quantities of liver.

mio. Combining form meaning less, smaller.

miocardia (mi-ö-kar'di-ä) [G *meiön*, less, + *kardia*, heart]. Systolic lessening of heart's volume. *SYN* *systole*.

mionectic (mi-ö-nek'tik) [G *miōnektikos*, taking less]. Pert to having or using a subnormal amount of oxygen, esp. blood. *SEE* *mesectic*, *pleonectic*.

mioplas'mia [G *meiön*, less, + *plasma*, a thing formed]. Abnormal lessening of the amount of blood plasma.

miopragia (mi-ö-prä'ti-ä) [' + *prassein*, to perform]. Decrease of functional power.

miosis, melosis (mi-ö'sis) [G *meiosis*, a lessening]. 1 Abnormal contraction of pupils. 2 Period of diminishing symptoms in a disease. 3 Phase in gametogenesis in which the number of chromosomes is reduced from diploid to haploid number; also called *reduction division*.

miot'ic [G *meiön*, less]. 1. An agent that causes the pupil to contract, such as

eserine and pilocarpine. 2. Pert. to or causing contraction of the pupil. 3. Diminishing. 4. Pert. to chromosome reduction.

miracidium (mi'rä-sid'i-üm). A ciliated free-swimming larva of a digenetic fluke. On emerging from an ovum, it penetrates a snag of a particular species and metamorphoses into a sporocyst. *Ser fluke*.

mire (mir) [L *mirare*, to look at.], *OPHTH*. An object used as a test, the images of which denote the amount of astigmatism.

mirror drill. Exercises before a mirror practicing control of convulsive tics.

Patient sitting in front of mirror tries to control movements. When he does, physician begins to distract his attention from his reflection by having patient do calisthenics.

m. speech. That which reverses the order of words in a sentence or pronounces words backward. *Ser* *idiopathy*.

m. writing. Writing in which the words are reversed, as seen in a mirror.

mis- [A S *mis*, wrong]. Prefix implying not, bad, wrong, improper, etc.

miscar'riage [A S *mis*, wrong, + L *carus*, cart]. A term used synonymously with *abortion*, and referring to the interruption of pregnancy prior to the 7th month.

Usually refers to expulsion of fetus, specifically in period bet 4th month and viability.

misce (mis'e) [L *mix*] *Abbr M Mix*. A direction to the pharmacist placed upon a prescription for mixing the preparation.

miscegenation (mis'ej-en-a'shun) [L *miscere*, to mix, + *genus*, race]. Sex relations or marriage bet those of different races.

miscible (mis'i-bl) [L *miscere*, to mix]. Capable of being mixed.

misocainia (mis-o-i'ni-ä) [G *misein*, to hate, + *kainos*, new]. An aversion to new ideas. *SYN* *misoneism*.

misog'amy [' + *gamos*, marriage]. Abnormal aversion to marriage.

misogyny (mis-oj'in-i) [' + *gynê*, woman]. Abnormal hatred of women.

misologia (mis-o-loj'i-ä) [' + *logos*, word]. Aversion to mental work.

misoneism (mi-sö-nê'izm) [' + *neos*, new]. Aversion to new things or new ideas; conservatism.

misopodia (mi-sö-pe'di-ä) [' + *pais*, paid-, child]. Abnormal dislike for children or the young.

Mist, mist. *Abbr for mistura, q.v.*

mistura [L *mixture*]. Preparation intended for internal use, and containing suspended insoluble substances which do not unite chemically.

Should always be shaken before using. There are 2 official mixtures.

mite (mit) [A S]. A minute arachnid, a member of the order Acarina. Some are parasitic and the cause of conditions such as mange and scabies. Some serve as vectors of disease organisms and as intermediate host for certain Cestodes.

m. follicle. *Demodex folliculorum*. M. which lives in hair follicles and sebaceous glands.

m., itch. *Sarcoptes scabiei, q.v.*

m., mange. Mites belonging to the families Sarcoptidae and Psoroptidae. The cause of mange and scabies in many species of animals.

m., red. Redbugs or chiggers, members of the family Thrombiculidae. *See: chiggers.*

mitridatism (mīth'ri-dāt'izm) [Mithridates, a king of Pontus, B. C. supposed to have acquired immunity in this fashion]. Immunity to a poison acquired by taking it in doses of increasing size.

mitigated (mīt'ġ-gāt-ed) [L. *mitigare*, to soften]. Diminished in severity. SYN: *allayed*, *moderated*.

mitochondria (mīt'ō-kon'drī-ā) (sing. *mitochondrion*) [G. *mitos*, thread, + *chondros*, cartilage]. Granular and filamentous structures in cell cytoplasm.

mito'ma, **mi'tome** [G. *mitos*, thread] A fine network support or framework of protoplasm in a cell.

mito'sis (pl *mitosēs*) [G. *mitos*, thread, + *-ōsis*] Indirect cell division involving indirect nuclear division (*karyokinesis*) and division of the cell body (*cytokinesis*), the process by which all somatic cells of multicellular organisms multiply.

Mitosis is a continuous process divided into four phases: (1) *Prophase*, the chromatin granules of the nucleus stain more densely and become organized into chromosomes which first appear as long, delicate, spiral structures each consisting of two spiral filaments called *chromatids*. Each chromosome possesses a clear region (*centromere*) usually in the mid-region. As the prophase progresses, the chromosomes become shorter, and more compact and stain densely, the nuclear membrane and the nucleoli disappear. At the same time, the centriole divides and the two daughter centrioles, each surrounded by a centrosphere, move to opposite poles of the cell. They are connected by fine protoplasmic fibrils which form the *achromatic spindle*. (2) *Metaphase*, the chromosomes (paired chromatids) arrange themselves in an equatorial plane midway between the two centrioles forming the *equatorial plate*. (3) *Anaphase*, the chromatids now called daughter chromosomes) diverge and move toward

their respective centrosomes. The end of their migration marks the beginning of the next phase. (4) *Telophase*: the chromosomes at each pole of the spindle undergo changes the reverse of these in the prophase, each becoming a long, loosely spiraled thread. The nuclear membrane reforms and nucleoli reappear. Outlines of chromosomes disappear and chromatin appears as granules scattered throughout nucleus and connected by a lightly staining *iron net*. The cytoplasm becomes separated into two parts, resulting in two complete cells. This is accomplished in animal cells by constriction in the equatorial region, in plant cells a *cell plate* which gives rise to the cell membrane forms in a similar position. The period between two successive divisions is called *interphase*.

Mitosis is of particular significance in that the hereditary determiners (*genes*) are distributed equally to each daughter cell and a constancy in number of chromosomes is maintained in all cells of an organism.

m., heterotypic. The first or reduction division in the maturation of germ cells.

m., homeotypic. The second or equational division in the maturation of germ cells.

mitosome (mī'tō-sōm) [" + *sōma*, body]. 1. A body giving rise to the middle piece of the spermatozoon. 2. Chromatin mass in a cellular nucleus.

mitotic (mī-toi'tik) [G. *mitos*, thread]. Pert. to mitosis.

mitral (mī'tral) [L. *mitra*, a miter]. Pert. to the bicuspid or mitral valve. *Sex: jacies*, *mitral*. [Sfr *heart*]

m. disease. That of the mitral valve.

m. murmur. One produced at the mitral valve. [aperture]

m. orifice. Left auriculoventricular **m. regurgitation.** Due to failure of valve to close completely, allowing blood to flow back into the auricle.

m. stenosis. Narrowing orifice of the valve obstructing free flow from auricle to ventricle.

m. valve. SYN: *bicuspid valve*, *valvula bicuspidalis*.

mittelschmerz (mīt'el-shmārts) [German]. Pain bet. menstrual periods.

mit'or [L. *mitere*, to rend]. A neuron terminal which transmits impulses toceptors of the adjoining neuron.

mixed (mīkst) [L. *mixtus*, from *miscere*, to mingle]. Consisting of 2 or more intermingling substances.

m. diet. One consisting of all the food elements in proper proportion. There is no scientific validity to the theory that carbohydrates and proteins should not be eaten together. Over 6000 determinations have been made which proved that the acid response to carbohydrates, to proteins, and to both taken together, is the same and that a mixed diet does not interfere with gastric secretions or with any of the digestive functions. The presence of protein seems to prolong carbohydrate assimilation.

m. nerves. The spinal nerves containing sensory or afferent, and motor or efferent fibers.

mix'osco'pia. Sexual perversion in which sexual gratification is obtained through observation of coition.

mixture (mīks'tūr) [L. *mistura*]. A combination of 2 or more substances without chemical union. *See: mistura*.

mm. Abbr. for *millimeter*.

MITOSIS.

Diagram illustrating the four phases of mitotic division in a cell having four chromosomes. A, B, and C illustrate the changes in the centrosome and nucleus during the prophase; D represents the metaphase; E and F, the anaphase; and G and H, the telophase.

mm. Abbr for micromillimeter.

Mn. Symb for manganese.

mne' *mne'thē'nia*. Poor memory.

mnemic (nē'mik) [G. *mnēmē*, memory].

Relating to memory.

m. hypothesis or theory. Stimuli leave engrams (definite traces) on protoplasm, which when frequently repeated set up a habit which persists after the stimuli cease, these engrams possibly may be transmitted to descendants. **SYN** *mnemism*. [Mnemonic hypothesis, q.v.]

mnemism (nēm'izm) [G. *mnēmē*, memory].

mnemonics (nē-mon'iks) [G. *mnēmōnikos*, pertaining to memory]. The art of memory culture

Mo. Chem. symb. for molybdenum.

mobile (mō'bīl) [L. *mobilis*, movable].

Movable

m. spasm. Tonic spasm with irregular, slow movements of limbs following hemiplegia. Athetosis

mobility (mō-bīl'itē) [L. *mobilitas*]. State or quality of being mobile; facility of movement

mobilization (mō'bīl-i-zā'shūn) [L. *mobilis*, movable]. 1 The making of a fixed or ankylosed part movable. 2 Restoration of motion to a joint

In fractures Lucas-Championnière advocated the regular administration of a definite dose of movement followed by a period of rest. This he called mobilization

3 Freeing an organ or making it movable 4 The freeing or making available substances held in reserve as glycogen or fat

mobilitize (mō'bīl-iz) [L. *mobilis*, movable].

1. To incite to physiological action. 2 To render movable, to put in movement.

modal (mōd'al) [L. *modus*, mode] Pert to form without reference to substance

modality [L. *modus*, mode] 1 Quality of being modal. 2 A method of application or the employment of any therapeutic agent; limited usually to physical agents. The word is avoided by scholarly writers

3 Any state that modifies the action of a drug 4 Psy Whole character of stimuli or sensations determined by the class to which they belong, that attribute of a sensation by which it is distinguished from all other sensations.

mode (mōd) [L. *modus*] The value or item of the class occurring most frequently in a series of variables

modiolus (mō-dī'ō-lūs) [L. a small measure]. BNA. Central pillar or axial part of cochlea extending from the base to the apex.

modulus (mōd'ū-lūs) [L. a small measure]. A unit of physical effects, as a *calorific unit*.

modus (mō'dus) [L. method]. A method or a mode.

m. operandi. Method of performing an act.

Moebius' sign (mō'bīl'ūs). A symptom in Graves' disease in which one eye converges and the other diverges when looking at the tip of one's nose.

mogigraphia (mō-jī-grāf'ī-ā) [G. *mogis*, with difficulty, + *graphein*, to write]. Writers' cramp.

mogilalia (mōj-i-lā'ī-ā) [' + *lalia*, chatter]. Any speech defect, as *stuttering*.

mogiphonia (mōj-i-fō'nī-ā) [' + *phōnē*, voice]. Difficulty in emitting vocal sounds.

mogipocia (mōj-i-tō'sī-ā) [' + *tokos*, birth]. Difficult birth or parturition.

Mohrenheim's space (mōr'en-hīm). Space bet. pectoralis major and deltoid just beneath the clavicle.

moist (moyst) [L. *musteus*, musty]. Damp, wet.

m. chamber. A vessel for keeping microscopic objects moist

mollé (mōl). A gram-molecule, a quantity of a chemical compound whose weight in grams equals its molecular weight. Thus 18.016 Gm of water would be 1 mol.

mō'lar [L. *mōlēs*, a mass] 1 Pert. to a mass; not molecular 2 Pert to a mole 3. [L. *molaris*, grinding] A grinding or back tooth, one of three on each side of the jaws

The first permanent one erupts at the 6th year, the second one about the 12th year. The third molars (wisdom teeth) are extremely variable, usually erupting between 17th and 25th years. However, they may erupt later or not at all. **Syn** *dentition*, *teeth* 4. Gram-molecule **SYN** *mol*, *q.v.*

m. solution. One in which there is 1 mole of the solute dissolved in each liter of the solution

molas'es [L. *mellaceus*, honeylike] (Cane). **AV. SERVING** 190 Gm. **PRO.** 4.6. **Carbo.** 131.2. **VITAMINS** B-4, **ASH** Ca 0.211, Mg 0.068, K 1.349, Na 0.019, P 0.044, Cl 0.317, S 0.129, Fe 0.0073. **SEE** *carbohydrate*, *sugar*.

mold (mōld) [Icelandic *mugga*, mist]. 1. A fuzzy coating of a fungus nature, on the surface of decaying vegetable matter 2 Any one of a group of parasitic or saprophytic fungi which causes mold. Examples are the *black molds* (Mucorales) and the *blue and green molds* (Aspergillales). The latter include *Penicillium*, the source of the antibiotic, *penicillin* 3 To shape a mass, as a pill 4 To shape the fetal head, adapting it to the pelvic inlet.

molding [L. *modus*, a small measure] 1 Shaping of the fetal head, adapting itself to pelvic inlet. 2 Manual shaping of infant's features following delivery 3 A protective border, used in plastic surgery. 4 Casting of a reproduction

mole (mōl) [AS. *mōl*]. 1 A congenital discolored spot elevated above the surface of the skin. **SYN:** *nevus*.

ETIO. Not clear. May arise from local or static condition of circulation in a small area. Harmless unless irritated, in which case cancer may appear.

TREATMENT. Protect against irritation. Do not tie a thread about a mole. Electro-surgery.

SEE *acephalocyst*, *racemose*, *melanoma*.

2 [L. *mola*, moistened meal] A uterine mass arising from a poorly developed or degenerating ovum

m., blood. A mass made up of blood clots, membranes, and placenta, retained following abortion.

m., Breus'. Malformation of the ovum, a decidua tuberosa subchorionic hematoma.

m., carneous. Blood mole which has assumed a fleshlike appearance, when retained in uterus for some time

m., false. One formed from a uterine tumor or polypus.

m., fleshy. **SEE:** *carneous mole*.

m., hydatid, hydatidiform. A polycystic mass in which the chorionic villi have undergone cystic degeneration.

m., pigmented. *Nevus pigmentosus*, *q.v.*

m., stone. Calcareous degeneration in the uterus.

m., true. Mole representing the degenerated embryo or fetus.

m., vascular. A hemangioma, *q.v.*

m., vesicular. SEE *hydatidiform mole*. **molecule** (mō-lek'ū-lar) [L. *molecula*, little mass]. Pert. to a molecule

m. layer. 1. Cortical l. of cerebellar or cerebral substance 2. (Inner). Inner retinal plexiform layer. 3. (Outer). Outer retinal plexiform layer

m. lesion. One not even visible through a microscope.

m. weight. Relative weight attained by totalling the weight of its constituent atoms, using the atomic weight of oxygen, 16, as a unit SEE *atomic weight*.

molecule (mōl'ē-kūl) [L. *molecula*, little mass] 1. The smallest quantity into which a substance may be divided without loss of its characteristics 2. Any small portions of a substance 3. A chemical combination of two or more atoms which form a specific chemical compound; the chemical elements are formed by the combination of atoms

Combinations of dissimilar atoms form chemical compounds. In normal molecules the positive and negative electric charges exactly balance. Excess or deficiency of either positive or negative charge by the loss or acquisition of electrons results in the formation of an ion.

The molecule is designated by the number of atoms it contains, as *monatomic*, (one atom), *diatomic*, (two), *triatomic*, (three), *tetratomic*, (four), *pentatomic*, (five), *hexatomic*, (six), etc SEE *cleavage*.

moll'ien (Pl. *molimina*) [L. *effort*] Effort to establish any normal function, esp the monthly effort to establish the menses and disturbances experienced at the time

m. climacterium virile. A neurasthenia in men bet 45-55 resulting from change of the testicular secretion.

m., men'strual. SEE *molimen*

Möllgaard treatment (mōl'gahr'd). Treatment of tuberculosis with sanocrysin and sometimes with serum

mollities (mol-lsh'tēz) [L.] Abnormal softening of a part.

m. ossium. Softening of the bones SYN *osteomalacia*.

Moll's glands. Modified sweat glands at border of eyelids SYN *ciliary glands*.

moll'usc, moll'usk. Any member of the phylum Mollusca

Mollus'ca. A phylum of animals which includes the bivalves (mussels, clams), slugs, snails, squids, and octopi. Snails serve as intermediate hosts of many parasitic flukes

molluscous (mol-lūs'kūs) [L. *molluscus*, soft] Concerning molluscum.

molluscum (mol-us'kum) [L. *soft*]. A mildly infective skin disease characterized by tumor formations on the skin.

m. contagiosum. The usual mildly contagious form of molluscum.

SYN Characterized by small waxy globular epithelial tumors containing semifluid caseous matter or solid masses, healing without scarring though they may suppurate and break down, commonly on face, eyelids, breasts, genitalia and inner surface of thigh. On pressure a substance resembling sebum is expressed.

Error. Still indefinite. Infection contracted in Turkish baths, bathing pools, and interchangeable bathing suits, etc.

TREATMENT. Incision, expression of contents, followed by iodine.

m. fibrosum. A form showing masses of fibrocellular tissue.

m. simplex. SEE *m. fibrosum*.

molybdenum (mō-līb'dē-nūm) A hard, heavy, metallic element SYMB: Mo. Atomic weight, 95.95

molysmophobia (mō-liz'mō-fō-bi-ā) SYN: *mysophobia* Morbid fear of contamination or infection

momentum (mō-nēn'tūm) [L. *equilibrium, motion*]. 1. Quantity of motion 2. Force of motion acquired by a moving object as a result of continuance of its motion, impetus

mon'ad [G. *monas*, a unit] 1. A univalent element 2. A unicellular organism

3. One of the four components of a tetrad

monarthritis (mōn-ar-thrī'tis) [G. *monas*, single, + *arthron*, joint, + *-itis*, inflammation] Arthritis affecting a single joint

monarticular (mōn-ar-ūl'ū-lār) [" + L. *articulus*, joint] Concerning or affecting one joint

monaster (mōn-as'ter) [" + *astēr*, star] Single starlike figure formed in mitosis.

monathetosis (mōn'ath-e-tō'sis) [" + *athētos*, not fixed, + *-osis*] Athetosis affecting a single part of the body

Mondonesi's reflex (mōn-dō-na'zī) Contraction of facial muscles following pressure on eyeball

monesthetic (mōn-ēs-thet'ik) [G. *monas*, single, + *aisthesis*, sensation]. Affecting only one of the senses

Mongolian idiocy. Congenital form with resemblance to an Asiatic SEE *idiotcy*.

Mon'golism. Mongolian idiocy, *q.v.* **monilithrix** (mōn-il-e-thrī'ks) [" + G. *thrix*, hair] Disease in which the hair becomes brittle and nodulated so that it has a beaded appearance

Monil'ia [L. *monilia*, necklace] SYN *Candida*, *q.v.* A genus of parasitic fungi or molds

moniliasis (mōn'il-lī-ā-sis) [G. *monas*, single, + G. *-osis* intensive] Infection of the skin or mucous membranes by yeastlike fungi. Usually localized in skin, nails, mouth, vagina, bronchi, or lungs, but may invade blood stream.

Error. Various species of *Candida* but chiefly *C. albicans*

moniliform (mōn-il-lī-form) [" + *forma*, shape] Resembling a necklace or string of beads

moniliosis (mōn-il-lī-ō'sis) [" + G. *-osis*, intensive] Infection with any species of *Monilia*.

mono, mon- [G.] Prefixes *One, single*.

mon'oadic'ic. Having one replaceable hydroxyl (OH) group

monoanesthesia (mōn-ō-ān-ēs-thē'si-ā) [G. *monos* + *an-*, priv. + *aisthēsis*, sensation]. Anesthesia of a single member or organ

monobasic (mōn-ō-bā'sīk) [G. *monos*, + *basis*, a base] Having one hydrogen atom replaceable by a metal or positive radical

mon'oblast. A cell which gives rise to a monocyte

monoblepsia (mōn-ō-blēp'si-ā) [G. *monos*, + *blepsis*, sight] 1. Condition in which vision is more distinct when only one eye is used, hence tendency to close one eye to see clearly 2. Color blindness in which only one color can be seen.

monobrachius (mōn-ō-brā'kī-us) [" + *brachion*, arm]. 1. State of having only one arm. 2. Fetus with only one arm.

monobromated (mōn-ō-brō'māt-ēd) [G. *monos*, single, + *brōmos*, starch]. Pert. to chemical compound with only one atom of bromine in each molecule.

monocalcic (mōn-ō-kal'sīk) [" + L. *calx*, calc-, lime]. Pert. to a chemical com-

pound containing only one atom of calcium in the molecule

monocardian (môn-ô-kar'di-ăn). Individual possessing a heart with only one atrium and one ventricle

monocelled (môn-ô-sêld) ['' + *L. cella*, a chamber]. Composed of a single cell

monochord (môn-ô-kord) ['' + *chordê*, cord]. An instrument for testing upper tone audition by means of friction.

monochorea (môn-ô-kor-ê-â) ['' + *chorea*, dance]. Chorea which affects but a single part

monochorionic (môn-ô-kor-ê-ôn'ik) Possessing a single chorion, as in the case of identical twins

monochromasy (môn-ô-kro-mă'si) Color blindness in which only one color can be perceived

monochromatic (môn-ô-kro-măt'ik) ['' + *chrôma*, color] 1 Having but one color. 2 A color-blind person to whom all colors appear to be of one hue

monochromator (môn-ô-kro-mă-tor) ['' + *chrôma*, color]. Instrument for selective transmission of homogeneous radiant energy

monococcus (môn-ô-kôk'us) ['' + *kokkos*, berry]. A form of coccus existing singly instead of as part of the usual group or chain

monocular (môn-ôk'û-lar) [G *monos*, single, + *L. oculus*, eye] 1 Concerning or affecting but one eye 2 Possessing a single ocular or eyepiece

monoculus (môn-ôk'û-lus) ['' + *L. oculus*, eye] 1 A bandage for shielding one eye. 2 A fetus with only one eye

monocyesis (mô-nô-si-ê'sis) ['' + *kyêsis*, pregnancy]. Average pregnancy with a single fetus

monocyte (môn-ô-sit) ['' + *kytos*, cell]. A large mononuclear leukocyte

monocytic (môn-ô-sit'ik) ['' + *kytos*, cell]. Concerning or resembling monocytes

monocytopenia (môn-ô-sit-ô-pe-ni-â) ['' + '' + *penia*, lack]. Diminished number of monocytes in the blood

monocytosis (môn-ô-si-tô'sis) Excessive number of monocytes in the blood

monodactylism (môn-ô-dak'til-izm) ['' + *daktylos*, digit]. Condition, usually congenital, of having only one digit on a hand or foot

monodal (mô-nod'al) [G *monos*, single, + *odos*, way]. Connected with one terminal of a resonator so that the patient acts as a capacitor for entrance and exit of high frequency currents

monodiplopia (môn-ô-di-plô'pi-â) ['' + *diploos*, double, + *ôps*, eye]. Double vision in one eye only

monodromia. Condition of muscles or nerves in which conduction occurs in one direction only

monogony (môn-ôg-ô-ni). Asexual reproduction

monograph (môn-ô-grăf) ['' + *graphein*, to write]. A treatise dealing with a single subject

monohemerous (môn-ô-hêm'er-us) ['' + *êmera*, day]. Continuing for only one day

monohybrid. Offspring of a cross between parents differing in a single pair of characters

monohydrated (môn-ô-hi'drăt-ed) [G. *monos*, single, + *ydor*, water]. United with only one molecule of water.

monoidaeism, **monoidesim** (môn-ô-i-dê-â-izm, -dê'izm) ['' + *idea*, idea]. Domination by only one idea

monolocular (môn-ô-lok'û-lar) ['' + *L. loculus*, a small chamber]. Having only 1 cell or cavity. SYN: *unilocular*.

monomania (môn-ô-mă-ni-â) ['' + *mania*, madness]. Insanity on one subject only, a term found in legal phraseology.

monoma'niac ['' + *mania*, madness]. One afflicted with monomania

monomastigote (môn-ô-măs'ti-gôt) ['' + *mastix*, *mastig-*, whip]. Possessing only one flagellum.

monomelic (môn-ô-mel'ik) [G. *monos*, single, + *melos*, limb]. Affecting a single limb

monomeric (môn-ô-mér'ik) ['' + *meros*, part]. Consisting of, or affecting a single piece or segment of a body.

monomorphic (môn-ô-mor'fik) ['' + *morphê*, form]. Unchangeable in form

monomyople'gia ['' + *mys*, *myo-*, muscle, + *plêgê*, stroke] Paralysis of only one muscle

monomyositis (môn-ô-mi-ô-si'tis) ['' + '' + *-itis*, inflammation]. Inflamed condition of only one muscle.

mononeural (môn-ô-nû-râl) [G. *monos*, single, + *neuron*, nerve]. Supplied by or concerning a single nerve

mononeuritis (môn-ô-nû-rî'tis) ['' + '' + *-itis*, inflammation]. Inflamed condition of a single nerve

mononuclear (môn-ô-nû-klē-âr) ['' + *L. nucleus*, kernel] SYN *uninuclear*. Having one nucleus

m. exudate cells. SYN *polyblasts*. Ameboid, phagocytic, nongranular cells found in inflamed tissues

mononucleosis (môn-ô-nu-klē-ô'sis) ['' + *L. nucleus*, kernel]. Presence of more than normal number of mononuclear leukocytes in the blood

m. infections. Glandular fever with great increase of mononuclear leukocytes in the blood

SYN Constitutional symptoms, fever, sore throat, and generalized lymphadenopathy, hyperplasia of lymphatic tissue. Blood contains heterophile agglutinins

mononucleotide. A product resulting from hydrolysis of nucleic acid consisting of phosphoric acid combined with a glucoside or pentoside

monoparesis (môn-ô-par'es-îs) ['' + *parêsis*, weakness]. Paralysis of a single part of body

monoparesthesia (môn-ô-păr-ês-thê'si-â) ['' + *para*, beside, + *aisthêsis*, sensation]. Paresthesia of only one region or limb

monopathy (môn-op'ăth-i) [G *monos*, single, + *pathos*, disease]. A disease attacking only one part of the body.

monophagia (môn-ô-fă'ji-â) ['' + *phagein*, to eat] 1 Appetite for only one kind of food 2 The habit of eating of just one meal a day

monophasia (môn-ô-fă'zi-â) ['' + *phasis*, speech]. Inability to utter anything but one word or phrase repeatedly.

monophobia (môn-ô-fô'bi-â) ['' + *phobos*, fear]. Abnormal fear of being alone

monophyletic (môn-ô-fil-êt'ik) ['' + *phylê*, tribe]. Originating from a single source.

monoplegia (môn-ô-plê'ji-â) [G *monos*, single, + *plêgê*, stroke] Paralysis of a single limb or a single group of muscles.

monopolar (môn-ô-pôl'âr) ['' + *L. polus*, pole]. Using 1 terminal only, the ground acting as the 2nd terminal. SEE *ground-terminal*.

monorchid (môn-or'kid) ['' + *orchis*, testicle]. Person having only 1 testicle.

monorchidism, **monorchism** (môn-ôr'kid-izm, môn-or'kizm) ['' + *orchis*, testicle]. Condition in which there is only 1 descended testicle.

monosaccharide (môn-ô-sak'ar-id) [G.

monos, single, + *sakcharon*, sugar]. A sugar which cannot be decomposed into simpler sugars. Ex: *fructose*, *galactose*, *glucose*.

The *m.* group consist of glucose, fructose, galactose, *q.v.* These sugars are absorbed directly without chemical changes unaffected by enzymes, if not attacked by bacteria. They are soluble, crystallized with difficulty, and fermented by yeast. They maintain the glucose content of the blood and provide for the production of glycogen. Syn *monosaccharose*.

monosaccharoses (môn-ô-sak'â-rôs-ês) [' + *sakcharon*, sugar] A group name for *monosaccharides*, *q.v.* Simple sugars which cannot be split into sugars of lower molecular weight.

They are unaffected by enzymes and enter the blood unchanged, except for the possible action of bacteria. All carbohydrates must be reduced by digestion to monosaccharoses before they may be absorbed by the body, where they are utilized for the production of glycogen. These sugars are very soluble. They ferment without the aid of yeast, and they are not easily crystallized. See: *disaccharoses*, *polysaccharoses*.

monosome (môn-ô-sôm) [' + *sôma*, body] An accessory chromosome which, without dividing, goes into only 1 of the daughter cells.

monospasm (môn-ô-spazm) [' + *spasmos*]. Spasm affecting a single part or organ.

Monosporium (môn-ô-spôr'î-m) A genus of fungi belonging to the Fungi Imperfecti.

M. apiospermum. Causative agent of maduromycosis, *q.v.*

monosymptomatic (môn-ô-simp-tô-mat'ik) [' + *symptôma*]. Having only 1 dominant symptom.

monosyphilitic (môn-ô-sif'il-îd) [' + *Fr. syphilide*] Characterized by only a single syphilitic lesion.

monoter'minal [' + *terma*, a limit] Using 1 terminal only in the giving of treatments, the ground acting as the 2nd terminal for the completion of the electrical circuit.

monothermia (môn-ô-therm'î-â) [G *monos*, single, + *thermê*, heat]. Condition in which bodily temperature is stable.

Monotricha (môn-ô-trîk-â) [' + *thriz*, *trich-*, hair]. Bacteria having a single flagellum at 1 pole.

monotrichous (mon-ô-trî-kus). Pert. to or having a single flagellum.

monovalent (mon-ô-va'lent) [' + *L. valere*, to have power]. Having the combining power of a single hydrogen atom. Syn: *univalent*.

monoxenous. Said of a parasite which has only one species as a host.

monoxide (môn-ôk'sid) [' + *oxys*, sour]. An oxide having only 1 atom of oxygen.

monozygotic (môn-ô-zî-gôt'ik). Originating from a single fertilized ovum, said of identical twins.

Monro's foramen (môn-rô'). Point of communication bet 3rd and lateral ventricles of the brain.

M.'s sulcus. Sulcus on 3rd ventricle's lateral wall from the foramen intertricularare to the aditus ad aquaeductum cerebri. Syn: *ulix*.

mons (môns) (pl. *montês*) [L. an elevation]. An anatomical eminence above the surface of the body.

m. pubis. BNA. Pubic eminence. Syn: *m. Veneris*.

m. veneris [L. mount of Venus]. A

pad of fatty tissue and coarse skin overlying the symphysis pubis in the woman. After puberty covered with short, curly hair called the *escutcheon*. Typically triangular in shape. See: *pubes*.

mon'ster [L. *monstrum*]. A malformed fetus. Syn: *teras*, *teratism*.

monstripar'ity [' + *parere*, to give birth to]. The act of bearing a monster.

monstros'ity [L. *monstrositâs*]. 1. Monster. 2. Congenital malformation.

Montgom'ery's glands. Small prominences around the nipple of the breast which enlarge during pregnancy and lactation. See: *areola*, *mamma*.

monthlies (munth'les) The menses.

monticulus (môn-tîk'u-lus) [L. little mountain]. A protuberance.

m. cerebelli. BNA. Protuberance of the superior vermis whose ant portion is called the *culmen*, the post portion the *declive*.

mood (môod) [A.S. *môd*, mind, feeling]. Temporary state of mind in regard to or as result of emotion.

moogrol (moog'rôl) Ethyl chaulmoograte. An oily liquid of faint odor.

Uses. In treatment of leprosy.

DOSAGE. Intramuscularly, 1 cc. weekly.

morament (môr-am'ent) [G *môros*, stupid, + *a-*, priv., + *L mens*, ment-, mind] A moron of low grade. A person who is mentally defective and without moral sense.

moramentia (môr-â-mên'shî-â) [' + + *L mens*, ment-, mind]. State of being without moral sense.

Morand's disease (môr-an'). Paresis affecting the lower extremities.

morbid (môr'bîd) [L *morbidus*, sick]. 1. Diseased. 2. Pert to disease.

morbidity [L *morbidus*, sick] State of being diseased.

m. rate. Number of cases of a specific disease in a calendar year per 100,000 of population.

morbific (môr-bîf'ik) [' + *facere*, to make]. Causing or producing disease.

morbilli (môr-bîl') [L *morbulus*, little disease]. Measles.

mor'bus [L. disease]. Disease.

m. addisonii. Addison's disease.

m. anglicus. Rickets.

m. arcuatus. Icterus.

m. caducus. Epilepsy.

m. caeruleus. Cyanosis which is congenital.

m. cardiacus. Cordis, *q.v.*

m. coeliacus. Celiac disease, *q.v.*

m. cordis. Chronic cardiac disease.

m. coxar'ius. Hip joint disease.

m. cutillaris. Whooping cough, pertussis.

m. divlnua. Epilepsy.

m. dormitivus. Sleeping sickness.

m. elephas. Elephantiasis.

m. gallicus. Syphilis.

m. maculosus neonorum. Fatal, hemorrhagic disease of the newborn.

m. magnus. Epilepsy.

m. miseriae. Condition due to neglect and want.

m. nauticus. Seasickness.

m. regius. Icterus, jaundice.

m. salutaris. Chorea.

m. senilis. Rheumatoid arthritis.

m. virgineus. Chlorosis.

m. vulpis. Alopecia.

morcellation, **morcellement** (môr-sel-â-shûn, -mon') [Fr. *morceller*, to subdivide]. Method of removing a tumor or organ in pieces.

mordant (môr'dânt) [L. *mordere*, to bite]. A substance which fixes a stain or dye, as *alum* and *phenol*.

morgagnian (mor-gan'yē-ăn). Pert. to or described by Morgagni.

Morgagni's caruncle (mor-gan'yē). The middle prostatic lobe.

M.'s cataract. One that is hypermature with a softened cortex and a hard nucleus. SEE *cataract*.

M.'s hydatid. Remains of müllerian duct attached to testicle or oviduct.

M.'s liquor. Fluid bet lens of eye and capsule.

M.'s ventricle. Ventriculus laryngis. SEE *ventricle*.

morgue (morg) [Fr.]. A public mortuary, a place for holding dead bodies before disposing of them.

moria (mo'ri-ă) [G. *mōria* folly]. 1. Simple dementia 2. Foolishness.

moribund (mor'i-bünd) [L *moribundus*, dying] In a dying condition, dying.

morioplasty (mo'ri-ô-plas-ti) [G *morion*, piece, + *plassein*, to form] Plastic surgery to restore portions of the body which have been lost through accident or disease.

morning or "A. M." care. Aim Comfort and cleanliness.

ARTICLES NECESSARY Basin with warm water. Washcloth and face towel Toothbrush, mouthwash, and water for mouth hygiene Emetics basin Comb and brush Fresh linen as needed Bath blanket. Rubbing alcohol and talcum powder.

PROCEDURE: If in ward screen bed or draw curtains. Offer bedpan before beginning procedure, and supply fresh perineal pad if necessary. Cover patient with bath blanket and fold top bedding to foot of bed. If very disordered, remove to chair. Remove all but 1 pillow. Assist patient with care of mouth, or care for it if patient is not able to. Wash face and hands. Turn patient on side and rub back with alcohol and powder. Patients whose skin is tender should have back washed before the rubbing. If patient is to have bath later the linen need not be changed until that is given. Loosen bottom sheet and draw sheet and pull them tight again, brushing out any crumbs that may be on them. Smooth patient's hair. Fluff and rearrange pillows. Rearrange upper bedding neatly. If patient has a hot water bottle or an ice cap refill them. Leave fresh water within patient's reach. Leave fresh washcloth and towel.

morning sickness. The nausea and vomiting that affect pregnant women during first few months of pregnancy, particularly in the morning.

Without these symptoms, headache, dizziness and exhaustion may be experienced. It may clear up after the 3rd month and may occur at other times of the day also.

Occurs usually about the 5th or 6th week and symptoms vary from simple morning sickness to pernicious vomiting of pregnancy. The latter is usually associated with serious liver damage. In some cases, hemorrhagic retinitis develops and is a serious complication. Usually clears up without treatment in 1-3 weeks. Occurs in about 50 per cent of pregnancies.

NP & TREATMENT Crackers or vanilla wafers on arising. Three to 5 small meals per day. Tea helps, some outdoor activities. Psychic causes aggravate, so mental hygiene is desirable. Eat what is craved. Good ventilation during sleep, effervescent drinks. Amytal, 1-2 gr. (0.065-0.13 Gm.).

mo'ren [G. *mōros*, stupid]. A feeble-minded person, not beyond the Binet age of 12, having the mentality ordinarily attained between 8 and 12; some authorities state 8 to 11 years. Of greater intelligence than an imbecile. The term implies no moral defect. Possessing an IQ of 50 to 70. SEE *idiot*, *imbecile*.

Moro's reaction or test. Test to determine the presence of tuberculosis, by application of an ointment of 5 cc. of old tuberculin and 5 Gm. of anhydrous wool fat to the thorax for 1 minute. An eruption of red papules on the skin appears in 24-48 hours in tuberculosis.

M.'s reflex. A defensive reflex, a response consisting of the drawing of the infant's arms across its chest in an embracing manner, in response to stimuli produced by striking the surface on which the infant rests.

morosis (mo-rô'sis) [G *mōros*, stupid, + *-osis*]. The mental state of a moron. Feeble-mindedness. SYN *morosity*.

morphea (mor-fe-ă) [G *morphe*, form] Skin disease characterized by discrete, circumscribed, grayish or yellowish patches, firm but not hard, bordered by pinkish or purplish areolae on breast, head, face, lower extremities, with telangiectases on the lesions.

Plaques disappear spontaneously but may leave cicatricial marks. Probably a trophoneurosis. SYN *Addison's keloid*, *circumscribed scleroderma*.

mor'phia. Morphine, *q. v.*

morphi'na [L] Morphine, *q. v.*

morphine (mor'fen) [L *morphina*, from *Morpheus* god of sleep] Main alkaloid found in opium, occurring in bitter, colorless crystals.

Widely used as analgesic and sedative.

Very satisfactory in combination with scopolamine in obstetrics.

POISONING Preliminary Symptoms. Brief mental exhilaration, languor, followed by weariness, sleepiness, pinpoint pupils, rapid, forcible pulse which becomes slow and feeble. Respiration slow and shallow. Unconsciousness, from which patient may be aroused with difficulty. Muscles become relaxed; reflexes diminished; temperature low, skin pale, cold and moist, pupils dilated; coma and death follow.

F. A. TREATMENT Gastric lavage may be administered and 1/2% potassium permanganate or 1% tannic acid or powdered charcoal. Large doses of atropine. Hot coffee or tea by mouth and rectum should be administered. Other stimulants injected hypodermically. The reflexes may be stimulated by walking, slapping, or alternate with cold and hot applications, and external heat. Inhalation of oxygen and artificial respiration may be necessary.

m. sulfate. USP. The sulfate of an alkaloid obtained from opium and occurring as white, feathery crystals, incompatible with alkalies, tannic acid and iodides. [gestic.]

ACTION AND USES: Hypnotic and analgesic. **DOSE:** 1/8 gr. (0.008 Gm.).

morphinism (mor'fin-izm) [L *morphina*]. Morbid condition due to habitual or excessive use of morphine. Morphine habit.

morphinomania, morphiomania (mor'fin-ô-mă-ni-ă, fe-ô-mă-ni-ă) [L + G *mania*, madness]. 1. Morbid desire for morphine. 2. Insanity resulting from use of morphine.

morphogenesis (mor'fô-jên'-ê-sis) [G.

morphé, form, + *genesis*, development]. The various processes occurring during development by which the form of the body and its organs is established.

morphogenetic (mor'fō-jên-et'ik) [" + *gennan*, to produce]. Stimulating growth and development of form

m. processes. Those by which morphogenesis is accomplished. Include cell migration, cell aggregation, localized growth, splitting, including delamination and cavitation, folding, including invagination and evagination

m. substance. Chemical substances present in eggs or early embryos which induce morphologic differentiation. *See* induction

morphology (mor-fol'ō-jī) [" + *logos*, study]. Science of external structure and form without regard to function

morphometry (mor-fom'e-trī) [" + *metron*, measure]. The measurement of external portions of forms and organisms.

morpio, morpion (mor'pī-ō, -pī-on) [L]. The crab louse infesting the pubic area.

mors [L] Death

m. putativa. Apparent death

m. subita. Sudden death

m. thymica. Sudden death in children associated with enlarged thymus

mortal [L *mors*, *mort-*, death] 1 Causing death. 2 Subject to death. 3. Human

mortality (mor-tal'i-tī) [L *mors*, *mort-*, death] 1. State of being mortal. 2 The death rate

mortar (mor'tar) [L *mortarium*] Vessel, with a smooth interior, used for powdering or pulverizing drugs with a pestle

mortification (mor'tī-fī-kā'shūn) [L *mors*, *mort-*, death, + *facere*, to make] Death or failure of a tissue, organ or part. *SYN* gangrene, necrosis

mortinatality (mor'tī-nā-tal'i-tī) [" + *natus*, birth] Ratio of stillbirths to normal births

mortise joint. Ankle joint

Mor'ton's disease. Neuralgia of the metatarsus

mortuary (mor'tu-a-rī) [L *mortuarium*, a tomb] 1 Temporary place for keeping dead bodies before burial. *SYN* morgue. 2. Rel to the dead or to death

morula (mor'ū-lā) [L *morus*, mulberry] Solid mass of cells, resembling a mulberry, resulting from segmentation of an ovum

moruloid (mor'u-loid) [" + G *eidōs*, form]. 1. Bact A colony made up of a mass resembling a mulberry 2 Resembling a mulberry

mosaic. 1 A picture or design made of many small colored pieces interspersed in some other material 2 Genetic, an individual with adjacent parts of different genetic constitution 3 Botany Spotted condition in plants as in tobacco mosaic, a disease caused by a virus

m. bone. B appearing as small pieces fitted together, characteristic of Paget's disease

m. development. Type of development exhibited by ova which undergo determinate cleavage in which each blastomere has a characteristic position and unalterable fate

m. sex. An individual consisting of male tissue in one part and female tissue in another owing to chromosomal abnormalities occurring during development. *See* gynandromorph

mosquito (mōs-kē'tō) [Sp little fly]. 1. A sucking insect belonging to the order Diptera, family Culicidae, q v. Import-

tant species are *Anopheles*, *Culex*, *Aedes*, *Haemagogus*, *Mansonia*, and *Psorophora*. They serve as transmitting agents of many diseases, including malaria, filariasis, yellow fever, dengue, viral encephalitis, and dermatobiasis

mossy cell (maws'ī) A protoplasmic astrocyte, a neuroglia cell with many branching processes. *See* neuroglia.

mossy fibers. Afferent fibers to the cerebellar cortex. They give off many collaterals, each ending in a glomerulus

moth'er [AS *mōdor*]. 1 Female parent.

2 A structure which gives rise to others.

m. cell. A cell which, by fission or budding, gives rise to similar cells.

m. cyst. An echinococcus cyst enveloping smaller ones

m. liquor. That left after removal of crystals from a solution.

m.'s mark. A birthmark. *See* mark.

motile (mō'til) [L *motilis*, moving]. Able to move spontaneously.

motility (mō-'lī-tī) [L *motilis*, moving]. Capability of moving spontaneously.

motion (mō'shun) [L *motio*, movement]. 1 A change of place or position, movement

2 Evacuation of the bowels 3. (Pl.) Matter evacuated. *See* "cine" words, efferent, "kine" words, circus movements

m., active. Movements caused by the patient's own intention

m. passive. Movements due to an attendant causing the part to be moved

m. sickness. Nausea, vomiting, and vertigo induced by irregular or rhythmic movements. Ex seasickness, airsickness, car sickness, swing sickness

motor (mō'tor) [L *motus*, moving] 1 Causing motion 2 A part or that which induces movements, as *nerves* or *muscles*.

m. aphasia. A condition in which the patient understands but cannot express himself in words, or read aloud

m. area. Post part of frontal lobe ant to the central sulcus from which impulses for volitional movement arise

m. end plate. Flat expansion ending a motor nerve fiber where it connects with a muscle fiber

m. fibers. Axons of motor neurons which innervate skeletal muscles

m. nerve. A n composed entirely of motor fibers

m. neuron. 1 A n which innervates muscle tissue 2 A n which carries impulses, initiating muscle contraction

m. points. Points where the motor nerve enters the muscle, and where visible contraction can be elicited with a minimal amount of stimulation

m. sense. The kinesthetic sense

m. unit. A single motor neuron and the muscle fibers its branches innervate

motorial (mō-tor'ī-āl) [L *motus*, moving]. Concerning motion or a motor center

motoricity (mō-tor'is-tī-ī) [L *motus*, moving] Capability of movement.

motorium (mō-tōr'ī-ūm) [L. power of motion]. Motor center of a body or organism.

motorius (mō-tōr'ī-ūs) [L. power of motion]. Any motor nerve.

m. oculi communis. Third cranial nerve. *SYN* motor oculi.

motorpathy (mō-tōr'pāth-ī) [L. *motus*, moving, + G *pathos*, disease]. Treatment of a condition by prescribed movements. *SYN*: *kinestherapy*, *kinetother-apy*.

mottled enamel. Condition in which the enamel of the teeth becomes porous and pigmented owing to excess of fluorine in drinking water. *See* fluorosis.

mottling (mô't'ling) [O.E. *motteley*, many colored] A condition which is marked by discolored areas

moulage (moo-lahzh') [Fr.] 1. A wax model or reproduction, as of a skin condition. 2. Molding of a wax model.

mould (môld). SEE *mold*.

moulding (môld'ing). SEE *molding*.

mounding [origin uncertain] Lumping, as the mounding of a wasting muscle when struck a quick, firm blow

mountain fever or **m. sickness**. SYN *hypobaropathy maro de la Cordillera, soroche, puna* Condition occurring in individuals ascending to high altitudes (over 10,000 ft.) or to those subjected to rarefied atmospheres. Due to anoxia resulting from reduced oxygen tension. SYN *tachycardia, headache, nausea, increased respiratory rate, fatigue, and cerebral disorders (loss of memory, errors of judgment)*

mounting (mownt'ing) [L *mons, mont-, mountain*] The arrangement of specimens on slides, frames, chart boards, display boards of any background for study

mouse unit (mows) Least amount of estrus-producing hormone which induces, in a spayed mouse, a characteristic desquamation of the vaginal epithelium

mouth (mowth) [A.S. *muth*] 1. The opening of any cavity. SYN *buccal cavity, oral cavity* 2. The cavity within the cheeks, containing the tongue and teeth, and communicating with the pharynx

Some conditions involving the mouth cavity are *abnormalities of tongue dry, coated, smooth, strawberry, large, pigmented, geographic, deviated, tremulous, sore, conditions involving gums and teeth gingivitis, sordes, lead line, pyorrhea, atrophy, hypertrophy, dental caries, alveolar abscesses, conditions involving mucous membrane or other parts of mouth eruptions accompanying exanthematous diseases, stomatitis, canker sores, thrush, trench mouth, cysts, tumors, carcinoma, lesions of syphilis such as chancre, mucous patches, gumma, lesions of tuberculous, abscesses*

Disorders of the mouth cavity may be indications of purely local disease or they may be symptoms of systemic disturbances such as dehydration, pernicious anemia, nutritional deficiencies, esp. avitaminoses

m. examination. In addition to visual examination, careful digital examination should be made, as such reveals areas of tenderness and alterations of texture characteristic of leukoplakia, cancer, and cystic swellings

Excessive moisture of the mouth is seen in stomatitis, irritation of pneumogastric nerve, ingestion of irritating drugs or foods, nervous disorders, teething, seeing appetizing foods, smelling pleasant odors, and during sexual intercourse

m., rashes in. Stomatitis, measles, scarlet fever. ON LIPS: Typhoid fever, meningitis, pneumonia. In secondary syphilis, chancre, cancer and epithelioma mucous patches appear. RS: *canker, catarrh*

m. trench. SYN: *Vincent's angina*. SEE *trench mouth*.

NP: Aim: To keep mouth clean and in good condition **Articles Necessary:** Small tray with glass of fresh water, glass or cup of mouthwash, applicators, tongue depressors, gauze bandage about 2 in. wide, emesis basin, towel, paper bag, liquid alboline or special ointment.

Procedure: 1. Have all equipment ready on bedside table 2. Place towel under patient's chin, across chest. 3. Turn patient's head to side and arrange emesis basin close to corner of mouth 4. Dip applicators in mouthwash and clean teeth, tongue, gums, and roof of mouth. 5. Discard used applicators into paper bag Do not dip into mouthwash after using 6 If teeth are difficult to clean make a larger swab by winding several turns of bandage around tongue depressor 7. Allow patient to rinse mouth with mouthwash, followed by fresh water Caution him not to expectorate the fluids forcibly, but to let them run gently out at the corner of his mouth Keep corner wiped clean 8. If lips are dry or cracked apply liquid alboline or special ointment 9 If the patient has a high temperature clean the mouth before each feeding 10 If he is unconscious hold the mouth open with a tongue depressor padded with gauze, 11. Be gentle and thorough

RS *agranulocytosis, Ludwig's, antitrimus, astomatous, bucca, buccal, b. glands, cancerum oris, chalinoplasty; chin jerk, fauces, ora, palate, oral, orifice, os, stoma, stomatitis, tongue, xerostomia*

movement (môov'mént) [L *movêre, to move*] 1. Act of passing from place to place or changing position of body or its parts 2. Evacuation of feces

m., active. Accomplished without outside assistance

m., amoeboid. Movement resembling that of an amoeba in which the protoplasm of a cell flows into a projection of the cell membrane forming a pseudopodium Characteristic of leukocytes and certain protozoa

m., associated. Involuntary movement of a part occurring coincident with and subsequent to the movement of another part

m., autonomic. A spontaneous, involuntary m., independent of ext stimulation

m., brownian. The peculiar jiggling or dancing movement of minute particles suspended in liquids or gases when observed under the microscope, due to bombardment of the particles by molecules of their surrounding medium

m., ciliary. That of the cilia of a ciliated cell or epithelium

m., circus. A phenomenon in an animal after injury to 1 corpus striatum, optic thalamus, or crus cerebri, causing it to move about in a circle.

m., disorders of. May be due to injury or disease of (a) muscle, (b) nerve ending, (c) motor nerve, (d) spinal cord, or (e) of the brain.

Types or Hemiplegia, ataxia, monoplegia, tremors, rigors, choreic, athetosis, convulsions, spasm (clonic or tonic), reflex (hysterical, habit spasm, tics), and spastic paralysis

m.'s, fetal. Muscular m.'s performed by the fetus in utero.

m., molecular. The movement of molecules of a substance the basis of the kinetic theory of matter. SEE: *m., brownian*

m., pendular. Swaying movements of the intestine when exposed, due to rhythmic contractions of the circular layer of muscle.

m., peristaltic. Peristalsis, *q.v.*

m., respiratory. Any m. resulting from the contraction of respiratory muscles or occurring passively as a result of elasticity of the thoracic wall or

lungs. **See:** *inspiration, expiration, respiration.*

m. of restitution. A partial rotation of the fetal head, in cases of head presentation.

m. segmenting. M. of the intestine in which annular constrictions occur dividing intestine into ovoid segments **m. vermicular.** Peristalsis.

m. vibratile. Ciliary m.

moxa (mók'sa) [Japanese]. Inflammable substance used as a cautery for the skin, or as a counterirritant.

moxibustion (mòks-i-büst'shùn) [Japanese *moxa*, + L. *combustus*, burned] Cauterization by means of a cylinder or cone of cotton wool, called a *moxa*, placed on the skin and fired at the top.

mososphyra (mòks-6-sof-i'rà) [Japanese *moxa* + G. *sphyrà*, hammer]. A hammer heated and used as a cautery

mu (mù) [Greek letter m] A micron, 1/1000 of a millimeter or 1/25,000 of an inch.

M. u. Abbr. for Maché unit and mouse unit

mucadin (mù'se-dín) [L. *mucedō*, mucus]. A substance obtained from gluten

Much-Holzmann reaction (mook-holts'-mahn). Inhibition of hemolysis of erythrocytes by cobra venom in manic-depressive insanity and dementia precox. **Syn.** *psychoreaction.*

muciferous (mù-sif'ér-ús) [L. *mucus*, mucus, + *ferre*, to carry]. Secreting or producing mucus

muciform (mù'si-form) [' + *forma*, shape]. Appearing similar to mucus.

mucigen (mù'si-jén) [L. *mucus*, mucus, + G. *gennan*, to produce] A substance present in mucous cells which upon being extruded from the cell is converted into mucin

mucigenous (mù-sij'én-ús). Producing mucus. **Syn.** *muciferous.*

mucilage (mù'si-láj). Vegetable preparation used in pharmaceuticals. **See** *mucilagō.*

mucilaginous (mù-sil-aj'in-ús) [L. *mucilagō*, moldy juice]. Resembling mucilage; slimy; sticky.

mucilla'go [L. moldy juice] Thick, viscid, adhesive liquid, containing gum or mucilaginous principles dissolved in water, usually employed to hold insoluble substances in suspension in aqueous liquids or as a demulcent. There are 2 official mucillages.

mucin (mù'sín) [L. *mucus*]. A glycoprotein found in mucus. It is present in saliva and bile and also found in salivary glands, in the skin, connective tissues, tendon, and cartilage. It is formed from mucigen and in water forms a slimy solution

On decomposition the mucins give dextrose, sulfur and nitrogen among other products. Increase of mucin in the urine indicates irritation and inflammation of the mucous membrane of the urinary tract or vagina.

m., gastric. A commercial preparation made from the gastric mucosa of the hog, used in the treatment of ulcers of the digestive tract. It forms a protective coating over the ulcer or erosion, which prevents irritation from the passing of bile and acid secretions in the duodenum, and from acid conditions irritating peptic ulcer of the stomach.

Dosage: Daily, 80-100 Gm. (100 Gm.-1½ qt., ½ milk and cream, flavored to taste, and divided into 12 hourly doses.)

mucinemia (mù-sín-ēm'i-á) [' + G. *aima*, blood]. Mucin in the blood.

mucinogen (mù-sín'ò-jén) [' + G. *gennan*, to produce]. A glycoprotein which forms mucin

mucinoid (mù'sín-old) [' + G. *eidos*, resemblance]. Appearing similar to mucin.

mucinuria (mù-sín-ù-rí-á) [' + G. *ouron*, urine]. Presence of mucin in the urine.

muciparous (mù-sip'ár-ús) [L. *mucus*, mucus, + *parire*, to bring forth]. Producing or secreting mucus. **Syn:** *muciferous, mucigenous.*

muco- [L]. Combining form, having relation to mucus.

mucocoele (mù'kò-sēl) [L. *mucus*, mucus, + G. *kēlē*, swelling]. 1. Enlargement of the lacrimal sac. 2. A mucous cyst. 3. A mucous polypus

mucocolpos (mù'kò-kòl-pòs). Accumulation of mucus in the vagina

mucocutaneous (mù'kò-kù-tà'nē-ús) [' + *cutis*, skin] Concerning a mucous membrane and the skin

mucodermal (mù-kò-dēr'mál) [' + G. *derma*, skin] Pert to a mucous membrane and the skin. **Syn.** *mucocutaneous.*

mucointeritis (mù'kò-én-tēr-i'tis) [' + G. *enteron*, intestine, + *-itis*, inflammation]. Inflammation of intestinal mucosa.

mucoglobulin (mù'kò-glòb-ù-lín) [' + *globulus*, globule] Any protein group to which plastin belongs

mucoid (mù'kòyd) [' + G. *eidos*, resemblance] 1. Glycoprotein similar to mucin. 2. Muciform similar to mucus

mucopurulent (mù-kò-pur-ù-lént) [' + *purulentus*, made up of pus]. Consisting of mucus and pus.

mucopus (mù'kò-pùs) [' + *pus*, pus] Mucus combined with or resembling pus

Mucor (mù'kor) [L. mold] A genus of mold fungi seen on dead and decaying matter. Sometimes responsible for infections of external ear, skin, and respiratory passageways.

mucoriferous (mù-kor-lf'ér-ús) [' + *ferre*, to carry]. Covered with mold or a mold-like substance.

mucorin (mù'kor-in) [L. *mucor*, mold]. An albuminoid substance derived from molds.

mucormycosis (mù-kor-mi-kò'sis) [' + G. *mykēs*, fungus, + *-ōsis*]. A fungous disease due to *Mucor*

mucosa (mù-kò'sà) (pl. *mucosae*) [L. *mucus*]. Mucous membrane.

mucosal (mù-kò'sál) [L. *mucōsa*, mucous]. Concerning any mucous membrane.

mucosanguineous (mù'kò-san-gwín'ē-ús) [L. *mucus*, mucus, + *sanguineus*, bloody]. Containing mucus and blood

mucosedative (mù'kò-séd'à-tiv) [' + *sedativus*, allaying]. Soothing to mucosae of the body. **Syn:** *demulcent.*

mucoserous (mù'kò-sēr'ūs) [' + *serum*, whey]. Composed of mucus and serum.

mucosin (mù'kò-sín) [L. *mucus*, mucus]. Mucin found in thick, sticky mucus.

mucous (mù'kūs) [L. *mucus*, mucus]. 1. Having the nature of or resembling mucus. 2. Secreting mucus. 3. Depending on presence of mucus.

RS: *mucitis, mucocoele, mucopurulent, mucosa, mucus, "myz-" words.*

m. colitis. Inflammation of the mucosa of the colon. **See:** *colitis.*

m. membrane. That lining passages and cavities communicating with the air. Consists of a surface layer of epithelium, a basement membrane, and an underlying layer of connective tissue, the lamina propria. Mucus-secreting cells or glands are usually present in the epithelium but may be absent.

EXAMINATION OF. Examination should reveal degree of moisture, cyanosis, pallor, hyperemia, pigmentation, lesions, or their absence, and hemorrhage.

PALLOR. Seen in all anemias. If temporary, may indicate shock, vasomotor spasm, or may occur in severe hemorrhages.

BLANCHING AND FLUSHING ALTERNATELY: Accompanies aortic regurgitation.

CYANOSIS. SEE *skin*.

HYPEREMIA OR EXCESSIVE REDNESS. *Buccal mucous membrane.* Due to decayed teeth, traumatism, stomatitis. SEE *mouth*.

Nasal mucosa. Ulceration of nose, rhinitis, inflammation. SEE *nose*.

Eyes (local irritation). Foreign body, ulcer, inflammation. SEE *jaundice*.

DRYNESS. Seen in fevers, chronic gastritis, some liver disturbances, excitement, shock, prostration, fatigue, thirst and certain drugs.

m. polypus. Small growth from mucous lining of the cervix or uterus.

mucoviscidosis. SEE *cystic fibrosis*.

mucus (mŭ'kŭs) [L.] A viscid fluid secreted by mucous membranes and glands, consisting of mucin, leukocytes, inorganic salts, water and epithelial cells.

A good example is the almostropy secretion from the sublingual and submaxillary glands. Mucus in feces indicates irritation of mucous lining of the intestines and inflammation. It gives a slimy appearance to the stool. If the inflammation is in the small intestines the mucus will be mixed with the stool, if in the colon it will be on surface.

RS amyorrhoea, "blenn-" words, expectorant, expectoration, glairy, goblet cell, "muc-" words.

mulatto (mŭ-lăt'ō) [Spanish *mulato*, of mixed breed, from L. *mulus*, mule]. First generation born of pure negro and white parentage, popularly anyone of white and negro blood mixed.

mullebría. The female genitalia.

mullebrity (mŭ-lē'brī-tī). Femininity; womanliness. The assumption of womanly qualities at puberty. The assumption of female characteristics by a male.

Müller's ducts. Embryonic tubes from which the oviducts, uterus and vagina develop in the female, in the male they become atrophied.

M.'s fibers. SYN *radial fibers of M*. Fine fibers of neuroglia cells which form supporting elements of the retina.

M.'s muscle. 1. Circular fibers of ciliary muscle. 2. The sup tarsal muscle of the eyelid. 3. Smooth muscle covering over sphenomaxillary fissure.

M.'s reaction. A sphincterlike muscular r at the point where the canal of the cervix uteri joins the cavity of the body of the uterus at an advanced stage of pregnancy.

M.'s ring. Muscular ring at junction of cervical canal and the gravid uterus.

M.'s trigone. Portion of *tuber cinereum* folding over the optic chiasm.

M.'s tubercle. Projection on dorsal wall of cloaca at which Müller's ducts terminate.

mult-, multi- [L.] Prefixes meaning *many*.

multangular. Having many bones.

m., greater, bone. SYN *trapezium*. The first or outermost of the distal row of carpal bones.

m., lesser, bone. SYN *trapezoid*. The second in distal row of carpal bones.

multarticular (mŭl'tī-ar-tīk'ŭ-lar) [L. *multus*, many, + *articulus*, joint]. Con-

cerning, having, or affecting many joints.

multicapsular (mŭl'tī-kap'sŭ-lar) [+ *capsula*, a little box]. Composed of many capsules.

multicellular (mŭl'tī-sēl'ŭ-lar) [+ *cellula*, small chamber]. Consisting of many cells.

Multiceps. A genus of tapeworms.

multicuspid, multicuspidate (mŭl'tī-kus'pīd, -pī-dāt) [+ *cuspis*, point]. Having several cusps.

multifid (mŭl'tīf-id) [+ *fidus*, from *findere*, to split]. Divided into many sections.

multiform (mŭl'tī-form) [+ *forma*, shape]. Having many forms or shapes. SYN *polymorphous*.

multiglandular (mŭl'tī-glānd'ŭ-lar) [+ *glandula*, a little acorn]. Concerning several glands.

multigravida [L. *multus*, many, + *gravida*, pregnant]. A woman who has borne children 2 or more times. SYN *multipara*.

multinfection (mŭl'tī-in-fek'shŭn) [+ *infectio*, an infection]. A mixed infection with several organisms developing at the same time.

multilobular (mŭl'tī-lōb'ŭ-lar) [+ *lobulus*, a small lobe]. Formed of, or possessing many lobules.

multilocular (mŭl'tī-lōk'ŭ-lar) [+ *loculus*, a cell]. Having many cells or compartments. SYN *multicellular*.

multimammæ (mŭl'tī-mam'mæ) [+ *mamma*, a breast]. Condition of possessing more than the normal number of breasts. SYN *polymastia*.

multinodal (mŭl'tī-nōdāl) [+ *nodus*, node]. Having many nodes or knots.

multinodular (mŭl'tī-nod'ŭ-lar) [+ *nodulus*, little knot]. Possessing many nodules or small knots.

multinuclear, multinucleate (mŭl'tī-nŭklē-ar, -āt) [L. *multus*, many, + *nucleus*, kernel]. Possessing several nuclei.

multiara (mŭl'tīp'ā-rā) [+ *parere*, to bear]. A woman who has borne more than 1 child.

multiparity (mŭl'tī-par'tī-tī) [+ *parere*, to bear]. 1. Condition of having borne more than 1 child. 2. Production of more than 1 child at birth.

multiparous (mŭl'tīp'ār-ŭs) [+ *parere*, to bear]. 1. Having borne more than 1 child. 2. Producing more than 1 child at birth.

multiple (mŭl'tī-pl) [L. *multiplus*, many folded]. 1. Consisting of, or containing more than 1; manifold. 2. Occurring simultaneously in various parts of the body.

m. personality. Condition in which the subject may develop more than 2 personalities. SEE: *dual personality, vigilambulism*.

multipolar (mŭl'tī-pō-lar) [L. *multus*, many, + *polus*, a pole]. 1. Possessing more than two poles. 2. Possessing more than two processes, said of neurons.

multiterminal [+ G. *terma*, a limit]. Providing several sets of terminals, making possible the use of several electrodes.

multivalent (mŭl'tī-vāl'ent) [+ *valere*, to have power]. Having ability to combine with more than 2 atoms of a univalent element or radical.

mummification (mum'mī-fi-kā'shŭn) [Arabic *mūmiya*, mummy, + L. *facere*, to make]. 1. Mortification producing a hard, dry mass. SYN: *dry gangrene*. 2.

Drying and shriveling of a body, as a dead *jetus*.

mumps (mumps) [Dutch *moppen*, to mumble]. An acute, contagious, febrile disease characterized by inflammation of the parotid gland and other salivary glands.

Etiol. Causative organism unknown. Probably a filterable virus.

Sym. Onset gradual. There may be chilliness, malaise, headache, pain below ears, moderate fever (101-102° F), sometimes higher, followed by swelling of parotid glands, the enlargement of 1 usually becoming evident a day or 2 before the other. Swelling is below and in front of the ear. It is pyriform in shape, and has a doughy feeling.

The lobe of the ear is sometimes pushed forward, surrounding tissues are edematous, the features may be greatly distorted. Movements of the jaw are painful and restricted. Saliva may be increased or diminished. Sometimes only 1 parotid is involved. Occasionally, the parotid glands seem to escape, and swelling is confined to the submaxillary gland. Swelling usually lasts from 5 to 7 days.

Complications. When complications set in, they usually develop about the time the swelling in the parotids subsides. The most common complication in the adult male is orchitis, in the female oophoritis, mastitis and vulvitis. Rarely permanent dullness of hearing follows an attack of mumps.

Differential diagnosis. Cases of symptomatic parotitis must be excluded. Instances of trauma, infections about teeth and mouth, or a blocking of Stensen's duct may be suggestive of mumps.

Prognosis. Favorable, although the possibility of sterility may have to be considered in extremely rare instances of double orchitis or double oophoritis.

Treatment. Rest in bed, liquid diet; avoid acids, promote elimination, cold, local applications may control swelling to some extent. Syn. *branks*, *epidemic parotitis*.

mural (mū'ral) [L. *murus*, a wall]. Pert. to a wall of an organ or part.

muriate (mūr'ī-āt) [L. *muria*, brine]. 1. An old synonym for *chloride*. 2. To charge with chlorine or certain chlorine compounds.

muriated (mūr'ī-āt-ēd) [L. *muria*, brine]. Charged with or containing chlorine or certain chlorine compounds.

murietic acid [L. *muria*, brine]. Commercial hydrochloric acid, q.v.

mur-mur [L. *mur-mur*]. A soft blowing or rasping sound heard on auscultation. An adventitious sound heard on auscultation of the heart. It results from vibrations produced by movement of the blood within the heart and adjacent large blood vessels. May be heard during systole or diastole or both.

Two of the valves give forth a "lubb" sound and the other 2 a "dupp" sound, known as the 1st and 2nd heart sounds. A blowing sound is heard if the valve does not close tightly, indicating an incompetent valve. The flow of blood through a narrowed orifice, as in aortic or mitral stenosis, or a great vessel irregularity, such as an aortic aneurysm, may produce a murmur.

A slight sound given off first does not necessarily indicate an organic trouble, and heart disease may not result in any murmur; this may also be true in *angina pectoris* and coronary disorders.

Air in the lungs may simulate sounds similar to heart murmurs.

RS. *auscultation, circulation of blood, heart, lumb, venous*.

m., aneurysmal. Whizzing systolic sound heard over an aneurysm.

m., aortic obstructive. Harsh systolic one heard with and after the 1st heart sound. Loudest at the base.

m., a. regurgitant. Blowing, hissing following 2nd heart sound.

m., apex. Inorganic m over apex of heart.

m., arterial. Soft flowing one, synchronous with pulse.

m., bronchial. M heard over large bronchi, resembling respiratory laryngeal m.

m., cardiac pulmonary. M caused by movement of heart against lungs.

m., diastolic. M during dilation of heart.

m., direct. M caused by obstruction of blood in normal course.

m., endocardial. M produced within the heart cavities.

m., exocardial. A cardiac murmur produced outside of the cavities of the heart.

m., friction. M caused by rubbing of 2 inflamed mucous surfaces.

m., functional. M occurring in the absence of any pathologic change in structure of heart valves or orifices. They do not indicate organic disease of the heart. They may disappear upon a return to health. They must not be mistaken for true pathological murmurs.

m., hemic. Sound heard on auscultation of anemic persons without a valvular lesion. Error. Abnormal, usually anemic, blood condition.

m., indirect. M heard when blood flows in abnormal directions.

m., inorganic. M not due to structural changes.

m., machinery. A continuous rough murmur heard in cases of a patent ductus arteriosus.

m., mitral. M produced at orifice of mitral or bicuspid valve.

m., organic. M due to structural changes.

m., pericardial. M produced within the pericardium.

m., physiologic. A functional murmur, q.v.

m., pulmonary. M produced at the orifice of the pulmonary artery.

m., regurgitant. M due to backward flow of blood current.

m., systolic. M heard during contraction of heart, due to obstruction.

m., to-and-fro. M heard during both systole and diastole.

m., tricuspid. M produced at orifice of tricuspid valve.

m., vascular. M occurring within a blood vessel.

m., vesicular. One heard in normal breathing.

Murphy's button. Mechanical device used to connect visceral ends of a divided intestine in anastomosis.

M.'s drip or treatment. Continuous slow passage of normal saline solution into the rectum; usually used in treating peritonitis.

Mus. A genus of rodents including mice and rats.

M. musculus. The common house mouse.

Musca. A genus of flies belonging to the order Diptera, family Muscidae.

M. domestica. The common house fly, the transmitting agent for causative

organisms of typhoid fever, bacillary and amebic dysentery, cholera, trachoma, and many other diseases.

muscae volitantes (mus'sé vol-i-tan'téz) [L. fitting flies] Black specks seen floating in the vitreous humor of the eye and visible to the patient, often seen in myopia.

muscle (mus'el) [L. musculus] A type of tissue composed of contractile cells or fibers, which effects movement of an organ or part of the body.

The outstanding characteristic of muscular tissue is its ability to shorten or contract. It also possesses the properties of irritability, conductivity, and elasticity. Muscle tissue possesses little intercellular material, hence its cells or fibers lie close together. Three types of muscle differentiated on basis of histologic structure occur in the body, namely, smooth, striated, and cardiac.

Smooth Nonstriated, Plain. Cells are fusiform or spindle-shaped, each containing a central nucleus. Cells usually arranged in sheets or layers but may occur as isolated units in connective tissue. Called *involuntary* because they are not under conscious control. Found principally in the internal organs, esp digestive tract, respiratory passages, urinary and genital ducts, urinary bladder and gallbladder, and walls of blood vessels. Smooth muscle lacks the cross striations characterized of other types of muscle.

Striated, Striped, Skeletal. The cytoplasm (sarcoplasma) contains numerous myofibrillae. The cytoplasmic cell membrane is called the *sarcolemma*. Muscle fibers are grouped into bundles called *fasciculi*, each of which is surrounded by a sheath of connective tissue called *perimysium*. The fibers within a fasciculus are surrounded by and held together by delicate reticular fibrils forming the *endomysium*. Striated muscle is found in all skeletal muscles. It also occurs in the tongue, pharynx and upper portion of esophagus.

Cardiac. Fibers branch and anastomose, forming a continuous network or syncytium. At intervals, prominent bands or *intercalated disks* cross the fibers. Certain atypical cardiac muscle fibers, called *Purkinje fibers*, form the *impulse-conducting system* of the heart.

SHAPE. A contractile organ consisting of muscle tissue which effects movements of parts of the body, esp a structure composed of striated muscle and attached to a part of the skeleton. A typical muscle consists of a central fleshy portion or *belly* and its attach-

ments. One end called the *head* is attached to a fixed structure termed the *origin*, the other end is attached to a movable part called the *insertion*. Some muscles are spindle-shaped, others form flat sheets or bands.

Muscles may be attached directly to the periosteum of bones or they may be attached by means of tough cords of connective tissue (*tendons*) or broad flat sheets (*aponeuroses*). The connective tissue enclosing a muscle is called *epimysium*, it is continuous with the deep *fascia*.

BLOOD SUPPLY. Obtained from small blood vessels which enter the muscular tissue and subdivide into capillaries which permeate throughout.

NERVE SUPPLY. *Voluntary.* From branches of the peripheral cerebrospinal nervous system. It is because of this that the skeletal muscles are under conscious control. *Involuntary.* Smooth and cardiac receive their nerve supply from autonomic nervous system and function involuntarily without conscious control.

FUNCTION. To bring about changes in position.

m., abductor. M which draws away from the midline.

m., adductor. M which draws toward the midline.

m., antagonistic. M which neutralizes the function of another.

m.'s, antigravity. M's which pull against the force of gravity to maintain posture.

m., appendicular. One of the skeletal muscles of the limbs.

m., articular. A joint muscle.

m., axial. A skeletal m. of the head or trunk.

m., bipennate. M in which the fibers converge toward a central tendon on both sides.

m. bound. Condition caused by overuse in which muscles are less elastic and bulkier.

m., branchial. M, non-myomeric in origin, arising from mesoderm of a branchial arch.

m., constrictor. A m which compresses a part.

m., corrugator. M drawing the skin up and causing it to wrinkle.

m. curve. A tracing of muscular contraction.

m., digastric. M with two bellies and inserted by a single tendon.

m., extensor. M which straightens a part.

m., extrinsic. M whose origin lies outside the part moved.

Tabular Comparison of the Properties of Three Types of Muscle

	Smooth	Cardiac	Striped
Synonyms	Involuntary Visceral Plain	Myocardium	Voluntary Skeletal Striated
Fibers.			
Length in micra	75.		25,000.
Thickness	5.		75.
Shape	Spindles	Blocks	Cylinders
Marking	No striation	Striation	Marked striation
Nuclei	Single	Single	Multiple
Speed of contraction	Very slow	Moderate	Very quick
Effects of cutting related nerve	Slight	Slight	Complete paralysis

m. fatigue. The reduced capacity of a muscle to perform work. For causes of, SEE: *fatigue*.

m. fixation. A m. which acts to steady a part in order that more precise movements in a related structure may be accomplished

m., flexor. M. which bends a part.

m., fusiform. A m. resembling a spindle

m., intra-aural. A m. within the tympanic cavity

m., intrinsic. A m. which has both its origin and insertion within a structure, as intrinsic muscles of the tongue, eye, or limb

m., involuntary. M. not controlled by the will, mainly smooth

m., joint. M. which produces motion in a joint.

m., mimetic. A m. of facial expression.

m., multipennate. M. with several tendons of origin and several tendons of insertion in which fibers pass obliquely from a tendon of origin to a tendon of insertion on each side

m., nonstriated. Smooth muscle, *q.v.*

m., papillary. M. on inner surface of ventricle of heart to which chorda tendinae are attached

m., pectinate. M. on inner surface of rt atrium giving it a ridged appearance

m., postaxial. M. on the post or dorsal aspect of a limb

m., preaxial. M. on the ant or ventral aspect of a limb

m., red. M. composed of dark fibers having a larger amount of sarcoplasm and less pronounced cross striations

MUSCLES OF THE CHEST AND ABDOMINAL WALL.

MUSCLES OF THE NECK, SHOULDER AND BACK.

They are slower in action and fatigue less readily than white fibers. Predominate in muscles concerned with maintenance of posture. SEE *m., white.*

m. sense. The proprioceptive or kinesthetic sense.

m., skeletal. M. which is connected with a bone, mainly striated.

m., smooth. Nonstriated muscle; muscle tissue which lacks cross striations on its fibers; involuntary in action and found principally in visceral organs.

m., somatic. M. derived from mesodermal somites. Includes most of skeletal m.

m., sphincter. M. controlling an opening.

m., striated. SYN: *striped m.* Muscle fibers which possess alternate light and dark bands or striations; mainly

voluntary and comprise skeletal muscles.

m., sugar. SYN: *inositol.* Sugar found in muscular tissue.

m.'s, synergistic. M.'s aiding one another in function.

m., unipennate. M. whose fibers converge on only 1 side of a tendon.

m., unstriated, m., unstriped. SYN: *smooth muscle.* M. without markings, mainly involuntary.

m., visceral. 1. Any m. not originated in somite of embryo. 2. Any m. of the visceral part of the skull, esp those of the visceral organs; those concerned with functions other than locomotion.

m., voluntary. M. whose action is controlled by will; excepting the cardiac m.; all striated m.'s are voluntary.

m., white. M. composed of pale fibers having pronounced cross striations.

tions and little sarcoplasm. Execute rapid movements and fatigue readily. SEE *m. red*.

mus'cular [L *musculus*, muscle] 1 Pert. to muscles. 2. Possessing well developed muscles.

m. contractions, graduated. Accomplished by use of electrical current of varying strength and duration. Used (a) in muscles with an intact nerve supply when muscles are atonic, wasted away, or when voluntary exercise is not feasible, and (b) in denervated muscles as in cases following nerve injury or anterior poliomyelitis.

m. dystrophy. Wasting away and atrophy of muscles. SEE *dystrophy*, *progressive muscular*.

m. rheumatism. That affecting the muscles.

muscularis (mús-kú-la'is) [L *muscularis*]. Muscular coat of a hollow organ or tubule.

m. mucosae. Unstriated muscular tissue layer of mucous membrane.

muscularity. State or quality of being muscular.

mus'culature [L *musculus*, muscle]. The arrangement of muscles in the body or its parts.

mus'culin [L *musculus*, muscle]. Muscle tissue globulin or protein.

musculo- [L] Combining form pert. to a muscle.

musculoaponeurotic (mús-kú-lô-áp'-ô-nú-rô'tík) Composed of muscle and an aponeurosis of fibrous, connective tissue.

musculocutaneous (mús'ku-lô-kú-tân'é-ús) [L *musculus*, muscle, + *cutis*, skin] 1 Pert. to the muscles and skin. 2 Supplying or affecting the muscles and skin.

musculofascial. Composed of muscle and fascia.

musculomembranous (mús'kú-lô-mém'-brán-ús) [' + *membrana*, membrane]. Pert. to or consisting of muscle and membrane.

mus'culophren'ic. Pertaining to muscles of the diaphragm.

mus'culoten'dinous. Composed of both muscle and tendon.

mus'culus (pl *musculi*) [L] Muscle, *q.v.*
mush'room [Fr *moucheron*, from L *muscus*, moss]. Umbrella-shaped fungus belonging to the Basidiomycetes which grows on decaying vegetable matter, common in woods and damp places. The poisonous varieties are commonly called *toadstools*, *q.v.*

COMP. Low in carbohydrates and fats; high in protein but of little alimentary value. Xanthic bodies and toxic elements are present. Their relationship and similarity to poisonous fungi are so close that only those who are thoroughly posted should attempt to gather or purchase them.

AV. SERVING (fresh): 50 Gm. Fat 0.2. VITAMINS B+, G+ to ++. ASH CONST: Ca 0.017, Mg 0.016, K 0.384, Na 0.027, P 0.108, Cl 0.021, S 0.051. A base-forming food, alkalinity, 4 cc. per 100 Gm; 9 cc. per 100 cal.

ACTION. As a seasoning they stimulate gastric secretions.

m. and toadstool poisoning. Poisoning resulting from ingestion of mushrooms, such as *Amanita muscaria*, which contains muscarin, or other species, which contain phalloidine, a component of the *amanita* toxin.

TREATMENT. These require an abundance of hot drinks, preferably containing a small amount of table salt, heat to the abdomen; strong tea, and above all atropine or belladonna and mor-

phine, which are physiologic antidotes. Patients are always in shock and need adequate treatment. Diarrhea and emesis are marked and ordinarily need to be allayed rather than stimulated.

mu'sicoma'nia [G *mousikê*, music, + *mania*, madness]. Insane love of music.

mu'sicother'apy [' + *therapeia*, treatment]. Treatment of mental diseases with music.

musk (mûsk) [G *moskos*, from Sanskrit *muska*, testicle]. Dried secretion of the preputial follicles of male musk deer.

musk'melon [' + G *mêlon*, apple] **AV. SERVING.** 200 Gm. Pro 1.2, Fat 0.2, Carbo 11.8. VITAMINS A++, B++, C++ to +++ ASH Ca 0.017, Mg 0.012, K 0.235, Na 0.061, P 0.015, Cl 0.041, S 0.014, Fe 0.0003. SFR *cantaloupe*, *melon*.

mus'sel [L *musculus*, little mouse]. A fresh-water bivalve mollusc belonging to the class *Pelecypoda*.

m. poisoning. SYN *mytilotoxism*. Poisoning common on the Pacific coast resulting from eating mussels or clams which have ingested a poisonous dinoflagellate producing mytilotoxin. Occurs from June to October. The poison is not destroyed by cooking.

mussification (mús-si-tá'shun) [L *musitare*, to mutter]. The muttering of delirium or the moving of the lips without sound.

must'ard [F1 *moustarde*]. Yellow powder of mustard seed used as a counterirritant, rubefacient, emetic and stimulant. SFR *plaster*.

As a condiment. **AV. SERVING** (prepared) 10 Gm. Pro 0.4, Fat 0.3, Carbo 0.7. ASH Ca 0.402, Mg 0.260, K 0.761, Na 0.056, P 0.755, Cl 0.016, S 1.230. No iron. SFR *condiments*.

m. gas. Dichloro-diethylsulfide, a vesicant war gas.

m. greens. **AV. SERVING** 50 Gm. Pro. 1.2, Fat 0.2, Carbo 2.00. VITAMINS A+++ , B+, G+++.

mutacism (mutá-tá-sizm) [G *mytakismos*, fondness for letter m]. Excessive or improper pronunciation and use of letter m or its sound. SYN *mytacism*.

mutant (mút'tánt) [L *mutare*, to change]. In heredity, a sport or variation which breeds true.

mutase (mut'ás) [' + *ase*, enzyme]. 1. Enzyme which accelerates oxidation-reduction reactions through activation of oxygen and hydrogen. 2. A food preparation made from leguminous plants high in protein content.

mutation (mút-tá'shun) [L *mutare*, to change]. 1. Change, transformation; instance of such change. 2. Sudden, permanent variation with offspring differing from parents in a marked characteristic as differentiated from gradual variation through many generations, so called by De Vries. Also person showing such change. 3. A change in a gene potentially capable of being transmitted to offspring.

m., induced. M. resulting from experimental treatment with x-rays, radioactive substances, etc.

m., natural. M. occurring in nature, thought to be a primary factor in evolutionary change.

m., somatic. M. occurring in somatic cells.

mute (mút) [L *mutus*, dumb]. 1. One who is unable to speak. 2. Dumb; without ability to speak.

m., deaf. Individual who is unable to hear or to speak.

mu'tilate. To deprive of a limb or a part; to maim or disfigure.

mutism (mû'tizm) [L] 1 Condition of being unable to speak 2 Psy Persistent inhibition to speech, seen in *dementia precox*.

mutualism (mut'u-al-izm) [L *mutuus*, exchanged] A form of symbiosis in which organisms of two different species live in close association to the mutual benefit of each.

myalgia (mi-al'jî-â) [G *mys*, *my-*, muscle, + *algos*, pain] Tenderness or pain in the muscles, muscular rheumatism.

myanesis (mi-ân-'ê-sin) A synthetic compound injected into a vein for relaxation of muscle tension. It gives relief in poliomyelitis and some types of arthritis.

myiasis (mi-â-sîs) [G *myia*, a fly] Condition which arises from larvae of flies or maggots in the body or upon mucous membranes. SYN *myiasis*.

myasthenia (mi-âs-thê'nî-â) [G *mys*, *my-*, muscle, + *astheneia*, weakness] Muscular weakness.

m. angiosclerotic. Vascular changes producing excessive muscular fatigue.

m. gastrica. Loss of muscular tone in coats of the stomach.

m. gravis. A disease characterized by great muscular weakness (without atrophy) and progressive fatigability. It is due to a functional abnormality, lack of acetylcholine, or excess of cholinesterase at the myoneurial junction in which nerve impulses fail to induce normal muscle contractions.

ETIOL Unknown. More common in females. Occurs most frequently between ages of 20 and 40.

SYM Abnormal fatigability and weakness of muscles. Muscles of the face and neck primarily involved, those of the trunk and extremities secondarily. Onset gradual, symptoms worse in the evening. Patient complains of difficulty in chewing, swallowing, and talking. Expressionless facies and ptosis usually present.

PROG Some cases mild, other rapidly fatal, death resulting from respiratory failure. Course is variable. Prolonged remissions may occur.

TREATMENT Restricted activity; complete rest in severe cases. Soft or liquid diet, tube feedings sometimes essential. Physostigmine and neostigmine given IM or orally are effective. Potassium chloride, ephedrine, and guanidine are also used as adjuvants of neostigmine, the drug of choice.

myasthenic [' + *astheneia*, weakness]. Marked by muscular weakness.

m. face. Type of facies seen in myasthenia gravis, in which one side of the face will have a normal smile, and the other side a sneer, when attempting to smile.

Another type exhibits the upper lids apparently closed and the mouth partly open, with evidence of fatigue or exhaustion.

myatonia (mi-â-tô'nî-â) [' + *tonos*, tone]. Deficiency or loss of muscular tone.

m. congenita. M of early childhood; it is not hereditary. SYN *Oppenheim's disease*.

myatrophy (mi-at'rô-flî) [' + *atrophia*, atrophy]. Muscular wasting away.

myc-, **myco-**. Combining form meaning *fungus*.

mycelfold (my-se'll-old) [G *mys*, *my-*, muscle, + *atrophia*, atrophy, + *eidos*, form]. Moldlike; resembling mold colonies in which filaments radiate from a center, said of bacterial colonies.

mycelium (mi-se'll-um) [G *mykês*, fungus, + *êlos*, nail]. The mass of fila-

ments (hyphae) which constitutes the vegetative body of fungi such as molds.

myces. The fungi.

mycethemia (mi-se-thê'mî-â) [' + *aima*, blood] Fungi in the blood. SYN *mycemia*.

mycet'in. An antibiotic derived from *Streptomyces violaceus*, effective against gram-positive bacteria.

mycetism, **mycetismus** (mi'se-tizm, -tiz-mûs) [' + *ismos*, condition] Poisoning from eating mushrooms.

mycogenetic, **mycogenic**, **mycetogenous** (mi-sê'tô-jên-ê't'ik, -jên'ik, -tôj'-ên-ûs) [G *mykês*, fungus, + *gennan*, to produce] Induced by fungi.

mycetoma (mi-se-tô'mâ) [' + *ôma*, tumor] A disease induced by fungi, seen in India, which attacks the foot. SYN *Madura foot*.

Mycobacterium [G *mykês* fungus, + *baktêrion*, little rod] A genus of acid-fast bacteria belonging to the Mycobacteriaceae which includes the causative organisms of tuberculosis and leprosy. They are slender nonmotile rods, gram-positive and do not produce spores or capsules.

M. leprae. Causative agent of leprosy.

M. tuberculosis. Causative agent of tuberculosis in mammals.

mycoid (mi'kôid) [G *mykês*, fungus, + *eidos*, form] Funguslike.

mycology (mi-kôl'ô-jî) [' + *logos*, study]. Science of fungi.

mycomyringitis (mi'kô-mî-rin-jî'tis) [' + *myria*, membrane + *-itis*, inflammation] Fungous inflammation of membrane tympani.

mycophthalmia (mi-kôf-thâl'mî-â) Ophthalmia resulting from fungus infection.

mycosis (mi-kô-sîs) [' + *-osis*, intensive] Any disease induced by a fungus.

m. fungoides. A rare chronic inflammatory malignant disease probably of septic origin that affects the superficial and deep layers of the skin, and occasionally the mucous membrane.

SYM Urticarial, erythematous or eczematous patches of irregular shape and size, with well-defined margins usually upon scalp and skin of trunk. Itching intense, and frequently the patches become hypertrophic and firm. Hard nodules varying from size of pea to apple, either sessile or pedunculated, develop on them. These eventually break down and form ulcers that contain sensitive, fungating granulation tissue, and discharge thin pus and serum. Death results from progressive cachexia.

TREATMENT Constitutional. Good, nourishing food. Hygienic living. Ulcers may be treated surgically. Cleanliness.

m. superficial. A dermatomycosis; a fungus infection of the skin or its appendages. Includes erythrasmia; tinea barbae, t. capitis, t. corporis, t. cruris, t. favosa, t. pedis, t. unguis; trichomycosis axillaris.

m. systemic. A deep mycosis; a fungus infection involving various bodily systems or regions. Includes aspergillosis, blastomycosis, chromoblastomycosis, coccidioidomycosis, candidiasis, cryptococcosis, geotrichosis, histoplasmosis, maduromycosis, moniliasis, mucormycosis, nocardiosis, para-actino-

mycosis, penicilliosis, rhinosporidiosis, sporotrichosis

mycotic (mī-kōt'ik) [G. *mykēs*, fungus]. Caused by or affected with microorganisms

mycterophonía (mīk'ter-ō-fō'nī-ā). Phonation in which the voice possesses a nasal quality

mydaleine (mīd-ā'le-ēn) [G. *mydaleos*, putrid]. A poisonous ptomaine from putrefied visceral organs, acting mainly on the heart

mydriasis (mīd-ri'ās-is) [G. *mydriasis*]. Abnormal dilation of the pupil

Error. Fright, sudden emotion, anemia, 1st and 3rd stages of anesthesia, drugs, coma, hysteria, botulism, irritation of cervical sympathetic nerve.

m., alternating. M which affects one eye, then the other. Also called *leaping, springing, or bounding m*

m., paralytic. M resulting from paralysis of oculomotor nerve.

m., spastic. M resulting from overactivity of dilator muscle of iris or of sympathetic nerves supplying that muscle. Also called *spasmodic m*

m., spinal. M resulting from a lesion of, or irritation of, ciliospinal center of spinal cord

mydriatic (mīd-ri-at'ik) [G. *mydriasis*, dilatation]. 1. Causing pupillary dilatation. 2. Any drug which dilates the pupil

Ex. atropine, cocaine, ephedrine, euphthalmine, homatropine.

myectomy (mī-ēk'tō-mī) Excision of a portion of a muscle

myectopia (mī-ēk-tō'pī-ā) [G. *mys*, my-, muscle, + *ek*, out, + *lopos*, place]. Muscle dislocation

myelalgia (mī-el-al'jī-ā) [G. *myelos*, marrow, + *algos*, pain]. Pain of the spinal cord or its membranes.

myelanolosis (mī-ēl-ā-nal-ō'sis) ["" + *anolosis*, wasting]. Gradual wasting of spinal cord. SYN: *tubes dorsalis*.

myelapoplexy (mī-el-ap'ō-plēks-i) ["" + *apoplexia*, stroke] Hemorrhagic effusion into the spinal cord

myelasthenia (mī-ēl-ās-thē'nī-ā) [G. *myelos*, marrow, + *astheneia*, weakness]. Spinal exhaustion; neurasthenia arising from spinal causes

myelateia (mī-ēl-ā-tē'lī-ā) ["" + *ateleia*, imperfection]. Defective development of spinal cord

myelatrophy (mī-el-at'rof-i) ["" + *atrophia*, atrophy]. Wasting of the spinal cord.

myelauze (mī-ēl-awks'ē) ["" + *auzē*, increase]. Abnormal enlargement of spinal cord.

myelemia (mī-ēl-ē'mī-ā) ["" + *atma*, blood]. Abnormal number of marrow cells in the blood. SYN: *myelocytosis*.

myelencephalon (mī-ēl-ēn-sēf'ā-lōn) [G. *myelos*, marrow, + *egkephalos*, brain]. The most posterior portion of the embryonic hind-brain (rhombencephalon) which gives rise to the medulla oblongata.

myel'ic. Pert. to the spinal cord.

myelin [G. *myelos*, marrow]. 1. A fat-like substance forming the principal component of the myelin sheath of nerve fibers. Composed of cholesterol, certain cerebrosides, phospholipins, and fatty acids. 2. A complex lipid substance present in the brain in small quantities.

myelination (mī-ēl-in-ā'shūn) [G. *myelos*, marrow]. Process of acquiring a myelin sheath. SYN: *myelinization*.

myelitic (mī-ēl-in'ik) [G. *myelos*, mar-

row]. Concerning or composed of myelin.

myelinization (mī'ēl-in-i-zā'shūn) [G. *myelos*, marrow]. Acquisition of myelin sheath for nerve fibers. SYN: *myelination*.

myelinogenetic (mī'ēl-in-ō-jēn-et'ik) ["" + *gennan*, to produce]. Producing myelin or a myelin sheath

myelinosis (mī'ēl-in-ō'sis) ["" + *-ōsis*, intensive]. Fatty degeneration during which myelin is produced.

myelitic (mī-el-it'ik) [G. *myelos*, marrow]. Concerning myelitis

myelitis (mī-el-i'tis) ["" + *-itis*, inflammation]. 1. Inflammation of the spinal cord. 2. Inflammation of bone marrow.

SYN: Moderate fever (101°-103° F.), loss of appetite, coated tongue and constipation, followed by pain in back radiating into the limbs. Various forms of paresthesia, as numbness, tingling, burning, etc. Frequently a sense of painful constriction, "girdle pain" at level of the disease. Paralysis soon develops, and may become more or less complete, at first may be retention, later frequently incontinence of feces, anesthesia, more or less complete. Bedsores soon develop. Death may result in few days from extension upward, and involvement of respiratory muscles. In rare cases a spontaneous arrest of inflammation and slow recovery follows, attended with partial paralysis

SEE *atrophage, osteomyelitis, poliomyelitis*

m., acute. Simple acute form which develops following injury

m., acute ascending. M which moves progressively upward in the spinal cord

m., bulbar. M involving the oblongata

m., central. M in which the gray matter is esp. involved

m., c., acute. Resembles acute transverse m, but the trophic disturbances are more marked and duration shorter. Usually fatal in 1 to 2 weeks

PROG. Always extremely grave.

TREATMENT. If possible place patient on water bed. Both in retention and incontinence of urine catheter should be used twice daily. In incontinence of urine and feces the discharges should be received on cotton, wool or oakum, which should be frequently renewed and parts thoroughly cleansed. In the beginning ice bags or wet cups may be applied to the spine. Frequent baths should be given, milk, eggs, rice, toast, farina, fruit and blanc mange may be given in early stages of disease. Later, more nutritious diet.

m., chronic. Form progressing slowly but steadily.

SYM: Begin with numbness, tingling or burning in lower extremities, followed by loss of power and sensation. Reflexes generally exaggerated. Sphincters soon become involved. Girdle pain at level of disease. Progress slow, 6 months to 10 years.

TREATMENT: Patient should be put at rest. Frequent tepid baths; plenty of sleep; good, nourishing food; moderate exercise that stops short of fatigue. Freedom from mental worry. Constitutional treatment, antispylitis, where indicated.

m., compression. M. caused by pressure on the cord, as by a hemorrhage.

m., cornual. M. affecting the spinal cord's horns of gray matter.

m., descending. M. affecting successively lower areas of the spinal cord.
m., diffuse. M. involving large sections of the cord
m., disseminated. M. with several separated foci on the cord
m., hemorrhagic. M. with hemorrhage.
m., parenchymatous. M. of nerve substance.
m., sclerosing. M. with hardening of cord, and interstitial tissue growth
m., systemic. M. affecting only certain tracts of the cord.
m., transverse. M. involving the whole thickness of the cord.
m., f., acute. Acute form of m. involving entire thickness of cord, developing subsequent injury to spinal cord
m., traumatic. M. due to cord injury.
myelo- [G] Prefix denoting the spinal cord, or bone marrow
myeloblast (mi'el-ō-blāst) [G. *myelos*, marrow, + *blastos*, germ] Bone marrow cell which develops into a myelocyte
myeloblastemia (mi'el-ō-blāst-ē'mi-ā) [" + " + *aima*, blood]. Occurrence of myeloblasts in the blood
myeloblastoma (mi'el-ō-blāst-ō'mā) [" + " + *-oma*, tumor] 1 Tumor containing myeloblasts 2. Myelogenic form of leukemia
myeloblastosis (mi'el-ō-blāst-ō'sis) Excess production of myeloblasts and their presence in circulating blood, myeloblastic leukemia
myelocoele (mi'el-ō-sēl) [" + *kēlē*, hernia] 1. A form of spina bifida with spinal cord protrusion. 2 [" + *kōilos*, hollow] Central canal of spinal cord
myelocyst (mi'el-ō-sist) [G. *myelon*, marrow, + *kystis*, bladder]. Cyst arising from the spinal cord
myelocystocele (mi'el-ō-sist-ō-sēl) [" + " + *kēlē*, hernia]. Cystic tumor of spinal cord
myelocystomeningocele (mi'el-ō-sist-ō-men-in'gō-sēl) [" + " + *meninx*, membrane, + *kēlē*, hernia]. Combined myelocystocele and meningocele
myelocyte (mi'el-ō-sit) [G. *myelos*, marrow, + *kytos*, cell] A large cell in red bone marrow, from which leukocytes are derived
myelocythemia (mi'el-ō-sit-thē'mi-ā) [" + " + *aima*, blood] Presence of an excess number of myelocytes in the blood. SYN: *myelocytosis*
myelocytic (mi'el-ō-sit'ik) [" + *kytos*, cell]. Characterized by presence of, or pert to, myelocytes
myelocytoma (mi'el-ō-sit-ō'mā) [" + " + *-oma*, tumor] Leukemia with leukocytes arising from both myeloid and lymphoid substance. SYN: *chronic myelogenous leukemia*.
myelocytosis (mi'el-ō-sit-ō'sis) [" + " + *-osis*, intensive] Myelocytes in large quantities in the blood. SYN: *myelocythemia*.
myelodiastasis (mi'el-ō-dī-as'tā-sis) [G. *myelos*, marrow, + *diastasis*, separation]. Destruction and disintegration of spinal cord.
myelodysplasia (mi'el-ō-dīs-plā'zī-ā) [" + *dys*, bad, + *plassein*, to form]. Defective formation of the spinal cord.
myeloencephalic (mi'el-ō-ēn-sēf-āl'ik) [" + *egkephalos*, brain] Concerning the spinal cord and brain
myeloencephalitis (mi'el-ō-ēn-sēf-ā-lī'tis) [" + " + *-itis*, inflammation]. Inflamed condition of spinal cord and brain.

myelogenesis (mi'el-ō-jen'ē-sis) [" + *genesis*, development]. 1. The development of brain and spinal cord. 2. Development of myelin
myelogenic, myelogenous (mi'el-ō-jen'ēk, -lō'ēn-ūs) [" + *gennan*, to produce]. Producing or originating in marrow.
myelography (mi'el-ōg'rā-fī) [" + *graphein*, to write]. Roentgenographical inspection of the spinal cord
myeloid (mi'el-oid) [" + *eidos*, form]. 1. Medullary, like marrow 2. Resembling a myelocyte, but not necessarily originating from bone marrow
myeloidosis (mi'el-oid-ō'sis) [" + " + *-osis*, intensive]. Formation of myeloid tissue, esp abnormal tissue formation
myelolymphangioma (mi'el-ō-līm-fān'gī-ō-mā) Elephantiastis, *qv*
myelolymphocyte (mi'el-ō-līm'fō-sit) [" + *L lymphat*, lymph, + *G kytos*, cell] Tiny lymphocyte formed abnormally in bone marrow
myeloma (mi-el-ō'mā) [G. *myelos*, marrow, + *-oma*, tumor] A tumor originating in cells of the hematopoietic portion of bone marrow
m., multiple. A neoplastic disease characterized by the infiltration of bone and bone marrow by myeloma cells forming multiple tumor masses Usually progressive and generally fatal Accompanied by anemia, renal lesions, and high globulin levels in blood. Common in 6th decade of life More frequent in males by ratio of 3:1
myelomalacia (mi'el-ō-mā-lā'si-ā) [" + *malakia*, softening]. Abnormal softening of spinal cord
myelomatosis (mi'el-ō-mā-tō'sis) [" + *-oma*, tumor, + *-osis*]. Disease marked by multiple tumors of the bone marrow, pernicious anemia, and albumosuria. SYN: *multiple myeloma*.
myelomenia (mi'el-ō-mē-ni-ā) [" + *mēn*, month]. Vicarious menstrual discharge in the spinal cord
myelomeningitis (mi'el-ō-men-in-jī'tis) [G. *myelos*, marrow, + *mēninx*, meninges, membrane, + *-itis*, inflammation] Inflamed spinal cord and membranes, spinal meningitis.
myelomeningocele (mi'el-ō-men-in'gō-sēl) [" + " + *kēlē*, hernia] Spina bifida with portion of cord and membranes protruding
myelomyces (mi-el-ō-mī'sēs) [" + *mykēs*, fungus] Malignant growth resembling brain substance. SYN: *encephaloma*.
myelon (mi'el-on) [G. *myelos*, marrow]. The spinal cord
myeloneuritis (mi'el-ō-nū-rī'tis) [" + *neuron*, nerve, + *-itis*, inflammation]. Multiple neuritis and myelitis combined.
myelonic (mi'el-on'ik) [G. *myelos*, marrow] Pert to the spinal cord
myeloparalysis (mi'el-ō-pā-rāl'i-sis) [" + *para*, beside, + *lyein*, to loosen] Paralysis of the spine
myelopathy (mi'el-op'ā-thī) [" + *pathos*, disease]. Any pathological condition of the spinal cord.
myelopetal (mi'el-op'et-āl) [" + *L. petere*, to seek for]. Proceeding toward the spinal cord.
myelophage (mi'el-ō-fā) [" + *phagein*, to eat]. A myelin ingesting macrophage.
myelophthisis (mi'el-ōf-thī-sis) [G. *myelos*, marrow, + *phthisis*, a wasting]. SYN: *myelomalacia* 1 Atrophy of the spinal cord 2. Aplastic anemia, *qv*.
myeloplast [G. *myelos*, marrow, + *plastos*, formed]. A bone marrow cell similar to a leukocyte.

myeloplax (mi' + plax, plate). Large, multinuclear, bone marrow cell.

myeloplaxoma (mi'él-ô-pläks-ô'mä) [G. *myelos*, marrow, + *plax*, plate, + *-ôma*, tumor]. Tumor composed of myeloplaxes.

myeloplegia (mi'él-ô-plê'ji-ä) [" + *plêgê*, stroke]. Paralysis of spinal origin.

myelopoiesis (mi'él-ô-poy-ê'sis) [" + *poiesis*, to form] The development of marrow or myelocytes

m., ectopic. Extramedullary, *q v*

m., extramedullary. Development of myeloid elements (erythrocytes and granular leukocytes) in regions other than bone marrow

myelorrhagia (mi'él-ô-rä'ji-ä) [" + *rêg-nai*, to burst forth]. Hemorrhage into myelon

myelorrhaphy (mi'él-ô-ra'fi) [" + *raphê*, a sewing] Suture of a cut or wound of the spinal cord

myelosarcoma (mi'él-ô-sär-kô'mä) [" + *sarx*, flesh, + *-ôma*, tumor]. Sarcoma of bone marrow cells and tissue **SYN.** *osteosarcoma*.

myeloschisis. Cleft spinal cord resulting from failure of neural tube to close **SEE** *spina bifida rachischisis*

myelosclerosis (mi'él-ô-skler-ô'sis) [G. *myelos*, marrow, + *sklerôsis*, hardening] Sclerosis of the spinal cord

myelosis (mi'él-ô'sis) [" + *-osis*, intensive] Formation of a myeloma or medullary tumor

myelospangium (mi'él-ô-spon'ji-üm) [" + *spongos*, sponge] Embryonic network from which the neuroglia arises

myelopore. An opening in the spinal cord

myeloradiculitis (mi'él-ô-rä-dik'ü-l'itis) Inflammation of spinal cord and dorsal roots of spinal nerves

myeloradiculodysplasia (mi'él-ô-rä-dik'ü-lô-dis-plä'si-ä) Congenital abnormality of spinal cord and spinal nerve roots

myelotome (mi'él-ô-tôm) [" + *tomê*, incision] Instrument used to dissect the spinal cord

myelotomy (mi'él-ô-tô-mi) [" + *tomê*, incision] Dissection of the spinal cord

myelotoxic (mi'él-ô-toks'ik) [" + *toxikon*, poison] 1. Destroying bone marrow 2. Pert. to or arising from diseased bone marrow

myelotoxin (mi'él-ô-toks'in) [" + *toxikon*, poison]. Toxin which destroys marrow cells

myenergia (mi'ên-er'ji-ä) [G. *mys*, *my-*, muscle, + *ergon*, work]. Muscular energy

myenteric (mi'ên-ter'ik) [" + *enteron*, intestine] Concerning the myenteron.

m. reflex. Intestinal contraction above and relaxation below the point of stimulation

myenteron (mi'en'têr-ôn) [" + *enteron*, intestine]. Muscular layer of the intestine

myesthesia (mi'ês-thê-zî-ä) [G. *mys*, *my-*, muscle, + *aisthêsis*, sensation] Muscle sense, consciousness of muscle contraction

myiasis (mi'î-ä-sis) [G. *myia*, fly] Condition resulting from infestation by the larvae (maggots) of flies Infestation may be (a) *cutaneous* (in the skin), (b) *intestinal*, (c) *atrial* (within a cavity such as mouth, nose, eye, sinuses, vagina, urethra), (d) *wound*, or (e) *external*

mylodesopsia (mi'î-ô-dês-op'si-ä) [G. *mylôdês*, flylike, + *opsis*, vision]. Condition in which spots are seen before the eyes. **SEE** *muscae volitantes*.

myitis (mi-l'itis) [G. *mys*, *my-*, muscle, + *-itis*, inflammation]. Inflamed condition of a muscle **SYN** *myositis*.

mylodus. A molar tooth.

mylohyoid (mi'lô-hi'oid) [G. *mylê*, mill, + *yoideis*, U-shaped]. Pert. to the hyoid bone and the molar teeth.

myo- [G.]. Combining form pert. to muscle.

myoalbumin (mi'ô-al-bu'min) [G. *mys*, *myo-*, muscle, + *L. albumen*, white of egg]. Albumin found in muscular tissue

myoalbumose (mi-ô-al-bu-mos) [" + *L. albus*, white]. A protein derived from muscle plasma

myoarchitectonic (mi'ô-ar'ki-têk-ton'ik) [" + *architekton*, master workman]. Pert. to or resembling structural arrangement of muscle or of fibers.

myoatrophy (mi-ô-ät'rô-fi) [" + *atrophia*, atrophy] Muscular wasting

myoblast (mi'ô-blast) [G. *mys*, *myo-*, muscle, + *blastos*, germ]. An embryonic cell which develops into muscle fiber cell

myoblastoma. A tumor consisting of cells resembling myoblasts

myobradia [" + *bradus*, slow] Slow muscular reaction to stimulation

myocardiac, myocardial (mi-ô-kar'di-äk, -äl) [" + *kardia*, heart] Concerning the myocardium

m. infarction. Development of an infarct in the myocardium, usually the result of myocardial ischemia following occlusion of a coronary artery

SYM. Pain similar to that of angina pectoris, shock, cardiac dysfunction, and frequently sudden death

m. insufficiency. Cardiac failure, *q v*

myocardiograph (mi'ô-kar'di-ô-gi-äf) [G. *mys*, *myo-*, muscle, + *kardia*, heart, + *graphein*, to write] Instrument for recording heart movements

myocardiosis (mi-ô-kär-di-ô'sis) [" + " + *-osis*, intensive] Noninflammatory cardiac disorder **SYN** *myocardia*.

myocarditis (mi-ô-kar-di'itis) [" + " + *-itis*, inflammation] Inflammation of the cardiac muscular tissue

ETIO. Unknown, but is associated with a number of conditions including many type, of infections, nephritis, carbon monoxide poisoning, heat stroke, and burns Occurs commonly after rheumatic fever and diphtheria or may be idiopathic

PHYSICAL SIGNS. Apex beat extremely weak and rapid, pulse irregular and weak; tenderness over precordium, percussion negative, auscultation reveals 1st sound of heart resembling 2nd heart sound, high pitched and wanting in muscular quality

NP. In acute myocarditis absolute rest is essential Years may be added in chronic myocarditis if moderation in all things is observed Plenty of rest and sleep, light diet, and avoidance of all worry, hurry, and physical strains are very important High altitudes must be avoided, and climbing stairs should be reduced to a minimum, and haste avoided The bowels should be kept regular In some instances graduated exercises may be ordered

m., acute, primary. Acute interstitial inflammation of the myocardium

m., a., secondary. Acute inflammation of the heart muscle

ETIO. Secondary to acute inflammation of pericardium or endocardium, or may occur during some infectious disease.

SYM: Marked by primary disease;

great weakness; cardiac palpitation with irregularity; small, feeble pulse, and dyspnea, precordial pain and distress.

m., a., septic. Localized, suppurative inflammation of the heart muscle.

Etiol. Distant infection, suppurating pericardium or endocardium.

m., chronic. Characterized by round cell infiltration of interstitial tissue, followed by parenchymatous changes of muscle fibers.

Etiol. Nephritis, syphilis, grave anemia, diabetes, rheumatic fever, malaria, toxic substance, or excessive use of alcohol and tobacco. Certain wasting diseases, disease of coronary arteries, joint affections, or extension from endocardium and pericardium.

Sym. Cardiac insufficiency. Rapid heart which does not immediately recover from exercise. On first exertion the heart and blood pressure rise quickly but become slower with prolonged exertion.

PHYSICAL SIGNS. Face appears cyanosed, esp about the lips and ears, also about the fingertips. Apex beat of heart not displaced unless the heart was previously hypertrophied, in which case apex beat will be displaced downward and to the left, or downward if dilatation exists. Pulse weak, blood pressure either low or high. Auscultation reveals a short, feeble 1st sound, lacking in muscular quality with reduplication of that sound. Second sound, esp the aortic, is accentuated. Systolic murmur at apex over a small area if dilatation exists.

m., Fiedler's. An idiopathic m. of unknown etiology. Also called "isolated myocarditis," as endocardium or pericardium are not affected.

m., fragmentation. F. of the myocardium.

m., indurative. Chronic m. causing hardening of muscular walls of the heart.

myocardosis (mī'ō-kar-dō'sis) [G. *mys*, *myo-*, muscle, + *kard'ia*, heart, + *-ōsis*, intensive] 1 A noninflammatory disorder of the myocardium. 2 Any degenerative condition (except myofibrosis) of the heart muscle.

myoele (mī'ō-sēl) [" + *kelē*, hernia]. 1. Muscular protrusion through a muscle sheath. 2 Cavity within a somite of an embryo.

myocelialgia (mī'ō-sē-lī'al'i-ā) [" + *koi'tia*, belly, + *algos*, pain]. Abdominal muscle pain.

myocelitis (mī'ō-sē-lī'tis) [" + " + *-itis*, inflammation]. Inflamed condition of abdominal muscles.

myocellulitis (mī'ō-sē-lū-lī'tis) [G. *mys*, *myo-*, muscle, + *L. cellula*, little chamber, + *G. -itis*, inflammation]. Myositis combined with cellulitis.

myocerosis (mī'ō-sē-ro'sis) [" + *kēros*, wax]. Waxy degeneration of a muscle.

myochochorditis (mī'ō-kor-dī'tis) [" + *chordē*, cord, + *-itis*, inflammation]. Inflammation of the muscles of the larynx.

myochrome (mī'ō-krōm) [" + *chrōma*, color]. Reddish pigment derived from hemoglobin and found in muscle. **Syn.** *myohematin*.

myochronoscope (mī'ō-krō'nō-skōp) [" + *chronos*, time, + *skopem*, to examine]. Device for determining time for producing a muscular contraction.

myoclonia (mī'ō-klo-nī-ā) [" + *klonos*, tumult]. Condition of intermittent, clonic spasm or twitching of a muscle or muscles.

myoclonus (mī-ok'lō-nūs) [G. *mys*, *myo-*, muscle, + *klonos*, tumult]. Twitching or clonic spasm of a muscle or group of muscles. **Syn.** *paramyoclonus*.

m. multiplex. Condition marked by persistent and continuous muscular spasms.

myocoele (mī'ō-sēl) [" + *koi'tos*, hollow]. **See** myoele.

myocolpitis (mī'ō-kol-pī'tis) [G. *mys*, *my-*, muscle, + *kolpos*, vagina, + *-itis*, inflammation]. Inflammation of the muscular tissue of the vagina, or inflammation of vaginal muscular tissue.

myocomma (mī'ō-kōm'ma) [" + *komma*, cut]. **Syn.** *myotome*. Septum dividing the myotomes.

myocrismus (mī'ō-kris'mūs) [" + *kri'zein*, to squeak]. A peculiar crackling sound sometimes heard in auscultation resulting from contraction of a muscle.

myocyte (mī'ō-sī't) [" + *ky'tos*, cell]. A muscular tissue cell.

myocytoma (mī'ō-sī-tō'mā) [G. *mys*, *myo-*, muscle, + *ky'tos*, cell, + *-ōma*, tumor]. Tumor containing muscle cells.

myodemia (mī'ō-de'mī-ā) [" + *dēmos*, fat]. Fatty degeneration of muscular tissue.

Muscular fiber cells become filled with fat granules and are ultimately destroyed.

myodesopsia (mī'ō-des-op'sī-ā) [G. *myōdēs*, flylike, + *opsis*, vision]. **Syn.** *myiodesopsia*.

myodiastasis (mī'ō-dī-as-tā'sis) [G. *mys*, *myo-*, muscle, + *diastasis*, separation]. Division or rupture of a muscle.

myodynamia (mī'ō-dī-nam'i-ā) [" + *dynamis*, force]. Muscular force or strength.

myodynamometer (mī'ō-dī-nā-mom'ēt-ēr) [" + " + *metron*, measure]. Device for measurement of muscular strength.

myodynina (mī'ō-dīn'i-ā) [" + *odynē*, pain]. Any muscle pain. **Syn.** *myalgia*.

myoedema (mī'ō-ē-dē'mā) [G. *mys*, *myo-*, muscle, + *o'idema*, swelling]. 1. Lump- ing in a wasting muscle when struck. **Syn.** *mounding*. 2 Muscular edema.

myoelastic. Pert to muscle and elastic tissue. **See** tissue, *myoelastic*.

myoelectric (mī'ō-ē-lēk'tik) [" + *elektron*, amber]. Pert to muscular electrical properties.

myoendocarditis (mī'ō-ēn'dō-kar-dī'tis) [" + *endon*, within, + *kardia*, heart, + *-itis*, inflammation]. Inflammation of the cardiac muscular wall and membranous lining.

myoepithelial (mī'ō-ēp-i-thē'lī-āl) [G. *mys*, *myo-*, muscle, + *epi*, upon, + *thelē*, nipple]. Pert to contractile epithelial cells.

m. cells. Spindle-shaped or branched contractile epithelial cells found between glandular cells and basement membrane of sweat, mammary, and salivary glands.

myofascitis (mī'ō-fās-i'tis) [" + *L. fascia*, band, + *G. -itis*, inflammation]. Inflamed condition of a muscle and its fascia.

myofibril, **myofibrilla** (mī'ō-fī-brīl, -fī-brīl'ā) (pl. *myofibrillae*) [G. *mys*, *myo-*, muscle, + *L. fibrilla*, a small fiber]. A tiny fibril found in muscular tissue, running parallel to the cellular long axis, from 1 cell to another.

May be the contractile element.

myofibroma (mī'ō-fī-brō'mā) [" + *L. fibra*, fiber, + *G. -ōma*, tumor]. Tumor containing muscular and fibrous tissue.

myofibrosis (mī'ō-fī-brō'sis) [" + " + *G. -ōsis*, intensive]. Increase of connective

or fibrous tissue with degeneration of muscular tissue.

myogelosis (mī-ō-jel-ō'sis) [+ L *gelāre*, to congeal]. Hardening of a portion of muscle.

myogen (mī-ō-jěn) [+ *gennan*, to produce]. A protein found in muscle plasma, which is spontaneously coagulable.

myogenesis (mī-ō-jěn-ē-sis) [+ *genesis*, development]. Formation of muscular tissue.

myogenetic (mī-ō-jěn-et'ik) [G. *mys*, *myo-*, muscle, + *gennan*, to produce]. Having origin in muscle. SYN *myogenic*.

myogenic, **myogenous** [+ *gennan*, to form]. Arising from muscle.

myoglia (mī-ō-g'li-ā) [+ *gha*, glue]. A fibrous network in muscular tissue resembling neuroglia in appearance.

myoglobin. Myohemoglobin. *q v*

myoglobulin (mī-ō-glob'u-lin) [+ L *globulus*, globule]. A coagulable globulin seen in muscular tissue.

myogram [+ *gramma*, a marking]. A tracing made by the myograph of muscular contractions.

myograph (mī-ō-grāf) [G. *mys*, *myo-*, muscle, + *graphein*, to write]. Instrument for tracing movements caused by muscular contractions.

myographic (mī-ō-graf'ik) [+ *graphein*, to write]. Pert to a myograph, or the tracings made by it.

m. tracing. A myogram or muscular tracing.

myography (mī-ō-g'rā-fi) [+ *graphein*, to write]. 1. Recording of muscular contractions by a myograph. 2. Description of the muscles and their action.

myohematin (mī-ō-hēm-tāt-in) [G. *mys*, *myo-*, muscle, + *aima*, blood]. SYN *histohematin*. An iron compound present in muscle tissue which functions in cellular respiration. Similar to hematin of the blood.

myo'hemoglobin. A respiratory pigment in muscle tissue which serves as an oxygen carrier. ABR. MHB. Also called *myoglobin*, *myoglobulin*.

myohysterectomy (mī-ō-his-tēr-ek'ō-mī) [+ *ystera*, uterus, + *ektomē*, excision]. Excision of the body of the uterus, leaving the cervix in place. SYN *subtotal hysterectomy*.

myoid [+ *eidos*, resemblance]. Resembling muscle.

myoidema (mī-ōl-dē'mā) [+ *oidēma*, swelling]. SYN *myocedema*.

myoischemia (mī-ō-is-kē'mi-ā) [+ *ischēin*, to hold back, + *aima*, blood]. Local anemia in a muscle.

myokerosis (mī-ō-kē-rō'sis) [G. *mys*, *myo-*, muscle, + *kēros*, wax, + *-ōsis*]. Waxy degeneration of muscle or muscular tissue.

my'okinase. An enzyme present in muscle which catalyzes the synthesis of adenosinetriphosphate. Also call *isomerase*.

myokinesis (mī-ō-kīn-ē'sis) [+ *kinēsis*, motion]. 1. Muscular activity. 2. Surgical displacement of muscular fibers.

myokymia (mī-ō-kim'i-ā) [+ *kyma*, wave]. Twitching of fibers of a muscle. It may be functional and is also seen in organic affections and general paresis.

myolipoma (mī-ō-lip-ō'mā) [+ *lipos*, fat, + *-ōma*, tumor]. Muscle tissue tumor containing fatty elements.

myology (mī-ōl-ō-jī) [+ *logos*, study]. The science or study of the muscles and their parts.

myolysis (mī-ō-lī'sis) [G. *mys*, *myo-*, muscle, + *lysis*, destruction]. Fatty degeneration and infiltration with destruc-

tion of muscular tissue accompanied by separation and disappearance of muscle cells.

myoma (mī-ō'mā) [+ *-ōma*, tumor]. A tumor containing muscle tissue. SEE: *chondromyoma*.

m. lymphangiectodes. M. containing dilated lymphatic vessels.

m., nonstriated. A tumor of unmarked muscle tissue. SYN *leiomyoma*.

m. stricellulare. Fibroma with striated muscular fibers. SYN *rhabdomyoma*.

m. telangiectodes. Colled blood vessel tumor in muscular fibers.

myomalacia (mī-ō-mā-lā'si-ā) [+ *malakia*, softening]. Softening of muscular tissue [muscle].

m. cordis. Softening of the heart.

myomatosis (mī-ō-ma-tō'sis) [+ *-ōma*, tumor, + *-ōsis*]. The development of myomas.

myomatous (mī-ō-mā-tūs) [+ *-ōma*, tumor]. Pert to or resembling a myoma.

myomectomy (mī-ō-mek'tō-mī) [+ *ektome*, excision]. 1. Removal of a portion of muscle or muscular tissue. 2. Removal of a myomatous tumor, generally uterine, usually by abdominal section, leaving the uterus in place.

NP Same as for cesarean section.

Position, dorsal, possibly followed by Trendelenburg's.

myomelanosis (mī-ō-mēl-ā-nō'sis) [G. *mys*, *myo-*, muscle, + *melanosis*, blackening]. Darkening of muscle tissue.

myomere (mī-ō-mēr) [+ *meros*, part]. SYN *myocomma*, *myotome*.

myometer (mī-ō-mēt-ēr) [+ *metron*, measure]. Device for measurement of muscular contractions.

myometritis (mī-ō-me-trī'tis) [+ *mētra*, uterus, + *-itis*, inflammation]. Inflamed condition of the muscular part of the uterus.

myometrium (mī-ō-me-trī-ūm) [+ *mētra*, uterus]. Muscular structure of the uterus.

myomohysterectomy (mī-ō-mō-his-tēr-ek'ō-mī) [G. *mys*, *myo-*, muscle, + *-ōma*, tumor, + *ystera*, uterus, + *ektomē*, excision]. Hysterectomy performed to remove a myomatous uterus.

myomotomy (mī-ō-mot'ō-mī) [+ *tome*, excision]. Excision of a myoma, usually uterine. SYN *myomectomy*.

my'on [G. *mys*, *myo-*, muscle]. A muscle.

myonarcosis (mī-ō-nār-kō'sis) [+ *narkosis*, a numbing]. Muscular numbness.

myonephropexy (mī-ō-nef'rō-pēk'sī) [+ *nephros*, kidney, + *pēxis*, fixation]. Fixation of a movable kidney by attaching it to a portion of muscular tissue with sutures.

my'oneur'al. Pert to muscle and nerve.

m. junction. Ending of a nerve in a muscle. SEE *motor end plate*.

myoneurasthenia (mī-ō-nūr-ās-thē'nī-ā) [+ *astheneia*, weakness]. Neurasthenic muscular relaxation.

myoneuroma (mī-ō-nū-rō'mā) [+ *-ōma*, tumor]. A neuroma partially composed of muscular elements.

myonosis (mī-on-ō-sūs) [+ *nosos*, disease]. A disease of muscular tissue. SYN *myopathy*.

myopachynsis (mī-ō-pāk-in'sis) [+ *pachynsis*, thickening]. Abnormal thickening of muscle tissue.

myopalmus (mī-ō-pal'mūs) [+ *palmos*, a twitching]. Twitching of muscles.

myoparalysis (mī-ō-pā-rai'lī-sis) [+ *para*, beside, + *lysis*, loosening]. Paralysis in a muscle.

myo''pare'sis. Slight paralysis of a muscle

myopathic (mī-ō-path'k) ['' + *pathos*, disease]. 1 Pert to muscular disease. 2. One suffering from a muscular disease.

m. facies. Facial expression caused by relaxation of facial muscles

myopathy (mī-ō-pā-thī) [G *mys*, *myo-*, muscle, + *pathos*, disease]. Any diseased condition of a muscle

m. facial. Atrophy of facial muscles
SYM Lips pouted, "twisted" smile. Sometimes ptosis of upper eyelids, inability to whistle or to blow out the cheeks, depending upon the muscles affected

myope (mī'ōp) [G *myein*, to shut, + *ōps*, eye] One afflicted with myopia or nearsightedness

myopericarditis (mī'ō-per-i-kar-dī'tis) [G *mys*, *myo-*, muscle, + *peri*, around, + *kardia*, heart, + *-itis*, inflammation] Inflammation of the pericardium and cardiac muscular wall

myophone (mī'ō-fōn) ['' + *phōnē*, voice] Device for conveying sound of muscular contractions

myopia [G *myein*, to shut, + *ōps*, eye] Defect in vision so that objects can only be seen distinctly when very close to the eyes, nearsightedness

Light rays come to a focus in front of the retina

m., axial. M. due to elongation of the axis of the eye.

m., chromic. Color blindness when viewing distant objects

m. of curvature. M. due to curvature of the eye's refracting surfaces

m., index. M. resulting from abnormal refractivity of the media.

m., malignant. Pernicious myopia

m., pernicious. M. with progressive disease of the choroid, terminating in blindness.

m., prodromal. M. in which reading is possible without glasses, seen in incipient cataract.

m., progressive. M. that increases steadily during adult life

m., stationary. Myopia that comes to a stop after adult growth is attained

m., transient. M. seen in spasm of accommodation, as in acute iritis or iridocyclitis.

myopic (mī-ōp'ik) ['' + *ōps*, eye]. Pert. to or affected with myopia.

m. crescent. Post. crescentic protrusion seen in myopia.

myoplasm (mī'ō-plazm) [G. *mys*, *myo-*, muscle, + *plasma*, a thing formed]. The contractile part of the muscle cell, as differentiated from the sarcoplasm.*

MYOPIC EYE.

Parallel rays of light reaching a focus in front of retina. See: emmetropia, hyperopia.

myoplastic (mī-ō-plást'k) ['' + *plassein*, to form] Pert to plastic use of muscle tissue or plastic surgery on muscles.

myoplasty (mī'ō-plas-tī) ['' + *plassein*, to form] Plastic surgery of muscle tissue.

myoplegia (mī'ō-plē'jī-ā) ['' + *plēgē*, stroke]. Muscular paralysis.

my'oportho'sis. Correction of myopia or nearsightedness

myoprotein (mī'ō-prō'tē-in) ['' + *prōtos*, first]. A protein found in muscle tissue.

myoproteose (mī'ō-pro'tē-ōs) ['' + *prōtos*, first]. A protein found in muscle plasma **SYN** *myocalbumose*.

myopsychosis (mī'ō-sī-kō'sis) [G *mys*, *myo-*, muscle, + *psychē*, mind, + *-ōsis*]. A muscular affection connected with a mental disorder

myorrhaphy (mī-or'ā-fi) ['' + *raphē*, a sewing] Suture of a muscle wound

myorrhexis (mī-or-eks'is) ['' + *rexis*, a rupture]. Rupture of a muscle

myosalgia (mī-ō-sal'jī-ā) ['' + *algos*, pain] Pain in a muscle **SYN** *myalgia*.

myosalpingitis (mī'ō-sāl-pin-jī'tis) ['' + *salpīx*, *salpīgē*, tube, + *-itis*, inflammation] Inflamed condition of muscular tissue of a fallopian tube

myosarcoma (mī'ō-sar-kō'mā) ['' + *sarx*, *sark-*, flesh, + *-ōma*, tumor] Tumor containing both muscular tissue and connective tissue cells

myosclerosis (mī'ō-sklēr-ō'sis) ['' + *sklēros*, hardening]. Hardening of muscle

myo-sin [G *mys*, *myo-*, muscle] A protein present in muscle fibrils and comprising about 60% of total muscle protein. It consists of long chains of polypeptides joined to each other by side chains. The molecular structure of myosin is thought to be responsible for the properties of muscle tissue, namely, birefringence, double refraction, contractility, and elasticity. Myosin combines with another muscle protein, *actin*, to form *actomyosin*.

m. ferment. A coagulating enzyme in muscle plasma. It converts myosinogen into myosin.

my'osinase. An enzyme that catalyzes the conversion of myosinogen to myosin.

myosinogen (mī'ō-sin'ō-jēn) [G. *mys*, *myo-*, muscle, + *gennan*, to produce. **SYN** *myogen*. A protein present in muscle tissue, the precursor of myosin.

Myosin, a derivative, is formed during rigor mortis **SYN** *myogen*.

myosinose (mī-ōs'īn-ōs) [G. *mys*, *myo-*, muscle] A protease resulting from the hydrolysis of myosin.

myo'sis [G *myein*, to close] Contraction of the pupil **SEE** *miosis*

Etiol. Irritation of oculomotor system, paralysis of dilators. Occurs in certain fevers, congestion of iris, in typhus and in early stages of meningitis, also from drug poisoning. Seen in brain lesions, sunstroke and pulmonary congestion. **SYN** *miosis*, 1.

myositis (mī-ō-sī'tis) [G *mys*, *myo-*, muscle, + *-itis*, inflammation]. Inflammation of muscle tissue, esp. voluntary muscles

Etiol. Infection, trauma, diathetic states, or infestation by parasites. **SEE** *fibrositis*

NP: In suppurative myositis a cold pack and free purgation at the onset may be ordered. After active inflammation has subsided, local heat, massage, and passive motion may help in preventing contractures. If they occur, ortho-

pedic treatment will be necessary. In traumatic myositis fomentations may be applied to the part. Counterirritants may be ordered for acute pain. Rest is essential.

m. fibrosa. See *interstitial m.*

m., interstitial. M. with hyperplasia of connective tissue

m. ossificans. M. marked by ossification of muscles.

m., parenchymatous. M. of substance of a muscle

m. purulenta. Suppurative myositis

m., rheumatic. A common form which may affect muscle tissue, fascia, or connective tissue

m., traumatic. May be simple, with pain and swelling, or suppurative

m. trichinosa, m., trichinosa. M. due to infestation with trichinae

myospasm (mī'ō-spāzm) [+ *spasmos*, spasm]. Spasmodic contraction of a muscle

myo'stat'ic. Of fixed length in relaxation
myosteo'ma [+ *osteon*, bone, + *ōma*, tumor] A bony growth found in muscle tissue

myostypsis (mī'ō-stīp'sis) [+ *stypsis*, a contracting]. 1 A contraction of muscles 2 Obstruction of any functional movement

myosuria (mī-ō-su'ri-ā) [+ *ouron*, urine] Presence of myosin in the urine. **Syn** *myosinuria*.

myosuture (mī'ō-sū'chūr) [+ *L. sutura*, a stitch] Stitching of a muscle

mysynizesis (mī-ō-sin-i-ze'sis) [G *mys*, *myo-*, muscle, + *synizesis*, sitting together] Adhesion of muscular layers of tissue

myofact'ic (mī'ō-tāk'tik) [G *mys*, *myo-*, muscle, + *L. tactus*, touch] Pert to muscle or kinesthetic sense

m. reflex. The stretch reflex, *q v.*

myofasis (mī-ō'ā-sis) [+ *fasis*, a stretching] Stretching of a muscle.

myofat'ic [+ *fasis*, stretching] Pert. to the stretching of muscles

myofenontoplasty (mī'ō-tēn-ōnt'ō-plast-i) [+ *tenōn*, *tenont-*, tendon, + *plassein*, to form] Plastic operation involving muscles and tendons **Syn** *tenontomyoplasty*.

myofenosis (mī'ō-tēn-ō-sī'tis) [+ *itis*, inflammation] Inflamed condition of a muscle and its tendon

myofenotomy (mī'ō-tēn-ōt'ō-mī) [+ *tomē*, incision] Division of the tendon of a muscle

myothermic (mī'ō-therm'ik) [+ *thermē*, heat] Pert to rise in muscle temperature due to its activity

myofic [G *myein*, to close]. 1 An agent that will contract the pupil of the eye. **Ex** *physostigmine*, *pilocarpine*. 2 Producing contraction of a pupil

myofility (mī-ō-tī'lī-tī) [G *mys*, *myo-*, muscle] Contractility of a muscle.

myofome (mī'ō-tōm) [G *mys*, *myo-*, muscle, + *tomē*, incision] **Syn** *muscle plate* 1 Knife for cutting muscles 2. That portion of an embryonic somite which gives rise to somatic (striated) muscles.

myotomy (mī-ōt'ō-mī) [+ *tomē*, incision] Division or anatomical dissection of muscles.

myotonia (mī-ō-tō'nī-ā) [+ *tonos*, tension]. Tonic spasm of a muscle, or temporary rigidity.

Syn *Thomsen's disease*.

m. atrophica. M. congenita, *q v.*

m. congenita. **Syn** *m. atrophica*, *m. dystrophica*, *Thomsen's disease* A disease characterized by tonic spasms of the muscles induced by voluntary movements, usually congenital and transmitted from one generation to another

Syn Disease appears in early childhood, is manifested by a tonic spasm of the muscles every time they are put in use In few minutes the rigidity wears away and the movements become free from repeated contractions, the muscles becoming firm and extremely well developed, under electrical treatment the muscles contract and relax slowly.

Prog Incurable

Treatment Physical exercise causes improvement

myoton'ic [+ *tonos*, tension] Pert. to tonic muscular spasm

myotonometer (mī'ō-tō-nom'ēt-ēr) [+ *metron*, measure] Instrument used to measure muscular tonus

myotonus [+ *tonos*, tension] A tonic muscle spasm with temporary rigidity

myotrophy [+ *trophe*, nourishment]. Nutrition of the tissues of muscle

Myriapoda (mīr-i-ap'ō-dā) [G *myrios*, numberless, + *pous*, *pod-*, foot] Group of arthropods including millepedes and centipedes.

myriapodiasis (mīr'ī-āp-ō-dī-ā-sis) [+ *pous*, *pod-*, foot]. Infestation with 1 of the Myriapoda

myringa (mīr-in'gā) [L *drum membrane*]. The tympanic membrane

myringectomy (mīr-in-jēkt'ō-mī) [+ *G. ektomē*, excision] **Syn** *myringodec-tomy*.

myringitis (mīr-in-jī'tis) [+ *G. -itis*, inflammation] Inflammation of the tympanum or eardrum.

m. bullosa. M. with blebs or vesicular inflammation of the outer layer

myringodectomy (mīr-in-gō-dēkt'ō-mī) [L *drum membrane* + *G. ektomē*, excision] **Syn** *myringectomy* Excision of a part or the entire tympanic membrane.

myringomycosis (mīr-in'gō-mī-kō'sis) [L *myringa*, drum membrane, + *G. mykes*, fungus, + *-osis*] **Syn** *mycomyngitis*, *otomycosis*, *mycotic otitis externa* Inflammation of the tympanic membrane resulting from infection by parasitic fungi.

myringoplasty (mīr-in'gō-plāst-i) [+ *G. plassein*, to form] Plastic operation on membrana tympani.

myringscope (mīr-in'gō-skōp) [+ *G. skopein*, to examine]. Instrument used for examination of the eardrum.

myringotome (mī-rin'gō-tōm) [+ *G. tomē*, incision] Knife for incising the tympanic membrane

myringotomy (mīr-in-got'ō-mī) [+ *G. tomē*, incision]. Incision of tympanic membrane.

myrrh (mur) [G. *myrra*]. USP. A gum resinous substance of great antiquity, cherished as a constituent of incense and perfume, most important use today is as an aromatic, astringent mouthwash.

mysophobia (mī-sō-fō-bī-ā) [G *mysos*, filth, + *phobos*, fear] Abnormal aversion to dirt or contamination.

mytacism (mī'tā-sizm) [G *mytakismos*, fondness for letter m]. Excessive or incorrect use of the letter m or the m sound. **See** *melacism*, *mutacism*

mythomania (mīth-ō-mā'nī-ā) [G. *mythos*, myth, + *mania*, madness] Abnormal tendency to lie and exaggerate.

mythophobia (mīth-ō-fō-bī-ā) [+ phobos, fear]. Abnormal dread of making a false or incorrect statement

mytilotoxin (mīt-i-lō-tōks'īn). A toxic substance found in mussels, the cause of mussel poisoning

mytilotoxism. Mussel poisoning, *Q v*.

myxurus (mī-u'rūs) [G. *mys*, my-, mouse, + *oura*, tail]. Gradually diminishing or tapering, said of certain symptoms, as the heart beat which, under certain conditions, grows feebler and then stronger

myxadenitis (mīks-ad-en-ī'tīs) [G. *myxa*, mucus, + *adēn*, gland, + *-itis*, inflammation]

m. labialis. *SYN*. *Baczi's disease* M of the lips

myxadenoma (mīks-ad-en-ō'mā) [+ + -ōma, tumor]. 1 A tumor with the structure of a mucous gland 2 A tumor of glandular structure containing mucous elements *SYN* *myxoadenoma*

myxangitis (mīks-an-jī'tīs) [+ *aggeion*, vessel, + *-itis*, inflammation]. Inflammation of mucous gland ducts

m. fibrosa. M accompanied by hyperplasia

m. hyalinosa. M with hyaline degeneration about the ducts

myxangoitis (mīks'an-gō-ī'tīs) [+ *aggeion*, vessel, + *-itis*, inflammation]. Inflammation of vessels with mucous discharge

myxasthenia (mīks-ās-thē-nī-ā) [+ *asthēnia*, weakness]. Imperfect or insufficient secretion of mucus

myxedema (mīks-ē-dē-mā) [G. *myxa*, mucus, + *oedema*, swelling] *SYN* *Gull's disease*. Condition resulting from hypofunction of the thyroid gland. Occurs in older children and adults.

ETIO. Iodine deficiency in diet, surgical excision or atrophy of thyroid gland, excessive use of antithyroid drugs. May occur secondary to hypofunction of ant. pituitary and is complicated by adrenal and gonadal deficiencies

SYM. Low BMR (-35 to -40), myxedematous facies, large tongue, slow speech, puffiness of hands and face, coarse and thickened edematous skin, loss and dryness of hair, mental apathy, drowsiness, and sensitivity to cold

TREATMENT. Adm. of desiccated thyroid

m., childhood. M occurring before puberty

m., operative. *SYN* *cachexia strumipriva*. M following removal of thyroid gland

m. pituitary. M occurring secondary to ant. pituitary hypofunction

myxedematoid (mīks-ē-dēm-ā-tōid) [+ + *eidos*, resemblance]. Resembling myxedema

myxedematous (mīks-ē-dēm-ā-tūs) [+ + *oedema*, swelling]. Marked by or concerning myxedema

myxemia (mīks-ē-mī-ā) [G. *myxa*, mucus, + *aima*, blood]. Accumulation of mucus in the blood *SYN* *mucinemia*

myxidiotic (mīks-id-ī-ō'tīk) [+ + *idiōtēs*, private]. Myxedema with few physical symptoms, but marked mental defects

myxiosis (mīks-i-ō'sīs) [G. *myxa*, mucus]. A mucous discharge or secretion.

myxo-, myx- [G.] Combining form meaning of, or pert. to mucus

myxoadenoma (mīks'ō-ād-en-ō'mā) [G. *myxa*, mucus, + *adēn*, gland, + *-ōma*, tumor] *SYN*: *myxadenoma*.

myx'ochon'drosfibrosar'co'ma. A malignant tumor composed of myxomatous, chondromatous, fibrous and sarcomatous elements

my'xochon'dro'ma. A malignant tumor composed of myxomatous and chondromatous elements

myxocystoma (mīks'ō-sīs-tō'mā) [+ *kystis*, cyst, + *-ōma*, tumor]. 1 A cystic tumor containing mucus 2 Ovarian cyst with lining structure resembling mucous membrane

myxoedema (mīks-ē-dē'mā) [G. *myxa*, mucus, + *oedema*, swelling] *Myxoedema*, *Q v*

myxoenchondroma (mīks'ō-ēn-kōn-drō'mā) [+ *en*, in, + *chondros*, cartilage, + *-ōma*, tumor]. A cartilaginous tissue tumor which has undergone partial mucous degeneration

myxofibroma (mīks'ō-fi-brō'mā) [+ L. *fibra*, fiber, + G. *-ōma*, tumor]. Tumor composed of mucous and fibrous elements

myxoglioma (mīks'ō-gli-ō'mā) [G. *myxa*, mucus, + *glia*, glue, + *-ōma*, tumor]. Tumor composed of myxomatous and gliomatous elements

myxoid (mīks-ōid) [+ *eidos*, resemblance]. Similar to or resembling mucus

myxoinoma (mīks-ō-in-ō'mā) [+ *is in-*, fiber, + *ōma*, tumor]. A *myxofibroma*, *Q v*

myxolipoma (mīks'ō-li-pō'mā) [+ *lipos*, fat, + *-ōma*, tumor]. Mucous tumor with fatty tissue elements in it

myxoma (mīks-ō'mā) [G. *myxa*, mucus, + *-ōma*, tumor]. A benign tumor composed of mucous connective tissue similar to that present in the embryo or umbilical cord. Cells are stellate or spindle-shaped and separated by mucoid. The tumors are usually soft, gray, lobulated, and translucent and are not completely encapsulated. May be pure or of mixed types involving other types of tissue

m., cartilaginous. *SYN* *chondromyxoma*

m., cystic, cystoid. One with parts fluid enough to resemble cysts

m., enchondromatous. One with nodules of hyaline cartilage

m., erectile. *SEE* *telangiectatic m.*

m., fibrous. *SYN* *fibromyxoma*

m., intracanalicular, of the mamma. One developing in the interstitial connective tissue of the mamma

m., lipomatodes. *SEE* *lipomatous m.*

m., lipomatous. *SYN* *lipomyxoma*

m., telangiectatic, vascular. One of highly vascular structure

myxomatosis (mīks'ō-mā-tō'sīs) [G. *myxa*, mucus, + *-ōma*, tumor, + *-osis*]. 1. Formation of multiple myxomas 2. Degeneration of myxomatous type

Myxomycetes (mīks'ō-mī-sē'tēs) [G. *myxa*, mucus, + *mykēs*, fungus]. A class of fungi which includes the slime molds

myxomyoma (mīks-ō-mī-ō'mā) [+ *mys*, myo-, muscle, + *-ōma*, tumor]. Muscle tissue tumor that has undergone mucous degeneration.

myxoneuroma (mīks'ō-nū-rō'mā) [+ *neuron*, nerve, + *-ōma*, tumor]. Tumor composed of mucous and nerve tissue elements

myxopapilloma (mīks'ō-pāp-il-ō'mā) [+ L. *papilla*, nipple, + *ōma*, tumor]. Combination myxomatous and papillomatous tumor or tumors

myxorrhœa (miks-or-rê'â) [" + *roia*, flow]. Free discharge from mucous surfaces. **SYN:** *biennorrhœa*.

m. gastrica. Excessive mucous secretion in the stomach.

m. intestinalis. Secretion of mucus from the bowel in neurotic persons in times of mental stress

myxosarcoma (miks"ô-sâr-kô'mâ) [" + *sarx*, *sark-*, flesh, + *-ôma*, tumor]. Mixed tumor, partly myxomatous and partly sarcomatous, having undergone partial degeneration.

myxosarcomatous (miks"ô-sâr-kô'mât-ûs) [" + " + *-ôma*, tumor]. Pert. to or of the nature of myxosarcoma.

myxospore (miks'ô-spor) [G. *myxa*, mucus, + *sporos*, seed]. Spore embedded in a gelatinous mass, seen in some fungi and protozoa

Myxosporidia (miks-ô-spor-îd'î-â) [" + *sporos*, seed] Parasitic sporozoans, most commonly found in epithelial cells of lower vertebrates.

myzesis (mî-zê'sis) [G. *myzein*, to suck]. Sucking.

N. 1. SYMB. for nitrogen. 2 ABBR for normal, esp with reference to solutions.

3 ABBR for *Neisseria*

n. SYMB for index of refraction; ABBR. for nasal

Na. Symb. for sodium.

NA. ABBR. for numerical aperture

nabothian cysts (na-bô-thi-ân). Retention cysts formed by the n. follicles at neck of uterus. See cyst.

n. follicles, n. glands. Mucous follicles of the external os uteri. They contain a glairy fluid.

Eriol. Due to closing of mouths of glands by new epithelium of a healed erosion. They always denote an erosion has been present

n. menorrhagia. Accumulated mucus in the pregnant uterus, the result of excessive secretion of the uterine glands.

NaBr. Sodium bromide.

N. A. C. G. N. National Association of Colored Graduate Nurses Dissolved in 1951

NaCl. Sodium chloride.

NaClO. Sodium hypochlorite.

Na₂CO₃. Sodium carbonate.

nacreous (na'kre-us) [Arabic, *nagir*, hollowed out] Having an iridescent, pearl-like luster, as bacterial colonies.

N. A. D. Abbr. for no appreciable disease.

Naegle's obliquity (na'ge-le). Inclination of fetal head, laterally in a flat pelvis.

N's pelvis. An obliquely contracted pelvis, caused by disease in infancy.

NaHCO₃. Sodium bicarbonate.

nail (nâl) [A S naegel]. SYN: *unguis* A horny cell structure of the epidermis forming flat plates upon the dorsal surface of the terminal phalanges

A nail consists of a *body*, the exposed portion, and a *root*, the proximal portion hidden by the *nail fold*, both of which rest on the *nail bed* or *matrix*. The latter consists of epithelium and corium continuous with the epidermis and dermis of the skin of the *nail fold*. The crescent-shaped white area near the root is the *lunula*. The epidermis extending from the margin of the nail fold over the root is called *eponychium*; that underlying the free border of the distal portion is called *hyponychium*.

A nail grows in length and thickness through activity of cells in the stratum germinativum in region of the root. Average rate of growth in fingernails is about 1 mm per week. It is slower in toenails and slower in summer than in winter. It varies with age and is affected by disease and certain hormone deficiencies.

Changes in the nails, such as ridges, may occur in defective nutrition or after a serious illness. In achlorhydria, hypochromic anemia, excessive spoon-shaped nails with center depression may occur. In chronic pulmonary conditions and congenital heart disease excessive curving of the nails may be associated with clubbed fingers.

Atrophy. May occur as a result of hereditary or congenital tendencies. Permanent atrophy may follow injuries, scars from disease, frostbite, nerve injuries and hyperthyroidism. Sulfur administration sometimes stops this proc-

ess. Nail shedding is due to the same causes.

Nails that are fragile or split often may be congenital or due to prolonged contact with chemicals or to too frequent manicuring.

DISCOLORATIONS. *Black.* In diabetes and other forms of gangrene. *Blue-black.* Common condition, usually due to hemorrhage, bleeding diseases such as hemophilia, and trauma. May be painful and can be relieved by drilling holes in the nails. *Brown.* May be due to arsenical poisoning. *Brownish-black.* This discoloration often indicates chronic mercurial poisoning, due to formation of sulfide of mercury in the tissues. *Cyanosis.* Usually indicates anemia, poor circulation, or venous stasis. *State.* This is an early manifestation of argyria and administration of silver should be stopped at once. *White spots.* Striate lesions may be due to trauma and are more frequent in women. Transverse white bands in all nails may be a sign of acute or chronic arsenical poisoning, or rarely of thallium acetate poisoning. SYN *leukonychia*.

DRY, MALFORMED. May result from trophic changes resulting from injury to nerve or finger, neuritis, Raynaud's disease, pulmonary osteoarthropathy, syphilis, onychia, scleroderma, acrodermatitis and granuloma fungoides of the fingers

STRIATIONS, LONGITUDINAL. Often found in those past middle life, frequently associated with onychorrhexis, splitting at the free margins. Note in association with a focus of infection in the bowel or at root of a tooth. Vitamin deficiency may be a cause. Microscopic examination of nail clippings should be made for ringworm. When hard and brittle, gouty conditions are indicated.

Transverse lines (Beau's lines): May result from previous interference of nail matrix growth. May be caused by local or systemic conditions. Approximate date of lesion may be determined, as it takes 4-6 months for the nail to grow.

ULCERS AND ECCHYMOSES. At base of nails noted in chloral addicts, syphilis and scrofula if not due to trauma. Chancre may be suspected if a small, indolent ulcer appears near the nail, esp if indurated and associated with enlarged lymph glands above the inner condyle.

QUINCKE'S CAPILLARY PULSATION: Rhythmic flushing and blanching most frequent in aortic regurgitation and often in anemia.

n. bed. The end of a finger or toe covered by the nail. SYN: *nail matrix*.

n. biting SYN: onychophagia. A nervous affliction or neurosis in which the free edges of the nails are bitten down to the quick.

n. culture. Test tube culture in which the culture grows in the shape of a nail.

n., eggshell. Nail plate is soft, semi-transparent, bends easily, and splits at end. Associated with arthritis, peripheral neuritis, leprosy and hemiplegia. May be the only visible sign of late syphilis.

n. fold. Groove in the cutaneous tissue surrounding the margins and proximal edges of the nail
n. groove. The space between nail wall and the nail bed
n., hang. Broken epidermis at edge of the nail. *SYN agnail, (I)*
n., ingrowing. Nail with tissue overgrowing its edges.
n. matrix. The nail bed.
n., reedy. One marked by longitudinal fissures.
n. root. Proximal portion of nail covered by nail fold
n. skin. The quill of the nail.
n., spoon. A nail with central portion depressed and lateral edges elevated
n. wall. Epidermis covering edges of the nail. *SYN. vallum unguis.*
naked (nâ'kêd) [A.S. *naced*, nude]. Uncovered, exposed to view, nude, bare
nanism (na'nizm) [G. *nanos*, dwarf]. Condition of being dwarflike in build.
n., symptomatic. N. with deficient dentition, sexual development and ossification
nancephalism (nan-ô-sef'âl-izm) ['' + *kephalê*, head] Condition of having an abnormally small head
nancephalous (nan-ô-sef'â-lûs) ['' + *kephalê*, head]. Having an abnormally small head.
nanocormia (na-nô-kor'mî-â) ['' + *kormos*, trunk]. Abnormally dwarfed thorax or body.
nanoid (na'noid) ['' + *eidôs*, like]. Dwarf-like.
nanomelus (nâ-nôm'ê-lês). A monster with undersized extremities.
nanosomia (na-nô-so'mî-â) ['' + *sôma*, body]. State of being a dwarf. *See nanism.*
nanosomus (nâ-nô-sô'mûs). A person of stunted size, a dwarf
nanous (nan'ûs) [G. *nanos*, dwarf]. Dwarfed or stunted
na'nus [G. *nanos*]. 1. A dwarf. 2 Stunted; dwarflike
NaOH. Sodium hydroxide.
nap (nâp) [A.S. *hnappian*, nap]. 1. To slumber. 2. A short sleep, a doze.
nape (nâp, nâp) [origin uncertain]. Upper back part of neck
napex (na'peks) [origin uncertain]. Scalp beneath the occipital protuberance.
naphtha (naf'thâ) [G. *naphtha*]. 1. A volatile inflammable liquid distilled from carbonaceous substances 2. Petroleum, esp. more volatile varieties
naphthalene (naf'thâ-len) [G. *naphtha*]. A hydrocarbon, one of principal constituents of coal tar $C_{10}H_8$
Uses. As a disinfectant, in moth balls, and in manufacture of dyes and explosives.
DOSAGE: 2-10 gr. (0.12-0.6 Gm).
naphthol (naf'thól). Coal tar substance used as an antiseptic and in certain dyes. Also prepared from naphthalene.
napiform (na'pl-form) [L. *napus*, turnip, + *forma*, shape]. BACF. Formed like a turnip, as gelatin liquefaction.
naprapathy (nap-râp'âth-l) [Czech *naprava*, correction, + G. *pathos*, disease]. Method of manipulation practiced by a certain school in the treatment of disease which is based upon the assumption that disease is due to faulty functioning of ligaments.
narceline (nâr'sên). $C_{10}H_{17}O_4N$, an alkaloid obtained from opium. A hypnotic and used as a substitute for morphine
narcism, narcissism (nâr'sizm, nar-sis'-izm) [G. from *Narkissos*, a mythical

character who fell in love with his own image]. 1. Self-love or self-admiration. 2. Voluptuous pleasure derived from observing one's own naked body.
narcissistic (nar-sis-sist'ik). Pert. to narcissism.
n. object choice. Selection of another like one's own self as the object of love, friendship or liking
narco- [G.] Prefix *numbness, stupor.*
narcoanesthesia (nar'kô-ân-ês-thê'zî-â) [G. *narkê*, stupor, + *an-*, priv + *aisthesis*, sensation] Anesthesia produced by a narcotic, as scopolamine and morphine.
narchohypnia (nar'kô-hîp'nî-â) ['' + *hypnos*, sleep]. Numbness following sleep.
narchohypnosis (nar-cô'hîp-nô'sis) *SYN. hypnopharcosis* Stupor or deep sleep produced by hypnosis
narcolepsy (nar-kô-lêp-sî) ['' + *lêpsis*, seizure] Overwhelming attacks of sleep which the victim cannot inhibit. *SYN. sleep epilepsy, sleep, paroxysmal.*
narcoleptic (nar-kô-lêp'tik) ['' + *lêpsis*, seizure] Pert. to or marked by an overwhelming desire to sleep
narcoma (nar-kô'mâ) ['' + *kôma*, coma]. Coma or stupor from use of a narcotic.
narcomania (nar-kô-mâ'nî-â) ['' + *mania*, madness] 1 Abnormal craving for alcohol or narcotics 2 Insanity due to use of alcohol or narcotics
narcomaniac (nar-kô-mâ'nî-âk) ['' + *mania*, madness] 1 Pert to narcomania 2 One affected by narcomania
narcomatous (nar-kô-mâ'tus) ['' + *kôma*, coma]. Pert to a state of stupor from use of narcotics
nar'cose [G *narkê*, stupor]. In a stuporous state
narco'sis [G *narkê*, stupor, + -ôsis]. Unconscious state due to narcotics
n., basal. N produced prior to administration of ether or any general anesthetic
n., insufflation. General anesthesia produced by administering the anesthetic through a tube passed bet. the vocal cords into the trachea.
n., medullary. General anesthesia induced by a local anesthetic injected in the sheath of the spinal cord in lumbar region *SYN. spinal anesthesia.*
n. paralysis. P induced by pressure on a nerve during surgical anesthesia.
narcosomania (nar-kô'sô-mâ'nî-â) ['' + *mania*, madness]. Morbid craving for, or insanity produced by narcotics. *SYN. narcomania.*
narcotic [G. *narkôtikos*, numbing] 1. Producing stupor or sleep 2 A drug which in moderate doses depresses the central nervous system thus relieving pain and producing sleep but which in excessive doses produces unconsciousness, stupor, coma, and possibly death. Examples are opium, morphine, codeine, papaverine, heroin, and many synthetics Most are habit forming 3 Anything that soothes, relieves or lulls 4. One addicted to the use of narcotics.
Narcotics are more powerful than hypnotics *Ex chloral hydrate, sulfonal, trional, veronal.*
RS' drug addiction.
narcotism (nar'kôt-izm) [G. *narkê*, stupor, + *ismos*, condition]. 1. State of stupor induced by a narcotic. *SYN: narcosis.* 2 An addiction to the use of narcotics.
Addiction may be said to exist when discontinuance causes abstinence symptoms relieved speedily by a dose of the drug. It is this addition to the original

purpose in taking the drug that so readily aggravates the need.

TREATMENT Can ordinarily be successful only under sanitarium conditions positively preventing the use of the drug, and then it consists mostly of substituted sedatives to minimize distress of withdrawal. Relapses are frequent and the building up of a new philosophy of life is sometimes of prime importance.

POISONING Narcotic or sleep producing poisons as opium and its derivatives, chloral combinations, barbitol and its myriad subvarieties, etc.

SYM Depression, slowing of heart and respiration, sleep, followed by coma.

F. A. TREATMENT. Remove poison by vomiting, purging, dilution of blood, diuretics, intravenous hypertonic glucose. Administer stimulants by all routes.

narcotize [G *narkōtikos*, numbing]. To render unconscious through the use of a narcotic.

nasalis (nā'ris) (pl. *nares*) [L. *nostril*]. The nostril.

n., anterior. BNA. External nostril.

n., posterior. BNA. Either internal opening into pharynx

RS: *anosmia*, *epistaxis*, *hyperosmia*, *nose*, *parosmia*, *septum*, *smell*.

nasal (nā'zī) [L. *nasus*, nose] 1. Pert to the nose 2. Uttered through the nose. 3. A nasal bone

n. bones. The 2 small bones forming the arch of the nose

n. cartilages. C forming principal portion of framework of external nose

n. cavity. C between floor of cranium and roof of mouth

n. conchae. SEE *concha*, *nasal*

n. douche. Injection of fluid into 1 nostril, with fluid passing into the other nostril, escaping by way of the nasopharynx out of the mouth.

Patient should keep mouth open to prevent fluid from entering the throat. Force must not be great. Atomized spray is safer. Container should not be suspended over 6 inches above patient, who should not blow the nose during treatment.

n. feeding. N gavage, *q.v.*

n. fossa. One of the two halves of the nasal cavity

n. gavage. Feeding through a tube in the nasal passage.

This is resorted to when all other methods fail, and quite often only 1 nasal feeding is necessary to make the patient realize that it is much easier to eat.

NP Throughout a course of tube feedings in mental cases, the nurse should frequently experiment to see if the patient will eat. Try him with a fully prepared tray. Also offer the tube feeding in a glass that he may drink it. Again, it should be remembered that suggestion is a very powerful factor in the care of the mental patient, so the nurse may see the reflection of her own attitude in the patient's behavior.

ARTICLES NECESSARY (a) Tray with feeding (consisting usually of milk, eggs, sugar and malted milk, or concentrated broths and purées with milk and cream) heated to 98° F. (b) Pitcher of water (about 100 cc.). (c) Pitcher of orange juice (200 cc.). (d) Basin with ice and nasal tube and funnel. (e) Medicine glass with glycerine. (f) Gown for doctor. (g) Rubber and draw sheet to protect patient. (h) Face towel. (i) Bowl of water to invert funnel in. (j) Any medication ordered.

PROCEDURE: (a) Have patient in bed or in chair, according to the doctor's wishes, usually in a chair, however. (b) Restrain, if a mental patient, with a blanket or sheet or put him in a dry pack if in bed. (c) Protect patient with rubber and draw sheet. (d) Pour water into funnel and clamp tube so no air will enter. (e) Dip end of funnel in glycerine. (f) After tube is inserted, note color of face, invert funnel in water and if air bubbles appear, obstruction is in the trachea and tube should be removed immediately. (g) Fill funnel with feeding and hold slightly above patient's head to allow flow by gravity. (h) Give orange juice and any medication, also water. (i) Hold towel over patient's mouth and keep head raised slightly as patient is more apt to retain the feeding. (j) Remove tube quickly and keep patient quiet for a few minutes, until desire for regurgitation has passed. (k) Entire amount of fluid given at 1 feeding should not exceed 1000 cc.

n. height. Distance bet. lower border of nasal aperture and the nasion.

n. index. The greatest width of the nasal aperture in relation to a line from the lower edge of the n. aperture to the nasion.

n. line. L. from lower edge of the ala nasii curving to outer side of the orbicularis oris muscle, seen in abdominal disorders **SYM** *Jadelot's furrow* or *line*.

n. meatus. SEE *meatus*.

n. obstruction. Commonest causes: (a) Irregular septum, (b) enlarged turbinates, (c) nasal polypi. Many complications result. **TREATMENT** Nasal douches, inhalations and operative care: (a) Resection of septum, (b) turbinectomy, (c) removal of polypi, (d) opening and draining sinuses

n. reflex. Sneezing resulting from irritation of nasal mucosa

n. sinuses, accessory. The paranasal sinuses, *q.v.* SEE *sinuses*, *accessory*

nasal

n. width. Maximum width of nasal aperture.

nascent (nā'sēnt, nā'sēnt) [L. *nascens*, born]. 1. Just born, incipient or beginning. 2. Pert. to a substance being set free from a compound

nasion (nā'zī-ōn) [L. *nasus*, nose]. The point where the nasiofrontal suture is cut across by the median anteroposterior plane.

nasitis (nā'zī'tis) [" + G. *-itis*, inflammation] Inflammation of the nose.* SEE *rhinitis*

Nasmyth's membrane (naz'mith). Epithelial m. enveloping enamel of a tooth for short period after birth.

naso- [L.]. Combining form, *rel. to the nose*.

nasoontritis (nā'zō-ān-trī'tis) [L. *nasus*, nose, + G. *antron*, cavity, + *-itis*, inflammation]. Inflammation of nose and antrum of Highmore with rhinitis.

nasociliary (nā'sō-sil'i-ār-l). Pert. to nose, eyebrow, and eyes. Applied esp. to nerve supplying these structures.

nas'ofron'tal [" + *frons*, front-, forehead]. Pert. to nasal and frontal bones.

nas'ola'bial [" + *labium*, lip]. Connected with or rel. to the nose and lip.

nasolacrimal (nā'zō-lāk'rīm-āl) [" + *lacrima*, tear]. Pert. to nose and lacrimal mechanism

nasology (nā-zōlō'jī) [" + G. *logos*, study]. Study of the nose and its diseases.

nasomental (nā'zō-mēn'tāl) [' + *mentum*, chin]. Pert. to the nose and chin.
n. reflex. Contraction of mentalis muscle with elevation of lower lip and wrinkling of skin of chin resulting from percussion of side of nose.
nasopalatine (nā'zō-pāl'āt-in) [L. *nasus*, + *palatum*, palate]. Pert. to both nose and palate.
nasopharyngeal (nā'zō-fār-in'jē-āl) [' + G. *pharynx*, pharynx]. Pert. to the pharynx and nose.
nasopharyngitis (nā'zō-fār-in-jī'tis) [' + " + *-itis*, inflammation] Inflamed condition of the nasopharynx. SYN. *rhinopharyngitis*.
nasopharynx (nā'zō-far'inks) [' + G. *pharynx*, pharynx]. Part of pharynx situated above the soft palate (postnasal space) SYN. *rhinopharynx*.
nasoscope (nā'zō-skōp) [' + G. *skopein*, to examine]. Electrical device for examination of the nasal cavity.
nasoseptitis (nā'zō-sēp-tī'tis) [' + *saep-tum*, partition]. Inflamed condition of the nasal septum.
nasosinusitis, **nasosinusitis** (nā'zō-sīn-ū-i'tis, -sī-nū-sī'tis) [' + *sinus*, cavity]. Inflammation of the nasal accessory sinuses and cavities.
nasospinale (nā'zō-spīn'-āl-ē). Point at which med sagittal plane intersects line joining lowest points on nasal margins.
nas'tin [G. *nastos*, solid] Oily substance from streptothrix of leprosy which, combined with benzoyl chloride, is said to produce active immunity against leprosy.
nasus (nā'sūs) [L]. The nose.
natal (nā'tāl) [L. *natus*, birth; *nasci*, to be born]. 1. Pert. to birth or the day of birth 2. [L. *nates*, buttocks]. Pert. to the nates or buttocks.
natality [L. *natus*, birth; *nasci*, to be born]. The birth rate.
natant (nā'tānt) [L. *natāre*, to swim]. Floating, swimming.
nates (nā'tēz) [L. pl. buttocks]. 1. Gluteal region, fleshy prominences formed by the gluteal muscles and covering of fat and skin. SYN. *buttocks*. 2. The ant., sup or upper 2 corpora quadrigemina * SEE *testes*.
natimortality (nā'tī-moi-tāl'i-tī) [L. *natus*, one born, + *mortalitas*]. Rate of stillbirths in proportion to birth rate.
National Formulary. ABBR NF Formulary issued by the Amer. Pharmaceutical Assn.
native (nā'tiv) [L. *nativus*, born in]. 1. Born with; inherent. 2. Natural, normal SYN. *indigenous*. 3. Belonging to, as place of one's birth.
n. albumin. A protein group found in tissues SEE *albumin*.
natremia (nā-trē-mī-ā) [L. *natrium*, sodium, + G. *aima*, blood]. Sodium in the blood.
natrium (nā'trī-um) [L. sodium]. SYMS: Na. Sodium.
This is found abundantly in plants, animal fluids and minerals, as common salt. It is the base of all the salts of soda. It seems necessary to animal life in order to keep proteins in solution and to make the secretions of a proper composition.
na'tron. Sodium carbonate. [sodium. *na'trum*. Homeopathic name for soda or *natary* (nā'tū-ar-i) [L. *natus*, birth]. A lying-in ward.
natural [L. *natura*, nature]. Not abnormal or artificial.
n. selection. A theory of evolution

proposed by Chas Darwin to account for the origin of species Essential points are that all species tend to over-produce. As food supply is limited, there is a struggle for existence Variations occur, hence individuals possessing favorable variations would tend to survive, those with unfavorable ones would die out Through heredity, such variations would be transmitted to successive generations and, in time, new types or species differing from their ancestors would come into existence.
na'turopath [' + G. *pathos*, suffering]. One who practices naturopathy.
naturopathy (nā-tūr-op'ā-thi) "A therapeutic system embracing a complete physianthropy employing Nature's agencies, forces, processes, and products, except major surgery" Amer. *Naturopathic Ass'n*.
naupathia (naw-path'i-ā) [G. *naus*, ship, + *pathos*, disease] Seasickness.
nausea (naw'shē-ā, naw'sē-ā) [G. *nausia*, seasickness]. Inclination to vomit, usually preceding emesis if of gastric origin.
It is present in seasickness, early pregnancy, diseases of the central nervous system, neurasthenia, hysteria, and sometimes in astigmatism. It may be due to the sight or odor of obnoxious matter or conditions, or to mental images of same. It may be present, without vomiting, in certain gallbladder disturbances and in carsickness.
NP Report the nature of vomitus, if it occurs, frequency and time, effect of food and sleep, bilious, fecal, profuse, purulent, watery, mucous and hematemeses. SEE *vomitus*.
n. gravidarum. Morning sickness of pregnancy.
n. navalis. Seasickness SYN *mal de mer*, *naupathia*.
nauseant (naw'shē-ānt, naw'sē-ānt) [G. *nausia*, seasickness]. 1. Causing nausea. 2. That which causes nausea.
nauseate (naw'shē-āt, naw'sē-āt) [G. *nausia*, seasickness]. To cause or affect with nausea.
nauseous (naw'shus, naw'shē-ūs) [G. *nausia*, seasickness]. Producing nausea, disgust or loathing.
navel (nā'vēl) [A.S. *nafela*]. The depression or scar in center of abdomen, where the umbilical cord of fetus was attached SYN. *umbilicus*, *q v*.
RS *circumphalos*, *umbilical cord*, *umbilicate*.
n. string. Umbilical cord.
navicula (nā-vīk'ū-lā) [L. *navicula*, boat]. Fossa navicularis *.
navicular (nā-vīk'ū-lar) [L. *navicula*, boat]. 1. Shaped like a boat. 2. Scaphoid bones in the carpus and in the tarsus. SEE: *skeleton*.
n. fossa. SEE *fossa navicularis*.
Nb. CHEM SYMS for niobium (columbium).
N.C.A. Neurocirculatory asthenia.
Nd. CHEM SYMS for neodymium.
N. D. A. National Dental Association.
Ne. CHEM SYM for neon.
near point. SYN. *punctum proximum*.
ABBR: np Closest point of distinct vision, with maximum accommodation.
It recedes with age, varying from 3 in. in 2 yr. to 40 in. at 60 yr.
n. p., absolute. For either eye.
n. p., relative. For both eyes taken together.
nearsight (nēr'sīt). Ability to see clearly only a short distance. SYN: *myopia*.
near'sight'ed. Able to see clearly only a short distance. SYN: *myopia*.

nearsightedness. Ability to see distinctly only a short distance. SYN *myopia*.

nearthrosis (nē-ar-thrō'sis) [G. *neos*, new, + *arthron*, joint]. A false joint or abnormal articulation.

nebula (nēb'ū-lā) [L. *mist*, cloud]. 1. Slight haziness. 2. Clouds in urine. 3. Group of oily substances.

n. corneae. Grayish opacity of the cornea.

nebulization [L. *nebula*, vapor]. 1. Treatment with spray method. 2. Conversion into a vapor. SYN *vaporization*.

nebulizer (nēb'ū-il-zēr) [L. *nebula*, mist]. An atomizer or sprayer.

Necator. A genus of nematode hookworms belonging to the family Ancylostomidae.

N. americanus. A species of hookworm widely distributed in tropical regions, and common in the southern United States. Called the American hookworm. Adults live in small intestine attached to mucosa by their buccal capsules. Adults lay eggs which pass out with feces and under proper conditions of warmth and moisture hatch within 24 hrs. into "rhabdiform" larvae. After two molts, the larvae becomes "strongiform." After two more molts occurring within five days, they become "infective" larvae. They enter the body through the skin, pass into the lymph or blood stream and are carried to the lungs. Here they burrow into air spaces from which they pass via bronchial tubes and trachea to the pharynx from which they are expectorated or swallowed. If swallowed, they reach the intestine, bury themselves among the villi, molt again, acquire a mouth capsule and attach themselves to the mucosa. Worms may live 5 yrs.

ne'catoria'sis. Infestation by *Necator americanus*, q.

neck (nēk) [AS. *hnecca*, nape]. 1. Part of body bet head and shoulders. 2. The constricted portion of an organ, or that resembling a neck. 3. Region between crown and root of a tooth.

n., anatomical. Constriction just below the head of the humerus. SYN: *collum anatomicum*.

n., back of. Nape of the neck. SYN: *nucha*, *scruff*.

n., Madelung's. Diffuse lipoma of the neck.

n., Nithsdale. Goiter.

n., surgical. Narrow part of humerus below the tuberosity. Fracture here is common.

n. of womb. The cervix uteri.

n., wry. Torsion of the neck caused by contracted muscles. SYN *torticollis*.

necrectomy (nē-krēk'to-mī) [G. *nekros*, dead, + *ektomē*, excision]. Surgical removal of necrosed tissue.

necro- [G.]. Combining form meaning *pertaining to death*.

necrobiosis (nēk-rō-bi-ō'sis) [G. *nekros*, dead, + *biosis*, life]. Gradual degeneration and death of tissue. SEE *necrosis*.

n. lipoidica diabetorum. SYN. *Op-penheim-Urbach disease*. A skin disease common in diabetics characterized by necrosis of connective tissue and discoloration of skin.

necrobiotic (nēkrō-bi-ō'tik) [+ *biosis*, life]. Pert. to or affected by necrosis. SYN: *necrotic*.

necrocytosis (nēkrō-si-tō'sis) [+ *kytos*, cell, + *-osis*]. Cellular death or decomposition.

necrocystotoxin (nēkrō-si-to-tōks'in). A toxin resulting from the death of cells.

necrogenic, necrogenous (nēkrō-jēn'ik, -krō-jēn-ūs) [+ *gennan*, to produce]. Caused by, pert. to, or originating in dead matter.

necrologist (nēk-rof'ō-jist) [+ *logos*, study]. A student of mortality statistics.

necrology (nēk-rof'ō-jī) [+ *logos*, study]. The study of mortality statistics.

necromania (nēk-rō-mā'nī-ā) [G. *nekros*, dead, + *mania*, madness]. 1. Abnormal interest in dead bodies or in death. 2. Mania with desire for death.

necrometer (nēk-rom'ēt-ēr) [+ *metron*, measure]. Device for measurement of dead organs.

necromimesis (nēk'rō-mī-mē'sis). A delusion in which a person believes himself to be dead or acts as though he were dead.

necronarcema (nēkrō-nar-sē'mā) [+ *narkē*, stupor]. Rigidity of a dead body. SYN *rigor mortis*.

necronectomy (nēk-rōn-ēktō-mī) [+ *ektomē*, excision]. Excision of a necrotic part, esp of necrotic ossicles.

necrophagous (nēkrōf'ā-gūs) [+ *phagēin*, to eat]. Feeding or existing on dead bodies or matter.

necrophile (nēk'rō-fil) [+ *philein*, to love]. One who has a morbid interest in or violates dead bodies.

necrophilia (nēk'rō-fil'ī-ā) [+ *philein*, to love]. 1. Sexual perversion with desire for, or coitus with, dead bodies. 2. Strong desire for death. SYN: *necrophilism*.

necrophilism (nēk-rōf'il-izm) [+ *philein*, to love, + *ismos*, condition]. 1. Sexual perversion in which there is insane love for, or violation of, the dead. 2. Strong desire for death.

necrophilous (nēk-rōf'il-ūs) [+ *philein*, to love]. 1. Having a morbid fondness for, or feeding on, dead tissue. 2. Pert. to or affected with necrophilism.

necrophobia (nēk-rō-fō-bī-ā) [G. *nekros*, dead, + *phobos*, fear]. 1. Abnormal aversion to dead bodies. 2. Insane dread of death. SYN: *thanatophobia*.

necropneumonia (nēkrō-nū-mō'nī-ā) [+ *pneumon*, lung]. Pulmonary gangrene.

necropsy (nēk'rōp-sī) [+ *opsis*, view]. The scientific examination of a dead body to determine cause of death or pathological conditions. SYN: *autopsy*, *necroscopy*, *postmortem*.

necrosadism (nēk'rō-sād'izm) [+ *sadism*]. Sexual gratification derived from the mutilation of dead bodies.

necroscopy (nēkrōs'kō-pī) [+ *skopein*, to examine]. Scientific inspection of a dead body to find cause of death or pathological condition. SYN: *autopsy*, *necropsy*.

necrose (nēk-rōs') [G. *nekros*, dead]. To cause or to undergo necrosis.

nec'ro'sin. A substance obtained from inflamed tissues which induces inflammatory changes in normal tissue.

necrosis (nēk-rō'sis) [G. *nekrosis*, a killing]. Death of areas of tissue or bone surrounded by healthy parts; death in mass as distinguished from *necrobiosis*, a gradual degeneration. SYN: *gangrene*, *mortification*.

The dead part in bone is called *sequestrum*; in soft tissue, a *slough* or *phagecelus*. Term is usually applied to bone destruction or small areas of tissue, while *gangrene* is generally applied to destruction of specific parts or larger areas.

Etiol. Cessation of blood supply; physical agents such as trauma, radiant

energy (electricity, infrared, ultra-violet, roentgen and radium rays); chemical agents (exogenous substances acting locally or acting internally following absorption and endogenous substances), or products (toxins) of bacteria.

n., anemic. N. caused by disturbed circulation in a part.

n., Balser's fatty. Pancreatitis with gangrenous areas in the fatty tissues.

n., caseous. See *cheesy n.*

n., central. N. which affects only the center of a part.

n., cheesy. N. of tuberculous type with cheese-like formation.

n., coagulative. N. occurring esp in infarcts in which coagulation occurs in necrotic area converting it into a homogenous mass.

n., colliquative. N. caused by liquefaction of tissue due to autolysis or bacterial putrefaction.

n., dry. N. with dryness of the sequestrum

n., embolic. N. resulting from an embolus which causes anemic n.

n., fat. N. in small scattered areas in the fatty tissue

n., fibrinous. See *coagulative n.*

n., focal. Coagulative n. in small scattered areas

n., gummatous. N. resulting from the treponema of syphilis forming a dry rubbery mass

n., ischemic. N. resulting from interference in blood supply to a part. Results in development of an infarct, decubitus, or gangrene

n., liquefactive. Syn: *colliquative necrosis, qv*

n., medial. N. of cells in tunical media of arteries

n., moist. N. with softening and moist condition of the dead bone

n., putrefactive. N. caused by bacterial decomposition.

n., superficial. N. affecting only the bone surface

n., thrombotic. N. due to thrombus formation

n., total. N. affecting an entire part

n., ustilaginea. Dry n. due to ergot poisoning

necro-sperm'a. Condition in which spermatozoa in the ejaculate are immobile or lifeless.

necrotic [G *nekrosis*, a killing]. Rel. to death of a portion of tissue

necrotomy (nĕk-rŏt'ŏ-mĭ) [G *nekros*, dead, + *tomē*, a cutting]. 1 Dissection of a cadaver. 2 Excision of a sequestrum or other necrotic tissue.

necfarine (nĕk'fer-ĕn'). Av. SERVING. 125 Gm. Pro. 0.8, Carbo. 19.9. VITAMINS: A+, C+

needle (nĕd'l) [A.S. *naedl*]. A pointed instrument for stitching, ligaturing or puncturing.

They may be *straight*, *half curved*, *full curved*, *semicircular*, or *double curved*, sometimes called "S" or *sigmoid-shaped*. There are 2 classifications: *cutting edge* and *round point*. *Cutting edge* type is used in skin and dense tissue work, while *round point* needles are used for more delicate operations. All curved needles are used with a holder, straight usually without a holder. CARE OF: Wash off, scrub with mild cleanser, benzine and ether, sharpen, oil, and then sterilize.

need'ling [A.S. *naedl*]. Treatment by puncturing with a needle. Syn: *dissection*.

Used in treatment of a cataract to allow entrance of aqueous humor and bring about absorption of the lens, and of an aneurysm in an effort to thicken and strengthen walls of the sac. Several fine needles are introduced into sac and left to be played upon by the blood stream, so that the farther wall becomes scratched and irritated, thus setting up an inflammatory thickening.

n. of aneurysm. Insertion of needles into an aneurysm in an effort to thicken and strengthen walls of the sac. Several fine needles are introduced into sac and left to be played upon by the blood stream, so that the farther wall becomes scratched and irritated, thus setting up an inflammatory thickening.

n., cataract. Syn. *dissection*. Puncturing of capsule of lens to allow entrance of aqueous fluid in order to bring about absorption of lens substance.

n. of heart. Cardiocentesis, *qv*.

n. of kidney. Insertion of a needle into the kidney to locate a stone

negative (neg'ā-tiv) [L. *negāre*, to deny].

1. Without positive statement 2. Lacking results 3. PSY. Marked by resistance or retreat, as to a suggestion 4. Directed away from a source of stimulation 5. Not affirming presence of an organism, as a negative diagnosis

n. culture. One not revealing the suspected organism

n. electricity. Static *e* in which elementary unit is the electron, and which is produced by friction.

n. electrode. The chemically active pole by which currents leave. Syn: *cathode, negative pole*

n. glow. The luminous glow that is adjacent to the cathode in a vacuum tube through which an electrical discharge is passing

n. reaction. Absence of a positive indication of disease, as a negative Wassermann reaction for syphilis

n. sensation. One caused by stimulus not perceived in consciousness.

n. sign. Minus sign (—) used in subtraction and to indicate a lack.

negativism (nĕg'ā-tiv-izm) [L. *negāre*, to deny, + G *ismos*, state] Behavior peculiarly marked by not performing suggested actions (*passive negativism*) or in doing the opposite (*active negativism*), as seen in dementia precox

A patient may refuse to respond to suggestions because of *sluggish mental reflexes*, or from *fear*. Retardation may be slow, or sudden and intense, as in manic depressive insanity. Opposition from fear must be considered apart from dementia precox, in which the patient performs acts directly contrary to those suggested

Ne'gri bodies. Very minute bodies formed in nerve cells of the brain of one affected by rabies

Neisseria (nĭ'sĕ-ri-ā). A genus of bacteria belonging to the family Neisseriaceae. They are gram-negative and usually occur in pairs with flattened sides but may occur singly or in irregular groups. Some are pathogenic

N. catarrhalis. Species of N. found in catarrhal inflammations of the upper respiratory tract

N. discoides. Species occurring in alimentary and urogenital tracts.

N. flava. Species found in nasopharynx; nonpathogenic. Produces a yellow pigment

N. flavescens. Species found in spinal fluid in meningitis patients.

N. gonorrhoeae. Species causing gonorrhea. SYN *gonococcus*.

N. intracellularis. SYN: *N. meningitidis*, *q v*

N. meningitidis. SYN: *N. intracellularis*, *Micrococcus meningitidis*, *M. intracellularis meningitidis* Species causing epidemic cerebrospinal meningitis.

N. orbiculata. Species found in alimentary and urogenital tracts

N. reniformis. Species found in alimentary and urogenital tracts

N. sicca. Species found in mucous membrane of respiratory tract Thought to be causative agent of kidney infections and endocarditis

Nelaton's catheter. A flexible, soft rubber catheter.

N.'s line. One from ant sup spine of the ilium to tuberosity of the ischium.

nem. A food value unit, the value in calories of 1 Gm of mother's milk, equalling about 2/3 calory

nematelminth (nēm-ā-thē'l-mīnth) [G. *nema*, thread, + *helmins*, worm] A roundworm belonging to the phylum Nematelminthes

Nematelminthes (nēm-ā-thē'l-mīnthēz). The phylum of the roundworm

nematocide (nēm-ā-tō-sīd) [' + *caedere*, to kill] An agent that kills nematode worms.

Nematoda (nēm-ā-tō-dā) [G. *nemat-*, thread, + *eidōs*, like] A class of the phylum Nematelminthes which includes the true roundworms or threadworms, many species of which are parasitic. They are cylindrical or spindle-shaped worms possessing a resistant cuticle, have a complete alimentary canal, lack a true coelom, sexes usually separate, development usually direct and simple

nematode (nēm-ā-tōd) [G. *nemat-*, thread, + *eidōs*, like] A member of the class Nematoda, *q v*

nematodiasis (nēm-ā-tō-dī-ā-sīs) [' + + *iasis*, infection] Infestation by a parasite belonging to the class Nematoda

nematoid (nēm-māt-oid). Threadlike, like a nematode

nematology (nēm-mā-tōl-ō-jī) The division of parasitology which deals with worms belonging to the class Nematoda

nembutal (nēm-bū-tāl) Pentobarbital sodium. One of the newer barbiturates, believed to have a short hypnotic action, and pronounced sedative effect.

USES As a preanesthetic, sedative and hypnotic

See *pentobarbital sodium*

neo [G.] Combining form meaning *new* or *recent*.

nearthrosis (nē-ō-ar-thrō-sīs) [' + *arthron*, joint, + *-osis*, increase, invasion]. A false joint. SYN *nearthrosis*

neoblastic [' + *blastos*, germ]. Pert. to, or constituting, a new growth of tissue

neocerebellum (nē-ō-sēr-ē-bē'l-ūm) [G. *neos*, new, + *L. cerebellum*, little brain] The portion of the corpus cerebelli of the cerebellum which lies between the primary and prepyramidal fissures. Consists principally of the ansiform lobules. Phylogenetically it develops last in conjunction with cerebral cortex and is concerned with the integration of voluntary movements.

neocinchophen (nē-ō-sīn-kō-fēn) [' + *cinchophen*]. USP. A tasteless preparation of cinchophen and less likely to cause gastric irritation.

neocortex (nē-ō-kōr-tēks). The neopallium, *q v*.

neodiatlhamy (nē-ō-dī-ā-thērm'f). Short wave diathermy.

neodymium (nē-ō-dīm-ē-um). A chemical element. SYMS Nd Atomic weight 144.27

neofetus (nē-ō-fē-tūs) [' + *L. foetus*, offspring]. Embryo during 8th and 9th week of intrauterine existence.

neoformation (nē-ō-for-mā'shūn) [' + *L. formatio*, a shaping] 1. Regeneration. 2. A neoplasm or new growth.

neogala (nē-og-ā-l-ā) [' + *gala*, milk]. The first milk following childbirth. SEE: *colostrum*.

neogenesis (nē-ō-jēn-ē-sīs) [' + *genesis*, formation] Regeneration or re-formation, as of tissue

neogenetic (nē-ō-jēn-ēt'ik) [' + *genesis*, formation] Newly formed, relating to new formations

neohymen (nē-ō-hī-mēn) [' + *ymēn*, membrane] A false or new membrane. SYN: *pseudomembrane*

neologism (nē-ō-lō-jīzm) [' + *logos*, study, + *ismos*, state]. 1. A new word or phrase, or a new meaning attached to an old word or phrase. 2. Psy A mental condition in which the patient coins new words which are meaningless, or words to which he gives special significance without being aware of their normal significance. SEE *lalopathy*.

neomembrane (nē-ō-mēm-brān) [' + *L. membrana*, membrane] A false or a new membrane. SYN *neohymen*.

neomorph (nē-ō-mōrf) [' + *morphē*, form]. BIOL A new formation or development which is not inherited from a similar structure in an ancestor.

neomycin (nē-ō-mī-sīn) [' + *mykes*, fungus] An antibiotic from a species of *Streptomyces*, isolated from soil. Active against gram-positive and gram-negative bacteria, as well as streptomycin-resistant strains of *Mycobacterium tuberculosis*. Toxic to kidneys and eighth nerve, and affects hearing.

neon (nē-ōn) [G. *neos*, new] SYMS Ne. An inert, gaseous element in the air derived from liquid argon. At wt. 20.2

neonal (nē-ō-nāl). A compound of barbituric acid, considered more active.

USES Similar in sedative effects to barbituric acid, regarded as useful in neuroses, but like all barbiturates, which may be habit forming, should be used with caution over long periods of time, always at the recommendation of the physician.

DOSAGE. 1½ gr. (0.1 Gm.).

neonatal (nē-ō-nā-tāl) [G. *neos*, new, + *L. natāre*, to be born]. Concerning the newborn. SEE *period*

neonatus. A newborn infant.

neopallium (nē-ō-pāl-l-ūm) [G. *neos*, new, + *L. pallium*, cloak] SYN. *neocortex*, *isocortex*. That portion of cerebral hemisphere not belonging to the rhinencephalon or corpus striatum, comprising most of the convoluted cortex and its associated white fibers.

Phylogenetically, it is the new part of the pallium

neopathy (nē-ō-p-ā-thī) [' + *pathos*, disease]. 1. A newly found disease. 2. A new complication or new condition of a disease.

neophilism (nē-ō-fī-l-izm) [' + *philein*, to love, + *ismos*, state]. Morbid love of novelty and new persons and scenes

neophobia (nē-ō-fō-bī-ā) [' + *phobos*, fear] Fear of new scenes or novelties; aversion to all that is unknown or not understood. SYN: *canotophobia*.

neophrenia (nē-ō-frē-nī-ā) [' + *phrēn*, mind]. Mental deterioration or primary psychical failure in early youth.

neoplasia (nē'ō-plā'zī-ā) ["" + *plassein*, to form]. The development of new tissues or neoplasms.

neoplasia (nē'ō-plāzm) ["" + *plasma*, a thing formed]. A new formation of tissue, abnormally, as a tumor or growth.

It serves no useful function, but grows at the expense of the healthy organism.

n., benign. A growth not spreading by metastases or infiltration of tissue.

n., mixed. A n. in which structure resembles the tissues and elements which surround it.

n., malignant. A growth, such as cancer, that infiltrates tissue, metastasizes, and often recurs after removal.

n., mixed. A n. composed of tissues from 2 of the germinal layers.

n., multicentric. A growth arising from a number of distinct groups of cells.

n., organoid. A n. in which the structure is similar to some organ of the body.

n., unicentric. A growth having origin in 1 group of cells.

neoplastic (nē'ō-plas'tik) [G. *neos*, new, + *plastikos*, formed]. Pert. to, or of the nature of, new, abnormal tissue formation.

neoplasty (nē'ō-plās-tī) ["" + *plassein*, to form]. Surgical formation or restoration of parts.

neoprontosil (nē'ō-pron'tō-sil). A sulfonamide and proprietary preparation of prontosil for parenteral injection, depending for efficacy on liberation of sulfanilamide through reduction in the body. The prontosil preparations have been largely replaced by other sulfonamides. SYN: *acosal/amide*.

Uses: As an antibacterial, especially in hemolytic streptococci, gonococci, and perhaps other infections. Cures gonorrhea of pregnancy.

Dosage: Orally, from 5 to 15 gr. at the discretion of the physician, proportioned according to body weight of the patient and the condition. In pregnancy, 40 gr. daily in 5-day courses. Subcutaneously or intramuscularly, 15-20 cc. of a 2.5% solution are recommended in severe cases.

neosalvarsan (nē'ō-sāl'var-sān). A compound of arsenic SEE: *neoursphenamine*.

Dosage: *Intraven.*, 10 gr. (0.6 Gm.).

neostigmine (nē'ō-stig'min). Prostigmine. **neostomy** (nē'ō-s'tō-mī) [G. *neos*, new, + *stoma*, opening]. Formation of opening into an organ or bet 2 organs.

neostriatum (nē'ō-strī-ā'tūm) [G. *neos*, new, + *L. striatum*, grooved]. The caudate nucleus and the putamen considered together.

neoteny (nē'ō-tēn-ī) SYN: *pedogenesis*. The production of young by immature or larval stages.

nephelometer (nēf-ēl-ōm'ēt-ēr) [G. *nephelē*, mist, + *metron*, measure]. Apparatus for measuring the turbidity of a fluid for the number of bacteria in a suspension.

nephelometry (nēf-ēl-ōm'ēt-rī) ["" + *metron*, measure]. The employment of the nephelometer.

nephelopia (nēf-el-ō'pī-ā) ["" + *ōps*, eye]. Dim or cloudy vision from lessened transparency of the ocular media.

nephroadenoma (nēf-rād-ēn-ō'mā) [G. *nephros*, kidney, + *adēn*, gland, + *-ōma*, tumor]. Renal adenoma.

nephralgia (nēf-rāl'jī-ā) ["" + *algos*, pain]. Renal pain.

In absence of other symptoms, may alone be symptomatic of an obstructive

renal process, but commonly presents a problem in differential diagnosis.

nephralgic (nēf-rāl'jīk) ["" + *algos*, pain]. Pert. to renal pain.

n. crises. Ureteral paroxysmal pain in locomotor ataxia.

nephropostasis (nēf-rā-pos'tā-sis) ["" + *apostasis*, suppuration]. Renal abscess or purulent inflammation of the kidney.

nephrostenia (nēf-rās-thē'nī-ā) ["" + *a-*, priv. + *sthenos*, strength]. A slight nephrosis without actual disease of the renal tubules.

nephrotony (nēf-rat'ō-nī) ["" + *a-*, priv. + *tonos*, tone]. Lack of normal renal tone.

nephrouze (nēf-rawks'ē) ["" + *aurē*, increase]. Renal hypertrophy.

nephrectasia, nephrectasis, nephrectasy (nēf-rēk-tā'zī-ā, -rēk'tā-sis, -tā-sī) [G. *nephros*, kidney, + *ektasis*, dilatation]. Renal distention.

nephrectomy (nēf-rēk'tō-mī) ["" + *ek-*, to remove, excision]. Removal of a kidney.

ONP. Patient lies on the good side. Lower thigh is flexed to a right angle at hip and the knee is drawn up to same extent. Other lower limb goes straight down the table. Upper extremity in contact with the table is flexed at the elbow, while the arm lies a little on front at side of body. A kidney bridge or sandbag is placed under the loin. The procedure is routine.

The wound should be redraped after kidney is removed and instruments used in its removal discarded. Plenty of heavy drainage tubing, both of plain and cigarette types, should be ready.

NP: Patient should be kept on back without a pillow. Urine should be measured each day. Bland diet throughout illness. Dressing watched for signs of bleeding and changed often. Drainage tube left in for a few days, removed, and dressings changed. Stitches removed in from 10-12 days.

Complications. Suppression of urine and secondary hemorrhage.

nephrelosis (nēf-rēl-kō'sis) ["" + *elkōsis*, ulceration]. Ulceration of the mucosa of the kidney.

nephrelicus (nēf-rēl'kūs) ["" + *elkos*, ulcer]. Renal ulcer.

nephremia (nēf-rē'mī-ā) ["" + *aima*, blood]. Congested state of kidney. SYN: *nephrohemia*.

nephroemphraxis (nēf'rem-fraks'is) ["" + *emphraxis*, obstruction]. Obstruction in the renal vessels.

nephric (nēf'rik) [G. *nephros*, kidney]. Pert. to the kidney or kidneys. SYN: *renal*.

nephria (nēf'rīn) [G. *nephros*, kidney]. An amino acid derived from protein digestion. SYN: *cystine*.

nephriasm (nēf'rīzm) ["" + *ismos*, condition]. Aggregate of symptoms produced by chronic kidney disease.

nephritic (nēf-rī'tīk) [G. *nephros*, kidney]. 1. Rel. to the kidney. 2. Pert. to nephritis. 3. An agent used in nephritis.

nephritis (nēf-rī'tis or nēf-rī'tis) (pl. *nephritides*) [G. *nephros*, kidney, + *-itis*, inflammation]. SYN: *Bright's disease*. Inflammation of the kidney.

Etiol: Bacteria or their toxins, scarlet fever, diphtheria, septicemia, or toxic drugs, such as mercury, arsenic, alcohol. The glomeruli, tubules, or interstitial tissue, or all may be affected. It may be either acute or chronic.

RS: *arteriosclerosis, Bright's disease, glomerulonephritis, kidney, neph-*

rosis, nephrotic syndrome, pyelonephritis, nephroscleroses

n., acute. An inflammatory form involving the glomeruli, the tubules, or the entire kidney. It is of various types, depending on the portion of the kidney involved, degenerative, diffuse, suppurative, hemorrhagic, interstitial, and parenchymatous

n., arteriosclerotic. SEE: *chronic interstitial n.*

n., chronic. Progressive form in which entire structure of kidney may be affected, or affection may be confined to the glomerular or tubular processes. One variety of nephritis may merge with another, causing a diffuse nephritis. Symptoms depend upon the tissues involved

n., diffuse, acute. An inflammatory process involving more or less the entire kidney.

SYM Acute onset; moderate fever; dull lumbar pain, marked edema and anasarca, hypertension, rapid pulse; vomiting, delirium, scanty, highly colored urine, containing large quantities of albumin and blood, bloody, hyaline and granular casts, uremic symptoms may develop

PROG Guardedly favorable. May become chronic or death through exhaustive uremia or dropsy.

TREATMENT Absolute rest in bed until albumin has disappeared. Hot fomentations to loins. Severe cases in pregnancy may require therapeutic abortion or induction of premature labor.

DRET. Milk, buttermilk, citrus fruit juices, later, cereals, fruits, vegetables. Cream and sugar allowable. Limit proteins, salt and fluids.

n., d., chronic. SEE: *interstitial n., chronic.*

n., focal. N. with foci of inflammation distributed throughout the kidney.

n., glomerular. A form involving the renal glomeruli. It may be acute or chronic. SEE *glomerulonephritis.*

n., g., acute. Acute form in which the pulse is rapid, and hypertension, edema and urine containing albumin, blood and casts are present. There is retention of urea and salt.

n., g., chronic. Form almost always following acute glomerular n. It is marked by hyalinization of the glomeruli, arteriosclerosis, hypertension, albuminuria, edema, and later uremic symptoms. Usually fatal. SEE *glomerulonephritis, chronic.*

n., g., focal, embolic. N. in which emboli lodge in the capillary loops of the glomeruli, occluding them.

ETIOI: Subacute bacterial endocarditis due to *Streptococcus viridans.*

Glomerulus becomes hyalinized and there is blood in the lumen of tubules. Marked by blood, albumen, and hyaline and granular casts in urine. There is no edema or hypertension. **TREATMENT:** That of endocarditis.

n., g., f., nonembolic. N. in which not all of the glomeruli are affected and those affected are not equally so.

ETIOI: Streptococcus infections.

Marked by blood, albumin, erythrocytes, leukocytes, and granular and hyaline casts in the urine. Lumbar pain and slightly painful urination. Edema and hypertension absent. **TREATMENT:** Removal of the etiologic disease.

n., hemorrhagic. Acute n. with tubular hemorrhage and subsequent hematuria.

n., idiopathic. N. of unknown etiology.

n., indurative. Chronic n. marked by atrophy of the renal secreting structure and enlargement of the connective tissue stroma.

n., interstitial, acute. Rare form of acute n. in which there occur areas of cellular infiltration irregularly distributed bet. the tubules and around the glomeruli. SEE *n., glomerular, focal, nonembolic*, for symptoms and treatment

n., i., chronic. Glomeruli and interstitial tissue involved.

ETIOI. May follow parenchymatous n., alcoholism, lead poisoning, irritating toxins, bacterial infection, syphilis.

SYM Headache, weakness, digestive disturbances, retinal hemorrhages and eye disturbances, dry skin. Vasomotor disturbances, such as tingling in fingers, with blanching. Hypertension marked. Low sp gr. of urine, the quantity of which is considerable, as much by night as by day. Trace of albumin, few narrow hyaline casts, and sometimes granular casts. Retention of urea, uric acid, creatinine and protein waste products in blood.

NP. Rest and general hygienic care. Observe diet strictly, care for skin, be particular in collection of urine specimens, avoid stimulation of kidneys, increase elimination of skin and bowels. Treat symptoms as they arise.

n., lipomatous. Fatty infiltration of the renal parenchyma. **SYN.** *lipomatosis renis.*

n., parynchmatous, acute. Acute glomerular nephritis with associated changes in tubules

n., p., chronic. Chronic glomerular nephritis (q.v.) with associated changes in renal tubules.

n., saturnine. N. from lead poisoning.

n., suppurative. Purulent form of n.

n., s., acute. Purulent form with abscess formation.

n., s., chronic. Cheesy and tubercular form of n.

n., tubal, n., tubular. N. affecting the renal tubules with little change in glomerular structure.

n., tuberculous. N. due to presence of tubercle bacilli.

nephro- [G.]. Prefix. Pert. to the kidney.

nephroabdominal (nĕf'ró-áb-dom'í-nál) [G. *nephros*, kidney, + L. *abdominalis*, pert. to abdomen]. Concerning the kidney and abdomen.

nephrocalcinosis (nĕf-ró-kál'sín-ó'sis). Calcinoses of the kidney characterized by deposits of calcium phosphate in renal tubules.

nephrocapsectomy (nĕf'ró-káp-sekt'ó-mí)

[" + L. *capsula*, capsule, + G. *ektomē*, excision]. Renal decapsulation for relief of chronic nephritis.

nephrocardiac (nĕf'ró-kar'dí-ák) [" + *kardia*, heart]. Concerning the heart and kidney.

nephrocele (nĕf'ró-sĕl) [" + *kēlē*, hernia]. 1. Renal hernia. 2. Embryonic cavity of a nephrotome.

nephrocolle (nĕf'ró-kòl'ík) [" + *kōlikos*, pert. to colon]. 1. Severe, colicky pain in ureter due to passage of stone. 2. Concerning the colon and kidney.

nephrocolopexy (nĕf'ró-kòl'ó-pĕks'í) [" + *kōlon*, colon, + *pēxis*, fixation]. Surgical suspension of kidney and colon using the nephrocolic ligament

nephrocoloptosis (nĕf'ró-kòl'óp-tó'sis) [" + " + *ptōsis*, a dropping]. Condition in which the kidney and colon are displaced downward.

nephrocystanastomosis (něf"rō-sīst-ān-ās"-to-mō'sis) [" + *kystis*, bladder, + *anastomosis*, outlet]. Surgical formation of a connection bet. kidney and the bladder, in permanent ureteral obstruction.

nephrocystitis (něf"rō-sīs-tī'tis) [G. *nephros*, kidney, + *kystis*, a bladder, + *-itis*, inflammation] Inflamed condition of kidneys and bladder

nephrogenetic, nephrogenic, nephrogenous (něf"rō-jén-ét'ik, -jén'ik, -rō-jén'ūs) [G. *nephros*, kidney, + *gennan*, to develop] Arising in or from the renal organs, capable of giving rise to kidney tissue

n. cord. The intermediate mesoderm, *q v*

nephrohydrosis (něf"rō-hī-drō'sis) [" + *ydōr*, water, + *-ōsis*]. Accumulation of renal fluid due to obstruction

nephrohypertrophy (něf"rō-hī-pēr'trō-fi) [" + *ypēr*, over, + *trophē*, nourishment] Overgrowth or dilatation of the kidneys

nephroid (něf'roid) [" + *eidos*, resembling]. Resembling a kidney; kidney-shaped SYN: *reniform*.

nephrolith (něf'rō-līth) [" + *lithos*, stone]. Stone in the kidney.

nephrolithiasis (něf"rō-līth-ī'ā-sīs) [G. *nephros*, kidney, + *lithos*, stone] The formation of renal stones SYN *lithiasis nephritica*, *lithiasis renalis*. SEE *calculus, renal*.

nephrolithotomy (něf"rō-līth-ōt'ō-mī) [" + " + *tōmē*, incision]. Renal incision for removal of calculus

nephrology (něf-rōl'ō-jī) [" + *logos*, study]. Science of the structure and function of the kidney.

nephrolysin (něf-rōl'īs-in) [" + *lysis*, dissolution] A toxic principle from animal serum that dissolves kidney cells. SYN: *nephrotoxin*.

nephrolysis (něf-rōl'īs-īs) [" + *lysis*, loosening]. 1. Surgical detachment of an inflamed kidney from adhesions. 2. Destruction of kidney tissue by action of a nephrotoxin

nephroma (něf-rō'mā) [" + *-ōma*, tumor]. Renal tumor or 1 of renal tissue.

nephromalacia (něf"rō-mā-lā-sī-ā) [" + *malakia*, softening]. Abnormal renal softness or softening

nephromegaly (něf"rō-mēg-ā-lī) [" + *megas*, megal-, large]. Extreme enlargement of 1 or both kidneys.

nephromere (něf'rō-mēr) [G. *nephros*, kidney, + *meros*, part]. SYN: *nephrotome* Segment in embryo from which kidney develops. The intermediate mesoderm in an embryo from which the kidney develops

nephron (něf'rōn) [G. *nephros*, kidney]. SYN: *renal tubule*, *uriniferous tubule*. The structural and functional unit of the kidney, consisting of a renal (malpighian) corpuscle (a glomerulus enclosed within Bowman's capsule) and its attached tubule consisting of the proximal convoluted portion, loop of Henle, and distal convoluted portion which connects by arched collecting tubules with straight collecting tubules. Urine is formed by filtration in renal corpuscle and selective reabsorption and secretion by cells of the renal tubule. There are approximately one million nephrons in each kidney. SEE: *kidney*, *malpighian corpuscle*, *urine*.

nephroncus (něf-rōn'kūs) [" + *ogkos*, tumor]. A renal tumor.

nephroparalysis (něf'rō-pār-āl'ī-sīs) [" + *paralysis*, a loosening]. Paralyzed renal function.

NEPHRON.
Copyright 1939, R. N. — A Journal for Nurses.

nephropathy (něf-rōp-ā-thī) [" + *pathos*, disease] Disease of the kidney.

This term includes inflammatory (nephritis), degenerative (nephrosis), and sclerotic (arteriosclerotic) lesions of the kidney

nephropexy (něf'rō-pēks-ī) [" + *pēxis*, fixation] Surgical attachment of a floating kidney

nephrophthisis (něf-rōf'thīs-īs) [" + *phthisis*, a wasting] 1. Tuberculosis of the kidney, with caseous degeneration 2. Suppurative nephritis with wasting of the kidney substance

nephropptosis (něf-rōp-tō'sīs) [" + *ptōsis*, a dropping]. Prolapse or downward kidney displacement

Etiol. Shape of lumbar recess, pregnancy, emaciation, enteroptosis are predisposing factors

SYM (1) None. (2) Symptoms not referable to kidney (nervous and digestive disorders or pain). (3) Painful paroxysms simulating renal colic; albuminuria; painful, scanty and frequent micturition

TREATMENT: Bed rest, truss, surgery. SEE: *nephrectomy*, *nephropexy*.

nephropyelitis (něf"rō-pī-ēl'ītis) [G. *nephros*, kidney, + *pyelos*, pelvis, + *-itis*, inflammation] SYN: *pyelonephritis* Inflammation of the renal pelvis and parenchyma of kidney.

nephropytosis (něf"rō-pī-ō'sīs) [" + *pyōsis*, suppuration] Purulence of a kidney.

nephrorrhagia (něf-rōr-ā-jī-ā) [" + *rēg-nūnai*, to burst forth]. Renal hemorrhage into pelvis and tubules.

nephrorrhaphy (něf-rōr-ā-fī) [" + *raphe*, a stitch]. Suture of a floating kidney to the post. wall of the abdomen.

nephros (něf'rōs). The kidney.

nephrosclerosis (něf"rō-sklē-rō'sīs) [" + *sklērōsis*, a hardening]. Renal sclerosis or hardening. SEE: *nephritis*, *chronic interstitial*.

n., arterial. Arteriosclerosis of kidney arteries Results in ischemia, atrophy of parenchyma, and fibrosis of kidney.

n., arteriolar. Sclerosis of the smaller

renal arterioles, esp the afferent glomerular arterioles with resulting fibrosis, ischemic necrosis and glomerular degeneration and failure. Occurs in most cases of essential hypertension.

n. malignant. N which develops rapidly in patients with severe hypertension. SEE *hypertension, malignant*.

nephrosis (nēf-rō'sis) [G *nephros*, kidney] Condition in which there are degenerative changes in the kidneys without the occurrence of inflammation.

n., acute. N accompanying acute infectious disease or resulting from poisoning or metabolic disturbances such as toxemias of pregnancy or obstructive jaundice.

n., amyloid. N due to deposition of amyloid within the walls of the renal blood vessels and at the base of the cells of the tubules. Marked degeneration of kidney tissue results.

n., lipoid. A chronic disease of unknown etiology in which large amounts of albumin are lost in urine, resulting in depletion of the plasma protein and development of nephrotic edema.

It is probably due to disordered metabolism. Occurs mainly in children and young adults.

Sym. Gradual development of edema, which reaches a high degree. Oliguria, albumin, casts of hyaline and granular type and lipids in urine. Blood serum proteins markedly reduced, but nitrogenous constituents remain normal. Blood cholesterol and globulin elevated. Hypertension absent. Anemia occurs.

Prog. Few weeks to several months.

Treatment. Etiologic disease, if known, high protein diet, and thyroid extract, salt and fluid restriction.

nephrostoma, nephrostome (nē-fros-tō-mā, nēf-rōs-tōm) [G. *nephros*, kidney, + *stoma*, mouth] The internal orifice of a Wolffian tubule, connected with the cloaca in the human embryo.

nephrostomy (nēf-rōs-tō-mī) [“ + *stoma*, mouth] Formation of an artificial fistula into the renal pelvis.

nephrotic (nēf-rōt'ik) [G. *nephros*, kidney] Rel to, or caused by, nephrosis.

n. syndrome. Term applied to renal disease of whatever cause, characterized by massive edema, proteinuria and usually elevation of serum cholesterol and lipids.

nephrotome (nēf-rō-tōm) [G. *nephros*, kidney, + *tome*, a section]. **Syn.** *intermediate cell mass, mesomere, nephromere*. Embryonic bridge of cells, connecting primitive segments along neural tube to the somatic and splanchnic mesoderm from which arises the urogenital system.

nephrotoxin (nēf-rō-tōk'sin) [“ + *toxikon*, poison]. A specific toxin which destroys renal cells.

nephrotresis (nēf-rō-trēs'is) [“ + *trēsīs*, piercing]. Formation of a permanent excretory opening in the kidney through the loin.

nephroureterectomy (nēf-rō-ū-rē'tēr-ēk-tō-mī) [“ + *ourēter*, ureter, + *ektomē*, excision]. Surgical excision of kidney with the ureter or part of it.

nephrydrosis (nēf-rī-drō'sis) [“ + *ydōr*, water, + *-ōsis*]. Water collected in the renal pelvis due to obstruction. **Syn.** *hydronephrosis, nephrohydro-sis*.

nepiology (nē-pī-ol'ō-jī) [G. *nēpios*, infant, + *logos*, study]. Pediatrics concerned with young infants.

Nep'tune gir'die. Compress of linen covered by flannel which encircles the trunk

TYPES OF NEURONS

A, Bipolar neuron, B, unipolar neuron, C, multipolar neuron

from lower end of sternum to the pubes. Used in applying wet packs, esp cold. Used to reduce cerebral congestion, visceral irritation and congestion of int. organs.

NP. Temperature of linen wrung out of water bet 42° and 50° F. Cover with blanket. Patient should first be given a foot bath of 104°-110° F for 5 minutes with cold compress over forehead. Gir'dle to remain on 1-6 hr. Forehead compress to remain during treatment.

neptun'ium. An element (**Syn.** Np), at. number 93, at. weight 239. Obtained by bombarding uranium with neutrons.

nerve (nerv) [L. *nervus*, sinew; probably from G. *neuron*, sinew]. A bundle or a group of bundles of nerve fibers outside the central nervous system which connects the brain and spinal cord with various parts of the body. Nerves conduct afferent impulses centrally from receptor organs and efferent impulses peripherally to effector organs. The fibers of peripheral nerves are the processes of neurons whose cell bodies are located within the brain, spinal cord, or in ganglia.

A bundle of nerve fibers is called a *fasciculus*. The fibers within a fasciculus are surrounded and held together by delicate connective tissue fibers forming the *endoneurium*. Each fas-

NERVE CELL FROM CEREBRAL CORTEX.

A. Axis cylinder, directed towards periphery. B. Dendrites.

THE FACIAL PORTION OF THE FACIAL NERVE.

1. Musculus sternocleidomastoideus.
2. Nervus subcutaneus colli medius.
3. M. sternohyoideus.
4. M. omohyoideus.
5. M. masseter.
6. N. mentalis.
7. N. maxillaris inferior.
8. N. subcutaneus.
9. Stensen's duct.
10. M. zygomaticus.

12. N. zygomaticus.
13. N. temporofrontalis.
14. N. nasociliaris.
15. M. orbicularis orbitae.
16. N. infratrochlearis.
17. N. supratrochlearis.
18. N. frontalis.
19. N. auriculotemporalis.
20. N. auriculo-temporalis.
21. N. occipitalis major.
22. N. anastomaticus.
23. N. auricularis posterior profundus.
24. N. stylohyoideus.
25. N. digastricus posterior.
26. M. digastricus.
27. N. occipitalis minimus.
28. M. cucullaris.
29. M. splenius.
30. N. auricularis magnus.

ciculus is surrounded by a sheath of connective tissue, the *perineurium*. The entire nerve is enclosed in a thick sheath of connective tissue, the *epineurium* which may contain numerous fat cells. Small nerves may lack an epineurium.

n., accelerator. N. to the heart carrying sympathetic fibers conveying impulses which accelerate the heart beat.

SECTION OF THE COCHLEA, WITH THE EXPANSION OF THE NERVUS COCHLEAE.

1. N. cochleae.
2. Ganglia.
3. Organon spirale.
4. Ligamentum spirale.
5. Membrana vestibularis Reissneri.
6. Scala vestibuli.
7. Scala media.
8. Scala tympani.

DIAGRAM OF THE ORIGIN OF THE 9TH, 10TH, 11TH, AND 12TH PAIRS OF CRANIAL NERVES.

1. Nervus recurrens.
2. N. hypoglossus.
3. N. glossopharyngeus.
4. N. vagus.

n., afferent. One which transmits impulses from the periphery to a nerve center.

n., augmentor. An accelerator nerve, *q v*

n., autonomic. A n. of the autonomic nervous system.

n. block. The induction of regional anesthesia by preventing sensory nerve impulses from reaching centers of consciousness. Accomplished by injecting an anesthetic solution (Ex. procaine or novocaine) about the nerve some distance from the region or by anesthetizing nerve endings in the region itself (*infiltration*).

n. cell. A neuron, *q v*

n., cerebrospinal. A n. originating from the brain or spinal cord

n., cranial. One of the 12 pairs of nerves arising from the brain and making its exit through a foramen of the cranium

n., depressor. An afferent n. which when stimulated lowers blood pressure

n., efferent. One transmitting impulses from a nerve center to the periphery.

n. ending. The termination of a nerve fiber (axon or dendrite) in a peripheral structure. May be sensory (receptor) or motor (effector). Sensory endings are (a) *nonencapsulated* (Ex: free nerve endings, peritrichal endings, tactile corpuscles of Merkel) or (b) *encapsulated* (Ex: end-bulbs of Krause,

THE SECOND DIVISION OF THE TRIGEMINAL NERVE.

1. Plexus dentalis.
2. Ansa supra-maxillaris.
3. N. dentalis posterior.
4. N. dentalis anterior.
5. N. infra-orbitalis.
6. N. malaris.
7. N. temporalis.
8. Chorda tympani.
9. N. buccinatorius.
10. N. mandibularis.
11. N. linguallis.
12. N. alveolaris superior.
13. Sphenopalatine ganglion.
14. N. sphenopalatinus.

OCULOMOTOR, TROCHLEAR, AND ABDUCENT NERVES.

1. Nervus abducens 2. N. trigeminus 3. Gasserian ganglion 4. Ciliary ganglion 5. N. lacrimalis. 6. N. ciliaris 7. Lacrimal gland 8. N. supra-trochlearis. 9. Lamina cribrosa. 10. N. ethmoidalis 11. N. infratrochlearis. 12. N. nasociliaris 13. N. opticus 14. N. oculomotorius. 15. N. trochlearis.

Melssner's corpuscles, Vater-Pacini corpuscles, Golgi-Mazzoni corpuscles, neuromuscular and neurotendinous spindles).

n., excitatory. N. transmitting impulses which stimulate function.

n. fiber. See: nerve fiber(s) (separate entry following nerve).

n. fibril. A fine fiber in the cytoplasm and cell processes of a neuron. Syn: neurofibrilla.

n., frigorific. A sympathetic n. causing a lowering in temperature on stimulation.

n. grafting. Insertion of a piece of healthy nerve, usually from an animal, to replace a degenerated portion in the human. Syn: neuroplasty.

n. hillock. Small bulge where a nerve fiber enters a muscle.

n. impulse. Name for the excitatory process which travels along a nerve fiber when stimulated.

n., inhibitory. One which, upon stimulation, lessens activity in a part.

n., mixed. One containing both afferent (sensory) and efferent (motor) fibers.

n., moderator. The aortic and sinus nerves, so named because of their role in the regulation of blood pressure.

n., motor. One containing motor fibers and conveying motor impulses. Syn: efferent n.

n., parasympathetic. A n. of the parasympathetic division of the autonomic nervous system.

n., peripheral. Any nerve which connects the brain or spinal cord with peripheral receptors or effectors.

n., pilomotor. A nerve which innervates the arrectores pilorum muscles of hair follicles.

n. plexus. A group of nerves intertwined like a braid.

n., pressor. An afferent n. which when stimulated excites the vasoconstrictor center thus reflexly increasing blood pressure.

n., secretory. N. whose stimulation excites secretion in a part.

n., sensory. A nerve which conducts afferent impulses from sensory receptors to the brain or spinal cord.

n., somatic. A n. which innervates somatic structures, i. e., those comprising the body wall and extremities.

n., spinal. One of 31 pairs of nerves which connect with the spinal cord. Includes 8 cervical, 12 thoracic, 5 lumbar, 5 sacral, 1 coccygeal.

n. stretching. Stretching of a nerve or nerve trunk to relieve pain.

n., sympathetic. N. of the sympathetic division of the autonomic nervous system. See: autonomic nervous system.

n. trunk. The main stem of a peripheral nerve.

n., vasoconstrictor. A n. which conducts impulses which bring about constriction of a blood vessel.

n., vasodilator. A n. which conducts impulses which bring about dilation of a blood vessel.

n., vasomotor. N. which controls the caliber of a blood vessel. A vasoconstrictor or vasodilator nerve, q.v.

THE FIRST DIVISION OF THE TRIGEMINAL NERVE.

1. Nervus trochlearis. 2. N. trigeminus. 3. Gasserian ganglion. 4. N. lacrimalis. 5. N. infratrochlearis. 6. N. frontalis. 7. Musculus levator palpebrae superioris. 8. Lacrimal gland. 9. N. supraorbitalis. 10. Crista galli. 11. N. ethmoidalis. 12. N. supratrochlearis. 13. Lamina cribrosa. 14. M. obliquus superior. 15. N. opticus. 16. N. oculomotorius.

OLFACTORY AND OPTIC NERVES.

1 Gasserian ganglion 2 Nervus trigeminus 3 N. trochlearis 4 N. oculo-motorius 5 Chiasma 6 Foramen opticum 7 Musculus levator palpebrae superioris 8 N. olfactorius 9. Crista galli 10 Trochlea 11 M. rectus superior 12 Bulbus. 13 M. rectus inferior 14 M. rectus inferior. 15. M. rectus exterior

nerve fiber(s). An elongated process of a nerve cell or neuron, usually the axon, concerned primarily with the conduction of impulses. Nerve fibers form the major portion of the white matter of the brain and spinal cord and all nerves. Most fibers in peripheral nerves are *myelinated*, i.e., they are covered by an noncellular sheath of myelin, a fatty substance). The myelin sheath is interrupted at intervals by the *nodes of Ranvier*. Outside the myelin sheath is a closely attached *glial* sheath, the *neurilemma* or *sheath of Schwann*. Between the two sheaths are *Schwann cells*, thin cells having flat, oval-shaped nuclei. One Schwann cell occurs at each internode length. Fibers lacking a myelin sheath are called *nonmyelinated* (unmyelinated). The neurilemma is lacking in all fibers of the central nervous system.

n. f., adrenergic. N 1 which liberates an adrenaline-like substance (sympathin) at its ending. Include most postganglionic fibers of the sympathetic division.

n. f., arcuate. Arch-shaped n. f. in the medulla. Comprise three groups, the ext. dorsal, ext. ventral, and internal

n. f., association. N f which connects one region of the cerebral cortex with another region in the same hemisphere

n. f., cholinergic. N f which liberates acetylcholine at its ending. Includes preganglionic fibers ending in sympathetic ganglia, postganglionic parasympathetic fibers, and efferent somatic fibers ending in skeletal muscle.

n. f.'s, climbing, of cerebellum. 1. **SYN:** mossy fibers. Afferent n f's entering cortex and synapsing with dendrites of Purkinje cells. 2. Collateral branches

of Purkinje cell axons which return to molecular layer terminating about Purkinje or basket-cell dendrites

n. f., collateral. SYN. collateral. A small branch extending at a right angle from an axon

n. f., commissural. N f which passes from one cerebral hemisphere to the other.

n. f., myelinated. One possessing a myelin sheath

n. f., mossy. SEE *n f*'s, climbing, of cerebellum

n. f., nonmedullated. N f containing only an axis cylinder and a neurilemma

n. f., postganglionic. N f of the autonomic nervous system which terminates in smooth or cardiac muscle or a gland. Its cell body lies in an autonomic ganglion.

n. f., preganglionic. N f of the autonomic nervous system which terminates and synapses in one of the autonomic ganglia. Its cell body lies in the brain or spinal cord

n. f., projection. N f arising in the diencephalon and passing to the cerebral cortex or a fiber arising in cerebral cortex and terminating in lower portions of the brain or in the spinal cord

n. f.'s, Remak's. Unmyelinated n. f.
nervine (nĕr'vĕn) [*L. nervus*, a sinew]. 1.
Acting as a nerve sedative 2 An agent
that lessens irritability of nerves and
increases nerve energy [*nerve*

nervomuscular [" + *musculus*, a muscle].
Rel to nerve supply of muscles

nerv'one. A cerebroside present in brain tissue, contains nervonic acid

nervosism (ner'vo-sizm) [n' + G *ismos*, state of] 1 Neurasthenia or nervousness 2 The idea that morbid conditions depend upon alterations of nerve force

nervous (ner'vus) [L. *nervus*, sinew]. 1. Characterized by instability of nerve action, excitability. 2. Pert. to the nerves.

THIRD DIVISION OF THE TRIGEMINAL NERVE.

1. Nervus alveolaris inferior. 2. N. mentalis. 3. Musculus pterygoideus internus. 4. M. buccinator. 5. N. buccinator. 6. N. infraorbitalis. 7. N. alveolaris superior. 8. N. zygomaticus. 9. N. supramaxillaris trigeminus. 10. N. temporalis profundus. 11. M. temporalis. 12. Temporalis superficialis. 13. N. pterygoideus inferior. 14. N. membrana tympani. 15. N. facialis. 16. M. pterygoideus externus. 17. N. massetericus. 18. N. lingualis. 19. N. mandibularis. 20. M. masseter.

n. debility. Nervous fatigue with resultant physical exhaustion. **SYN:** *neurasthenia*.

n. exhaustion. **SEE:** *nervous debility*.

n. impulse. The excitatory process set up in nerve fibers by stimuli.

It is probably in the nature of a wave of electrochemical disturbance traveling at the comparatively slow rate (even in fastest conducting mammalian nerves) of 50-80 meters per second. The velocity varies in different fibers according to the diameter.

n. prostration. **SEE:** *nervous debility*.

n. system. A system of extremely delicate nerve cells, elaborately interlaced with each other, collectively consisting of the brain, cranial nerves, spinal cord, spinal nerves, autonomic ganglia, ganglionated trunks and nerves, maintaining the vital function of reception and response to stimuli.

The nervous system regulates and coordinates bodily activities and brings about responses by which the body adjusts to changes in environment, either external or internal. These changes constitute stimuli which initiate impulses in receptors or sense organs. The principal organs of this group are the eye, ear, the organs of taste and smell, and sensory receptors located in the skin, joints, muscles, and various parts of the body.

The nervous system is divided into two divisions: (1) the *central nervous system*, which includes the brain and spinal cord, and (2) the *peripheral nervous system*, which includes the craniosacral nerves, the organs of special sense, and the sympathetic nervous system. **SEE:** *autonomic n.s., central n.s., parasympathetic n.s., sympathetic n.s.*

n. tissue. The tissue which comprises the nervous system. Includes the nervous elements proper or *neurons* and the interstitial tissue (neuroglia, neurolemma cells, and satellite cells).

nervousness (nèr vūs-nēs) [*L. nervus, sinew*]. Morbid excitability of the nervous system associated with unrest.

nervus. Nerve. *q.v.* **PL. nervi.**

n. erigens. The pelvic nerve. A scattered bundle of ramosacral autonomic fibers originating from the 2nd to 4th sacral nerves and passing to terminal ganglia from which post-ganglionic fibers pass to the pelvic organs (bladder, colon, rectum, prostate gland, seminal vesicles, ext. genitalia).

n. intermedius. The pars intermedia (intermediate nerve of Wrisberg), a branch of the facial nerve consisting principally of sensory fibers.

n. nervorum. Nerve fibers which innervate sheaths of nerves.

n. terminalis. The terminal nerve, a small nerve accompanying the olfactory nerve to the brain. Consists principally of sensory fibers from mucosa of nasal septum.

n. vasorum. Nerve fibers which innervate the walls of blood vessels.

nest. cell. A small mass of epithelial cells set apart from surrounding cells by connective tissue.

nēs'tis [*G. nēstis, fasting*] 1. Jejunum. 2. Fasting.

nestither'apy [*G. nēstis, hunger, + therapeia, treatment*] Use of hunger cure therapeutically.

nestother'apy [*G. nēstis, hunger, + therapeia, treatment*] Therapeutic use of fasting or reduced diet.

net'tle rash. Skin rash with intense itching, resembling condition produced by

stinging with nettles. **SYN:** *hives, urticaria*.

net'work [*AS net, net, + wyrcan, to work*]. Fiber arrangement in a structure resembling a net. **SYN:** *rete, reticulum*.

Neumann's disease (nol'mānz). Malignant form of pemphigus with growths. **SYN:** *pemphigus nequetans, q.v.*

neuraemia (nū-rāg'mī-ā) [*G. neuron, sinew, + aemos, break*]. The tearing or rupturing of a nerve trunk.

neural (nū-rāl) [*G. neuron, sinew*]. Pert. to nerves or connected with the nervous system.

n. crest. A band of cells extending longitudinally along the neural tube of an embryo from which cells forming cranial, spinal, and autonomic ganglia arise.

n. fold. One of two longitudinal elevations of the neural plate of an embryo which unite to form the neural tube.

n. plate. A thickened band of ectoderm along the dorsal surface of an embryo, from which the nervous system develops.

n. spine. Spinous vertebral process.

n. tube. Tube formed from fusion of the neural folds from which the brain and spinal cord arise.

neuralgia (nū-rāl jī-ā) [*" + algos, pain*]. Severe, lancinating pain along the course of a nerve.

Etiol. Pressure on nerve trunks, faulty nerve nutrition, toxins, neuritis. Usually no morphologic changes can be detected.

SYM. According to the part affected. **SEE:** *geniculate, sciatica*.

n., articular. Neuralgia of a joint.

n., cardiac. Angina pectoris.

n., degenerative. N. caused by degenerative changes in the nerves or nerve cells.

n., epileptiform. Spasmodic facial n. **SYN:** *tic douloureux*.

n., facial. **SEE:** *n., trigeminal*.

n., facialis vera. Geniculate n.

n., Fothergill's. Trigeminal n.

n., geniculate. N. characterized by pain over all or any part supplied by sensory fibers of facial nerve. Pain may be deep in facial muscles, within the ear, or in pharynx.

n., glossopharyngeal. N. along the course of the glossopharyngeal nerve characterized by severe pain in back of throat, tonsils, and middle ear.

n., hallucinatory. Impression of local pain without actual peripheral pain.

n., Hunt's. Geniculate n.

n., idiopathic. N. without structural lesion or pressure from a lesion.

n., intercostal. Pain follows course of intercostal nerves, frequently associated with eruption of herpes zoster, spots of tenderness near vertebral column, in middle of nerve, and near sternum. May be dependent upon spinal caries, or thoracic aneurysm.

n., mammary. N. of the breast. **SYN:** *mastodynia*.

n., Morton's. N. of joint of 3rd and 4th toes.

n., nasociliary. N. of eyes, brows and root of nose.

n., occipital. Involves upper cervical nerves. A spot of tenderness found bet. mastoid process and upper cervical vertebrae. May be due to spinal caries.

n., otic. Geniculate n.

n., reminiscent. Continued mental impression of pain after n. has ceased.

n. (of) sphenopalatine ganglion. **SYN:**

Sluder's n. *SYM.* Pain on one side of face, radiating to eyeballs, ear, occipital and mastoid areas of skull, sometimes to nose, upper teeth and shoulder of same side. *Proc* good.

n., stump. Pressure on nerves in stump after amputation, causing pain.

n., symptomatic. N. not primarily involving the nerve structure

n., trifacial. Old term for trigeminal neuralgia, *q. v.*

n., trigeminal. N. involving the gasserian ganglion or one or more branches of the trigeminal nerve
Error. Unknown Attacks often precipitated by contact with certain hypersensitive areas called *trigger zones* on face, lips, or tongue.

SYM. Tender points correspond to supraorbital, infraorbital, and mental foramina. Often violent spasm of muscles. In long standing cases hair on affected side sometimes becomes coarse and bleached.

Prog For attack, good; permanent cure, guarded.

TREATMENT: Quiet, cool, well-ventilated room, cold applications, hot fomentations, or hot salt bags. Trace course of nerve with oil of peppermint or oil of cloves. Bet. attacks, improve nutrition, give constitutional remedies. Surgical interference, nerve stretching, section, or removal of a portion of the nerve.

SYN: *tic douloureux, prosopalgia.*

neuralgic (nū-rā'jĭk) [G. *neuron*, sinew, + *algos*, pain]. Of, or concerning, neuralgia.

neuramebimeter (nū-rām-ē-blm'ēt-ēr) [" + *ameibē*, response, + *metron*, a measure] Device for determining time of response of a nerve to a stimulus

neurapophysis (nū-rā-pōf'ĭ-sis) [G. *neuron*, sinew, + *apo*, from, + *physis*, growth]. Either of the two sides of a vertebra which unite to form the neural arch.

neurapraxia (nū-rā-prāk'sĭ-ā). Cessation in function of a peripheral nerve induced by compression, drugs, or cold; brings on temporary motor and sensory paralysis.

neurasthenia (nū-rās-thē'nĭ-ā) [G. *neuron*, sinew, + *astheneia*, weakness]. An ill-defined disease commonly following depressed states characterized by a sense of weakness or exhaustion, or by the symptoms of various types of organic disease without the existence of organic disease in a degree sufficient to justify the subjective complaints of the patient.

SYM: Fatigue; weakness; headache; sweating; polyuria; tinnitus and vertigo; photophobia; fear; easy exhaustion on the slightest effort; inability to concentrate; irritability and complaint of poor memory; poor sleep; numerous, constantly varying aches and pains; vasomotor disturbances.

The neurasthenic is often physically asthenic with a long, narrow thorax, small muscles and undernourished. The face is thin, alert, and often suggests chronic suffering. Much of this is the result of the neurasthenia, but it suggests also a physical type, inherently predisposed to develop the disease.

Freud believes the disease is probably a frustration (esp. sexual) which possibly complicates the symptoms by an element of renunciation as well.

Proc: Favorable, if cause can be removed.

TREATMENT: Largely hygienic and dietetic. Where there has been great in-

activity give regular physical exercise. Weak and anemic require rest. Frequent bathing with salt water followed by friction massage. Tobacco and alcohol interdicted, tea and coffee used sparingly. Constitutional remedies. *See. apokam-nosis.*

neurastheniac, neurasthenic (nū-rās-thē-nĭ-āk, -nĭk) [G. *neuron*, sinew, + *astheneia*, weakness]. 1. Suffering from or concerning neurasthenia. 2. Individual suffering from neurasthenia

neuratrophia, neuratrophy (nū-rā-trōf'ĭ-ā, -rāt'rō-fĭ) [" + *atrophia*, a wasting]. Atrophy of the nervous tissue or deficient nutrition of the nervous system

neuraxitis (nū-rāks-ĭ'tis) [" + *axon*, axis, + *-itis*, inflammation] 1. Inflamed condition of a neuraxis 2. Encephalitis *n. epidemic.* Epidemic encephalitis.

neuraxonie (nū-rāks'ōn) [" + *axon*, axis]. The axis cylinder process of a nerve cell *SYN:* *axon* *SEE. nerve fiber.*

neurectasy, neurectasia, neurectasis (nū-rēk'tā-sĭ, -rēk-tā'zĭ-ā, -rēk'tā-sĭs) [" + *ektasis*, a stretching]. Surgical nerve stretching

neurectomy (nū-rēk'tō-mĭ) [" + *ektomē*, excision]. Partial or total excision or resection of a nerve.

neurectopia, neurectopy (nū-rēk-tō'pĭ-ā, nūr-ēk'tō-pĭ) [" + *ek*, out, + *topos*, place]. Displacement or abnormal position of a nerve

neurenteric (ū-rēn-ter'ĭk) [G. *neuron*, sinew, + *enteron*, intestine] Rel to the neural canal and intestinal tube of the embryo.

n. canal. Temporary canal of the embryo between the neural and intestinal tubes. In human development, the temporary communication between cavities of the yolk sac and the amnion

neurepithelium (nūr'ep-ĭ-thē'lĭ-ūm) [" + *epi*, upon, + *thelē*, nipple]. 1. Epithelial structures forming the terminations of nerves of special sense 2. Embryonic layer from which arises the cerebrospinal axis *SYN. neuroepithelium.*

neuregic (nū-rer'ĭk) [G. *neuron*, sinew, + *ergon*, work]. Concerning the activity of a nerve.

neurexaresis (nū-rēks-ĭ-rēs'is) [" + *exairein*, to draw out]. Ripping or tearing out of a nerve to relieve neuralgia.

neuriatry (nū-rĭ-ā-trĭ) [" + *iatria*, treatment]. Study and treatment of diseases of nervous system. *SYN. neurology.*

neurilemma, neurolemma [G. *neuron*, sinew, + *lemma*, rind]. *SYN* sheath of Schwann A thin membranous sheath enveloping a nerve fiber. *SEE. nerve fiber.*

neurilemmitis (nū'rĭ-lēm-mĭ'tis) [G. *neuron*, sinew, + *lemma*, sheath, + *-itis*, inflammation]. Inflamed condition of a neurilemma.

neurilemmoma. *SYN:* *neurinoma, schwannoma, peripheral glioma.* A firm, capsulated fibrillar tumor of peripheral nerves.

neurilemosarcoma (nū-rĭ-lēm-ā-sar-kō-mā). A malignant neurilemmoma.

neurimotility (nū-rĭ-mō-tĭl'ĭ-tĭ) [" + *L. motilis*, able to move]. Power of neural motion. *SYN:* *neurimotility.*

neurimotor [" *L. motor*, a mover]. Concerning a motor nerve.

neurinoma (nū-rĭn-ō'mā) [G. *neuron*, sinew, + *-oma*, swelling]. *SYN:* *neurilemmoma, neurofibroma, schwannoma.* A tumor of a peripheral nerve arising from endoneurium or sheath of Schwann.

neurinomatosis (nū'rĭn-ō-mā-tō'sis). Con-

dition of having multiple neurinomas on nerve fibers. **SYN** *neurofibromatosis*.
neurite (nu'rīt) [*G. neuron, sinew*]. The axis cylinder process of a neuron. **SYN**: axon, neuraxon.

neuritis (nu'rītis) [*G. neuron, sinew, + -itis, inflammation*]. Inflammation of a nerve or nerves, usually associated with a degenerative process. Called *mononeuritis* if a single nerve is involved, *mononeuritis multiplex* if single nerves in separated areas are involved, and *polyneuritis* if several nerves are involved simultaneously.

ETIOLOGY 1 Mechanical factors, compression, contusion, trauma 2 Infections may be localized involving direct infection of nerves or may accompany diseases such as leprosy, tetanus, or tuberculosis, malaria, measles, etc 3 Toxins, esp. poisoning by heavy metals (arsenic, lead, mercury), alcohol, carbon tetrachloride, etc 4 Metabolic factors, as in thiamine deficiency, gastrointestinal dysfunction, diabetes, toxemias of pregnancy, etc 5 Vascular, as in n accompanying peripheral vascular disease

SYM Neuralgia in part affected, hyperesthesia, paresthesia, dyesthesia, hypesthesia, or anesthesia, muscular atrophy of part supplied by affected nerve, paralysis, lack of reflexes

NP Rest in bed, water or air bed. Uniformity of pressure on body Temperature of water in water bath must be maintained by frequent replacement of cooling water with warm water Hot water bags or electric heating pads under covers but not next to skin, as lack of sensibility to heat on part of patient may lead to burns Cradles may be necessary Padded splints with little bandage compression to affected parts. No sudden change of position Place limb in suspended towel to move it No rubbing Later diathermy under direction of physician, also massage, using mildest of manipulations Avoid all strain on patient **SEE** *polyneuritis*.

n., adventitial. Inflammation of nerve sheath.

n., ascending. N along a nerve trunk away from periphery

n., axial. Parenchymatous n

n., degenerative. N with rapid degeneration of nerve

n., descending. N along nerve trunk toward the periphery

n., diphtheritic. N. following diphtheria.

n., disseminated. Segmental n.

n., endemic. Beriberi or multiple n.

n., infectious. **SYN** *acute idiopathic polyneuritis* An acute infectious polyneuritis accompanied by prodromal febrile illness Probably due to a virus

n., interstitial. N involving connective tissue of a nerve

n., intraocular. N. of retinal fibers of optic nerve

SYM Disturbed vision, contracted field, enlarged blind spot, fundus findings such as exudates, hemorrhages and abnormal condition of blood vessels.

TREATMENT Depends on etiology such as brain tumors, meningitis, syphilis, nephritis, diabetes, etc

n., migrans. N which passes along a nerve trunk. May be ascending or descending, q v.

n., multiple. Inflammation of many nerves at the same time.

SYM: *Acute*: Chill, fever, 102-103° F.; headache; pain in back, malaise; coated tongue; loss of appetite; constipation;

loss of power, esp. in legs and extensor muscles, abolition of reflexes; atrophy of muscles, more or less anesthesia, tenderness over nerve trunks *Chronic*: Pains in limbs, hyperesthesia, paresthesia, irregular areas of anesthesia, loss of power, abolition of deep reflexes, tenderness over nerve trunks, wasting of muscles, impaired electrical contractility, edema of hands and feet.

PROG Guardedly favorable. *Acute* form may prove fatal from involvement of respiratory muscles.

TREATMENT *Acute* cases, absolute rest, limb in splint later, and in chronic cases, massage, electricity, general treatment

SYN *polyneuritis* **SEE** *beriberi*.

n., nodosa. N with formation of nodules on nerves

n., optic. N of optic nerve.

n., parenchymatous. N of nerve fiber substance

n., peripheral. N of terminal nerves or of end organs.

n., retrolubar. N of optic nerve behind eyeball

SYM Loss of vision in affected eye. (a) *Acute* Seen in sinus disease, orbital cellulitis, poisons, as lead and alcohol; multiple sclerosis (b) *Chronic*, or *toxic amblyopia* Seen in excessive tobacco and alcohol users. **SYM** Central scotoma.

n., rheumatic. N with symptoms of rheumatism

n., segmental. N affecting segments of a nerve interspersed with healthy segments

n., senile. N. in feet and legs of the elderly.

n., simple. **SYN** *mononeuritis*. Inflammation of single nerve trunk.

n., sympathetic. N of opposite nerve without attacking nerve center.

n., tabetic. N. in locomotor ataxia

n., toxic. N. resulting from metallic poisons such as arsenic, mercury, thallium, or nonmetallic poisons (various hydrocarbons and organic solvents).

n., traumatic. N following an injury.

neuro- [*G. neuron, sinew, nerve*] Combining form meaning *pert. or rel. to a nerve, nervous tissue, or nervous system*

neu"roanat"omy [*G. neuron, sinew, + ana, up, + tomē, a cutting*] Study of structure of the nervous system

neuroarthritism (nu'rō-ar-thrit-izm) [*" + arthron, joint, + ismos, condition*]. Tendency toward contraction of nervous and gouty disorders

neuroarthropathy (nu'rō-ar-throp-āth-ī) [*" + arthron, joint, + pathos, disease*]. Disease of a joint combined with disease of the central nervous system

neurobion (nu-rō-bi'on) [*" + bios, life*]. A hypothetical particle connected with renewal of nerve tissue

neurobiotaxis (nu-rō-bi-ō-tāks-īs) [*G. neuron, sinew, + bios- life, + taxis, order*] The phenomenon involving growth of dendrites and migration of nerve-cell bodies during development toward the region from which their dominant impulses are initiated

neuroblast (nu'rō-blāst) [*G. neuron, sinew, + blastos, germ*] An embryonic cell derived from neural tube or neural crest, which gives rise to a neuron.

neuroblastoma (nu'rō-blāst-ō'mā) [*G. neuron, sinew, + blastos, germ, + oma, tumor*] A malignant soft and hemorrhagic tumor composed principally of cells resembling neuroblasts which give rise to cells of the sympathetic system,

esp. adrenal medulla. Occurs chiefly in young infants and children.
neurocanal (nū'rō-kā-nāl) [" + *L. canalis*, passage]. The central canal of the spinal cord.

neurocardiac (nū'rō-kar'dī-āk) [" + *kardia*, heart]. 1. Pert. to the nerves supplying the heart or nervous system and the heart. 2. Concerning a cardiac neurosis.

neurocele (nū'rō-sēl) [" + *kōilia*, cavity]. Ventricle and cavities in the cerebrospinal axis.

neurocentral (nū'rō-sēn'trāl) [" + *ken-tron*, center]. Pert. to the centrum of a vertebra and the neural arch.

neurochemistry (nū'rō-kēm'ī-ī) [" + *chemēia*, chemistry]. Physiological chemistry dealing with nervous tissue.

neurochoreoretinitis (nū'rō-kō'rē-i-o-rēt-in'ītis) [" + *chorion*, skin, + *L. rētē*, a net, + *G. -itis*, inflammation]. Inflammation of chorioid and retina combined with optic neuritis.

neurochoroiditis (nū'rō-kō-rōi-dī'tis) [" + *chorion*, skin, + *eidos*, like, + *-itis*, inflammation]. Inflamed condition of the choroid coat and optic nerve.

neurocirculatory (nū'rō-sur'ku-lā-tō'rī) [" + *L. circulatio*, circulation]. Pert. to circulation and the nervous system.

n. asthenia. A combination of nervous and circulatory disturbances with fatigue and precordial pain, usually seen in soldiers. *SYN* *irritable heart*, *soldier's heart*. *SEE* *asthenia*.

neuroclonic (nū'rō-klon'īk) [" + *klonos*, spasm]. Marked by spasms of nervous origin.

neurocele (nū'rō-sēl) [" + *kōilia*, cavity]. System of cavities in cerebrospinal axis. *SYN* *neurocele*.

neurocranium (nū'rō-kra'nī-ūm) [" + *kranion*, skull]. The part of the skull enclosing the brain.

neurocutaneous (nū'rō-kū-tā-nē-ūs) [" + *L. cutis*, skin]. Pert. to the nervous system and skin.

neurocyte (nū'rō-sīt) [*G. neuron*, sinew, + *kytos*, cell]. A nerve cell. *SYN* *neuron*.

neurocytoma (nū'rō-sī-tō'mā) [" + " + *-ōma*, tumor]. A tumor formed of cells, usually ganglionic, of nervous origin. *SYN* *neuroma*, 2.

neurodealgia (nū'rō-de-al'jī-ā) [*G. neurodēs*, retina, + *algos*, pain]. Pain in the retina.

neurodendrite, neurodendron (nū'rō-dēn'drīt, -dron) [*G. neuron*, sinew, + *dendron*, tree]. Protoplasmic branched process of a nerve cell. *SYN* *dendrite*, *dendron*.

neurodermatitis (nū'rō-dēr-mā-tī'tis) [" + *derma*, skin, + *-itis*, inflammation]. Cutaneous inflammation of neural origin, or accompanied by nervous disorder, marked by itching.

n. circumscribed. *SYN* *lichen vidual*, *lichen simplex chronicus*. Chronic superficial inflammation of the skin characterized by thick, dry, desquamating plaques accompanied by severe pruritis.

n., disseminated. *SYN* *atopic*, *n. prurigo*. Chronic superficial inflammation of skin characterized by thickening, excoriation, and lichenification, beginning usually in infancy. Common in families with high familial incidence in allergic diseases.

neurodermatosis (nū'rō-dēr-mā-tō'sis) [" + " + *-ōsis*, condition]. Any skin disease of neural origin. Includes *neurofibromatosis* (von Recklinghausen's dis-

ease), von Hippel-Landau disease, Sturge-Weber syndrome, and tuberous sclerosis.

neurodermatrophia (nū'rō-derm-ā-trōf'ī-ā) Atrophy of the skin from nervous disease.

neurodiagnosis (nū'rō-dī-ā-gnō'sis) [" + *dia*, through, + *gnōsis*, knowledge]. Diagnosis of nervous disorders.

neurodocitis (nū'rō-dō-sī'tis) [" + *-itis*, inflammation]. Lesion of nerve roots due to pressure.

neurodynamia (nū'rō-dī-nam'ī-ā) [" + *dynamis*, power]. Nervous energy or force.

neurodynamic (nū'rō-dī-nam'īk) [" + *dynamis*, power]. Concerning nervous force or energy.

neurodynia (nū'rō-dīn'ī-ā) [*G. neuron*, nerve, + *odynē*, pain]. Pain in a nerve or nerves. *SYN* *neuralgia*.

neuroendocrine (nū'rō-ēnd'ō-krīn) . Pertaining to the nervous and endocrine system as an integrated functioning mechanism.

n. apparatus. The hypothalamico-hypophyseal mechanism by which certain hormones (the antidiuretic hormone) are produced by the hypothalamus and stored in the neurohypophysis.

neuroepidermal (nū'rō-ēp-i-dēr'māl) [" + *epi*, upon, + *derma*, skin]. Pert. to or giving rise to nervous system and epidermis.

neuroepithelioma (nū'rō-ēp'ī-thē-lī-ō'mā) [" + " + *thelē*, nipple, + *-ōma*, tumor]. A tumor of neuroepithelium in a nerve of special sense.

neuroepithelium (nū'rō-ēp'ī-thē-lī-ūm) [" + " + *thelē*, nipple]. 1. A specialized epithelial structure forming the termination of a nerve of special sense. Includes gustatory cells, olfactory cells, hair-cells of inner ear, and rods and cones of retina. 2. Embryonic layer of the epiblast from which the cerebrospinal axis is developed.

neurofibril, neurofibrilla (nū-rō-fī-brīl, -fī-brīlā) (pl. *neurofibrils, neurofibrillae*) [" + *L. fibrilla*, a small fiber]. A tiny fiber in the cytoplasm of a neuron which continues on into the nerve processes.

SEE *neuron*.
neurofibroma (nū'rō-fī-brō'mā) (pl. *neurofibromata* or *-mas*) [" + *L. fibra*, fiber, + *G. -ōma*, tumor]. A tumor of connective tissue of a nerve including medullated layer of a nerve fiber. *SYN* *neuroma*, 1, *pseudoneuroma*.

neurofibromatosis (nū'rō-fī-brō'mā-tō'sis) [" + " + " + *-ōsis*, increase]. Condition in which there are tumors of various sizes on peripheral nerves.

They may be neuromas or fibromas.
n., multiple. *SYN* von Recklinghausen's disease, *q.v.*, *molluscum fibrosum*, *multiple neuroma*.

neurofibrosarcoma (nū'rō-fī-brō-sār-kō-mā) *SYN* *neurogenic sarcoma*. A malignant neurofibroma.

neurofibrosis (nū'rō-fī-brō-sī'tis) [" + " + *G. -itis*, inflammation]. Inflammation of nerve fibers and sensory nerve fibers in muscular tissue.

neuroganglitis (nū'rō-gan-glī'tis) [*G. neuron*, sinew, + *gaglion*, knot, + *-itis*, inflammation]. Inflamed condition of a neuroganglion.

neurogenesis (nū'rō-jēn'ē-sis) [" + *genesis*, production]. 1. Growth or development of nerves. 2. Development from nervous tissue.

neurogenic (nū'rō-jēn-ē'tīk) [" + *genesis*, production]. 1. Pert. to nerve formation. 2. Pert. to origin in nerves.

neurogenic, neurogenous (nû-rô-jên'îk, -rôjên-ûs) [" + *gennan*, to produce].

1. Originating from nervous tissue. 2. Due to or resulting from nervous impulses.

neurogeny (nû-rôjên-î) [" + *gennan*, to produce]. *Syn.* *Neurogenesis*.

neuroglia (nû-rôg'î-â) [G. *neuron*, sinew, + *glia*, glue]. The tissue which forms the interstitial or supporting elements—cells and fibers—of the nervous system. Neuroglia, also called glia includes: (1) astrocytes, (2) oligodendroglia, (3) microglia (mesoglia), (4) ependyma, (5) neurilemma sheath cells or nerve fibers (cells of Schwann), and (6) satellite (capsule) cells surrounding cranial and spinal ganglia. All except the microglia are of ectodermal origin. Neuroglia functions as connective or supporting tissue and also plays an important role in the reaction of the nervous system to injury or infection.

n. cell. *Syn.* *Glial cell*. Any of the cells of neuroglia, a neurogliaocyte.

n. proper. Astroglia (astrocytes) and oligodendroglia (oligodendrocytes) of the central nervous system.

neurogliaocyte (nû-rôg'î-â-sî) [" + " + *kytos*, cell]. Any one of the cells found in neuroglial tissue.

neuroglial (nû-rôg'î-âl). Pertaining to neuroglia.

neuroglioma (nû-rô-gî-ô'mâ) [" + " + -ôma, tumor]. Tumor of neuroglial tissue. *Syn.* *glioma*.

n., ganglionic, n., ganglionare. Glioma with ganglion cells.

neurogliosis (nû-rô-gî-ô'sîs) [" + " + -ôsis, increase]. Development of numerous neurogliomas.

neurogram (nû-rô-grâm) [" + *gramma*, a mark]. The impression left upon the physical brain following any cerebral experience which is retained as unconscious memory. *See:* *engram*.

neurography (nû-rôg'î-fî) [G. *neuron*, sinew, + *graphein*, to write]. 1. A study or description of the nervous system. 2. Formation of neurograms in the brain.

neurohematology (nû-rô-hem"at-ô-lô-jî) [" + *aima*, blood, + *logos*, study]. The study of hemic changes in neural diseases.

neurohistology (nû-rô-hîs-tô-lô-jî) [" + *istos*, tissue, + *logos*, study]. The study of nervous tissue.

neurohumor (nû-rô-hûm"ôr) A chemical substance liberated at a nerve-ending which excites or activates and adjusts structure (neuron or muscle fiber). Ex: acetylcholine and sympathin (epinephrine). These substances are essential for transmission of impulses across synapses or myoneural junctions.

neurohypophysis (nû-rô-hî-pôf'îs-îs) [" + *ypo*, under, + *physis*, growth]. Post. portion of the pituitary gland.

neuroinduction (nû-rô-in-dûk'shûn) [" + *L. in*, into, + *ductus*, leading]. Suggestion.

neurokeratin (nû-rô-ker"â-tîn) [G. *neuron*, sinew, + *keras*, kerat-, horn]. The variety of keratin found in myelinated nerve fibers.

neurologic, neurological (nû-rô-lôj'îk, -î-kal) [" + *logos*, study]. Pert. to the study of nervous diseases.

neurologist (nû-rô-lô-jîst) [" + *logos*, study]. A specialist in diseases of nervous system.

neurology (nû-rô-lô-jî) [G. *neuron*, sinew, + *logos*, study]. The branch of medicine that deals with the nervous system and its diseases.

neurolymph (nû-rô-lîmf) [" + *L. lymph*, fluid]. The cerebrospinal fluid.

neurolysin (nû-rô-lîs-în) [" + *lysis*, destruction]. A substance which destroys nerve cells.

neurolysis (nû-rô-lîs-îs) [" + *lysis*, a loosening; a degeneration]. 1. Exhaustion of a nerve or nerves from prolonged stimulation. 2. Stretching of a nerve to relieve tension. 3. Loosening of adhesions surrounding a nerve. 4. Disintegration of nerve tissue.

neurolytic (nû-rô-lî-tîk) [" + *lysis*, destruction]. Concerning neurolysis.

neuroma (nû-rô-mâ) [G. *neuron*, sinew, + -ôma, tumor]. A tumor along the course of a nerve or at the end of a divided nerve, consisting of coiled masses of axis cylinders, Schwann cells and fibrous tissue, since classified on a basis of cytology and histology.

n., amputation. N. occurring on a stump after amputation.

n., amyelinic. N. composed principally of unmyelinated nerve fibers.

n., appendiceal. N. found in mucosa and submucosa of the appendix.

n. cutis. N. of the derma.

n., cystic. N. with cystic formations.

n., false. Tumor arising from connective tissue of nerves, including the myelin sheath. *Syn.* *neurofibroma*, *psudoneuroma*.

n., ganglionated. N. composed of nerve cells.

n., myelinic. N. composed of medullated nerve fibers.

n., plexiform. Congenital n. involving all branches of a nerve. Usually found around head and are painless.

n. telangiectodes. N. with an abundance of blood vessels contained within it.

n., traumatic. N. occurring in wounds or on an amputation stump.

neuromalacia (nû-rô-mal-a'sî-â) [" + *malakia*, softening]. Pathological softening of neural tissue.

neuromatosis (nû-rô-mâ-tô'sîs) [" + -ôma, tumor, + *osis*, increase]. Multiple neuromas occurring in the body.

neuromatous (nû-rô-mâ-tûs) [" + -ôma, tumor]. Rel. to a neuroma.

neuromechanism (nû-rô-mêk"ân-îzm) [" + *mêchanê*, machine]. The neural structure controlling organic and systemic function.

neuromere (nû-rô-mêr) [G. *neuron*, sinew, + *meros*, part]. *Syn.* *rhombomere*. One of a series of segmental elevations on the ventrolateral surface of the rhombencephalon.

neuromimesis (nû-rô-mîm-ê'sîs) [" + *mîmêsis*, imitation]. Resemblance of hysteria to organic disease.

neuromuscular (nû-rô-mus-kû-lâr) [" + *L. musculus*, a muscle]. Concerning both nerves and muscles.

neuromyelitis (nû-rô-mî-êl-î-tîs) [G. *neuron*, sinew, + *myelos*, marrow, + -itis, inflammation]. Inflammation of nerves and the spinal cord.

n. optica. A syndrome resulting from demyelination occurring in the spinal cord, optic nerves, and chiasma; also called *dissimulated myelitis with optic neuritis*, *ophthalmoneuromyelitis*, *Devic's disease*.

neur'o-my'opath'ic. Pert. to pathologic conditions involving both muscles and nerves.

neuromyositis (nû-rô-mî"ô-sî-tîs) [" + " + -itis, inflammation]. Inflammation of both nerves and muscles of a part.

NEURON.

1. Terminal branches. 2. Neurilemma.
3. Axon. 4. Dendrites. 5. Cell body.
6. Myelin sheath

neuron(e) (nû'rôn) [G *neuron*, sinew] A nerve cell, the structural and functional unit of the nervous system. A n consists of a *cell body* or *perikaryon* and its processes, an *axon* and one or more *dendrites*. Neurons function in the initiation and conduction of impulses. *See*: *nerve*, *nerve impulse*, *nervous system*, *nervous tissue*.

n., afferent. N. conducting impulses toward brain or spinal cord, a sensory neuron.

n., associative (association). N. which mediates impulses between a sensory and a motor neuron, a central neuron.

n., bipolar. N. bearing two processes, an axon and a dendrite.

n., central. N. confined entirely to central nervous system, an association n.

n., commissural. N. whose axon crosses to opposite side of brain or spinal cord.

n., doctrine. Formulated by Waldeyer in 1891. Considers the neuron as the anatomical, genetic, trophic, and functional unit of the nervous system.

n., efferent. N. which conducts impulses away from the brain or spinal cord.

n., heteromeric. A commissural n., *q v*.

n., motor. N. which conveys impulses initiating muscle contraction.

n., motor, lower. *Syn.* *ventral horn cells*. N. whose cell body lies in ant. gray column of spinal cord and axon innervates striated muscle fibers.

n., motor, upper. N. whose cell body lies in motor area of cerebral cortex. Its axon passes down spinal cord and synapses with lower motor neurons.

n., multipolar. N. with one axon and many dendrites.

n., peripheral. N. whose process constitutes a part of the peripheral nervous system (cranial, spinal or sympathetic nerves).

n., postganglionic. N. of autonomic nervous system whose cell body lies in central nervous system and axon terminates in peripheral ganglia.

n., preganglionic. N. whose body lies in an autonomic ganglion and axon terminates in an effector organ (smooth or cardiac muscle or glands).

n., pseudounipolar. A unipolar neuron which is derived embryologically from a bipolar neuron. *Ex.* sensory neurons of spinal nerves.

n., sensory. An afferent n. which

conveys impulses which give rise to sensations.

n., automeric. N. whose axon remains on same side of brain or spinal cord.

n., unipolar. N. whose cell body bears one process.

neuronitis (nû-rôn-î'tis) [' + -itis, inflammation]. Inflammation, or degenerative inflammation of nerve cells.

neuronophage (nû-rôn-ô-fâ) [' + *phagein*, to eat]. A phagocyte which destroys neurons.

neuronophagia, neuronophagy (nû-rôn-ô-fâ-î-â, -ô-fâ-î) [' + *phagein*, to eat]. Destruction of nerve cells by phagocytes.

neuronyxis (nû-rô-niks'is) [' + *nyxis*, a piercing]. Neural puncture.

neuropath (nû-rô-pâth) [G *neuron*, nerve, + *pathos*, disease]. One predisposed to neural disorders.

neuropathic (nû-rô-pâth'ik) [' + *pathos*, disease]. Rel. to neural disorders.

n., eschar. A bed sore, a decubitus, *q v*.

neuropathogenesis (nû-rô-pâth-ô-jên-ê-sis) [' + + *genesis*, production]. Development of a neural disease.

neuropathology (nû-rô-pâ-thol-ô-jî) [' + + *logos*, study]. The study of the diseases of the nervous system and the structural and functional changes occurring in them.

The diseases are divided into congenital defects in development, those in which an inherent tendency to degeneracy reveals itself only after a period of time, and finally those in which destructive influences act upon a brain initially normal. The latter group are mainly inflammatory, toxic, traumatic, mechanical and neoplastic in type. Circulatory impairment, disuse and overactivity also contribute to the development of nervous diseases.

neuropathy (nû-rô-pâ-thî) [' + *pathos*, disease]. Any disease of the nerves.

neurophonia (nû-rô-fô-nî-â) [' + *phônê*, voice]. A tic or spasm of muscles of speech resulting in an involuntary cry or sound.

neurophysiology (nû-rô-fîz-i-ol-ô-jî) [' + *physis*, growth, + *logos*, study]. Physiology of the nervous structure of the body.

neuropil (nû-rô-pîl) [G *neuron*, sinew, + *pîlos*, felt]. 1. Network of unmyelinated fibrils into which nerve processes of central nervous system divide.

neuropilasm (nû-rô-plâzm) [G *neuron*, sinew, + *plâsmos*, a thing formed]. *Syn.* *interfibrillar* or *perifibrillar substance*. The undifferentiated cytoplasmic substance of a neuron which surrounds and separates the neurofibrils.

neuroplasmic (nû-rô-plâz-mîk) [' + *plâsmos*, a thing formed]. Concerning the protoplasm of a neuron.

neuroplasty (nû-rô-plâs-tî) [' + *plâsein*, to form]. Reparative surgery of the nerves.

neu'ropod'ia. *Syn.* *end feet, terminal boutons*. Small bulblike expansions of axon terminals which contact the cell body or dendrites of another neuron at a synaptic junction. *Syn:* *neuropodium*.

neuropore (nû-rô-pôr) [' + *poros*, an opening]. Embryonic opening from neural canal to exterior.

neuropsychiatry (nû-rô-sî-kî-â-trî) [' + *psychê*, mind, + *iâtria*, healing]. Study and treatment of nervous and mental diseases.

neuropsychology (nû-rô-sî-kol-ô-jî) [G. *neuron*, sinew, + *psychê*, mind, + *logos*,

study]. The science of connection of neurological and psychological facts.

neuropsychopathy (nū'rō-sī-kop'āth-l) [*+* + *pathos*, disease]. A neurosis in combination with a mental disease.

neurorecidive (nū'rō-rēs'ī-div) [*+* + *L. recidere*, to fall back]. Nervous symptoms in syphilis following a salvarsan injection. SYN *neurorelapse*.

neurorecurrence (nū'rō-rē-kūr'ān) [*+* + *L. rē*, back, + *currere*, to run]. Nervous manifestation as a sequel to salvarsan injection. SYN *neurorelapse*.

neurorelapse (nū'rō-rē-lāps') [G. *neuron*, sinew, + *L. relapsus*, fallen back]. Nervous symptoms in syphilis subsequent to an injection of salvarsan. SYN *neurorecidive*, *neurorecurrence*.

neuroretinitis (nū'rō-rēt'in-ī'tis) [*+* + *L. rētē*, net, + G. *-itis*, inflammation]. Inflamed condition of optic nerve and retina.

neurorrhaphy (nu-ror'ā-fl) [*+* + *raphē*, a sewing]. Suturing of ends of a severed nerve.

neurorrhynes hydrophobiae (nū'rō-rik'-tes hi-drō'fō-bī-e) [*+* + *oryktes*, a digger, + *ydor*, water, + *phobos*, fear]. Supposed microorganisms of rabies. Inclusion bodies usually found in cells of cerebellum and cerebrum in animals infected with rabies. SYN *Negri bodies*.

neurosarcokleisis (nū'rō-sār'kō-klī'sis) [*+* + *sarx*, sark-, flesh, + *kleisis*, closure]. Operation for relief of neuralgia by resection of a wall of the osseous canal carrying a nerve and transplanting the nerve to soft tissues.

neurosarcoma (nū'rō-sār-kō'mā) [*+* + *-ōma*, tumor]. A sarcoma containing neuromatous components.

neurosclerosis (nū'rō-sklē-rō'sis) [*+* + *sklērōsis*, a hardening]. Hardening of nervous tissue.

neurosecretion (nū'rō-sē-krē'shūn) The elaboration and discharge of a substance by a neuron. EX secretion of hormones by cells of the hypothalamus.

neurosensory (nū'rō-sēn'sō-rī) [*+* + *L. sensōrius*, pert to a sensation]. Concerning a sensory nerve.

neurosis (nū-rō'sis) [G. *neuron*, sinew, + *-ōsis*, disease]. A mental or psychic disorder irrespective of etiology. Minor disorders are called *neuroses*, major ones, *psychoses*.

Included among the neuroses are neurasthenia, psychasthenia, anxiety neurosis and hysteria, *q.v.* In general, they manifest themselves as bodily disturbances, without structural abnormality, or as mental disturbances quite distinct from the psychoses. The personality as such is not essentially changed, it mirrors, and reacts to reality as does the normal individual. Conduct may be inefficient and inadequate but it is not antisocial. Emotional reaction may be intensified or dulled but not sufficiently to change the individual basically. Feelings, ideas, failings are not projected or explained by external forces. Language is not distorted though enunciatory difficulties are rather frequent and aphonia is not uncommon.

The neurotic does not violate his ethical standards in the presence of clear consciousness, though during a period of hysterical amnesia he may not escape from a situation that conscious duty would avoid. He has good insight but may falsely consider his symptoms the onset or evidence of insanity. **See:** *pruritus*, *psychoneurosis*, *psychosis*.

n., accident. A nervous disorder caused by injury or an accident.

n., anxiety. N. in which fear or apprehension is the essential symptom. **See** *anxiety n.*

n., association. N. in which association of ideas causes mental repetition of an experience.

n., compensation. N. developing after an accident in people who think they can obtain compensation by being ill.

n., compulsion. N. marked by overpowering impulse to perform acts against the will.

n., expectation. Condition in which anticipation of an occurrence produces nervous symptoms.

n., fatigue. Neurasthenia, *q.v.*

n., obsessional. Uncontrollable obsessions dominating the victim's behavior; a psychoneurosis.

n., occupational, n., professional. N. in a group of muscles caused by constant repetition of an act, as in playing the piano.

n., sexual. Disorder of sex function, as impotence.

n., traumatic. **See** *accident n.*

n., war. Disorder with or without physical cause brought on by conditions of war. SYN *shellshock*.

neurospasm (nū'rō-spāzm) [*+* + *spasmos*, spasm]. Spasmodic muscular twitching due to a nervous disorder.

Neurospora. The pink bread-mold, a fungus belonging to the Ascomycetes. Used experimentally in studies of genetics and in bio-assays.

neurosurgery (nū'rō-sur'jē-rī) [G. *neuron*, sinew, + *L. chirurgia*, from G. *cheir*, hand, + *ergon*, work]. Surgery of the nervous system.

neurosuture (nū'rō-su'chūr) [*+* + *L. sutura*, a stitch]. Stitching of ends of a cut nerve. SYN *neurorrhaphy*.

neurosyphilis (nū'rō-sif'ī-lis) [*+* + *syphilis*]. Syphilis affecting the nervous structures. **See** *dementia paralytica*.

n., asymptomatic. N. preceding symptomatic neurosyphilis but showing no symptoms. Diagnosed by changes in spinal fluid.

n., meningovascular. A form of n. involving the meninges and vascular structures in the brain or spinal cord or both.

neurotension (nū'rō-tēn'shūn) [*+* + *L. tensio*, a stretching]. Operative stretching of a nerve. SYN *neuractasis*.

neurothecitis (nū'rō-the-sī'tis) [*+* + *thēkē*, sheath, + *-itis*, inflammation]. Inflamed condition of a nerve sheath.

neurotherapeutics (nū'rō-thēr-ā-pū'tiks) [*+* + *therapeutikē*, treatment]. Treatment of disorders of the nervous system. SYN *neurotherapy*.

neurotherapy (nū-rō-thēr-ā-pī) [*+* + *therapeia*, treatment]. Treatment of neural disorders. **See** *psychotherapy*.

neurothlipsis (nū'rō-thlip'sis) [*+* + *thlipsis*, pressure]. Irritation or pressure on a nerve.

neurotic (nū-rō'tik) [G. *neuron*, sinew]. 1. One suffering from instability of the nervous system. 2. Nervous or pert. to a neurosis.

neuroticism (nū-rōt'ī-sizm) [*+* + *ismos*, state of]. A condition or trait of neurosis.

neurotization (nū-rōt-i-zā'shūn) [G. *neuron*, sinew]. 1. Acquisition of nervous substance. 2. Regeneration of a nerve after division. 3. Surgical introduction of a nerve into a paralyzed muscle.

neurotology (nū'rō-lō'ō-jī) [G. *neuron*,

- sinew, + *ous*, *ot-*, ear, + *logos*, study]. The division of otology which deals with the inner ear, esp its nerve supply, nerve connections with the brain, and auditory and labyrinthine pathways and centers within the brain.
- neurotome** (nū'rō-tōm) [' + *tomē*, a slice]. Fine knife used in the division of a nerve.
- neurotomy** (nū'rō-tō-mī) [' + *tomē*, an incision]. Division or dissection of a nerve.
- neurotonic** (nū'rō-ton'īk) [' + *tonos*, tension]. 1 Concerning neural stretching. 2 Having a stimulating effect upon nerves or the nervous system.
- neurotony** (nū'rō-tō-nī) [G. *neuron*, sinew, + *tonos*, a stretching]. Nerve stretching.
- neurotoxic** (nū'rō-toks'īk) [' + *toxikon*, poison]. Poisonous to the nerve cells.
- neurotoxin** (nū'rō-toks'in) [' + *toxikon*, poison]. A toxin that attacks nerve cells. SYN: *neurolysin*.
- neurotrauma** (nū-rō-trau'mā) [' + *trauma*, wound]. Nerve lesion. SYN: *neurotrosis*.
- neurotripsy** (nū'rō-trīp-sī) [' + *tripsis*, a rubbing]. Surgical crushing of a nerve.
- neutrophasthenia** (nū'rō-trof-ās-thē-nī-ā) [' + *trophē*, nourishment, + *asthēnia*, weakness]. Malnutrition of the nervous system.
- neutrophy** (nū-rō-trof-ī) [' + *trophē*, nourishment]. Nutrition of the nerves.
- neutrophilic**. Pert to the influence of nervous impulses upon the well-being of an organ or structure.
- neutropism** (nū-rō-trof-plīzm) [' + *ismos*, condition]. Attraction which nutritive elements, basic dyes, and microorganisms have for nervous tissue.
- neurotrosis** (nū'rō-trō'sīs) [' + *trōsis*, a wound]. A lesion of a nerve. SYN: *neurotrauma*.
- neurovaccine** (nū'rō-vāk'sēn) [' + *L. vaccinus*, pert. to a cow]. A standardized vaccine virus of specific strength secured by cultivation in a rabbit's brain.
- neurovaricosis** (nū'rō-vār-ī-kō'sīs) [' + *L. varicōsus*, pert. to a swollen vein]. Multiple swellings along the pathway of a nerve.
- neurovascular** (nū'rō-vās-kū-lār) [' + *L. vasculus*, a small vessel]. Concerning both the nervous and vascular systems.
- neurula** (nū'rū-lā) Stage in development of an embryo, esp amphibian embryos, during which the neural plate develops and axial embryonic nervous structures are elaborated.
- neutral** (nū'trāl) [L. *neuter*, neither]. 1. Neither alkaline nor acid. 2. Indifferent; having no positive properties.
- n. diet**. One in which total basic ash is equal to or exceeded by the total acid ash. A slight excess of acids is usually planned. Protein allowance, 0.85-1 Gm. per Kg. ideal body weight. All food prepared and served without salt.
- n. fat**. One of the fats commonly found in the tissues, an ester of fatty acids with glycerol. Ex: *tristearin*, *triolein*, *tripalmitin*.
- n. point**. pH 7, a point on the pH scale which represents neutrality, *i. e.*, the solution is neither acid or alkaline in reaction.
- n. red**. A dye used as an indicator and as a vital stain.
- neutralization** (nū-tral-ī-zā'shūn) [L. *neuter*, from *ne*, not, + *uter*, either, one of two]. 1. The opposing of one force or condition with an opposite force or condition to such degree as to cause counteraction that permits neither to dominate. 2. In chem. the process of destroying the peculiar properties or effect of a substance, as the neutralization of an acid with a base, or vice versa. 3. In med. the process of checking or counteracting the effects of any agent which produces a morbid effect.
- neutralize** (nū'tral-īz) [L. *neuter*, from *ne*, not, + *uter*, either, one of two]. 1 To counteract. 2 CHEM To destroy peculiar properties or of effect of, to make inert.
- neutroclulsion** (nū'trō-klū'zhūn) [' + *occlusio*, a closing before]. State in which the anteroposterior occlusal positions of the teeth or the mesiodistal positions are normal, but malocclusion of the other positions exists.
- neutron** (nū'trōn) [L. *neuter*, neither]. Elementary particle with approximately the mass of a hydrogen atom, but without any electric charge. [nucleus]. It is a constituent of the atomic
- neutropenia** (nū'trō-pē'nī-ā) [' + *G. penia*, lack]. Abnormally small number of neutrophil cells in the peripheral blood stream.
- neutrophile** (nū'trō-fīl, -fīl) [' + *G. philein*, to love]. 1. Staining easily with neutral dyes. 2. A leukocyte which stains easily with neutral dyes. SEE *polymorphonuclear leukocyte*.
- neutrophilia** (nū'trō-fīl'ī-ā) [' + *G. philein*, to love]. Increase in the number of neutrophile leukocytes.
- neutrophilic**, **neutrophilous** (nū'trō-fīl'īk, -trōf'ī-lūs) [' + *G. philein*, to love]. Staining readily with neutral dyes. SYN: *neutrophil*.
- nevold** (nē'voyd) [L. *naevus*, birthmark, + *G. eidos*, form]. Resembling a nevus.
- nevolipoma** (nē-vō-līp-ō'mā) [' + *G. lipos* fat, + *-ōma*, tumor]. Rare lipoma containing numerous blood vessels, probably a degenerated nevus.
- nevose** (nē'vōs) [L. *naevus*, birthmark]. Spotted or marked with nevi. SEE *nevus*.
- nevus** (nē'vūs) [L. *naevus*, birthmark]. 1. A congenital discoloration of a circumscribed area of the skin due to pigmentation. SYN: *birthmark*, *mole*. 2. Circumscribed vascular tumor of the skin, usually congenital, due to hyperplasia of the blood vessels. SEE: *angioma*. Pt: *nev*.
- n. angiectodes**. SEE: *n. vascularis*.
- n. angiomatodes**. Extensive diffuse angiomatous condition of the subcutaneous tissues.
- n. araneus**. Acquired or congenital dilatation of the capillaries, marked by red lines radiating from a central red dot. SYN: *spider n.*
- n. capillary**. N. of dilated capillary vessels, elevated above the skin. TREATMENT: Ligation, excision.
- n. cutaneous**. N. formation on the skin.
- n. flammeus**. Reddish discoloration of the face or neck, usually not elevated above the skin. A serious deformity due to large size and color. TREATMENT: Freezing, cautery, escharotics.
- n. lipomatodes**. Fatty connective tissue tumor, probably a degenerated nevus, containing numerous blood vessels. TREATMENT: Excision, caustics, electrolysis. SYN: *nevolipoma*.
- n. maternus**. A birthmark.

n. pigmentosus. Congenital pigment spot varying in color from light yellow to blackish. **SYM.** Color as stated, variable in size, single or multiple, with many names according to cutaneous changes. **PROG.** Potentially malignant. **TREATMENT:** Small ones destroyed by electrolysis or carbon dioxide snow. Excision in presence of inflammation. X-rays, radium and electrodesiccation.

n. pilosus. A n. covered with hair.

n., spider. SEE *n. araneus*.

n. spilus. Pigmented n. with smooth surface

n., strawberry. SEE *n. vascularis*.

n., telangiectatic. N. containing dilated capillaries.

n. vascularis, n. vasculosus. N. in which superficial blood vessels are enlarged.

They are usually congenital and of variable size and shape, slightly elevated, reddish or purplish, on face, head, neck and arms, though no region is exempt; permanent, or disappearing spontaneously, leaving white or pigmented atrophic scars

TREATMENT: Puncture followed by colloid, electrolysis (superficial growths), surgery for deep-seated, x-rays cautiously employed.

SYN. *strawberry n.*

n. venosus, n. venosus. N. formed of dilated venules

n. verrucosus. N. with a raised wart-like surface.

new growth. Any morbid new formation, as a tumor. **SYN.** *neoplasm*.

nexus (nek'sus) [L. *nectere*, to bind]. A connection or link, a binding together.

N. F. Abbr for *National Formulary*

NH₃. Ammonia.

NH₄Cl. Ammonium chloride.

Ni. Symb for nickel [acid.

niacin (ni'ā-sin). A synonym for *nicotinic*

n. amide. A synonym for *nicotinamide*.

niccolum (nik'ō-lūm) [L.] Nickel, q.v.

niche. A depression or recess

n., enamel. **SYN.** *enamel crypt* One of two depressions which develop between the dental lamina and the enamel organ

nickel (nik'el) [L. *niccolum*]. **SYMS:** Ni. Metallic element with an at wt of 58.6, salts of which are used medicinally.

n. arc. One that emits strongly at 230 and esp. at 350 millimicrons.

Nicolas-Favre disease (nē'kō-lā fāvr'). Venereal disease marked by involvement of inguinal lymph glands with an exuding lesion **SYN.** *Fret's disease, lymphogranuloma venerea*.

nicotinamide (nik'ō-tin'ā-mīd). Member of vitamin-B complex, used in management or prevention of pellagra. The peripheral flush that often accompanies therapy with nicotinic acid, q.v., is avoided with nicotinamide. **SYN.** *niacinamide*.

nicotine (nik'ō-tēn, -tīn). A poisonous alkaloid found in all parts of the tobacco plant, but esp. in the leaves.

When pure, it is a colorless oily fluid with little odor but a sharp, burning taste. On standing or in crude materials, it becomes deep brown with a characteristic smell.

POISONING: **SYM:** Hot, burning sensation in mouth, extending to stomach, followed by nausea, increased salivation, vomiting, diarrhea, restlessness, confusion and weakness. Convulsions may appear either locally or generally. Respiration and pulse very rapid.

F. A. TREATMENT: Wash out stomach

and administer finely divided charcoal to absorb nicotine. Stimulants, massage, artificial respiration and inhalation of oxygen important adjuncts.

nicotinic acid (nik'ō-tin'ik). The antipellagra principle of vitamin-B complex.

USES: In pellagra, in cutaneous circulatory deficiency (trostbite, acne vulgaris), in trigeminal neuralgia, in multiple sclerosis, in certain cases of deafness, and in Mènière's syndrome

Formula C₆H₅N-COOH

FUNCTIONS This vitamin, or its amide, nicotinamide, acts as a coenzyme in cellular respiration. It consists of two coenzymes. Coenzyme I (diphosphopyridine nucleotide, or DPN) and Coenzyme II (triphosphopyridine nucleotide, or TPN). These coenzymes act in series with flavoprotein enzymes and function as hydrogen acceptors and when reduced as hydrogen donors.

nicotinism (nik'ō-tēn-izm, -tīn-izm). Poisoning from excessive use of tobacco or nicotine.

nictitate (nik'tī-tāt) [L. *nictitāre*, to wink] To wink

nictitating (nik'tī-tāt-ing) [L. *nictitāre*, to wink]. Winking or blinking

n. spasm. Clonic spasm of eyelid with continuous winking.

nictation, nictitation (nik-tā'shun, nik-tī-tā'shun) [L. *nictitāre*, to wink]. The act of involuntary winking due to a nervous disorder

nidal (nī'dal) [L. *nidus*, nest]. Pert. to a

nidus

nidation (nī-dā'shun) [L. *nidus*, nest]. 1. Periodic intramenstrual preparation of endometrial epithelium.

nidus (nī'dūs) [L. nest] 1 A cluster, nest-like structure. 2 Focus of infection. 3. A nucleus or origin of a nerve.

n. avis cerebelli. A deep sulcus of each side of the inferior vermis separating it from adjacent lobes of hemispheres

Niemann-Pick disease (nē-mahn-plk). **SYN.** *lipoid histiocytosis* A lipid disorder in which cells of reticuloendothelial system, esp. liver and spleen, become infiltrated with a phospholipid (sphingomyelin)
